DISCLAIMER

This book contains questions based on topics asked in previous years' MCI Screening Exams. Often repeated topics and sub-topics have been included for students' benefit. We do not claim that these questions are exact or similar to the questions asked in MCI Exams. If any such similarity is found, it is purely coincidental and by chance.

Dedicated to

My Loving wife Renuka

Dr Deepak Marwah

My adorable daughter Sarah S. Ahmad

"Your smile, when I see you after a long, exhaustive day, is the purest form of opioid."

and

My Loving wife Dr Sadia H. Ahmad

Dr Siraj Ahmad

Preface to 5th Edition

Dear Students,

We convey our sincere regards and thanks to all our readers for the huge response to the previous edition of FMGE Solutions and also for making it the best book for FMGE aspirants. In order to improvise further we are coming up with the fifth edition of the book.

Here once again we are providing you the best text for your preparation in most updated form possible, keeping in mind the structure and level of examination at present. Medical Council of India (MCI) screening examination has always been a tough nut to crack because the examination pattern is very unpredictable ranging from single one liner to long case-based questions. Keeping that in mind we have added multiple additional image-based questions as per the recent pattern and another separate section for clinical-pattern questions.

Your preparation level should start from the basics and then gradually it should reach the maximum height. The preparation should be started from the very beginning and with perseverance, and thankfully, persistence is a great substitute for talent.

“A river cuts through the rock, NOT because of its power but because of its persistence”.

As we have mentioned earlier also ***“hard work beats talent, when talent doesn’t work hard”***. This examination does not test your talent rather it tests your dedication, your hard work, your capacity to sit for 12 to 14 hours per day. We have seen all of you studying the same matter with similar dedication, but only a handful of people taste the success of crossing the boundary line. Oftentimes the most talented ones are also left behind. Ever wondered what is the thing that separates the winners from the rest of the population? The reasons can be many. But here we could enumerate a few:

First and foremost is: **The faith and belief that you can do it.** It is said, ***“if you have acquired this belief that you can do it, your half of the journey is done.”*** Now the question arises, is it just enough to believe that you can do it? The answer is NO. In addition to this belief, you also need to show the consistency and willpower to challenge what comes next. You will have to work accordingly.

The second is: ***“The extra mile they ran.”*** After your full-day exhaustive classes it is practically impossible to reach home and sit with the notes once again for the next one hour. But dear friends, this is what differentiates the winners from the rest of the population. They show this toughness, aggressiveness and willpower to run that extra mile on the same evening. It is this attitude that brings them one step closer to victory every day. Therefore it is advisable to all of you: rejuvenate yourself after all the tiredness and do the revision of the day-work in the evening itself. ***“This is your battle, push yourself for one more step, no one else is going to do it for you, the success lies right there.”***

The willingness to explore the new and to accept the challenge. Remember, ***“if it doesn’t challenges you, it won’t change you,”*** and ***“old ways won’t open new doors.”***

As the level of examination has been most unpredictable, you will have to accept the challenge and be ready to learn the new things that come along. Remember, the percentage of repeated questions in the examination is very less but ***“the topics are often repeated”***. Hence, your analytical and reading skills will determine your score. In the book,

the explanation section contains more information than the number of questions in each topic. Therefore we would suggest you to read all the explanations in detail at least three to four times including the “**Extra Mile**” boxes which are an add-on and golden points.

At the end of the book we have also included a separate section of “**Key Points**,” which will be your most important revision tool in last few days of revision and 2 sets of model papers along with OMR sheet for self evaluation before examination.

Last but not the least, is **the proper strategy and time management**. Remember, you get only five to six months for your preparation and in this duration, you have to finish the classes of all nineteen subjects. Besides, you have to revise these subjects and appear in the tests, which certainly is a lot of work in a very short span of time. Hence, you are advised to finish the first reading in first three to four months. In the fourth and fifth months your revision should start. Whenever you start your revision, remember to do two or three subjects per day, *for example, one clinical/ major subject + one paraclinical/preclinical + one minor subject*. You should be in continuous touch with the dry subjects like Anatomy, Biochemistry and Microbiology as well. Give at least 2 hours every day on these subjects alternatively and follow them religiously on priority basis.

“The key is NOT to prioritize what’s on your schedule, but to schedule your priorities.”

One more point which we would like to highlight here is, keep yourself away from negative thoughts or negative people, it somehow degrades your confidence level from within. Only you have the right and power to do this task.

“Your mind is a powerful thing, when you fill it with positive thoughts, your life will start to change.”

Every possible effort has been made to bring this book in the best shape possible. However, if you come across any typographical errors, queries or suggestions, please write us on: marwahmedicine@gmail.com/sirajahmad9@gmail.com

With these words we would like to extend our best wishes to all our readers across the globe.

Deepak Marwah

Siraj Ahmad

Acknowledgements

We would like to thank all our readers across the globe and the people who helped and motivated us in moulding and shaping this book. Besides, our thanks are also due to:

- Our parents whose prayers and blessings have given us the strength to keep working.
- All our students in India and abroad for their continuous feedback—appreciation and criticism—which helped us shaping this book
- All our previous batch students of test and discussion batch and regular batch for their valuable contributions to the book. You all have been a constant source of motivation for us as well because you have made us work harder every day.
- Our teachers whose valuable lessons and teachings are always with us at each and every step.
- Dr Yusuf Tyagi, MS, Orthopaedics, for his priceless suggestions and round-the-clock availability in shaping this book.
- Dr Manoj Kumar Bhoomigari, MS, Anatomy, for his worthy support and contribution.
- Dr Sravan, MD, Paediatrics, for his impressive support in paediatrics section and for all his continuous support.
- Dr Mona Lisa, MS, Anatomy AFMC, for her remarkable contribution in anatomy section
- Dr Prashant Agrawal, MD, psychiatry, PGI Chandigarh for his valuable suggestions and contributions to psychiatry section.
- Dr Asma, MD (PSM), for her phenomenal contribution and support in shaping and moulding this book
- Dr Deepanshu Goyal, Prepladder for all your efforts in promotion of the book.

Not to forget the constant feedbacks and support of our colleagues:

- Dr Ankit Goel, MD Psychiatry
- Dr Naveen Porwal MD (Physiology), KGMU Lucknow
- Dr Sushant Soni, MD Pathology
- Dr Pawan, MS, General Surgery
- Dr Sonam Pruthi, MD Pathology
- Dr S Sazawal (Baltimore, John Hopkins, USA)
- Dr Shrikant, Gulbarga
- Dr Niraj Singh, Kolkata
- Dr Sinagaram, MD Pediatrics, Chennai
- Dr Pallavi Pradeep, MD, Medicine (Res), USA
- Dr Cinderella B, Medical Officer, Ranchi
- Dr Nikita, MD (Radiology)
- Dr Arshad Ansari, MD
- Dr Shanthan V, MD
- Dr Sadia H. Ahmad, MD Obstetrics and Gynecology (Res), for putting up all the efforts and for your round-the-clock availability in bringing up this book. It was next to impossible without your dedicated efforts.
- Dr Bushra Sufiyan Khan, MD Pharmacology; most disciplined and a wonderful colleague-cum-guide for all her suggestions and feedback from time to time.
- Dr Nida Rizvi, Dr Shamshi Azmi, MD Pharmacology, for all the timely intervention that was needed in shaping up this book.

- Dr Sulthan Al Rashid, MD Pharmacology (Res), for being a wonderful friend and for all his help and availability throughout the journey.
- Dr Prerna Singh, Dr Aparajita for all their dedication and making themselves available in the hour of need and not to forget for endless cups of coffee.
- Dr Prashant, MD (Psychiatry) for his valuable support and expert opinion on the subject
- Dr Saleem, MD (Preventive Medicine, Res) and Dr Shahnawaz, MS (For being cool and supportive friends).
- Md Raza for being the most effective and best friend one can ever pray for.
- Mr David Pillai and Mr Kadwin Pillai, Transworld Educare, Pune for being a potent source and inspiration and motivation, and for all their constant support in shaping the book.
- All our students of Transworld educare, Pune (to mention some Dr Balaji, Dr Thirumalai, Dr Venkat, Dr Phillip and Ms Anshjeet Kaur Bar) for their continuous feedback and appraisal of the book.
- Dr Deepika (BSMU), Dr Himanshu Pandya, Dr Madhu Hundi, Dr Shailika Sharma (Davao Medical School, Philippines), Dr Sarona Sharma (Guangxi Medical School, China), Dr Asif Siddiqui (BSMU, Ukraine), Dr Mukul, Dr Suman Roy, Dr Arka Das (Guangzhou, China), Dr Pankaj Patle, Dr Vishnupriya, Dr Md Ibrahim Khan, Dr Ulfat Jahan, Dr Rahi Shoib, Dr Tanu, Dr Anindya, Dr Pradeep, Dr Avik, Dr Nikita Mahant, Dr Preksha, Dr Sukirty, Dr Sagar, Dr Angelo, Dr Balaji, Dr Aparajita, Dr Lokesh, Dr Sudarshan Subramani, Dr Avnish, Dr Preeti Gaonkar, Dr Zeeshan, Dr Nimit, Dr Sylvia, Dr Nandha, Dr Roshan, Dr Urwashi, Dr Naresh, Dr Gayathri Priyanka, Dr Stephen, Dr Paul and all others who showed interest and feedbacks about the previous edition which helped us in improvising.
- Our office staff members, Mr Soumen, Mr Naveen, Mr Alam, Ms Shweta, Ms Prachi, Mr Manish, Mr Abhishek, Mr Sandeep, Mr Krishna for their true efforts in completion of this book.

No words can describe the role of all Medical Graduate Students in India and abroad, with whom we have ever interacted, in helping me to give this book its final shape.

Our special thanks to **Mr Satish Kumar Jain** (Chairman) and **Mr Varun Jain** (Managing Director), M/s CBS Publishers and Distributors Pvt Ltd for providing me the platform in bringing out the book. We have no words to describe the role, efforts, inputs and initiatives undertaken by **Mr Bhupesh Arora**, (Vice President - Publishing and Marketing, PGME&N and Nursing Division) for helping and motivating me.

We sincerely thank the entire CBS team for bringing the book colorful with utmost care and presentation. We thank Dr Mrinalini Bakshi (*Editorial Head and Content Strategist*) for her editorial support and Ms Nitasha Arora (*Production Head & Content Strategist*), Dr Anju Dhir (*Senior Scientific Coordinator/Editor*), Mr Nitish Dubey (*Senior Editor*), Mr Shivendu Pandey (*Editor*) and all the production team members Mr Ashutosh Pathak, Mr Chaman Lal, Mr Prakash Gaur, Mr Phool Kumar, Mr Bunty Kashyap, Ms Tahira Parveen, Ms Babita Verma, Mr Chander, Mr Raju Sharma, Mr Manoj Chaudhary, Mr Vikram Chaudhary, Mr Manoj Malakar, Mr Arun Kumar and Ms Manorama for devoting laborious hours in designing and typesetting of the book.

From the Publisher's Desk

We request all the readers to provide us their valuable suggestions/errors (*if any*) at:

feedback@cbspd.com

so as to help us in further improvement of this book in the subsequent editions.

Questions (Explained, Board Review and Image-Based Questions)	1214-1227
Answers with Explanations	1228-1250
KEY POINTS	1251-1338
MODEL TEST PAPER-I	1339-1360
MODEL TEST PAPER-II	1361-1381

Clinical Pattern Questions

FMGE Solutions Screening Examination

1. A 25-year-old tall thin man comes to your OPD with complaints of dragging sensation in groin and scrotum on left side. On examination in standing position impulse of coughing is present. His scrotum feels like a bag of worms and supine position leads to reduction of the tortuous swelling. Which is correct about this condition?
- USG abdomen to look for tumor of Adrenals
 - Unilocular acquired retention cyst
 - Urgent aspiration
 - Excision via scrotal approach

Ans. (d) Excision via scrotal approach

Ref: SRB: 5th ed. pg. 1076

- The clinical finding of bag of worms feeling in scrotum points to Varicocele. It leads to dilatation and tortuosity of pampiniform plexus of veins and testicular veins. It is more common on left side.
- The leading cause is idiopathic but can occur due to left sided renal cell cancer with tumor thrombus in left renal vein leading to obstruction to venous flow of left testicular vein.
- Venous doppler should be done for scrotum and groin and since it is mentioned as a tortuous swelling, excision of veins should be done.

2. Middle aged male presents with a scrotal swelling which has been present for previous 6 months. It shows positive fluctuation and the surgeon can get above the swelling. Which of the following is not to be done in the patient?
- Lord's plication
 - Jaboulay's procedure
 - Aspiration
 - Evacuation and Eversion

Ans. (c) Aspiration

Ref: SRB: 5th ed. pg. 1072

The clinical presentation is of a hydrocele. The key word is that surgeon can get above the swelling. The surgeries for hydrocele are-

- Subtotal excision of sac
- Jaboulay's Operation
- Evacuation and Eversion
- Lord's plication
- Sharma and Jhawars Technique (After excision, the sac with the testis is placed in newly created pocket between the fascial layers of the scrotum).

3. A 25-year-old male presents with inability to place back the retracted preputial skin over the glans. The glans is edematous, swollen with severe pain and tenderness. Which is initial management of this condition?
- Dorsal slit to relieve edema
 - Urgent circumcision
 - Injection of lignocaine in swollen part to reduce pain
 - Part elevation and local dressing

Ans. (a) Dorsal slit to relieve edema

Ref: SRB: 5th ed. pg. 1061

The key word in the question is inability to push back the preputial skin over the glans penis post intercourse indicating development of Paraphimosis.

Manual reduction should be tried. If it fails, initial dorsal slit is made to reduce edema and compression. Antibiotics and analgesics are given. Circumcision is done after 3 weeks.

4. A 35-year-old alcoholic has presented with 2 episodes of hematemesis. On examination his pulse rate is 100/min with BP of 90/60 mm Hg. Per abdomen examination shows spleen palpable 3 cm below costal margin. Which is true about this patient?
- Elevated CRP and Low C3
 - Most common site of bleeding is First part of duodenum
 - Urgent Elective intubation of patient
 - The increased portal vein pressure should be lowered with octreotide

Ans. (d) The increased pressure of portal vein pressure should be lowered with octreotide

Ref: CMDT 2019 pg. 627

- The presence of splenomegaly with hematemesis points to etiology of portal hypertension. Hence after stabilization of patients with fluids, octreotide should be started to lower the pressure in portal vein.
- The leading cause of hematemesis is peptic ulcer disease but this patient is having portal hypertension leading to vomiting of blood.

5. A pregnant lady was admitted with diagnosis of PIH for monitoring and bed rest. In supine position which of the following is a complication of the below representation?

- Abdominal aorta syndrome
- Supine vena cava syndrome
- Ascending aorta syndrome
- Superior vena cava syndrome

Ans. (b) Supine vena cava syndrome*Ref: William Obstetrics pg. 1369*

The image shows the developing baby compressing the IVC of the mother. This will lead to reduced venous return and development of dizziness and hypotension in the mother. This is called supine hypotension syndrome or supine vena cava syndrome.

6. A 25-year-old primigravida has presented in obstructed labor. On examination she is exhausted and has a tender uterus with a groove felt per abdomen as shown in the image. Fetal parts are not felt. What is the diagnosis?

Normal shape of the abdomen

- a. Constriction ring b. Retraction ring
c. Abruptio placentae d. Cervical dystocia

Ans. (b) Retraction ring*Ref: Dutta 8th ed. pg. 421*

The presence of an exhausted patient with a tender uterus favours diagnosis of retraction ring. Please note that constriction ring is only revealed during CS in first stage, forceps application during second stage and during manual removal in 3rd stage.

Pathological retraction ring	Constriction ring
Occurs in prolonged 2nd stage	Occurs in the 1st, 2nd or 3rd stage
Always between upper and lower uterine segments	At any level of the uterus
Rises up	Does not change its position
Felt and seen abdominally	Felt only vaginally
The uterus is tonically retracted, tender and the fetal parts cannot be felt	The uterus is not tonically retracted and the fetal parts can be felt
Maternal distress and fetal distress or death	Maternal and fetal distress may not be present
Relieved only by delivery of the fetus	May be relieved by anesthetics or antispasmodics

7. The following instrument is used for performing aspiration of uterine cavity within _____ days of a missed period in a woman with previously normal cycle

xiii

- a. 14 days b. 28 days
c. 42 days d. 72 days

Ans. (a) 14 days*Ref: Dutta: 8th ed. pg. 646*

The image shows 50 ml syringe used for performing menstrual regulation. After cervical dilatation, Karman cannula is inserted and attached to the syringe for aspiration. The cannula is rotated, pushed in and out with gentle strokes. This method is used within 14 days of a missed period in a woman with a previous normal cycle.

8. A 25-year-old lady is undergoing the following procedure for an unplanned conception. The maximum pressure generated during the procedure is?

- a. 100–200 mm Hg b. 200–400 mm Hg
c. 400–600 mm Hg d. 600–800 mm Hg

Ans. (c) 400–600 mm Hg*Ref: Dutta 8th ed. pg. 646*

The image shows suction evacuation being performed. The pressure of suction is raised to 400–600 mm Hg. The end-point of the suction evacuation procedure is when the cannula is gripped by a contracted uterus with a grating sensation.

FMGE Solutions Screening Examination

9. During the following procedure, optimum interval between uterine incision and delivery should be less than _____ seconds.

- a. 30 seconds b. 45 seconds
c. 60 seconds d. 90 seconds

Ans. (d) 90 seconds

Ref: Datta, 8th ed. pg. 673

The image shows LSCS being performed, with the head being delivered by hooking fingers carefully between the lower uterine flap. The head is delivered by elevation and flexion using the palm as fulcrum and the optimum time between the uterine incision and delivery should be less than 90 seconds.

10. The following patient presented to the OPD with history of hair loss. There was no erythema, scarring or scratching. Diagnosis is?

- a. Trichotillomania b. Alopecia Areata
c. Telogen Effluvium d. Tinea infection

Ans. (a) Trichotillomania

Ref: Rook's Textbook of Dermatology, 9th ed. pg. 86

- In Trichotillomania, the hairs are plucked from fronto-parietal region and a bizarre angular pattern of hair loss is produced.

- Telogen effluvium develops when hair follicles go into telogen or resting phase prematurely. It is related to stress like chronic illness, depression and pregnancy. It is more common in women
- Alopecia areata has a clear demarcation without any signs of inflammation or exclamation mark hair.

11. A child has been brought with the following scalp lesion with history of itching in scalp and hair loss for past 2 months. Which of the following is useful for diagnosis of this patient?

- a. Gram stain b. KOH mount
c. Slit Skin smear d. Tzanck smear

Ans. (b) KOH mount

Ref: Fitzpatrick's Dermatology, 8th ed. pg. 2284-85

The image shows black dot sign classical of tinea capitis. The hairs are damaged due to endothrix infection and break easily.

12. The following image shows?

- a. Acanthocyte b. Acantholytic cell
c. Sezary cells d. Clue cells

Ans. (b) Acantholytic cell

Ref: IAVDL Colour Atlas of Dermatology pg. 565

The image shows multinucleate giant cell with peripheral rim of cytoplasm. This is an acantholytic cell (Tzanck cell) which is a large rounded keratinocyte.

Primary acantholysis	Secondary acantholysis
<ul style="list-style-type: none"> • Pemphigus • Staphylococcal scalded skin syndrome • Darier disease • Hailey-Hailey disease 	Seen in viral infection like herpes

13. A 10-year-old child presents with fever and wound with discharging pus from right thigh for 4 months. Given below is the X-ray of the patient. Identify the marked area.

- a. Sequestrum
- b. Cloacae
- c. Involucrum
- d. Woven bone

Ans. (a) **Sequestrum**

Ref: *Essential Orthopaedics, Maheshwari 5th ed. pg. 172*

- The image shows a radio-dense area (marked by blue arrow) than the surrounding bone. Between the marked devitalized irregular bone fragment and normal bone is a radiolucent rim of granulation tissue.
- Involucrum is the *subperiosteal* reactive bone and hence, is ruled out due to location.

14. A 4-year-old boy fell on outstretched hand. X- ray is shown below. Which blood vessel is most commonly affected?

- a. Ulnar artery
- b. Radial artery
- c. Brachial artery
- d. Cubital vein

Ans. (c) **Brachial artery**

Ref: *Essential Orthopaedics, Maheshwari 5th ed. pg. 97*

The image shows displaced supracondylar fracture of humerus and the spike of proximal segment can easily traumatize the brachial artery.

15. An elderly patient slipped in the bathroom and sustained injury over the hip joint. X-ray is shown below. Her attitude of leg will be?

- a. Shortened, abducted and externally rotated
- b. Shortened and abducted
- c. Lengthened and internally rotated
- d. Flexed and adducted and internally rotated

Ans. (a) **Shortened, abducted and externally rotated**

Ref: *Essential Orthopaedics, Maheshwari 5th ed. pg. 134*

The image shows fracture of neck of femur on right side. This is commonly seen due to trivial trauma in older patients. Minimal limb shortening can be seen with limb showing flexion, abduction and external rotation.

FMGE Solutions Screening Examination

16. A 40-year-old male complains of hot flushes each time he bathes. Hb: 20%gm, Platelet: 1,89,000/mm³, WBC: 30,000/mm³, Investigation revealed JAK2 mutation. What is the most likely diagnosis?

- Progressive massive fibrosis
- Chronic myeloid leukaemia
- Polycythemia vera
- Essential thrombocytosis

Ans. (c) **Polycythemia vera**

Ref: Harrison 20th ed. pg. 734

The clinical diagnosis of polycythemia is based on presence of JAK 2 mutation with elevated cell counts and characteristic aquagenic pruritus. The elevated basophils produce histamine which leads to intense pruritus, after exposure to water.

17. A patient with thalassemia with a need of recurrent transfusion, develops transfusion reaction like fever and chills. What can be done to the blood to decrease the rate transfusion reactions?

- Leucocyte depletion
- Antibiotics
- Deglycerolization
- Washed RBCs

Ans. (a) **Leucocyte depletion**

Ref: Wintrobe' Clinical Hematology: 13th ed. pg. 554

- In setting of recurrent transfusions, the donor leucocytes increase the risk of development of febrile nonhemolytic transfusions as well as graft versus host disease.
- Of the methods available to reduce the number of WBC in blood products, washing of red cells, freezing and deglycerolization are effective and yield a product with short shelf life. Modern generation of leukoreduction filters and apheresis machines can provide greater than 4 log reduction of WBC.
- Leukoreduction of blood products should produce blood products with residual WBC $<5 \times 10^6$ per unit (99.9 percent or log 3 reduction).

18. A CKD patient had to undergo dialysis. His Hb was 5.2 gm% so two blood transfusions were to be given. First bag was completed in 2 hours. Second was started and midway he developed shortness of breath, hypertension. Vitals: BP 180/120 mm Hg and pulse rate 110/min. What is the cause?

- Allergy
- Transfusion related circulatory overload
- TRALI
- FNHTR

Ans. (b) **Transfusion related circulatory overload**

Ref: Harrison 20th ed. pg. 814

- This CKD patient has developed severe anemia which is a compensated heart failure state. The patient was given first unit of blood in two hours instead of standard four hours and he is already in compensated heart failure.
- The acute decompensation due to volume overloading that has subsequently occurred will result in pulmonary edema and shortness of breath. This presentation is called as transfusion associated circulatory overload.
- Ideally patients of CKD should be given erythropoietin injections to reduce the incidence of having severe anemia.

19. A 57-year-old man presents with sudden onset of severe and central chest pain radiating to the back. ECG shows ST segment elevation in lead V1-V6, I, aVL. The chest X-ray shows a widened mediastinum. The diagnosis is:

- Aortic dissection
- Acute cor pulmonale
- Acute myocardial infarction
- Acute Pericarditis

Ans. (a) **Aortic dissection**

Ref: CMDT 2019 pg. 496

The ECG finding of ST Elevation prompts diagnosis of Myocardial infarction. But the CXR showing mediastinal widening is the key word which favors diagnosis as tear in the aorta.

The answer is aortic dissection which exhibits a retrograde extension that can affect the coronary artery and can explain the resultant MI in this patient.

20. A 43-year-old 190 cm man post a flight to Chennai presents with left-sided chest discomfort and dyspnea. On chest X-ray, there is a small area devoid of lung markings in the apex of the left lung. Diagnosis is?

- Spontaneous pneumothorax
- Myocardial infarction
- Acute cor pulmonale
- Aortic dissection

Ans. (a) Spontaneous pneumothorax

Ref: CMDT 2019 pg. 325

Spontaneous pneumothorax occurs from a rupture of an apical pleural bleb and is associated with tall, young males and is also seen with *aeroplane ascent*.

21. A 52-year-old businessman with nephrotic syndrome after a non-stop flight from New York to New Delhi presents with sudden onset of breathlessness, hemoptysis, and chest pain. He is brought into Casualty in shock. His chest X-ray is normal. The ECG shows sinus tachycardia. The diagnosis is:

- Pneumothorax
- Myocardial infarction
- Pulmonary embolism
- Aortic dissection

Ans. (c) Pulmonary embolism

Ref: CMDT 2019 pg. 312

- Long distance air travel is contraindicated in patients with hypercoagulable state. Patients of nephrotic syndrome have a hypercoagulable state. This patient has developed pulmonary embolism. *Pulmonary embolism leads to Sinus tachycardia. The small clots obstructing the small blood vessels of lungs cannot be seen in CXR. Hence the CXR is normal.*
- Choice A on CXR will show Deep sulcus sign and absent vascular shadows. Choice C will show bat wing pulmonary edema. Choice D will show pulmonary edema and widened mediastinum.

22. A 42-year-old man presents with central, crushing chest pain that radiates to the jaw. The pain occurred while jogging around the local park. The pain was alleviated with rest. The ECG is normal. Diagnosis is?

- Angina pectoris
- Acute Pericarditis
- STEMI
- NSTEMI

Ans. (a) Angina pectoris

Ref: CMDT 2019 pg. 369

The patient is having chest pain on jogging which is a presentation of chronic stable Angina. It is aggravated by cold, by anxiety, and by exercise. In the case of a normal resting ECG, an exercise ECG should be obtained. All other choices present with chest pain on rest.

23. A 53-year-old woman with ovarian tumor presents with breathlessness and right-sided chest pain. The chest X-ray shows obliteration of the right costophrenic angle. Diagnosis?

- Pleurisy
- Pericarditis
- Myocardial infarction
- Parapneumonic effusion

Ans. (a) Pleurisy

Ref: CMDT 2019 pg. 323

Ovarian tumor (Fibroma and thecoma) can be associated with a right-sided pleural effusion (Meigs syndrome). The obliteration of CP angle on X-ray is another pointer for pleural involvement of this patient.

24. A 32-year-old man involved in a high-speed Road traffic accident is found unconscious at the scene. He is breathing spontaneously. In Accident and emergency, the ECG monitor now shows an irregular rhythm and no P, QRS, ST, or T waves. The rate is rapid. Which is the best management of this patient?

- CPR until a defibrillator is present
- IV adrenaline
- Urgent Echo guided pericardiocentesis
- IV amiodarone

Ans. (a) CPR until a defibrillator is present

Ref: CMDT 2019 pg. 411

The patient is in ventricular fibrillation and needs an urgent CPR to maintain blood flow to the brain in ratio of 30:2.

FIGURE: AHA ACLS cardiac arrest algorithm

25. A 53-year-old man presents to Casualty with severe chest pain. He has a history of angina. ECG shows ST elevation of 4 mm in leads V_1 and V_4 . Thrombolysis has been done but pain and ECG findings are persisting 90 minutes after start of thrombolysis. What is the best management of this patient?

- Rescue PCI
- Primary PCI
- Delayed PCI
- IV Abciximab

Ans. (a) **Rescue PCI**

Ref: CMDT 2019 pg. 386

The patient is having failure of thrombolysis. In case of failure of thrombolysis, rescue PCI is performed. Primary PCI is done for STEMI. Delayed PCI is done for NSTEMI and hence are ruled out.

26. A 42-year-old pedestrian has been struck by a speeding car driven by a juvenile. She is brought into emergency wearing a pneumatic anti-shock garment for an extensive

injury to her pelvis which is distorted. She is intubated with fluids running via two grey color cannulas. Her current blood pressure is 100/60 mm Hg. Which is the next step in management of this patient?

- Transfuse O negative blood and apply external fixator
- Start Packed RBC and perform exploratory laparotomy
- Start Packed RBC and perform decompressive hemicraniectomy
- Start vasopressors and perform pelvic drainage of blood

Ans. (a) **Transfuse O negative blood and apply external fixator**

Ref: CMDT 2019 pg. 507-8

This patient's chief concern will be massive blood loss. No delay should be taken to crossmatch blood. Ideally O negative Blood should be transfused immediately. The blood pressure may be misleading, as she is wearing an anti-shock garment. An external fixator applied by the surgeons will aid in pelvic fracture stabilisation and stem blood loss.

27. A 10-year-old boy with smoke inhalation is brought into Casualty with worsening stridor. A face mask with 100% oxygen is covering his face, but his oxygen saturation continues to fall. What is next step in management of this patient?

- Emergency tracheostomy
- Hyperbaric oxygen therapy
- Urgent intubation with positive pressure ventilation
- Extracorporeal membrane oxygenation

Ans. (a) **Emergency tracheostomy**

Ref: CMDT 2019 pg. 316

Due to hot smoke probably both the nasopharynx and oropharynx are compromised, and a tracheostomy to achieve an airway is essential. Choice B is used for management of carbon monoxide poisoning which may be considered in this patient but would be performed after tracheostomy has failed to relieve symptoms of this patient.

28. A 4-year-old asthmatic child is brought to casualty. She is not speaking and has fast shallow breathing with pulsus paradoxus. ABG shows respiratory acidosis. What is the next best step in management of this patient?

- Urgent endotracheal intubation
- Hyperbaric oxygen therapy
- MDI with salbutamol and corticosteroids
- Terbutaline subcutaneous with aminophylline drip

Ans. (a) **Urgent endotracheal intubation**

Ref: CMDT 2019 pg. 256

The child is having impending respiratory arrest due to severe exacerbation of asthma. Carbon dioxide narcosis will necessitate elective intubation and ventilation.

	Mild	Moderate	Severe	Respiratory arrest imminent
Symptoms				
Breathlessness	While walking	At rest, limits activity	At rest, interferes with conversation	While at rest, mute
Talks in	Sentences	Phrases	Words	Silent
Alertness	May be agitated	Usually agitated	Usually agitated	Drowsy confused
Sings				
Respiratory rate	Increased	Increased	Often >30/minute	>30/minute
Body position	Can lie down	Prefers sitting	Sits upright	Unable to recline
Use of accessory muscles; suprasternal retraction	Usually not	Commonly	Usually	Paradoxical thoracoabdominal movement
Wheeze	Moderate, often only end expiratory	Loud; throughout exhalation	Usually loud; throughout inhalation and exhalation	Absent
Pulse/minute	<100	100–120	>120	Bradycardia
Pulsus paradoxus	Absent <10 mm Hg	May be present 10–25 mm Hg	Often present >25 mm Hg	Absence suggests respiratory muscle fatigue

29. A 13-year-old known asthmatic presents with severe wheezing and a respiratory rate of 40. Her pulse rate is 120. What is the next best step in management of this patient?

- Oxygen and nebulized salbutamol
- Oxygen and Metered dose inhaler of salmeterol
- Oxygen and intravenous Aminophylline
- Oxygen and Intravenous magnesium sulphate

Ans. (a) **Oxygen and nebulised salbutamol**

Ref: CMDT 2019 pg. 256

An acute asthmatic attack is treated initially with oxygen and salbutamol. If necessary IV hydrocortisone is added.

30. A 33-year-old cyclist is struck by a car in a head-on collision and arrives intubated to emergency department. Upon arrival, his Glasgow Coma Scale is 3. He has fixed and dilated pupils with absent gag reflex and with absence of spontaneous breathing efforts. EEG shows isolated bursts along a flat line. What is the next step in management of this patient?

- Pronounce the patient as brain dead
- Do urgent craniotomy
- Do urgent ventriculostomy
- Do urgent Burr hole surgery

FMGE Solutions Screening Examination

Ans. (a) **Pronounce the patient as brain dead**

Ref: Bailey and Love, 26th ed. pg. 1418

A Glasgow Coma Scale of 3 is the lowest score possible with absent gag reflex and light reflex, no breathing efforts. If indicate brain-stem death. This is further confirmed by flat line on EEG.

American Academy of Neurology (AAN) guidelines for brain death in adults require one neurologic examination and one apnea test. Pediatric brain death guidelines from the American Academy of Pediatrics, Child Neurology Society, and Society of Critical Care medicine require two different physicians to conduct two neurologic examinations and two apnea tests, separated by an observation period.

AAN Guidelines for Brain Death in Adults

Clinical evaluation (prerequisites)	Clinical evaluation (neurologic assessment)	Ancillary tests	Documentation
Establish irreversible and proximate cause of come	The following must be assessed	Ordered only if	Time of death is documented
Achieve normal core temperature	Coma	Clinical examination cannot be performed	A checklist is filled out, signed, and dated
Achieve normal systolic blood pressure	Absence of brainstem reflexes	Apnea testing is inconclusive or aborted	
Perform one neurologic examination	Apnea		
			

31. A 62-year-old man is brought to Accident and emergency following assault to the head. He has a face mask and reservoir bag delivering 15L/min of oxygen, a stiff cervical collar and is attached to an intravenous drip. He has no spontaneous eye opening except to pain, makes incomprehensible sounds, and does not obey commands. He demonstrates flexion withdrawal to painful stimuli. On suction, he has no gag reflex. What is the next best step in management of this patient?

- Intubate the patient
- Urgent decompressive hemicraniectomy
- Urgent NCCT head
- Give mannitol and perform burr hole surgery

Ans. (a) **Intubate the patient**

Ref: AHA 2015 Guidelines

A GCS of 8 or less or absence of a gag reflex are both indications for urgent intubation. The patient has sustained head injury and after securing his airway, imaging would be performed to assess nature of CNS injury.

32. A 17-year-old girl presents with fever, odd behaviour, purpura, and conjunctival petechiae. Her lumbar puncture reveals Gram-negative cocci. Best treatment of this patient is?

- Ceftriaxone with vancomycin
- Ampicillin with gentamycin
- Ceftriaxone with dexamethasone
- Piperacillin with tazobactam

Ans. (a) **Ceftriaxone with vancomycin**

Ref: CMDT 2019 pg. 1305

The clinical diagnosis is Meningococcal meningitis and empirical ceftriaxone is started with vancomycin.

Indication	Antibiotic
Preterm infants to infants <1 month	Ampicillin + cefotaxime
Infants 1–3 months	Ampicillin + cefotaxime or ceftriaxone
Immunocompetent children >3 months and adults <55	Cefotaxime, ceftriaxone, or cefepime + vancomycin

Contd...

Indication	Antibiotic
Adults >55 and adults or any age with alcoholism or other debilitating illnesses	Ampicillin + cefotaxime, ceftriaxone or cefepime + vancomycin
Hospital-acquired meningitis, post-traumatic or postneurosurgery meningitis, neutropenic patients, or patients with impaired cell-mediated immunity	Ampicillin + ceftazidime or meropenem + vancomycin

33. A 22-year-old woman presents with a plethora of signs and symptoms. She complains of arthralgia, depression, alopecia, fits, oral ulceration, and facial rash. She is found to have proteinuria and a normocytic normochromic anaemia. What is the best test for her diagnosis?

- Anti-Nuclear antibody
- Anti-Smith antibody
- Anti-Ribosomal P antibody
- Anti-Topoisomerase Antibody

Ans. (a) Anti-Nuclear antibody

Ref: CMDT 2019 pg. 855

The clinical diagnosis of patient is Systemic lupus erythematosus and diagnosis is based on positive ANA.

34. A 67-year-old hypertensive man presents with lower abdominal pain and back pain. An expansive abdominal mass is palpated lateral and superior to the umbilicus. What is the best investigation for this patient?

- X-ray KUB
- Ultrasound abdomen
- Coronary angiography
- Intravenous Pyelography

Ans. (b) Ultrasound abdomen

Ref: CMDT 2019 pg. 492

The presentation is suggestive of abdominal aortic aneurysm. The size should be evaluated by ultrasound and surgical repair is advisable if the aneurysm is greater than 5.5 cm in diameter as it can exhibit spontaneous rupture.

35. An 83-year-old woman suffering from rheumatoid arthritis presents with severe epigastric pain and vomiting. She also complains of shoulder tip pain. What investigation should be done in the emergency room?

- USG chest
- Serum electrolytes
- Upper GI endoscopy
- Erect chest X-ray

Ans. (d) Erect chest X-ray

Ref: CMDT 2019 pg. 640

Steroid usage for rheumatoid arthritis puts this woman at risk for a perforated peptic ulcer. Hence an urgent Erect CXR should be done to look for gas under diaphragm.

36. A 42-year-old woman with benign ovarian tumor presents with ascites and breathlessness. CXR is performed. The clinical diagnosis is?

xxi

- Meigs syndrome
- Dressler syndrome
- Budd-Chiari syndrome
- Cholangiocarcinoma

Ans. (a) Meigs syndrome

Ref: CMDT 2019 page 323

- The CXR shows presence of right sided pleural effusion along with history of ascites and a benign ovarian tumor. This a triad seen in Meigs syndrome.
- Choice B is seen in post MI patients
- Choice C leads to acute onset ascites and right upper quadrant pain
- Choice D leads to obstructive jaundice and cachexia.

37. A 25-year-old woman develops nausea, vomiting, and abdominal pain. On examination, she has tender hepatomegaly and ascites. She was recently started on oral contraceptives. The clinical diagnosis is?

- Budd-Chiari syndrome
- Acute viral hepatitis
- Portal hypertension
- Acute cholecystitis

Ans. (a) Budd-Chiari syndrome

Ref: CMDT 2019 page 726

Budd-Chiari syndrome occurs from thrombosis of the major hepatic veins and has been associated with oral contraceptives. The main diagnostic features are

- Right upper quadrant pain and tenderness
- Ascites
- Imaging studies show occlusion/absence of flow in the hepatic vein(s) or inferior vena cava
- Clinical picture is similar in sinusoidal obstruction syndrome but major hepatic veins are patent.

FMGE Solutions Screening Examination

38. A 42-year-old woman presents with ascites. On examination, she has large 'a' wave in JVP and a low volume pulse. She has history of rheumatic fever. Clinical diagnosis is?

- Right ventricular hypertrophy due to pulmonary artery hypertension
- Right ventricular failure due to tricuspid regurgitation
- Left heart failure due to mitral stenosis
- Left heart failure due to aortic regurgitation

Ans. (a) **Right ventricular hypertrophy due to pulmonary artery hypertension**

Ref: CMDT 2019 pg. 347

- The most common valvular lesion in rheumatic etiology is mitral stenosis. Long standing mitral stenosis leads to pulmonary edema and resultant Pulmonary artery hypertension. This will lead to compensatory right ventricular hypertrophy.
- Choice B is ruled out as it leads to large V wave in JVP.
- Choice C is ruled as mitral stenosis does not lead to left heart but right heart enlargement
- Choice D does not lead to ascites, and instead leads to collapsing pulse.

39. A 52-year-old woman presents with exertional fatigue and ascites. She is noted to have a rapid, irregular pulse rate. The chest X-ray reveals a small heart with calcification seen on the lateral view. The 12-lead ECG demonstrates low QRS voltage. Clinical diagnosis is?

- Rheumatic pancarditis
- Constrictive pericarditis
- Restrictive cardiomyopathy
- Acute cor pulmonale

Ans. (b) **Constrictive pericarditis**

Ref: CMDT 2019 page 441

The presence of rapid irregular pulse points to presence of atrial fibrillation. The CXR finding of calcification narrows down the diagnosis to constrictive pericarditis. The impaired filling of ventricles explains the ascites. Since the left side of heart also receives less blood it can explain presence of exertional fatigue. Low voltage ECG occurs due to calcification impairing the flow of current to recording electrodes.

40. A 34-year-old female presents with hypertension, pinched facies and progressive dysphagia with decreased tone of lower esophageal sphincter (LES) The clinical diagnosis is?

- Scleroderma
- Hiatus hernia
- Rolling hernia
- Diffuse esophageal spasm

Ans. (a) **Scleroderma**

Ref: CMDT 2019 page 323

- Pinched facies with hypertension points to presence of scleroderma. The tone of LES is reduced in scleroderma due to fibrosis.
- Choice B and C can lead to GERD but it does not have other features like systemic hypertension.
- Choice D presents with chest pain and dysphagia and is hence ruled out.

41. A 70-year-old man presents with a 16-week history of progressive dysphagia, and recurrent pneumonia episodes. He also has palpable stony hard neck nodes on examination. Diagnosis is?

- Carcinoma of the esophagus
- Achalasia Cardia
- Diffuse esophageal spasm
- Zenker's diverticulum

Ans. (a) **Carcinoma of the esophagus**

Ref: Bailey and Love, 26th ed. page 1004

Esophageal cancer presents with mechanical symptoms, principally dysphagia, but sometimes also regurgitation. The main feature for malignancy in this case is stony hard consistency of neck Lymph nodes.

42. A 70-year-old man presents with regurgitation of food, dysphagia, halitosis, and a sensation of 'lump in the throat'.

- Pharyngeal pouch
- Carcinoma esophagus
- Diffuse esophageal spasm
- Esophageal Dysmotility

Ans. (a) **Pharyngeal pouch**

Ref: Bailey and Love, 26th ed. page 1018

The key word is regurgitation of food with dysphagia which is seen with Pharyngeal pouch. When it is small, symptoms largely reflect only in-coordination with predominantly pharyngeal dysphagia. As the pouch enlarges, it tends to fill with food on eating, and the fundus descends into the mediastinum. This leads to halitosis and esophageal dysphagia.

43. A 63-year-old man recently treated for renal tuberculosis presents with weight loss, diarrhea, hypoglycemia, hypotension, and is noted to have hyperpigmented buccal mucosa, palmar and hand creases. Which investigation is most suitable for this clinical presentation?

- Serum iron and ferritin
- Serum copper and ceruloplasmin
- Plasma ACTH and cortisol
- Gene XPERT and Intravenous pyelography

Ans. (c) Plasma ACTH and cortisol*Ref: CMDT 2019 page 323*

- The key finding of hyperpigmentation of buccal mucosa, palmar and sole creases point to etiology of Addison disease. The leading cause of Addison's disease in India is tuberculosis.
- The presence of hypotension indicates hypoaldosteronism in Addison's disease. Simultaneous mention of hypoglycemia indicates cortisol deficiency.
- Choice B is done in case of hemochromatosis and bronze diabetes
- Choice C is done in case of Wilson disease
- Choice D is done in for diagnosis of tuberculosis

44. A 66-year-old man presents with a sudden onset of diabetes, anorexia, weight loss, epigastric pain with radiation to back. Next best investigation for this patient is?

- Ultrasound of abdomen
- CT abdomen
- Enteroclysis
- Triple contrast barium enema

Ans. (b) CT abdomen*Ref: Bailey and Love: 26th ed. page 1137*

- The clinical history of epigastric pain radiating to back points to pancreatic etiology. This patient may have developed pancreatic cancer. Sudden onset of diabetes in the elderly is also suggestive. *The best imaging modality to image chronic pancreatitis or pancreatic malignancy is CT abdomen.*
- Choice A is ruled out as gas shadows of stomach obscure ultrasound view of pancreas.
- Choice C is fluoroscopic intubation-infusion small-bowel examination which is used to evaluate for small bowel pathology while this patient has pancreatic lesion
- Choice D is ruled out as it used for large bowel evaluation.

45. A 53-year-old woman presents with weight loss, increased appetite, sweating, palpitations, and preference for cold weather, hot, moist palms, and tremors. What is the best investigation for the clinical diagnosis of this patient?

- TSH levels
- Autoimmune panel
- Plasma catecholamines
- Plasma Cortisol

Ans. (a) TSH levels*Ref: CMDT 2019 page 1139*

This patient presents with classic signs and symptoms of hyperthyroidism. The increased Basal metabolic rate and

calorigenesis explain the symptoms of the patient. These patients have highly suppressed TSH levels. The highlights of hyperthyroidism are:

- Sweating, weight loss or gain, anxiety, palpitations, loose stools, heat intolerance, fatigue, menstrual irregularity.
- Tachycardia; warm, moist skin; stare; tremor.
- **Graves disease:** Majority have a palpable goiter (sometimes with bruit); ophthalmopathy.
- Suppressed TSH in primary hyperthyroidism; usually increased T_4 , FT_4 , T_3 , FT_3 .

46. A 69-year-old man is noted to have a glucose level of 600mg% and a Na of 163 mmol/L. pH of blood is normal. There is no previous history of Diabetes mellitus. What is best management for this patient?

- Insulin sliding scale and 5% dextrose
- Insulin sliding scale and 0.9% normal saline
- Insulin sliding scale and 3% saline
- Insulin sliding scale and 0.45% saline

Ans. (b) Insulin sliding scale and 0.9% normal saline*Ref: CMDT 2019, page 323*

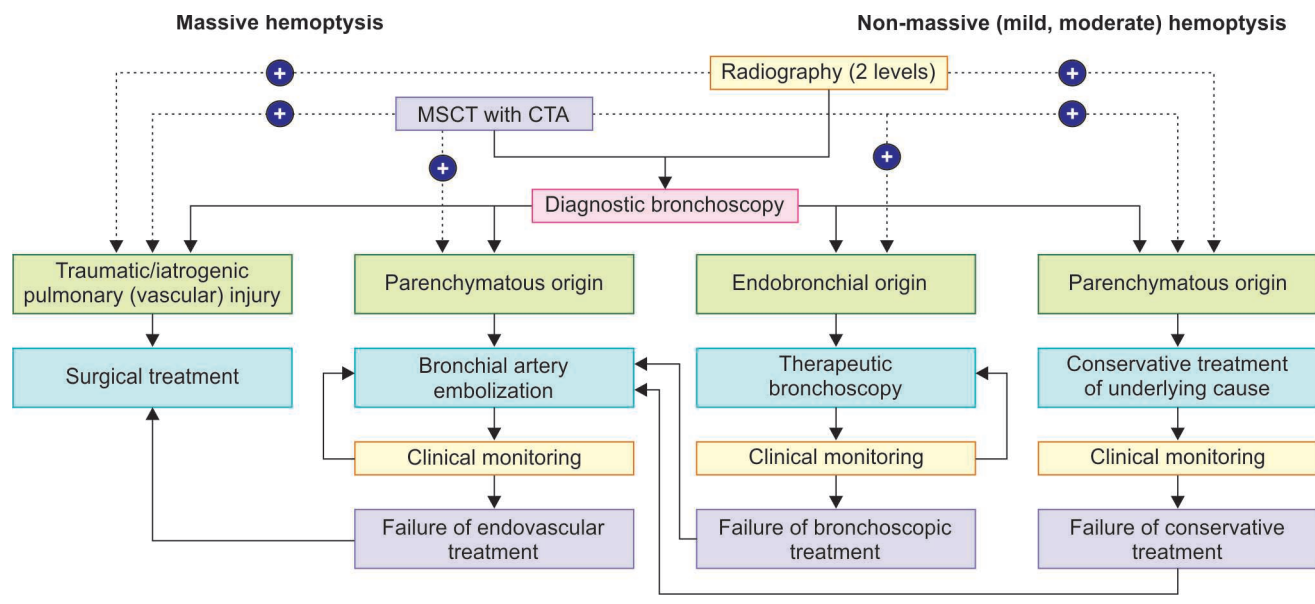

- The blood sugar of 600 mg% leads to increased plasma osmolality and resultant fluid shift across the brain leading to loss of consciousness.
- The clinical diagnosis is nonketotic hyperosmolar coma.
- It occurs in patients with mild or occult diabetes, and most patients are typically middle-aged to elderly.
- It is characterized by severe hyperglycemia in the absence of significant ketosis, with hyperosmolality and dehydration.

47. A patient tested positive for MTB on sputum CBNAAT. He did not come again to the hospital despite multiple reminders. Today he presents with massive hemoptysis and is alarmed. What is the next best step for this patient?

- Urgent coagulation studies
- Perform multi slice CT scan chest
- Schedule a flexible fibre optic biopsy
- Urgent rigid bronchoscopy and prophylactic balloon tamponade

Ans. (b) Perform multi slice CT scan chest*Ref: CMDT 2019, page 26-27*

Multislice computed tomography is the diagnostic imaging modality that yields most information on the cause and site of hemoptysis.

48. A 45-year-old smoker presents with sudden onset unrelenting chest pain with loss of peripheral pulses. BP measured in both arms is different. First differential diagnosis is?

- Mirizzi syndrome
- Aortic dissection
- Viral pericarditis
- Spontaneous pneumothorax

Ans. (b) **Aortic dissection**

Ref: CMDT 2019, page 28

The clinical presentation of chest pain with loss of peripheral pulses points to diagnosis of aortic dissection. The antegrade progression of tear leads to unequal BP between left and right arms.

49. A patient develops chest pain after bout of vomiting with subcutaneous emphysema. Comment on the diagnosis.

- Eventration of diaphragm
- Hampton hump
- Pneumomediastinum
- Water bottle heart

Ans. (c) **Pneumomediastinum**

Ref: Bailey and Love, 26th edition, page 992

The CXR shows continuous diaphragm sign. The presence of vomiting, chest pain and subcutaneous emphysema points to Mackler's triad of Boerhaave's syndrome. The rupture of esophagus due to vomiting against a closed glottis leads to contents of esophagus to spill over into mediastinum. This leads to chemical mediastinitis and pneumomediastinum.

50. A 70-year-old woman has a progressive neurological disorder resulting in degeneration of the anterior horn cells throughout her spinal cord and brainstem. Which of the following abnormal movements is she most likely to exhibit?

- Asterixis
- Chorea
- Fasciculations
- Gait Apraxia

Ans. (c) **Fasciculations**

Ref: Ganong 25th edition, Page 240

- The lesion at anterior horn cells of spinal cord leads to lower motor neuron lesion of spinal cord. It causes twitching of muscles leading to fasciculations.
- Choice A is seen in hepatic and uremic encephalopathy
- Choice B is seen in basal ganglia damage
- Choice D is seen in frontal lobe damage.

Anatomy

MOST RECENT QUESTIONS 2019

1. An injury to the shown area can lead to fracture of which bone?

- a. Scaphoid
- b. Lunate
- c. Trapezium
- d. Hamate

2. Identify the marked muscle tendon in the diagram

- a. Flexor hallucis longus
- b. Extensor hallucis longus
- c. Extensor digitorum longus
- d. Tibialis anterior

3. Which muscle originates from medial epicondyle of humerus?

- a. Supinator
- b. Pronator teres
- c. Pronator quadratus
- d. Brachioradialis

4. Killian dehiscence is formed due to:

- a. Superior constrictor muscle
- b. Inferior constrictor muscle
- c. Middle pharyngeal constrictor muscle
- d. Esophageal fibres

5. Glossopharyngeal nerve supplies which of the following gland?

- a. Parotid gland
- b. Submandibular gland
- c. Sublingual gland
- d. Lacrimal gland

6. Failure of closure of rostral neuropore at 25th day leads to:

- a. Rachischisis
- b. Spina bifida
- c. Anencephaly
- d. Hydranencephaly

7. A patient presents with hypthenar muscle wasting and loss of sensation of medial one and a half digits. Which nerve is involved?

- a. Ulnar nerve
- b. Median nerve
- c. Radial nerve
- d. Musculocutaneous nerve

8. Identify the muscle marked in the diagram:

- a. Teres major
- b. Teres minor
- c. Infraspinatus
- d. Supraspinatus

9. Deep inguinal ring is formed in:

- Transversus abdominis
- Transversalis fascia
- External oblique aponeurosis
- Internal oblique aponeurosis

10. Inguinal ligament is formed due to:

- External oblique aponeurosis
- Transversus abdominis
- Internal oblique aponeurosis
- Inguinal muscle

11. Abduction at the hip joint is done by:

- Gluteus maximus
- Obturator internus
- Quadratus femoris
- Gluteus medius

12. Inferior scapular angle is at which level?

- T4
- T6
- T8
- T2

13. Testicular artery is a branch of:

- Common iliac artery
- Abdominal aorta
- Internal iliac artery
- External iliac artery

14. Flexion, adduction and medial rotation of arm is done by which muscle?

- Pectoralis minor
- Pectoralis major
- Subclavius
- Serratus Anterior

15. Upper lateral cutaneous nerve of arm is a branch of:

- Radial nerve
- Ulnar nerve
- Axillary nerve
- Musculocutaneous nerve

EMBRYOLOGY HISTOLOGY AND OSTEOLOGY

16. Fetal midgut rotates in IUL:

(Recent Pattern Question 2018-19)

- 270 degree clockwise
- 360 degree clockwise
- 270 degree anticlockwise
- 360 degree anticlockwise

17. Rotation of mid gut loop occurs around:

(Recent Pattern Question 2018-19)

- Superior mesenteric artery
- Inferior mesenteric artery
- Middle-colic artery
- Superior rectal artery

18. Neural crest cell migration is due to:

(Recent Pattern Question 2018)

- Heparin
- Heparan sulfate
- Hyaluronic acid
- Dermal sulfate

19. Which of the following is the derivative of ultimobranchial body?

(Recent Pattern Question 2018)

- Thyroid
- Parafollicular 'C' cells
- Capsule of thyroid
- 2nd branchial pouch

20. Which of the following is the derivative of tumor from Rathke's pouch?

(Recent Pattern Question 2018)

- Meningioma
- Craniopharyngioma
- Ependymoma
- Low grade glioma

21. Hardest bone of the body is?

(Recent Pattern Question 2017)

- Head of humerus
- Calcaneum
- Tibial condyle
- Osseus labyrinth

22. Which of the following structure is derived from umbilical artery?

(Recent Pattern Question 2017)

- Ligamentum arteriosum
- Medial umbilical ligament
- Ligamentum venosum
- Ligamentum teres

23. Labia majora is homologous to _____ in a male.

(Recent Pattern Question 2017)

- Glans penis
- Scrotum
- Corpus cavernosa
- Shaft of penis

24. Morula cell stage has how many cells?

(Recent Pattern Question 2017)

- a. 8
- b. 16
- c. 32
- d. >64

25. Umbilical cord has:

(Recent Pattern Question 2017)

- a. One artery, two veins and umbilical artery going to fetus
- b. One artery, two veins and umbilical artery going to placenta
- c. Two arteries and one vein, umbilical artery supplying towards fetus
- d. Two arteries and one vein, umbilical vein supplying towards fetus

26. In the Umbilical cord which of the following structure does not get obliterated during fetal life?

(Recent Pattern Question 2017)

- a. Vitelline duct
- b. Vitelline vessels
- c. Allantois
- d. Umbilical vessels

27. What is correct about embryogenesis?

(Recent Pattern Question 2017)

- a. Branchial cleft: Mesoderm
- b. Branchial arch: Ectoderm
- c. Branchial pouch: Endoderm
- d. All are correct

28. Superior vena cava is derived from:

(Recent Pattern Question 2017)

- a. Aortic arch
- b. Pharyngeal arch
- c. Cardinal vein
- d. Vitelline vein

29. Arch of aorta is derived from:

(Recent Pattern Question 2017)

- a. 2nd aortic arch
- b. 3rd aortic arch
- c. 3rd pharyngeal arch
- d. 4th pharyngeal arch

30. Common carotid artery is derived from:

(Recent Pattern Question 2017)

- a. 2nd aortic arch
- b. 3rd pharyngeal arch
- c. 4th pharyngeal arch
- d. 6th pharyngeal arch

31. Stylohyoid ligament is derived from:

(Recent Pattern Question 2017)

- a. 1st branchial arch
- b. 2nd branchial arch
- c. 1st branchial pouch
- d. 2nd branchial pouch

32. Sphenomandibular ligament is derived from which branchial arch?

(Recent Pattern Question 2017)

- a. 1
- b. 2
- c. 3
- d. 4

33. Which of the following is a derivative of 2nd branchial arch?

(Recent Pattern Question 2017)

- a. Stylohyoid ligament
- b. Sphenomandibular ligament
- c. Spine of sphenoid
- d. Greater cornu of hyoid

34. Lesser cornu of hyoid bone is derived from which arch?

- a. 1st mandibular arch
- b. 2nd branchial arch
- c. 3rd branchial arch
- d. 4th branchial arch

35. Superior portion of hyoid bone is derived from which branchial arch?

- a. I
- b. II
- c. III
- d. IV

36. All of the following muscles are derived from 6th branchial arch EXCEPT:

- a. Lateral cricoarytenoid
- b. Posterior cricoarytenoid
- c. Interarytenoid
- d. Cricothyroid

37. Which of the following does not develop from branchial pouch?

- a. Superior parathyroid
- b. Inferior parathyroid
- c. Thymus
- d. Thyroid

38. The auricle develops from:

- a. 1st branchial cleft
- b. 1st branchial arch
- c. 1st, 2nd and 3rd branchial arch
- d. 1st and 2nd branchial arch

39. Inferior parathyroid gland develops from:

(Recent Pattern Question 2017)

- a. Branchial arch 3rd
- b. Branchial arch 4th
- c. Branchial pouch 3rd
- d. Branchial pouch 4th

40. Tonsil is derived from?

(Recent Pattern Question 2017)

- a. 1st pouch
- b. 2nd pouch
- c. 3rd pouch
- d. 4th pouch

41. Which of the following is not derived from 1st pharyngeal pouch?

- a. Middle ear
- b. Eustachean tube
- c. Tympanic membrane
- d. Palatine tonsils

42. External auditory canal is formed from:

(Recent Pattern Question 2017)

- a. Ventral part of 1st cleft
- b. Dorsal part of 1st cleft
- c. Ventral part of 2nd cleft
- d. Dorsal part of 2nd cleft

43. Lower 1/3 of vagina is formed by:

(Recent Pattern Question 2017)

- a. Mesonephric duct
- b. Paramesonephric duct
- c. Sinovaginal bulb
- d. Mesoderm of mullerian duct

44. Hypoblast forms:

(Recent Pattern Question 2017)

- a. Notochord
- b. Apical ligament of atlas
- c. Endoderm
- d. Prochordal plate

45. First organ to attain functional maturity is:

(Recent Pattern Question 2017)

- a. CVS
- b. CNS
- c. GIT
- d. Lungs

46. Gastrulation occurs in which week of embryonic development?

(Recent Pattern Question 2017)

- a. Week 1
- b. Week 2
- c. Week 3
- d. Week 4

47. First germ layer to be formed is:

- a. Ectoderm (Recent Pattern Question 2017)
- b. Endoderm
- c. Mesoderm
- d. All of them develop simultaneously

48. Notochord is formed by: (Recent Pattern Question 2017)

- a. Nucleus pulposus b. Epiblast
- c. Hypoblast d. Myeloblast

49. Homeobox gene is responsible for:

(Recent Pattern Question 2017)

- a. Segmental organization of embryo in craniocaudal direction
- b. Proper organization along dorsal ventral axis
- c. Stimulation for lengthening of limbs
- d. All of the above

50. Chromaffin cells are derived from:

(Recent Pattern Question 2017)

- a. Neural crest b. Surface ectoderm
- c. Neuroectoderm d. Endoderm

51. Pancreas is derived from: (Recent Pattern Question 2017)

- a. Foregut b. Midgut
- c. Hindgut d. Notochord

52. Proximal umbilical artery forms:

(Recent Pattern Question 2017)

- a. Superior vesical artery b. Median umbilical fold
- c. Lateral umbilical fold d. Ligamentum teres

53. Ligamentum teres is a remnant of:

- a. Ductus venosus b. Ductus arteriosus
- c. Hypogastric artery d. Umbilical vein

54. Remnant of ductus venosus will be:

- a. Ligamentum teres b. Ligamentum venosum
- c. Ligamentum arteriosum d. Falciform ligament

55. Left horn of sinus venosus forms:

(Recent Pattern Question 2017)

- a. Coronary sinus b. Smooth part of right atrium
- c. Superior vena cava d. Inferior vena cava

56. Stapedial artery is derived from which aortic arch:

(Recent Pattern Question 2017)

- a. 1 b. 2
- c. 3 d. 4

57. Fossa ovalis is a remnant of:

(Recent Pattern Question 2017)

- a. Septum primum b. Septum secundum
- c. Bulbus cordis d. Conus

58. In a fetus, testis lies at superficial inguinal ring at:

(Recent Pattern Question 2017)

- a. 6th month b. 7th month
- c. 8th month d. 9th month

59. Pons is derived from:

(Recent Pattern Question 2017)

- a. Metencephalon b. Myelencephalon
- c. Mesencephalon d. Prosencephalon

60. Glomerulus is derived from:

(Recent Pattern Question 2017)

- a. Metanephros b. Mesonephros
- c. Ureteric bud d. Urogenital sinus

61. Prostate gland is derived from:

(Recent Pattern Question 2017)

- a. Urogenital sinus b. Urogenital folds
- c. Labioscrotal swelling d. Gubernaculum

62. Collecting duct is derived from:

- a. Ureteric bud b. Mesonephros
- c. Metanephros d. Allantois

63. Synovial fluid is produced by:

(Recent Pattern Question 2017)

- a. Type A synoviocytes b. Type B synoviocytes
- c. Type C synoviocytes d. Type D synoviocytes

64. Blue color cartilage is:

(Recent Pattern Question 2017)

- a. Hyaline b. Elastic
- c. Fibrocartilage d. Sychondrosis

65. Tyson's glands are:

(Recent Pattern Question 2017)

- a. Apocrine glands b. Holocrine gland
- c. Eccrine gland d. Endocrine gland

66. Fecal fistula at the umbilicus is due to:

(Recent Pattern Question 2017)

- a. Persistent urachus
- b. Persistent vitellointestinal duct
- c. Raspberry tumor
- d. Sister Joseph nodules

67. Failure of fusion of maxillary and medial nasal process leads to:

(Recent Pattern Question 2017)

- a. Cleft lip b. Cleft palate
- c. Bifid uvula d. Deviated nasal septum

68. Ribs develop from:

(Recent Pattern Question 2017)

- a. Endothoracic fascia b. Para-axial mesenchyme
- c. Deep intercostal fascia d. Superficial intercostal fascia

69. Pituitary develops from: (Recent Pattern Question 2017)

- a. Posterior neural ridge b. Rathke pouch
- c. Neural crest d. Neural plate

70. What is true about spermatogenesis?

- a. It takes 74 days
- b. Takes place in spermatid cord
- c. Meiosis occurs only after secondary spermatocyte
- d. Spermatid is formed from spermatozoa

71. Which of the following has the largest size?

- a. Spermatogonium
- b. Primary spermatocyte
- c. Secondary spermatocyte
- d. Spermatozoa

72. Spermatogonium to spermatozoon transformation takes place in:

- a. 64 days b. 74 days
- c. 84 days d. 94 days

- 73. Sperm acquires motility in:**
 a. Seminiferous tubule b. Fallopian tube
 c. Epididymis d. Spermatic cord
- 74. All the following statements about seminal vesicles are true EXCEPT:**
 a. Stores the spermatozoa
 b. Actively depends on the level of testosterone
 c. Secretion has abundant fructose
 d. Lined by pseudostratified columnar epithelium
- 75. At what stage of embryonic development does an embryo normally begin to implant in the endometrium?**
 a. Blastocyst b. Four-cell stage
 c. Morula d. Trilaminar embryo
- 76. Embryo term is used till:**
 a. 12 weeks after LMP b. 10 weeks after fertilization
 c. 10 weeks after LMP d. 8 weeks of fertilization
- 77. Fetal stage is termed:**
 a. From the day of implantation
 b. From 6th week of gestation
 c. From 8th week of gestation
 d. From 10th week of gestation
- 78. Which is not a derivative of midgut:**
 a. Appendix b. Jejunum
 c. Ascending colon d. Descending colon
- 79. Which of the following artery mainly supplies hind gut?**
 a. Celiac trunk b. Superior mesenteric artery
 c. Inferior mesenteric artery d. Rectal artery
- 80. Adrenal medulla is derived from:**
 a. Ectoderm b. Endoderm
 c. Mesoderm d. Neural crest
- 81. Germ cells develop from:**
 a. Yolk sac b. Surface ectoderm
 c. Coelomic endoderm d. Trophoblastic layer
- 82. How many ossification centres are there for the hyoid bone?**
 a. 5 b. 4
 c. 6 d. 3
- 83. Trigone of urinary bladder develops from:**
 a. Endoderm b. Ectoderm
 c. Mesoderm d. None
- 84. What are the vessels in umbilical cord?**
 a. 1 artery, 2 veins b. 2 arteries, 1 vein
 c. 1 artery, 1 vein d. 2 arteries, 2 veins
- 85. What is the content of umbilical cord?**
 a. 2 arteries, 1 vein b. 2 veins, 1 artery
 c. 2 arteries, 2 veins d. 1 artery, 1 vein
- 86. Testosterone in male is secreted from:**
 a. Leydig cell b. Sertoli cell
 c. Seminal vesicle d. Epididymis

- 87. Gall bladder is lined by:**
 a. Ciliated columnar cells
 b. Brush bordered columnar epithelium
 c. Striated columnar epithelium
 d. Pseudostratified columnar cells
- 88. Hassall's corpuscles are found in:**
 a. Liver b. Spleen
 c. Kidney d. Thymus
- 89. Malpighian corpuscles are seen in:**
 a. Thyroid b. Kidney
 c. Neurons d. Liver
- 90. Cord of billroth is seen in:**
 a. Liver b. Spleen
 c. Kidney d. Thymus
- 91. T cells are derived from:**
 a. Tonsils b. Thymus
 c. Thalamus d. Thyroid

UPPER LIMB

- 92. Identify the marked bone:**

(Recent Pattern Question 2018-19)

- a. Capitulum b. Olecranon
 c. Trochlea d. Radial head
- 93. Retraction of scapula at sternocleidomastoid joint is by:**
(Recent Pattern Question 2018-19)
 a. Serratus anterior b. Trapezius
 c. Suprascapularis d. Deltoid muscle
- 94. Winging of scapula is due to paralysis of:**
(Recent Pattern Question 2018-19)
 a. Nerve to trapezius
 b. Nerve to serratus anterior
 c. Nerve to latissimus dorsi
 d. Nerve to pectoralis major
- 95. In a patient with Fracture of upper radius and ulna at the insertion of pronator teres muscle, which movement is restricted:**
(Recent Pattern Question 2018-19)
 a. Pronation b. Supination
 c. Hyperpronation d. Hyperabduction

96. Which of the following is the insertion of the shown muscle?
(Recent Pattern Question 2018-19)

- a. Radial tuberosity
- b. Olecranon process
- c. Radial head
- d. Medial malleolus

97. Coracoid process of the scapula is:

(Recent Pattern Question 2018)

- a. Pressure epiphysis
- b. Traction epiphysis
- c. Atavistic epiphysis
- d. Aberrant epiphysis

98. Which of the following is *not* a component of carpal tunnel?
(Recent Pattern Question 2018)

- a. Ulnar nerve
- b. Median nerve
- c. Flexor digitorum superficialis
- d. Flexor digitorum profundus

99. Which structure passes through Guyon's canal?

(Recent Pattern Question 2018)

- a. Ulnar nerve
- b. Median nerve
- c. Radial nerve
- d. Flexor carpi radialis

100. Which is the nerve root of Biceps jerk?

(Recent Pattern Question 2017)

- a. C5-C6
- b. C6-C8
- c. C7-C8
- d. C8-T1

101. Angle of humeral torsion is _____ degrees?

(Recent Pattern Question 2017)

- a. 15
- b. 35
- c. 135
- d. 164

102. Which carpal bone has a hook?

(Recent Pattern Question 2017)

- a. Capitate
- b. Lunate
- c. Hamate
- d. Pisiformis

103. Which is the 1st carpal bone to ossify?

(Recent Pattern Question 2017)

- a. Capitate
- b. Lunate
- c. Hamate
- d. Pisiformis

104. Which is not a part of proximal row of carpal bones?

(Recent Pattern Question 2017)

- a. Scaphoid
- b. Lunate
- c. Triquetral
- d. Hamate

105. Which is the most commonly fractured carpal bone?

- a. Hamate
- b. Lunate
- c. Scaphoid
- d. Capitates

106. Articulation of pisiform bone is with:

- a. Triquetral
- b. Lunate
- c. Scaphoid
- d. Trapezoid

107. Middle trunk of branchial plexus is formed of:

(Recent Pattern Question 2017)

- a. C6, C7
- b. C7, C8
- c. C8, T1
- d. C7

108. Regimental band anaesthesia is due to lesion of:

(Recent Pattern Question 2017)

- a. Musculocutaneous nerve
- b. Axillary nerve
- c. Long thoracic nerve
- d. Spinal accessory nerve

109. Screwing movement in upper limb is possible with:

(Recent Pattern Question 2017)

- a. Brachioradialis
- b. Anconeus
- c. Supinator
- d. Pronator teres

110. Radial artery ends as: (Recent Pattern Question 2017)

- a. Superficial palmar arch
- b. Deep palmar arch
- c. Both of above
- d. Profunda brachii artery

111. The largest bursa in the body is:

(Recent Pattern Question 2017)

- a. Prepatellar bursa
- b. Infrapatellar bursa
- c. Subacromial bursa
- d. Trochanteric bursa

112. Which is the nerve passing through medial epicondyle?

- a. Ulnar
- b. Radial
- c. Median
- d. Posterior interosseus

113. Anastomosis of subscapular artery are formed by all EXCEPT:

- a. Transverse cervical artery
- b. Suprascapular artery
- c. 1st part of subclavian artery
- d. 2nd part of axillary artery

114. Which structure is present in the anatomical snuff box?

- a. Ulnar artery
- b. Radial artery
- c. Median nerve
- d. Radial nerve

115. Anatomical snuff box contains:

- a. Axillary nerve
- b. Radial artery
- c. Brachial artery
- d. Ulnar artery

116. The medial boundary of the anatomical snuffbox is formed by the:

- a. Ext. pollicis brevis
- b. Ext Carpi radialis longus
- c. Extensor pollicis longus
- d. Ext Carpi radialis brevis

117. Surgical neck fracture leads to all EXCEPT:

- a. Teres major palsy
- b. Teres minor palsy
- c. Weakness of abduction
- d. Deltoid muscle palsy

118. Which of the following artery is affected in anterior shoulder dislocation?

- a. Radial
- b. Axillary
- c. Median
- d. Ulnar

- 119. Which among the following muscles receives Dual Nerve supply?**
 a. Flexor digitorum profundus
 b. Flexor digitorum superficialis
 c. Palmaris longus
 d. Extensor carpi radialis
- 120. All of the following structures are passing deep to flexor retinaculum EXCEPT:**
 a. Flexor pollicis longus
 b. Flexor digitorum superficialis
 c. Palmaris longus
 d. Flexor digitorum profundus
- 121. Which structure passes superficial to flexor retinaculum?**
 a. Ulnar nerve
 b. Median nerve
 c. Flexor digitorum superficialis
 d. Flexor digitorum profundus
- 122. Root value to axillary nerve:**
 a. C5, C6
 b. C6, C7, C8
 c. C5, C6, C7
 d. C5-T1
- 123. Musculocutaneous nerve arises from which cord:**
 a. Medial cord
 b. Lateral cord
 c. Anterior cord
 d. Posterior cord
- 124. Root of radial nerve:**
 a. C6, C7, T1
 b. C5, C6, C7, T1
 c. C5, C6, C7, C8, T1
 d. C4, C5, C6, C7, C8, T1
- 125. Winging of scapula is due to damage of:**
 a. Axillary nerve
 b. Long thoracic nerve
 c. Median nerve
 d. Ulnar nerve
- 126. Winging of scapula is due to paralysis of:**
 a. Serratus anterior muscle
 b. Latissimus dorsi muscle
 c. Rhomboidus major muscle
 d. Pectoralis major muscle
- 127. Winging of scapula is due to paralysis of:**
 a. Serratus anterior muscle
 b. Latissimus dorsi muscle
 c. Rhomboid major muscle
 d. Pectoralis major muscle
- 128. 'Dropped shoulder' occurs due to paralysis of:**
 a. Teres minor
 b. Deltoid
 c. Teres major
 d. Trapezius
- 129. Trapezius muscle is attached to all structures EXCEPT:**
 a. First rib
 b. Clavicle
 c. Scapula
 d. Occiput
- 130. All of the following show ulnar nerve injury EXCEPT:**
 a. Clawing of medial 2 digits
 b. Abductor pollicis palsy
 c. Adductor pollicis palsy
 d. Weak grip
- 131. Pointing finger injury is due to injury of which nerve?**
 a. Radial nerve
 b. Ulnar nerve
 c. Median nerve
 d. Axillary nerve
- 132. Claw hand is due to:**
 a. Median nerve
 b. Ulnar nerve
 c. Median and ulnar both
 d. Radial nerve
- 133. Ape thumb deformity is due to injury of which nerve:**
 a. Radial nerve
 b. Ulnar nerve
 c. Median nerve
 d. Axillary nerve
- 134. Compression of which of the following nerves lead to carpal tunnel syndrome:**
 a. Ulnar nerve
 b. Median nerve
 c. Radial nerve
 d. Both A and B
- 135. Median nerve supplies all EXCEPT:**
 a. Abductor pollicis longus
 b. Pronator quadratus
 c. Flexor pollicis longus
 d. Flexor carpi radialis
- 136. All are muscles of rotator cuff EXCEPT:**
 a. Teres major
 b. Teres minor
 c. Infraspinatus
 d. Supraspinatus
- 137. Most common injured muscle in rotator cuff is:**
 a. Supraspinatus muscle
 b. Infraspinatus muscle
 c. Teres minor
 d. Subscapularis
- 138. In a man lifting up a suitcase, downward dislocation of glenohumeral joint is prevented by:**
 a. Deltoid
 b. Latissimus dorsi
 c. Coracobrachialis
 d. Supra spinatus
- 139. Short head of biceps is innervated by:**
 a. Musculo cutaneous nerve
 b. Radial nerve
 c. Axillary nerve
 d. Median nerve
- 140. Muscle which covers both elbow and shoulder joint:**
 a. Biceps
 b. Biceps brachialis
 c. Coracobrachialis
 d. Long head of triceps brachii
- 141. Which one of the following is a multipennate muscle?**
 a. Tibialis anterior
 b. Deltoid
 c. Tibialis posterior
 d. Latissimus dorsi
- 142. Fracture of shaft of humerus leads to:**
 a. Radial nerve injury
 b. Ulnar nerve injury
 c. Median nerve injury
 d. Musculocutaneous nerve injury
- 143. Posterior wall of axilla is formed by all EXCEPT:**
 a. Teres major
 b. Subscapularis
 c. Supraspinatus
 d. Latissimus dorsi
- 144. Location of level III axillary lymph node in relation to pectoralis minor is:**
 a. Anterior
 b. Posterior
 c. Superior
 d. Inferior
- 145. Supination and pronation of upper limb is due to:**
 a. Wrist joint
 b. Radioulnar joint
 c. Elbow joint
 d. Carpometacarpal joint

146. Medial border of cubital fossa is formed by:

- a. Pronator teres b. Brachioradialis
- c. Supinator d. Brachialis

147. All are contents of the cubital fossa EXCEPT:

- a. Ulnar artery b. Median nerve
- c. Brachial artery d. Ulnar nerve

148. All are contents of cubital fossa EXCEPT:

- a. Median nerve b. Ulnar nerve
- c. Biceps tendon d. Brachial artery

149. Boundary of triangle of auscultation is formed by all EXCEPT:

- a. Scapula b. Trapezius
- c. Serratus anterior d. Latissimus dorsi

LOWER LIMB

150. Tibial and common peroneal nerve supplies:

(Recent Pattern Question 2018-19)

- a. Adductor magnus muscle
- b. Adductor longus muscle
- c. Gracilis muscle
- d. Biceps Femoris muscle

151. Which of the following muscle is supplied by obturator nerve:

(Recent Pattern Question 2018-19)

- a. Gluteus medius b. Obturator internus
- c. Sartorius d. Adductor brevis

152. Which of the following muscle is evtor of foot:

(Recent Pattern Question 2018-19)

- a. Tibialis anterior muscle
- b. Tibialis posterior
- c. Peroneus longus muscle
- d. Extensor digitorum longus

153. Most common nerve damaged in leg:

(Recent Pattern Question 2018)

- a. Common peroneal nerve
- b. Femoral nerve
- c. Sciatic nerve
- d. Tibial nerve

154. Femoral triangle base is formed by:

(Recent Pattern Question 2018)

- a. Medial border of sartorius
- b. Inguinal ligament
- c. Medial border of adductor longus
- d. Iliacus

155. Medial compartment of thigh is supplied by which nerve?

(Recent Pattern Question 2018)

- a. Tibial nerve
- b. Obturator nerve
- c. Femoral nerve
- d. Common peroneal

156. First web space of foot is supplied by:

(Recent Pattern Question 2018)

- a. Common peroneal nerve
- b. Superficial peroneal nerve
- c. Deep peroneal nerve
- d. Sural nerve

157. Which bone in foot is not attached by any muscle?

(Recent Pattern Question 2017)

- a. Talus b. Calcaneum
- c. Metatarsals d. Fibula

158. Which muscle originates from anterior superior iliac spine?

(Recent Pattern Question 2017)

- a. Iliofemoral ligament
- b. Sartorius
- c. Vastus lateralis
- d. Vastus medialis

159. Tibialis posterior muscle is supplied by which nerve?

(Recent Pattern Question 2017)

- a. Posterior tibial nerve b. Deep peroneal nerve
- c. Femoral nerve d. Sural nerve

160. Adductor canal lateral boundary is formed by:

(Recent Pattern Question 2017)

- a. Adductor longus
- b. Rectus medialis
- c. Vastus lateralis
- d. Vastus medialis

161. Which is true about origin of Femoral nerve root value?

- a. Anterior division of L2, L3, L4 ventral rami
- b. Anterior division of L1, L2, L3 ventral rami
- c. Posterior division of L2, L3, L4 ventral rami
- d. Posterior division of L1, L2, L3 ventral rami

162. Which is the muscle marked as A in the femoral triangle?

(Recent Pattern Question 2017)

- a. Iliacus b. Psoas major
- c. Pectineus d. Adductor longus

163. Biceps femoris does which of the following function?

(Recent Pattern Question 2017)

- a. Adduction of knee b. Flexion of knee
- c. Extension of knee d. Abduction of knee

164. Chief extensor of thigh at hip joint is supplied by:

(Recent Pattern Question 2017)

- a. Inferior gluteal nerve
- b. Superior gluteal nerve
- c. Sciatic nerve
- d. Peroneal nerve

165. Which of the following muscles is an evertor of foot?

(Recent Pattern Question 2017)

- a. Peroneus tertius b. Tibialis anterior
- c. Extensor hallucis longus d. Extensor digitorum longus

166. What is the nerve supply of popliteus muscle?

(Recent Pattern Question 2017)

- a. Tibial nerve b. Popliteal nerve
- c. Common peroneal nerve d. Deep peroneal nerve

167. Which is not a cause of positive trendelenburg sign?

(Recent Pattern Question 2017)

- a. Paralysis of gluteus maximus
- b. Congenital dislocation of hip
- c. Un-united fracture of neck
- d. Coxa vara

168. Which of the following nerve injury leads to positive trendelenburg test?

- a. Inferior gluteal b. Obturator
- c. Tibial d. Superior gluteal nerve

169. Trendelenburg test is done for:

- a. Gluteus medius, minimus
- b. Gluteus maximus, minimus
- c. Gluteus maximus, medius
- d. Gluteus maximus, medius, minimus

170. Capsule of knee joint is supplied by:

(Recent Pattern Question 2017)

- a. Genital branch of genitofemoral nerve
- b. Femoral branch of genitofemoral nerve
- c. Genicular branch of obturator nerve
- d. Femoral branch of obturator nerve

171. Fabella is present in: *(Recent Pattern Question 2017)*

- a. Medial head of gastrocnemius
- b. Lateral head of gastrocnemius
- c. Adductor magnus d. Adductor longus

172. Which is the nerve supply of soleus muscle?

(Recent Pattern Question 2016)

- a. Tibial nerve
- b. Common peroneal nerve
- c. Superficial peroneal nerve
- d. Deep peroneal nerve

173. What is true about iliotibial tract?

- a. Thickening of fascia lata *(Recent Pattern Question 2016)*
- b. Gluteus medius is inserted into it
- c. Insertion at medial aspect of tibia
- d. Runs along the medial aspect of thigh

174. Which muscle is responsible for sitting to standing position? *(Recent Pattern Question 2016)*

- a. Gluteus medius b. Gluteus maximus
- c. Gluteus minimus d. Tensor fascia lata

175. All are branches of femoral artery EXCEPT:

- a. Superficial epigastric artery
- b. Superficial circumflex artery
- c. Inferior epigastric artery
- d. Descending genicular artery

176. Gluteus maximus is inserted on:

- a. Lesser trochanter b. Gluteal tuberosity
- c. Iliotibial tract d. Iliac crest

177. Iliotibial band has insertion of all of the following muscles EXCEPT:

- a. Tensor fasciae latae b. Gluteus maximus
- c. Gluteus minimus d. Vastus lateralis

178. Which is the longest muscle of the body:

- a. Sartorius b. Extraocular muscle
- c. External oblique d. Popliteal muscle

179. Which of the following muscles has attachment on the capsule of hip joint?

- a. Sartorius b. Rectus femoris
- c. Vastus lateralis d. Vastus medialis

180. This muscle is part of hamstrings muscle:

- a. Semimembranous
- b. Gracilis
- c. Short head of biceps femoris
- d. Sartorius

181. Gluteus medius is supplied by:

- a. Superior gluteal nerve
- b. Inferior gluteal nerve
- c. Nerve to obturator internus
- d. Nerve to quadratus femoris

182. Which of the following nerve supplies gluteus maximus?

- a. Superior gluteal nerve b. Inferior gluteal nerve
- c. Anterior gluteal nerve d. Posterior gluteal nerve

183. Which is the nerve supplying gamellus inferior muscle?

- a. Nerve to obturator internus
- b. Nerve to obturator externus
- c. Nerve to quadratus femoris
- d. Ventral rami to S1 and S2

184. All of the following structures pass through lesser sciatic foramen EXCEPT:

- a. Pudendal nerve
- b. Internal pudendal vessels
- c. Nerve to obturator internus
- d. Nerve to obturator externus

185. All of the structures pass through lesser sciatic foramen EXCEPT:

- a. Pudendal artery
- b. Pudendal nerve
- c. Nerve to obturator internus
- d. Nerve to obturator externus

- 186. Which is the main extensor of knee?**
 a. Biceps femoris b. Quadriceps femoris
 c. Semitendinosus d. Semimembranosus
- 187. Which muscle is responsible for unlocking of knee?**
 a. Popliteus b. Quadriceps femoris
 c. Semitendinosus d. Semimembranosus
- 188. Which of the following bone has no muscle attachment?**
 a. Navicular b. Calcaneum
 c. Talus d. Cuboid
- 189. In injury to the neck of fibula, which of the following nerve is usually injured?**
 a. Superficial peroneal nerve
 b. Deep peroneal nerve
 c. Common peroneal nerve
 d. Tibial nerve
- 190. Medial border of Hesselbach's triangle is formed by:**
 a. Linea alba b. Linea semilunaris
 c. Inferior epigastric artery d. Conjoint tendon
- 191. Poupart's ligament forms which border of hesselbach's triangle:**
 a. Anterior b. Posterior
 c. Superior d. Inferior
- 192. All of the following are true about lateral cutaneous nerve EXCEPT:**
 a. Supplies skin over the lateral skin of thigh
 b. Supplies skin over the medial aspect of thigh
 c. Arises from L2 and L3
 d. It is a purely sensory nerve
- 193. What is the nerve Root value of superior gluteal nerve:**
 a. L_{4,5}, S₁ b. L_{4,5}, S₁, S₂
 c. L_{4,5}, S₁, S₂, S₃ d. L₅, S₁, S₂
- 194. Root value of the posterior cutaneous nerve of the thigh:**
 a. S₁, S₂ b. S₁, S₂, S₃
 c. S₂, S₃ d. S₂, S₃, S₄
- 195. Root value of sciatic nerve is:**
 a. S₁S₂S₃ b. L₄L₅S₁S₂S₃
 c. L₁L₂L₃ d. L₂L₃L₄
- 196. Nerve root of pudendal nerve is:**
 a. S₁S₂S₃ b. S₂S₃S₄
 c. S₃-S₄ d. S₂-S₃

THORAX AND ABDOMEN

- 197. Which of the following structure is present over the mediastinal surface of right lung:**
(Recent Pattern Question 2018-19)
 a. Azygos vein b. Right thoracic duct
 c. Aorta d. Trachea
- 198. Which of the following structures is not found in superior mediastinum:**
 a. Pulmonary trunk b. Thymus
 c. Left intercostal artery d. Arch of aorta

- 199. Which of these is true about bronchopulmonary segment?**
(Recent Pattern Question 2018)
 a. Nonresectable
 b. Spherical in shape
 c. Artery is intersegmental
 d. Pulmonary veins are intersegmental
- 200. Left anterior descending artery is a branch of:**
(Recent Pattern Question 2018)
 a. Right coronary artery b. Left coronary artery
 c. Ascending aorta d. Coronary sinus
- 201. VAN (vein, artery, nerve) sequence is present in intercostal space at:**
(Recent Pattern Question 2017)
 a. Upper border of rib b. Middle border of rib
 c. Lower border of rib
 d. Middle portion of intercostal space
- 202. Anterior group of lymph node runs along:**
(Recent Pattern Question 2016)
 a. Internal mammary artery b. Cephalic vein
 c. Lateral thoracic vein d. Subscapular vein
- 203. Which of the following rib is known as floating rib?**
(Recent Pattern Question 2017)
 a. 8 b. 9
 c. 10 d. 11
- 204. Which is not a true rib:**
 a. 5th b. 6th
 c. 7th d. 8th
- 205. Xiphoid process unites with the body at age of _____ years?**
(Recent Pattern Question 2017)
 a. 10 b. 20
 c. 30 d. 40
- 206. Which structures passes through foramen of langer?**
(Recent Pattern Question 2017)
 a. Inguinal canal b. Tail of spence
 c. CN V3 d. CN VII
- 207. Sappey's plexus drains?**
(Recent Pattern Question 2017)
 a. Breast b. Thyroid
 c. Adrenal d. Porta hepatis
- 208. Lingula is which part of lung?**
(Recent Pattern Question 2017)
 a. Left lower lobe b. Left upper lobe
 c. Right lower lobe d. Right upper lobe
- 209. Which muscle is involved in violent expiratory efforts?**
(Recent Pattern Question 2017)
 a. Diaphragm b. Latissimus dorsi
 c. External oblique d. Internal intercostal
- 210. Right coronary artery supplies all EXCEPT:**
 a. Right atrium
 b. Posterior part of interventricular septum
 c. Anterior interventricular groove
 d. SA node
- 211. Base of the heart is formed by:**
 a. RA b. RV
 c. LA d. LV

212. All of these form right heart border EXCEPT?

- a. SVC
- b. IVC
- c. Right atrium
- d. Right ventricle

213. What is the length of trachea?

- a. 5 cm
- b. 10 cm
- c. 20 cm
- d. 25 cm

214. What is the diameter of trachea?

- a. 0.5 cm
- b. 2 cm
- c. 3 cm
- d. 5 cm

215. Most commonly foreign body lodges in which part of esophagus?

- a. Where it crosses the aortic arch
- b. Cricopharyngeus
- c. Where it is crossed by left bronchus
- d. Where it pierces the diaphragm

216. Which is not an accessory muscle of respiration?

- a. Sternocleidomastoid
- b. Scalaneus
- c. Erector spinae
- d. None

217. 75% respiration is due to:

- a. Diaphragm
- b. Internal intercostals
- c. Intercostals
- d. Serratus anterior

218. Which is the motor supply of diaphragm?

- a. Phrenic nerve
- b. Thoracodorsal nerve
- c. Intercostals
- d. Sympathetic nerves

219. Intercostal veins drain into:

- a. Left subclavian vein
- b. Internal jugular vein
- c. Azygous vein
- d. Inferior vena cava

220. All of the following drain into azygous vein EXCEPT:

- a. Hemi-azygos vein
- b. Posterior intercostal vein
- c. Left superior intercostal vein
- d. Right superior intercostal vein

ABDOMEN

221. Identify the branch originating from Celiac trunk:

(Recent Pattern Question 2018-19)

- a. Splenic artery
- b. Left gastric artery
- c. Left Gastroepiploic Artery
- d. Left renal artery

222. Pancreas tail present in:

(Recent Pattern Question 2018-19)

- a. Gastrosplenic ligament
- b. Splenorenal ligament
- c. Hepatogastric ligament
- d. Gastroduodenal ligament

223. Sternum attached to scapula via:

(Recent Pattern Question 2018-19)

- a. Manubrium
- b. First rib
- c. Second rib
- d. Clavicle

224. Vasa Brevia is the name of:

(Recent Pattern Question 2018-19)

- a. Long gastric arteries
- b. Short gastric arteries
- c. Duodenal arteries
- d. Renal arteries

225. Identify the part of duodenum marked below:

(Recent Pattern Question 2018)

- a. 1st part
- b. 2nd part
- c. 3rd part
- d. 4th part

226. Cords of billroth in spleen are found in:

(Recent Pattern Question 2018)

- a. White pulp
- b. Trabecular zone
- c. Red pulp
- d. Mantle zone

227. Which is the watershed area of inferior mesenteric artery and internal iliac artery? (Recent Pattern Question 2017)

- a. Griffith's point
- b. Sigmoid colon
- c. Ano rectal junction
- d. Sudeck's point

228. Portal vein starts at level of ___?

(Recent Pattern Question 2017)

- a. L2
- b. L3
- c. L4
- d. L5

229. Which is not a derivative of dorsal mesogastrium?

(Recent Pattern Question 2017)

- a. Greater omentum
- b. Gastrosplenic ligament
- c. Gastro-phrenic ligament
- d. Coronary ligament

230. Which of the following is not a part of pancreatic bed?

(Recent Pattern Question 2017)

- a. Splenic vein
- b. Right suprarenal gland
- c. Aorta
- d. Left crus of diaphragm

231. Smallest branch of celiac artery is:

(Recent Pattern Question 2017)

- a. Right gastric artery
- b. Splenic artery
- c. Left gastric artery
- d. Cystic artery

232. Constriction of diaphragm will not cause constriction of which opening:

(Recent Pattern Question 2016)

- a. Aortic opening
- b. Esophageal opening
- c. IVC opening
- d. Thoracic duct aperture

233. Identify the intestinal segment:

- a. Ileum
- b. Jejunum
- c. Caecum
- d. Large intestine

234. Shape of left adrenal gland:

- a. Oval
- b. Semilunar
- c. Triangular
- d. Trapezoid

235. All of the following form boundary of Left supra renal gland EXCEPT:

- a. Greater sac of stomach forms anterior border
- b. Psoas major forms posterior border
- c. Spleen forms anterolateral border
- d. Left kidney forms inferior border

236. What is the weight of adrenal gland?

- a. 4 gram
- b. 8 grams
- c. 10 grams
- d. 15 grams

237. Aortic hiatus pierces diaphragm at what level?

- a. T 8
- b. T10
- c. T11
- d. T12

238. Structures passing through aortic opening in diaphragm are all EXCEPT:

- a. Aorta
- b. Azygous vein
- c. Thoracic duct
- d. Vagus nerve

239. Right phrenic nerve passes through this diaphragmatic opening:

- a. Aortic opening
- b. Caval opening
- c. Esophageal opening
- d. Phrenic nerve opening

240. Structures passing through esophageal opening are all EXCEPT:

- a. Esophagus
- b. Phrenic nerve
- c. Vagus nerve
- d. Gastric artery branches

241. Which of the following structure does not pass through diaphragm?

- a. Aorta
- b. IVC
- c. Esophagus
- d. Cisterna chyli

242. All of the following vessels are valveless EXCEPT:

- a. Inferior vena cava
- b. Superior vena cava
- c. Pulmonary vein
- d. Internal jugular vein

243. All of the following are valveless EXCEPT:

- a. Internal jugular vein
- b. Portal vein
- c. Superior vena cava
- d. Inferior vena cava

244. All are muscular arteries EXCEPT?

- a. Aorta
- b. Femoral artery
- c. Popliteal artery
- d. Splenic artery

245. Inferior vena cava is formed at which level:

- a. L2
- b. L3
- c. L4
- d. L5

246. Portal vein forms at which vertebral level?

- a. L1
- b. L5
- c. S1
- d. S5

247. Brunner glands are seen in:

- a. Duodenum
- b. Esophagus
- c. Cardia of stomach
- d. Small intestine

248. Brunner's gland in the duodenum secretes:

- a. Mucinus alkaline
- b. Acid
- c. Pepsin
- d. Gastrin

249. All of the following form visceral relation of spleen EXCEPT:

- a. Fundus of stomach
- b. Left kidney
- c. Splenic flexure of colon
- d. Duodenum

250. Which of the following forms the posterior wall of kidney?

- a. Latissimus dorsi
- b. Quadratus lumborum
- c. Transverse abdominis
- d. External Oblique

251. Which of the following is not in anterior relationship with left kidney?

- a. Jejunal flexure
- b. Splenic flexure
- c. Head of pancreas
- d. Left suprarenal gland

252. Which of these is present anterior to right kidney:

- a. Suprarenal gland
- b. Right colic flexure
- c. Intestinal looping
- d. Duodenum 2nd part

253. Which is the following structure will affect or stop the ascent of kidney?

- a. Superior mesenteric artery
- b. Inferior mesenteric artery
- c. Left splenic vein
- d. Celiac trunk

- 254. Kidney cortex contains:**
 a. Loop of henle
 b. Pyramids
 c. Collecting tubule and duct
 d. Calyces
- 255. All are in close association with 3rd part of duodenum EXCEPT:**
 a. Pancreas
 b. Transverse colon
 c. Sigmoid colon
 d. Stomach
- 256. Which is the longest part of duodenum?**
 a. First part
 b. Second part
 c. Third part
 d. Fourth part
- 257. Which of the following is dermatome of umbilicus:**
 a. T8
 b. T10
 c. T12
 d. L1
- 258. Commonest position of the appendix is:**
 a. Paracoecal
 b. Retrocoecal
 c. Pelvic
 d. Subcoecal
- 259. Which is the least common position of appendix?**
 a. Retrocecal
 b. Preileal
 c. Postileal
 d. Pelvic
- 260. All are tributaries of portal vein EXCEPT:**
 a. Left gastric vein
 b. Right gastric vein
 c. Inferior pancreaticoduodenal vein
 d. Superior mesenteric vein
- 261. Which are the correct boundaries of Calot triangle?**
 a. Cystic artery, liver, right hepatic duct
 b. Cystic duct, liver, common hepatic duct
 c. Cystic duct, liver, cystic artery
 d. Common bile duct, cystic duct, liver
- 262. Superior boundary of calot's triangle is formed by:**
 a. Hepatic duct
 b. Superior surface of liver
 c. Inferior surface of liver
 d. Cystic duct
- 263. All of the structures pass through Calot's triangle EXCEPT:**
 a. Portal vein
 b. Cystic artery
 c. Right hepatic artery
 d. Lymph node of Lund
- 264. Structures at the transpyloric plane include all EXCEPT:**
 a. Fundus of gall bladder
 b. Termination of portal vein
 c. Hilum of kidneys
 d. Pylorus of stomach
- 265. Which is true regarding portal venous system?**
 a. Whole system is valve less
 b. Valves are present at the junction of superior mesenteric artery and splenic artery
 c. Valves are present in the intrahepatic system
 d. There are about 10-12 valves along the entire course
- 266. Chief cells are found in which area of stomach?**
 a. Fundus
 b. Pit
 c. Neck
 d. Body
- 267. Average weight of spleen in adult:**
 a. 5 ounce
 b. 7 ounce
 c. 14 ounce
 d. 21 ounce
- 268. Which is the most mobile part of rectum?**
 a. Upper 1/3rd
 b. Middle 1/3rd
 c. Lower 1/3rd
 d. Lower 2/3rd
- 269. What is the length of rectum:**
 a. 5 cm
 b. 12 cm
 c. 15 cm
 d. 20 cm
- 270. Which of the following is not in posterior relationship to rectum:**
 a. Sacral vertebra
 b. Superior rectal artery
 c. Seminal vesicles
 d. Middle rectal artery
- 271. Opening of anal epithelium is made up of:**
 a. Squamous cell
 b. Columnar
 c. Transitional
 d. Cuboidal
- 272. The puborectalis covers anorectal angle:**
 a. Completely
 b. Anteriorly
 c. Posteriorly
 d. Laterally
- 273. All of the following arteries supply pancreas EXCEPT:**
 a. Gastroduodenal artery
 b. Superior mesenteric artery
 c. Inferior mesenteric artery
 d. Pancreatic branch of splenic artery
- 274. Fundus of stomach is supplied by which of the following artery:**
 a. Celiac trunk
 b. Splenic artery
 c. Left gastric artery
 d. Left gastroepiploic artery
- 275. Which of the following is not a ventral branch of abdominal aorta?**
 a. Gonadal artery
 b. Celiac trunk
 c. Superior mesenteric artery
 d. Inferior mesenteric artery
- 276. Which of the following is a branch of external iliac artery?**
 a. Femoral artery
 b. Deep circumflex artery
 c. Inferior epigastric artery
 d. Gonadal artery

NEUROANATOMY, HEAD AND NECK

- 277. Which branch of facial nerve supplies muscles of lower lip?**
(Recent Pattern Question 2018-19)
 a. Temporal branch
 b. Cervical branch
 c. Buccal branch
 d. Mandibular branch
- 278. Lower lip blood supply:**
(Recent Pattern Question 2018-19)
 a. Angular artery
 b. Lateral nasal artery
 c. Labial artery
 d. Greater palatine artery
- 279. Landmark of facial nerve in parotid gland:**
(Recent Pattern Question 2018-19)
 a. Tragal pointer
 b. Anterior belly of digastric muscle
 c. Helical point
 d. Suprameatal triangle

280. Trismus is due to spasm of which muscle?

(Recent Pattern Question 2018-19)

- a. Orbiculis
- b. Lateral pterygoid
- c. Mentalis
- d. Medial pterygoid

281. Accessory muscle of mastication:

(Recent Pattern Question 2018-19)

- a. Risorius
- b. Orbicularis oris
- c. Buccinator
- d. Platysma

282. Parotid duct opens into:

(Recent Pattern Question 2018-19)

- a. First mandibular molar
- b. First maxillary pre-molar
- c. Second mandibular molar
- d. Second maxillary molar

283. Mammillary body projects via:

(Recent Pattern Question 2018-19)

- a. Thalamus
- b. Corpus callosum
- c. Pituitary gland
- d. Fornix

284. Which structure connects the Broca's area and Wernicke area?

(Recent Pattern Question 2018-19)

- a. Arcuate fasciculus
- b. Anterior commissure
- c. Corpus callosum
- d. Fornix

285. The function of superior rectus muscle is:

(Recent Pattern Question 2018)

- a. Elevation, intorsion, abduction
- b. Elevation, intorsion, adduction
- c. Depression, extorsion, abduction
- d. Depression, extorsion, adduction

286. The nerve passing through cavernous sinus:

(Recent Pattern Question 2018)

- a. Optic nerve
- b. Olfactory
- c. Abducens
- d. Facial

287. The blood supply of abdominal part of esophagus:

(Recent Pattern Question 2018)

- a. Bronchial vein and arch of aorta
- b. Right gastric artery and inferior phrenic nerve
- c. Left gastric artery and inferior phrenic nerve
- d. Pulmonary trunk

288. Skin over parotid is supplied by:

(Recent Pattern Question 2018)

- a. Retroauricular nerve
- b. Greater auricular nerve
- c. Greater occipital nerve
- d. Facial nerve

289. Deepest nuclei of cerebellum is:

(Recent Pattern Question 2018)

- a. Putamen
- b. Lentiform
- c. Caudate
- d. Fastigii

290. Which cranial nerve supplies lateral rectus muscle?

(Recent Pattern Question 2017)

- a. Trochlear
- b. Trigeminal
- c. Abducens
- d. Glossopharyngeal

291. Blood supply of spinal cord is _____ spinal arteries?

(Recent Pattern Question 2017)

- a. 1 anterior and 2 posterior
- b. 2 anterior and 1 posterior
- c. 2 anterior and 2 posterior
- d. 1 anterior and 1 posterior

292. Anterior 2/3rd of spinal cord is supplied by:

(Recent Pattern Question 2017)

- a. Anterior choroidal artery
- b. Anterior communicating artery
- c. Anterior cerebral artery
- d. Anterior spinal artery

293. Which muscle is attached to the temporal bone?

(Recent Pattern Question 2017)

- a. Stapedius muscle
- b. Postauricular muscle
- c. Tensor tympani muscle
- d. Digastric muscle

294. Ipsilateral deviation of tongue occurs due to which intact tongue muscle?

(Recent Pattern Question 2017)

- a. Palatoglossus
- b. Styloglossus
- c. Genioglossus
- d. Pharyngoglossus

295. Arteria thyroidea ima originates from:

(Recent Pattern Question 2017)

- a. External carotid artery
- b. Thyrocervical trunk
- c. Vertebral artery
- d. Arch of aorta

296. Thyroid gland is situated at the level of:

(Recent Pattern Question 2017)

- a. C4-C8
- b. C4-T1
- c. C5-T1
- d. C6-T2

297. How many lobes are present in cerebellum?

(Recent Pattern Question 2017)

- a. 2
- b. 4
- c. 6
- d. 8

298. Which is the smallest lobe of cerebellum?

(Recent Pattern Question 2017)

- a. Flocculonodular lobe
- b. Lingular lobe
- c. Pyramidal lobe
- d. Archicerebellum

299. Vertebral artery is derived from:

(Recent Pattern Question 2017)

- a. First part of subclavian artery
- b. Second part of subclavian artery
- c. Third part of subclavian artery
- d. Fourth part of subclavian artery

300. Which of the following is a branch of 3rd part of subclavian artery?

(Recent Pattern Question 2017)

- a. Thyrocervical trunk
- b. Dorsal scapular artery
- c. Vertebral artery
- d. Internal thoracic artery

301. Cavernous sinus is a collection of venous sinuses on either side of pituitary. Which of the following does not pass through the wall of the cavernous sinus?

(Recent Pattern Question 2017)

- a. CN III
- b. CN V2
- c. Post ganglionic sympathetic fibers
- d. Internal carotid artery

- 302. Anterior inferior cerebellar artery is a branch of:** (Recent Pattern Question 2017)
 a. Subclavian artery b. Vertebral artery
 c. Basilar artery d. Middle cerebral artery
- 303. Smallest branch of external carotid artery is:**
 a. Superior thyroid artery (Recent Pattern Question 2017)
 b. Ascending pharyngeal artery
 c. Facial artery
 d. Maxillary artery
- 304. Subarachnoid space extends up to:** (Recent Pattern Question 2017)
 a. Lower border L1 b. Upper border L1
 c. Upper border of S2 d. Lower border of S2
- 305. Skin over angle of mandible is supplied by:** (Recent Pattern Question 2017)
 a. Greater auricular nerve b. Posterior auricular nerve
 c. Greater occipital nerve d. Lesser occipital nerve
- 306. Which of the following cranial nerve carries parasympathetic fibers?** (Recent Pattern Question 2017)
 a. CN 1 b. CN 2
 c. CN 3 d. CN 4
- 307. Which of the following cranial nerve is a pure sensory nerve?** (Recent Pattern Question 2017)
 a. CN 3 b. CN 5
 c. CN 8 d. CN 9
- 308. Leptomeninges is formed by:** (Recent Pattern Question 2017)
 a. Dura mater and Arachnoid
 b. Arachnoid and pia mater
 c. Dura and pia mater
 d. Dura, arachnoid and pia matter
- 309. Sylvian fissure separates:** (Recent Pattern Question 2017)
 a. Temporal lobe from occipital lobe
 b. Temporal lobe from frontoparietal areas
 c. Temporal lobe from opposite frontal lobe
 d. Temporal lobe from cerebellum
- 310. Superior vena cava is formed by fusion of _____:** (Recent Pattern Question 2017)
 a. Internal and external jugular veins
 b. Subclavian and internal jugular veins
 c. Left and right brachiocephalic veins
 d. Left and right common iliac veins
- 311. A patient was hit in the eye with a tennis ball. Following this blunt eye injury he developed a hyphema. Which blood vessel is the source of bleeding?** (Recent Pattern Question 2017)
 a. Circulus iridis major b. Hyaloid artery
 c. Anterior ciliary arteries d. Retinal artery
- 312. Which of these is a Bi-condylar joint?** (Recent Pattern Question 2017)
 a. TM joint b. Atlanto-occipital
 c. Interphalangeal d. Inter-meta-tarsal joint
- 313. Which structure is not transmitted by foramen ovale?** (Recent Pattern Question 2017)
 a. Middle meningeal artery
 b. Accessory meningeal artery
 c. Lesser petrosal nerve
 d. Emissary vein
- 314. Maxillary nerve is transmitted via:** (Recent Pattern Question 2017)
 a. Foramen ovale b. Foramen rotundum
 c. Foramen lacerum d. Foramen spinosum
- 315. Foramen transversarium is found at:** (Recent Pattern Question 2017)
 a. Anterior cranial fossa b. Middle cranial fossa
 c. Posterior cranial fossa d. Cervical vertebra
- 316. Nerve carrying taste sensation from anterior 2/3rd of tongue is called:** (Recent Pattern Question 2017)
 a. Arnold nerve b. Jacobson nerve
 c. Criminal nerve of grassi d. Nerve of wrisberg
- 317. Which of the following areas of the brain is not a primary sensory cortex?** (Recent Pattern Question 2017)
 a. 1 b. 2
 c. 3 d. 4
- 318. Which is a part of limbic system:** (Recent Pattern Question 2017)
 a. Corpus callosum b. Pineal gland
 c. Cingulate gyrus d. Tegmentum
- 319. Nucleus ambiguus is composed of:** (Recent Pattern Question 2017)
 a. Sensory to 9, 10, 11 cranial nerve nucleus
 b. Motor to 9, 10, 11 cranial nerve nucleus
 c. Sensory to 7, 9, 10 cranial nerve nucleus
 d. Motor to 7, 9, 10 cranial nerve nucleus
- 320. IIInd cranial nerve is:** (Recent Pattern Question 2017)
 a. Optic nerve b. Abducens nerve
 c. Trigeminal nerve d. Occulomotor nerve
- 321. Lower one-third of auricle is supplied by:**
 a. Auriculotemporal nerve
 b. Vagus nerve
 c. Greater auricular nerve
 d. Greater retrasal nerve
- 322. All are related to facial nerve EXCEPT:**
 a. Maxillary process
 b. Stylomastoid foramen
 c. Posterior belly of diagstric muscle
 d. Parotid gland
- 323. Parotid duct opens:**
 a. Opposite to lower 1st molar tooth
 b. Opposite to lower 2nd molar tooth
 c. In floor of mouth
 d. In relation with upper 2nd molar tooth

- 324. Which of the following is not a test for integrity of 7th and 9th nerve:**
- Position of uvula
 - Palate symmetry
 - Deviation of tongue
 - Taste sensation of anterior 2/3rd of tongue
- 325. Opening of mouth is caused by:**
- Lateral pterygoid
 - Medial pterygoid
 - Temporalis
 - Masseter
- 326. Sensory supply to anterior 2/3rd of tongue given by:**
- Facial nerve
 - Trigeminal nerve
 - Hypoglossal nerve
 - Glossopharyngeal nerve
- 327. Taste sensation is not carried by:**
- CN V
 - CN VII
 - CN IX
 - CN XI
- 328. Taste sensation from mucosal membranes of oral side of tongue is carried by:**
- Lingual nerve
 - Vagus nerve
 - Hypoglossal nerve
 - Glossopharyngeal nerve
- 329. What is the site of lesion affecting cranial nerve VI, VII and VIII?**
- Pons
 - Midbrain
 - Medulla
 - Junction between pons and medulla
- 330. Which of the following cranial nerve decussate within the brain?**
- Optic
 - Oculomotor
 - Trochlear
 - Trigeminal
- 331. Ptosis is due to:**
- 3rd CN palsy
 - 4th CN palsy
 - 5th CN palsy
 - 6th CN palsy
- 332. Muller muscle is supplied by which nerve?**
- Facial nerve
 - Sympathetic nerve
 - Trigeminal nerve
 - Vagus nerve
- 333. Which muscle is not supplied by cranial nerve III?**
- Superior oblique
 - Superior rectus
 - Inferior oblique
 - Medial rectus
- 334. Which cranial nerve has the largest intracranial course?**
- Vagus nerve
 - Oculomotor nerve
 - Trochlear nerve
 - Abducens nerve
- 335. Which of the following nerve is known as criminal nerve of grass?**
- Hypoglossal nerve
 - Trigeminal nerve
 - Thyroglossal nerve
 - Vagus nerve
- 336. Which nerve pierces the thyroid gland?**
- Superior laryngeal nerve
 - Inferior laryngeal nerve
 - Recurrent laryngeal nerve
 - Posterior laryngeal nerve
- 337. All of the following structures pass through superior orbital fissure EXCEPT:**
- Inferior ophthalmic vein
 - Lacrimal nerve
 - Trigeminal nerve
 - Nasociliary nerve
- 338. Which cranial nerve is not transmitted by superior orbital fissure? (Recent Pattern Question 2017)**
- 2
 - 3
 - 4
 - 5
- 339. Which is the following structure passes through the lateral part of superior orbital fissure?**
- Superior ophthalmic vein
 - Inferior ophthalmic vein
 - Abducent nerve
 - Nasociliary nerve
- 340. All these nerves pass through superior orbital fissure EXCEPT?**
- Mandibular nerve
 - Abducens nerve
 - Trochlear nerve
 - Oculomotor nerve
- 341. Which of the following structure passes through inferior orbital fissure?**
- Infraorbital nerve
 - Infraorbital artery
 - Both
 - None
- 342. Which of the following causes injury to cranial nerve 3rd, 4th and 1st branch of CN 5?**
- Sphenoid bone tumor
 - Parotid gland tumor
 - Petrous bone tumor
 - Acoustic neuroma
- 343. What is the root value of phrenic nerve?**
- C2, C3, C4
 - C4, C5, T1
 - C3, C4, C5
 - C5, T1, T2
- 344. Which of the following is the most common congenital anomaly?**
- Cleft lip
 - Cleft palate
 - Cleft lip and cleft palate both
 - None
- 345. Which is the dangerous layer of scalp?**
- Subcutaneous layer
 - Musculoaponeurotic layer
 - Loose subaponeurotic layer
 - Periosteum layer
- 346. Which of the following layer of scalp is made up of a tough layer of dense fibrous tissue:**
- Subcutaneous layer
 - Musculoaponeurotic layer
 - Loose subaponeurotic layer
 - Galea aponeurotica
- 347. Medial wall of orbit is formed by which bone:**
- Lesser wing of sphenoid
 - Frontal process of maxilla
 - Greater wing of sphenoid
 - Arterial and posterior ethmoidal canals
- 348. Which of the following nerve supplies the muscles of palate?**
- Hypoglossal nerve
 - Greater palatine nerve
 - Glossopharyngeal nerve
 - Trigeminal nerve

- 349. Safety muscle of tongue is?**
 a. Genioglossus b. Palatoglossus
 c. Styloglossus d. Hyoglossus
- 350. Safety muscle of larynx is:**
 a. Aryepiglotticus b. Cricothyroid
 c. Thyroarytenoid d. Posterior cricoarytenoid
- 351. At the end of C6 which is not true:**
 a. Trachea bifurcates b. Pharynx ends
 c. Esophagus begins d. Larynx ends
- 352. Which muscle of larynx is supplied by external laryngeal nerve?**
 a. Cricothyroid b. Lateral Cricothyroid
 c. Thyroarytenoid d. Posterior cricoarytenoid
- 353. Which one of the following muscle is supplied by the glossopharyngeal nerve?**
 a. Sternohyoid b. Stylopharyngeus
 c. Styloglossus d. Stylohyoid
- 354. Which muscle is supplied by the glossopharyngeal nerve?**
 a. Stylopharyngeus b. Palatopharyngeus
 c. Glossopharyngeus d. Salpingopharyngeus
- 355. Adult larynx extends between cervical spine:**
 a. C₇ to T₁ b. C₂ to C₃
 c. C₃ to C₄ d. C₃ to C₆
- 356. Anterior fontanel corresponds to all EXCEPT:**
 a. Frontal bones b. Coronal suture
 c. Lambdoid suture d. Saggital suture
- 357. Which is not a T.M. joint ligament?**
 a. Temporomandibular b. Sphenomandibular
 c. Stylomandibular ligament
 d. Tympanomandibular
- 358. What is the location of Hyoid bone in terms of cervical vertebral level:**
 a. C2 b. C3
 c. C4 d. C5
- 359. What is the level of Isthmus of the thyroid gland across tracheal ring?**
 a. 3rd to 5th b. 2nd to 4th
 c. 5th to 6th d. 2nd to 3rd
- 360. Which of the following artery supplies parathyroid glands?**
 a. Superior thyroid artery b. Inferior thyroid artery
 c. Common carotid artery d. Middle thyroid artery
- 361. Which of the following is not a part of lower motor neuron?**
 a. Anterior nerve root b. Peripheral ganglia
 c. Peripheral nerve d. Anterior horn cells
- 362. All of the following are pneumatic bones EXCEPT:**
 a. Maxilla b. Frontal
 c. Mandible d. Ethmoid
- 363. Which of the following is a pneumatic bone?**
 a. Tibia b. Frontal bone
 c. Clavicle d. Femur
- 364. Gustatory cortex is situated in:**
 a. Superior temporal gyrus b. Inferior frontal gyrus
 c. Superior frontal gyrus d. Inferior parietal gyrus
- 365. Optic radiation arises from:**
 a. Superior colliculus b. Inferior colliculus
 c. Lateral geniculate body d. Medial geniculate body
- 366. All of the following are features of Horner's syndrome EXCEPT:**
 a. Ptosis b. Miosis
 c. Heterochromia iridis d. Exophthalmos
- 367. Maximum contribution to the floor of orbit is by which bone?**
 a. Maxillary b. Zygomatic
 c. Sphenoid d. Palatine
- 368. Angular vein infection causes thrombosis in:**
 a. Cavernous sinus b. Suprasagittal sinus
 c. Transverse sinus d. Inferior petrosal sinus
- 369. Left spinal lemniscus contains which fibers?**
 a. Left sided pain, touch, temperature
 b. Left sided position, vibration sense
 c. Right sided pain, touch, temperature
 d. Right sided position, vibration sense
- 370. All of the following muscles are attached to the apex of orbit EXCEPT:**
 a. Superior oblique b. Superior rectus
 c. Medial rectus d. Inferior oblique
- 371. Which nerve helps in looking laterally and downward:**
 a. Abducent b. Trochlear
 c. Trigeminal d. Oculomotor
- 372. All of the following are parts of nasal septum EXCEPT:**
 a. Septal cartilage b. Lateral cartilage
 c. Crest of maxilla
 d. Perpendicular plate of ethmoid
- 373. Which is not a part of basal ganglia?**
 a. Caudate nucleus b. Thalamus
 c. Lenticular nucleus d. Globus pallidus
- 374. Cerebellar cortex contains:**
 a. Pyramidal cells b. Purkinje cells
 c. Stromal cells d. Kupffer cells
- 375. Cerebellar connection to other parts of the brain is projected through which cell?**
 a. Golgi cells b. Basket cells
 c. Purkinje cells d. Oligodendrocytes
- 376. In adults, the spinal cord normally ends at:**
 a. Lower border of L1 b. Lower border of L3
 c. Lower border of L5 d. Lower border of S1
- 377. The spinal cord in infants ends at the level of:**
 a. L1 b. L2
 c. L3 d. L4
- 378. Which nerve passes from parapharyngeal space?**
 a. VI b. VII
 c. VIII d. X

379. Which of the following tracts is seen in the posterior column of spinal cord?
 a. Lateral spinothalamic tract
 b. Fasciculus gracilis
 c. Rubrospinal tract
 d. Posterior spinocerebellar
380. Which is the most prominent spinous process?
 a. T1
 b. C7
 c. C6
 d. L5
381. The movement at the following joint permits a person to say NO by head movement:
 a. Atlanto-occipital joint
 b. Atlanto-axial joint
 c. C2-C3 joint
 d. C3-C4 joint
382. In epidural lumbar puncture, all of these structures are pierced EXCEPT:
 a. Posterior longitudinal ligament
 b. Ligamentous flavum
 c. Interspinous ligament
 d. Supraspinous ligament
383. 'Chassaignac's tubercle' is:
 a. Erb's point
 b. Carotid tubercle on C6 vertebra
 c. Found on first rib
 d. Medial condyle of humerus

PELVIS AND PERINEUM

384. The patient is having bleeding from haemorrhoids. Which of the following artery is the source of bleeding?
(Recent Pattern Question 2018-19)
 a. Superior rectal vein
 b. Superior rectal artery
 c. Middle rectal artery
 d. Middle rectal vein
385. Blood supply of bulb of the penis:
(Recent Pattern Question 2018)
 a. Scrotal artery
 b. Superficial pudendal artery
 c. Bulbourethral artery
 d. Bulbocavernosus artery
386. Cremasteric muscle nerve supply:
(Recent Pattern Question 2018)
 a. Ilioinguinal nerve
 b. Iliohypogastric nerve
 c. Genital branch of genitofemoral nerve
 d. Femoral nerve
387. Which of the following is the artery for endometrial blood supply?
(Recent Pattern Question 2018)
 a. Endometrial artery
 b. Myometrial artery
 c. Spiral artery
 d. Cervical artery
388. Alcock's canal transmits:
(Recent Pattern Question 2017)
 a. Pudendal nerve
 b. Epididymis
 c. CN VIII
 d. Fallopian tube
389. Posterior superior iliac spine is at which level?
(Recent Pattern Question 2016)
 a. S1
 b. S2
 c. L1
 d. L2

390. Coccyx has how many vertebra:
(Recent Pattern Question 2016)
 a. 1
 b. 2
 c. 3
 d. 4
391. Muscles of the perineal body include all of the following EXCEPT:
 a. External anal sphincter
 b. Iliococcygeus
 c. Superficial transverse perinei
 d. Bulbocavernosus
392. Structures forming perineal body are all EXCEPT:
 a. Levator ani muscle
 b. Bulbospongiosus
 c. Deep transverse perinei
 d. Ischiococcygeus
393. Pelvic diaphragm is made of all EXCEPT:
 a. Iliococcygeus
 b. Ischiococcygeus
 c. Pubococcygeus
 d. Puborectalis
394. Which is true regarding prostate gland?
 a. Only glandular tissue
 b. Glandular tissue covered with transitional epithelium
 c. Glandular tissue and fibromuscular stroma
 d. Entire gland is composed of collagen
395. What is the normal weight of uterus?
 a. 20 g
 b. 40 g
 c. 60 g
 d. 100 g
396. What is the position of normal uterus?
 a. Anteverted, extended
 b. Anteverted, Anteflexed
 c. Retroverted, extended
 d. Retroverted, anteflexed
397. All of the following statements are true EXCEPT:
 a. Cervix is lined by stratified squamous epithelium
 b. Cervix is lined by transitional epithelium
 c. It gets its blood supply from uterine artery
 d. Vagina is lined by nonkeratinized stratified squamous epithelium.
398. Transitional epithelium is seen in:
 a. Gallbladder
 b. Urinary bladder
 c. Thyroid gland
 d. Stomach
399. Ovarian artery is a branch of:
 a. Abdominal aorta
 b. Internal iliac artery
 c. External iliac artery
 d. Inferior mesenteric artery
400. Left testicular vein drains into:
 a. Inferior vena cava
 b. Left renal vein
 c. Right renal vein
 d. Femoral vein
401. Left gonadal vein drain into:
 a. Left renal vein
 b. Right renal vein
 c. Inferior vena cava
 d. Pampiniform plexus
402. Right ovarian vein drains into:
 a. IVC
 b. Right renal vein
 c. Hemi azygos vein
 d. Inferior mesenteric vein
403. Which of the following is not a branch of internal iliac artery?
 a. Superior rectal artery
 b. Middle rectal artery
 c. Superior gluteal artery
 d. Inferior vesicle artery

404. Which of the following is a direct branch of Inferior mesenteric artery?
- Superior rectal artery
 - Middle rectal artery
 - Inferior rectal artery
 - Inferior epigastric artery
405. All of these drain into internal iliac lymph nodes EXCEPT:
- Ovaries
 - Uterus
 - Rectum
 - Bladder
406. What is the lymphatic drainage of glans of penis?
- Superficial inguinal nodes
 - Deep inguinal nodes
 - Paraortic nodes
 - Internal iliac nodes
407. What is the length of male urethra?
- 10 cm
 - 15 cm
 - 20 cm
 - 30 cm
408. Urinary bladder is supplied by which branches of lumbar plexus?
- L1 & L2
 - L2 & L3
 - L3 & L4
 - L2, L3 & L4
409. Efferent cremastic reflex is carried by:
- Ilioinguinal nerve
 - Genitofemoral nerve
 - Iliohypogastric nerve
 - Pudendal nerve
410. Cremasteric reflex is elicited by stroking on which aspect of thigh skin?
- Anterior
 - Posterior
 - Medial
 - Lateral
411. All of the following are contents of the spermatic cord EXCEPT:
- Ductus deferens
 - Testicular artery
 - Pampiniform plexus of veins
 - Ilioinguinal nerve
412. Which of the following artery is *not* a content of spermatic cord?
- Cremasteric artery
 - Deferential artery
 - Internal iliac artery
 - Testicular artery

BOARD REVIEW QUESTIONS

413. Nerve supplying area between Great toe and 2nd toe:
(Recent Pattern Question 2018-19)
- Deep peroneal nerve
 - Superficial peroneal nerve
 - Sural nerve
 - Saphenous nerve
414. Retraction of scapula is by which fibre
(Recent Pattern Question 2018-19)
- Upper fibre of trapezius
 - Middle fibre of trapezius
 - Lower fibre of trapezius
 - Upper and Lower fibre of trapezius
415. Area around umbilicus is supplied by this spinal nerve:
(Recent Pattern Question 2018-19)
- T8
 - T9
 - T10
 - T12
416. Adam's apple seen in males because of:
(Recent Pattern Question 2018-19)
- Laryngeal ring
 - Hyoid bone
 - Thyroid cartilage
 - Cricoid cartilage
417. CNS development begins in which intrauterine week?
- 5 weeks
 - 6 weeks
 - 3 weeks
 - 2 weeks
418. Double arch aorta arises from:
- Right 6th aortic arch
 - Left 6th aortic arch
 - Right 4th aortic arch
 - Left 1st aortic arch
419. Urachus fistula is a remnant of?
- Yolk sac
 - Allantois
 - Chorion
 - Amnion
420. Three layers of embryo are formed at what age?
- 8 days
 - 12 days
 - 16 days
 - 21 days
421. Uterus develops from:
- Paramesonephric ducts
 - Sinovaginal bulbs
 - Metanephricblastema
 - Urogenital folds
422. Elastic cartilage is found in:
- Tracheal cartilage
 - Auricular cartilage
 - Articular disc
 - Bronchi
423. Third coronary artery is:
- Left anterior descending
 - Left anterior descending
 - Conus artery
 - Viessens's artery
424. Cardiac end of stomach lies at which rib?
- 8th rib
 - 7th rib
 - 9th rib
 - 10th rib
425. Sensory supply of palatine tonsil is by which cranial nerve?
- IXth
 - Xth
 - XIth
 - VIIth
426. Recurrent laryngeal nerve lies in relation to:
- Superior thyroid artery
 - Inferior thyroid artery
 - Superior thyroid vein
 - Inferior thyroid vein
427. Which is not a connective tissue?
- Blood
 - Bone
 - Cartilage
 - Muscle/Tendon
428. What is the function of Genioglossus?
- Retraction of tongue
 - Protruding tongue
 - Diverges to the same side
 - All of the above

429. Palatopharyngeus is supplied by which nerve?

- a. Vagus nerve
- b. Cranial accessory nerve
- c. Hypoglossal nerve
- d. Spinal accessory nerve

430. Blood supply of medial surface of cerebral hemisphere is from:

- a. Anterior cerebral artery
- b. Posterior cerebral artery
- c. Middle cerebral artery
- d. Vertebral artery

431. VonEbner glands are mainly present in:

- a. Palate
- b. Buccal mucosa
- c. Tongue
- d. Posterior pharyngeal wall

432. Which bone has no muscle attachment?

- a. Talus
- b. Navicular
- c. Calcaneum
- d. Cuboid

433. Alderman's nerve is:

- a. Tympanic branch of Glossopharyngeal nerve
- b. Auricular branch of vagus nerve
- c. Branch of vestibulocochlear nerve
- d. Nerve from carotid body to glossopharyngeal nerve

434. What is torus aorticus?

- a. Bulge in the atria
- b. Bulge in aorta
- c. Aortic wall tear
- d. Septal defect

435. Vein of Mayo is seen at:

- a. Saphenous junction
- b. Pylorus
- c. Colon
- d. Brain

436. Left testicular vein drains into:

- a. Left renal vein
- b. Inferior vena cava
- c. Common iliac vein
- d. Internal iliac vein

437. Where is fascia of Waldeyer's seen?

- a. Between prostate and rectum
- b. Between rectum and sacrum
- c. Between rectum and pouch of Douglas
- d. Between bladder and vas

438. Maxillary artery develops from:

- a. 1st arch
- b. 3rd arch
- c. 4th arch
- d. 5th arch

439. Root value of phrenic nerve is:

- a. C2, C3, C4
- b. C3, C4, C5
- c. C4, C5, T1
- d. C5, T1, T2

440. Lateral horn of the spinal cord is seen at which level?

- a. Thoracic
- b. Lower lumbar
- c. Sacral
- d. Cervical

441. Pisiform bone articulates with:

- a. Triquetral
- b. Lunate
- c. Scaphoid
- d. Trapezoid

442. The muscle of hand that contains a sesamoid bone is:

- a. Flexor pollicisbrevis
- b. Flexor pollicislongus
- c. Opponenspollicis
- d. Adductor pollicis

443. Lymphatic drainage of testis is?

- a. External iliac nodes
- b. Internal iliac nodes
- c. Pre & para aortic nodes
- d. Superficial inguinal node

444. Trachea is lined by?

- a. Simple columnar
- b. Pseudostratified columnar
- c. Simple cuboidal
- d. Stratified squamous, nonkeratinized

445. Medial arch of foot is made up of:

- a. Deltoid ligament
- b. Spring ligament
- c. Short plantar ligament
- d. Long plantar ligament

446. Constrictions of esophagus when measured from upper incisors are present at:

- a. 15 cm, 20 cm, 40 cm
- b. 15 cm, 25 cm, 40 cm
- c. 20 cm, 30 cm, 40 cm
- d. 30 cm, 40 cm, 60 cm

447. Maximum amount of CSF is found in:

- a. Ventricular system
- b. Subarachnoid space
- c. Epidural space
- d. Subpial space

448. Which of the following is not a branch of 1st part of maxillary artery?

- a. Middle meningeal artery
- b. Accessory meningeal artery
- c. Inferior alveolar artery
- d. Greater palatine artery

449. Short gastric artery is a branch of:

- a. Splenic artery
- b. Left gastroduodenal artery
- c. Left gastroepiploic artery
- d. Portal vein

450. Gartner cyst is a remnant of:

- a. Mesonephric duct in female
- b. Mesonephric duct in males
- c. Paramesonephric duct in males
- d. Paramesonephric duct in females

451. Which organ is derived from both mesoderm and ectoderm?

- a. Kidney
- b. Suprarenal
- c. Urinary bladder
- d. None

452. Outer cell mass gives rise to:

- a. Embryo proper
- b. Trophoblast
- c. Syncytiotrophoblast
- d. None

453. Genital ridge develops from:

- a. Paraxial mesoderm
- b. Lateral plate mesoderm
- c. Intermediate mesoderm
- d. None

454. Which of the following is true about horseshoe kidney?

- a. Fused at upper pole, lies in pelvis
- b. Fused at lower pole, lies in pelvis
- c. Fused at upper pole, lies in front of L1
- d. Fused at lower pole, lies in front of L4

455. Simple squamous epithelium is seen in:

- a. Blood vessel
- b. Thyroid follicle
- c. Esophagus
- d. Hard palate

- 456. Costochondral joint is example of:**
 a. Fibrous joint
 b. Primary cartilaginous joint
 c. Secondary cartilaginous joint
 d. Synovial joint
- 457. Hyoid bone is at which vertebral levels:**
 a. C1 to C3
 b. C2 to C5
 c. C3 to C6
 d. C4 to C7
- 458. Posterosuperior iliac spine is at the level of:**
 a. L5
 b. S1
 c. S2
 d. S3
- 459. Most posterior structure seen in root of lung is:**
 a. Bronchus
 b. Superior pulmonary vein
 c. Inferior pulmonary vein
 d. Pulmonary artery
- 460. Most prominent spinous process is of:**
 a. C2
 b. C5
 c. C6
 d. C7
- 461. Right tracheobronchial angle is:**
 a. 10-15 degrees
 b. 25-30 degrees
 c. 40-50 degrees
 d. 80-90 degrees
- 462. Middle meningeal artery passes through which foramen:**
 a. Foramen rotundum
 b. Foramen spinosum
 c. Foramen ovale
 d. Jugular foramen
- 463. Arrange coverings on peripheral nerve from inner to outer?**
 a. Endoneurium, epineurium, perineurium
 b. Endoneurium, perineurium, epineurium
 c. Perineurium, endoneurium, epineurium
 d. Epineurium, endoneurium, perineurium
- 464. Nerve supply of deltoid is:**
 a. Axillary
 b. Musculocutaneous
 c. Median
 d. Radial
- 465. Nerve supply of obturator is by:**
 a. L1-L3
 b. L4-S1
 c. L5-S2
 d. S1-S3
- 466. Lymphatic drainage of glans penis is by:**
 a. Superficial inguinal lymph nodes
 b. Deep inguinal lymph nodes
 c. Internal iliac lymph nodes
 d. Preaortic nodes
- 467. Preauricular sulcus is seen in:**
 a. Mandible
 b. Maxilla
 c. Skull
 d. Pelvis
- 468. Cribriform plate is a part of:**
 a. Ethmoid
 b. Maxilla
 c. Nasal
 d. Frontal
- 469. Ligament preventing the displacement of humerus is:**
 a. Coracoclavicular
 b. Coracohumeral
 c. Coracoacromial
 d. Glenohumeral
- 470. Anterior cerebral artery supplies which part of brain:**
 a. Anterior
 b. Lateral
 c. Medial
 d. Posterior
- 471. Korner's septum is seen in?**
 a. Petrosquamous suture
 b. Temporosquamous suture
 c. Petromastoid suture
 d. Frontozygomatic suture
- 472. Third tubercle of femur provides attachment to:**
 a. Gluteus maximus
 b. Gluteus medius
 c. Gluteus minimus
 d. Piriformis
- 473. Muscle which helps in protrusion and upper movement of tongue is:**
 a. Palatoglossus
 b. Hyoglossus
 c. Genioglossus
 d. Styloglossus
- 474. Which of the following has a single ossification centre only?**
 a. Clavicle
 b. Carpals
 c. Metacarpals
 d. Metatarsals
- 475. Which of the following is the muscle of third pharyngeal arch?**
 a. Stylohyoid
 b. Mylohyoid
 c. Cricothyroid
 d. Stylopharyngeus
- 476. Morula reaches uterus on:**
 a. 3rd day after fertilization
 b. 4th day after fertilization
 c. 6th day after fertilization
 d. 8th day after fertilization
- 477. Testis are developed from:**
 a. Genital ridge
 b. Genital tubercle
 c. Wolffian duct
 d. Gubernaculum
- 478. Common carotid artery is formed by:**
 a. 2nd arch
 b. 3rd arch
 c. 4th arch
 d. 6th arch
- 479. Palatine tonsil develops from:**
 a. 1st pharyngeal arch
 b. 1st pharyngeal pouch
 c. 2nd pharyngeal arch
 d. 2nd pharyngeal pouch
- 480. Neural tube completely closes at what intrauterine age?**
 a. 10 days
 b. 20 days
 c. 25 days
 d. 27 days
- 481. Tympanic membrane develops from:**
 a. Mesoderm
 b. Endoderm
 c. Ectoderm
 d. All three germ layers
- 482. Horse shoe kidney is due to prevention of ascent by:**
 a. Superior mesenteric artery
 b. Inferior mesenteric artery
 c. Supernumerary arteries
 d. Ureters
- 483. Skin over femoral triangle is supplied by:**
 a. Iliohypogastric nerve
 b. Ilioinguinal nerve
 c. Genitofemoral nerve
 d. Lateral femoral cutaneous nerve

484. Vertebral level of body of sternum is:

- a. T 3 to T 4
- b. T 4 to T 5
- c. T 5 to T 7
- d. T 5 to T 9

485. Ligaments for anteroposterior stability of knee are:

- a. Cruciate ligaments
- b. Medial collateral ligament
- c. Lateral collateral ligament
- d. Patellar ligaments

486. Which structure passes through greater sciatic foramen?

- a. Superior gluteal nerve and vessels
- b. Tendon of obturator internus
- c. Anterior cutaneous nerve of thigh
- d. Semimembranosus tendon

487. Which structure passes through both greater and lesser sciatic foramen?

- a. Nerve to quadrates femoris
- b. Superior gluteal nerve
- c. Nerve to obturator internus
- d. Piriformis muscle

488. Sacrotuberous ligament is pierced by:

- a. Nerve to obturator internus
- b. Inferior gluteal artery
- c. Superior gluteal artery
- d. Sciatic nerve

489. Lesser petrosal is a branch of:

- a. Oculomotor nerve
- b. Abducens nerve
- c. Facial nerve
- d. Glossopharyngeal nerve

490. Middle piece of sperm tail is made up of:

- a. Golgibody
- b. Centriole
- c. Mitochondria
- d. Lysosome

491. Third part of duodenum is crossed by:

- a. Portal vein
- b. Hepatic artery
- c. Bile duct
- d. Superior mesenteric artery

492. Innervation of lower one fourth of vagina is done by:

- a. Pudendal nerve
- b. Pelvic splanchnic nerve
- c. Lumbar splanchnic nerve
- d. Hypogastric nerve

IMAGE-BASED QUESTIONS

493. Which part of brain presents in Turkish saddle shaped space in cranium?

- a. Pituitary
- b. Frontal lobe
- c. Hypothalamus
- d. Basal ganglia

496. Which nerve is marked by an arrow in the vicinity of popliteal fossa?

- a. Common peroneal nerve
- b. Deep peroneal nerve
- c. Sural nerve
- d. Sciatic nerve

494. Which nerve is involved in this presentation?

- a. Long thoracic Nerve
- b. Musculocutaneous nerve
- c. Lateral anterior thoracic nerve
- d. Thoracodorsal nerve

497. A patient complains of pain in the distribution shown below. All are true about the condition except:

- a. Sciatic Nerve is involved
- b. Pain worse on standing
- c. Straight Leg raising leading to pain in opposite leg indicates disc herniation
- d. Nerve originates from nerve roots L5-S2

495. Name the ligament:

- a. Coraco-acromial ligament
- b. Acromio-clavicular ligament
- c. Coraco-Humeral Ligament
- d. Sterno-clavicular Ligament

498. Which of the following is branch of external carotid Artery?

- a. A
- b. B
- c. C
- d. All of the above

499. The blockage of which of the following blood vessel will lead to medial medullary syndrome?

a. A
c. C

b. B
d. D

500. What is the insertion of shown muscle:

(2018)

- a. Supraglenoid tubercle of scapula
- b. Tip of coracoid process of scapula
- c. Radial tuberosity
- d. Ulnar tuberosity

501. The marked area in skull represents:

(2018)

a. Asterion
c. Bregma

b. Pterion
d. Lambda

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTIONS 2019

1. Ans. (a) Scaphoid

- The floor of the anatomical snuff box is formed by the scaphoid bone. An injury to this area increases the suspicion of scaphoid fracture

2. Ans. (b) Extensor hallucis longus

- The shown tendon is extensor hallucis longus.
- Origin:** Anterior surface of fibula and the adjacent interosseous membrane
- Insertion:** Base of dorsal center of distal phalanx of great toe
- Function:** Dorsal flexion and eversion of foot and extension of toes.
- Innervation:** Deep peroneal nerve (L4, L5, S1)

FMGE Solutions Screening Examination

26

3. Ans. (b) **Pronator teres**

- Among given options pronator teres originates from medial epicondyle.
- Pronator teres muscle (from anterior arm, superior group of muscle):
 - **Action:** Pronates and flexes forearm
 - **Origin:** Medial epicondyle of humerus, coronoid process of ulna
 - **Insertion:** Lateral surface of radius
- **Muscles originating from medial epicondyle of humerus:**
 - Pronator teres
 - Flexor carpi radialis
 - Palmaris longus
 - Flexor carpi ulnaris

4. Ans. (b) **Inferior constrictor muscle**

- Killian's dehiscence is a potential gap between thyropharyngeus oblique fibres and transverse fibres of cricopharyngeus muscle.
- These two muscles thyropharyngeus and cricopharyngeus are collectively called inferior constrictor muscle.
- There are 3 pharyngeal circular/constrictor muscles namely: Superior, Middle, Inferior.
- This Killian's dehiscence is also the site for development of Zenker's diverticulum.

5. Ans. (a) **Parotid gland**

- All the glands in the face (like submandibular, sublingual, lacrimal gland) are supplied by facial nerve except parotid gland, which is supplied by glossopharyngeal nerve.

6. Ans. (c) **Anencephaly**

- Cranial (rostral) neuropore closes by day 25
- Caudal neuropore closes by day 28
- Failure of cranial neuropore to close at day 25 results in anencephaly
- Failure of caudal neuropore to close results in spina bifida.

7. Ans. (a) Ulnar nerve

- The shown course of nerve is of ulnar nerve
- Please refer the image below

8. Ans. (a) Teres major

- The shown muscle in the image is teres major.
- Origin-Inferior angle of scapula
- Insertion-Intertubercular sulcus of humerus
- Action
 - Extends arm at shoulder joint
 - Assist in adduction and medial rotation of arm at shoulder joint
- Nerve supply
 - Lower subscapular nerve

FMGE Solutions Screening Examination

28

Extra Mile

Identify the deep muscles of shoulder in image

9. Ans. (b) Transversalis fascia

- **Deep inguinal ring** is an oval opening formed in transversalis fascia.
- It lies about 0.5 inch (1.3 cm) above inguinal ligament midway between anterior superior iliac spine and symphysis pubis.
- Medial to deep inguinal ring is inferior epigastric vessels.

Extra Mile

- **Superficial inguinal ring:** A triangular shaped opening in the aponeurosis of external oblique muscle and lies immediately above and medial to pubic tubercle.

10. Ans. (a) External oblique aponeurosis

- Inguinal ligament is a fibrous, thickened, folded margin of the external oblique aponeurosis.
- It extends from anterior superior iliac spine to pubic tubercle.

11. Ans. (d) Gluteus medius

Gluteus medius

- Posterior part covered by gluteus maximus

Origin

- Outer surface of ilium b/w iliac crest above and posterior gluteal line behind and middle gluteal line below.

Insertion

- Lateral surface of greater trochanter
- Nerve-superior gluteal nerve

Action

- With Gluteus minimus and tensor fascia lata-powerful abductor at hip
- Anterior fibres medially rotate the thigh
- Walking and running
- Holds opposite side of pelvis horizontally when foot is off the ground

12. Ans. (c) T8

- Inferior scapular angle lies at the anatomical level of T8

• **C2**—First palpable SP below the occipital bone

• **C7 or T1**—most prominent SP at base of neck (C7 will usually slide anterior from a palpating finger with cervical extension)

• **T4**—Level with the root of the spine of scapula or apex of axillary fold

• **T7–T8**—Level with the inferior angle of scapula

Thoracic TP palpation rule of 3s

• **T1–T3 TPs**: At level of corresponding SP

• **T4–T6 TPs**: ~1/2 Segment above SP

• **T7–T9 TPs**: At ~level of SP of vertebrae above
T10–T12 have SPs that project from a position similar to T9 and rapidly regress until T12 is like T1

• **T12**—Level with the head of the 12th rib

• **L4**—Level with the superior border of the iliac crest

• **PSIS and S2**—Level with the most inferior portion of the PSIS

• **Sacral Apex**—Level with upper greater trochanter (have patient rotate hip to locate trochanter)

SP: Spinous process, TP: Thoracic process

13. Ans. (b) Abdominal aorta

- Testicular artery is a branch of abdominal aorta.
- Please refer the image given below:

14. Ans. (b) **Pectoralis major**

Anatomy of pectoralis major muscle:

- **Origin:** Clavicle, sternum and costal cartilage 2nd – 6th ribs
- **Insertion:** Lateral lip of intertubercular groove of humerus
- **Function:** Flexion, adduction and medial rotation of arm

15. Ans. (c) **Axillary nerve**

- Upper lateral cutaneous nerve of the arm is a branch of axillary nerve.
- Supplies skin over lower half of deltoid.

Extra Mile

Cutaneous innervation of Arm

Lateral side of arm:

- Supraclavicular: Supply skin over shoulder and upper ½ of deltoid
- Upper lateral cutaneous nerve of arm: A branch of axillary supplies skin over lower ½ of deltoid
- Lower lateral cutaneous nerve of arm: A branch of radial, supplies skin over lateral side of arm below deltoid.

Medial side of arm:

- Intercostobrachial nerve: Supplies skin of upper part of medial side of arm (close to axilla)
- Medial cutaneous nerve of arm: A branch of medial cord, supplies medial side of arm below axilla.

EMBRYOLOGY HISTOLOGY AND OSTEOLOGY

31

16. Ans. (c) 270 degree anticlockwise

Ref: Textbook of Clinical Embryology by Vishram Singh, P 148

- The rotation of midgut occurs when herniated intestinal loop returns back to the abdominal cavity.
- It begins at the end of third month of intrauterine life
- The primary intestinal loop rotates around an axis formed by the superior mesenteric artery, which divides the midgut loop into 2 segments:
 - **Proximal (prearterial) segment-** present cranially
 - ◆ Give rise to: Distal half of duodenum, Jejunum, Ileum except its terminal part
 - **Distal (postarterial) segment-** present caudally
 - ◆ Give rise to terminal part of ileum, Cecum, appendix, ascending colon, proximal 2/3rd of transverse colon.
- In order to return to abdominal cavity, the midgut loop undergoes anticlockwise rotation of 90° thrice → total rotation of 270°.
 - The first 90° rotation occurs outside abdominal cavity (within umbilicus), remaining 2 rotations in abdominal cavity

Stepwise midgut rotation

FIGURES: Rotation of midgut loop as seen in left side view. A. Primitive loop before rotation; B. Anticlockwise 90° rotation of midgut loop while it is in the extraembryonic coelom in the umbilical cord; C. Anticlockwise 180° rotation of midgut loop as it is withdrawn into the abdominal cavity; D. Descent of cecum takes place later; E. Intestinal loops in final position.

17. Ans. (a) **Superior mesenteric artery**

Ref: Gray's Anatomy 41st ed. P 1054

Rotation of Midgut Loop

- Midgut loop has 2 ends: Cranial end and caudal end.
- The primary intestinal loop rotates around an axis formed by the superior mesenteric artery

Refer to above explanation for more detailed explanation

18. Ans. (c) **Hyaluronic acid**

Ref: Gray's Anatomy, E-book, 41st ed. P 188

- Hyaluronic acid and chondroitin sulfate are present in the migration pathways of neural crest cells.
- Hyaluronic acid is synthesized by the neural crest cells, ectoderm, somites and neural tube cells.
- The role of hyaluronic acid is to expand the extracellular spaces and facilitate migration of neural crest cells.

19. Ans. (b) **Parafollicular 'C' cells**

Ref: Gray's Anatomy E-book. P 61

ENDODERMAL POUCHES

- **1st pouch:** Dorsal part forms tubotympanic recess which forms the middle ear cavity and eustachian tube.
- **2nd pouch:** Joins with ventral part of 1st pouch to form palatine tonsil. Also forms parts of middle ear.
- **3rd pouch:** Dorsal part forms the inferior parathyroid gland and ventral forms thymus.
- **4th pouch:** Dorsal part forms the superior parathyroid gland.
 - Ventral part forms the ultimobranchial body which forms the parafollicular C-cells of thyroid.

20. Ans. (b) **Craniopharyngioma**

Ref: Gray's Anatomy E-Book 2015 ed. P 431

- In embryogenesis Rathke's pouch is an evagination at the roof of the developing mouth in front of buccopharyngeal membrane. It gives rise to anterior pituitary (adenohypophysis).
- Craniopharyngioma are benign cystic lesions derived from Rathke's pouch, most frequently in children. It is associated with hypopituitarism, growth retardation and diabetes insipidus.
- **Clinical features:**
 - Raised ICT
 - Presents before 20 years of age
 - Visual field abnormalities
 - Weight gain
 - Cranial nerve damage
- **Investigation:** MRI is superior to CT.

21. Ans. (d) **Osseus labyrinth**

Ref: Gray's Anatomy, 41st ed. pg. 644

- Osseous labyrinth is considered as hardest bone of the body. It is embedded in petrous part of temporal bone, which is also known as "rock bone".
- **American edition of British encyclopedia states:** "The labyrinth of the ear is formed of cochlea, 3 semicircular canals and a small cavity known as vestibulum into which cochlea and semicircular canal opens. These parts are formed of the hardest bone in body, almost equal in solidity to ivory and petrous portion of temporal bone.

22. Ans. (b) **Medial umbilical ligament**

Ref: Langman Embryology, pg. 148

Fetal structure	Adult structure
Foramen Ovale	Fossa Ovalis
Umbilical vein (intra-abdominal part)	Ligamentum teres
Ductus venosus	Ligamentum venosum
Umbilical arteries and Proximal part of umbilical artery	Medial umbilical ligaments Superior vesicular artery (supplies bladder)
Ductus arteriosus	Ligamentum arteriosum

23. Ans. (b) **Scrotum**

Ref: D.C. Dutta, 8th ed. pg. 1

- Labia majora is homologous to scrotum in male.
- Round ligament terminates at upper border of labia majora

24. Ans. (b) **16**

Ref: D.C. Dutta, 8th ed. pg. 22

MORULA FORMATION

- Morula is a 16 cell stage where embryo is enclosed in zona pellucida.
- After the zygote formation, typical mitotic division of the nucleus occurs producing two blastomeres.
- The two cell stage is reached *approximately 30 hours* after fertilization. Each contains equal cytoplasmic volume and chromosome numbers.
- The blastomeres continue to divide by binary division through 4, 8, 16 cell stage until a cluster of cell is formed which is called *morula*, resembling a mulberry. As the total volume of the cell mass is not increased and the zona pellucida remains intact, the morula after spending

about 3 days in the uterine tube enters the uterine cavity through the narrow uterine ostium (1 mm) on the 4th day in the 16–64 cell stage.

25. Ans. (d) Two arteries and one vein, umbilical vein supplying towards fetus

“Remember 2AV”

- Umbilical cord is the structure which connects mother to fetus and acts as a bridge for transfer of blood and other nutrients from mother to baby.
- It contains 2 arteries and one vein. Arteries carry deoxygenated blood from fetus to mother while vein carries oxygenated blood from mother towards fetus.
- Cord contains Wharton's jelly and the structures embedded in this are:
 - 2 arteries and 1 vein
 - Allantois and
 - Remains of vitellointestinal duct

26. Ans. (d) Umbilical vessels

Ref: Textbook of Human Embryology, pg. 56

- As the amniotic cavity enlarges, it obliterates the chorionic cavity and covers the connecting stalk and gets reflected at the region of **primitive umbilical ring** (amino-ectodermal junction).
- The primitive umbilical region gradually gets crowded and contains: (i) connecting stalk having allantois, umbilical vessels (two arteries and one vein), (ii) yolk stalk (vitelline duct) along with vitelline vessels, and (iii) the canal connecting the intraembryonic and extraembryonic cavities.
- All these structures finally give rise to primitive umbilical cord. A part of the yolk sac which lies in the chorionic cavity later shrinks and gets obliterated.
- Initially when the abdominal cavity is too small, and the loops of intestine grow very fast, some of them get pushed into the extraembryonic space in the umbilical cord. This is called **physiological umbilical hernia**.
- By the end of the third month, the abdominal cavity enlarges and the loop of intestine returns into the abdomen and the extraembryonic cavity of umbilical cord gets obliterated.
 - The structures of the umbilical cord, i.e., vitelline duct, vitelline vessels and allantois also get obliterated and are converted into **Wharton's jelly**. The only structures

which remain functional in Wharton's jelly are the umbilical vessels.

Extra Mile

- Obliterated umbilical artery gives rise to medial umbilical ligament
- Obliterated umbilical veins give rise to ligamentum teres

27. Ans. (c) Branchial pouch: Endoderm

Ref: Netter's Essential Histology, 2nd ed. pg. 355

The branchial apparatus is composed up of branchial clefts, arches and pouch

Branchial Clefts	Ectoderm
Branchial Arches	Mesoderm
Branchial Pouches	Endoderm

28. Ans. (c) Cardinal vein

Ref: Langman's essential medical Embryology pg. 57

- During early embryonic development (through 4th week), paired cardinal veins drain the body. *Anterior cardinal veins* drain the head and upper limb buds, while *posterior cardinal veins* drain the body. Both the anterior and posterior veins on each side unite at the common cardinal veins that flow into the sinus venosus and ultimately into the common atrium (Image).
- Anterior cardinal veins are retained. An anastomosis between the two forms the left brachiocephalic vein, and anterior segments from both form the jugular system for the head and neck (Image).
- Most of the posterior segment on the left disappears except for that forming the left superior intercostal vein, whereas the right posterior segment forms the superior vena cava.

Extra Mile

Defects of SVC Development

- **Double inferior vena cava** occurs when the left supracardinal vein persists, thereby forming an additional inferior vena cava below the level of the kidneys.
- **Left superior vena cava** occurs when the left anterior cardinal vein persists, forming a superior vena cava on the left side. The right anterior cardinal vein abnormally regresses.
- **Double superior vena cava** occurs when the left anterior cardinal vein persists, forming a superior vena cava on the left side. The right anterior cardinal vein also forms a superior vena cava on the right side.

29. Ans. (d) 4th pharyngeal arch

Ref: Gray's Anatomy, 41st ed. pg. 607

DERIVATIVES OF THE PHARYNGEAL ARCHES

Arch number	Arch name	Embryonic cartilage	Cartilage derivative	Muscle	Nerve	Artery
1	Mandibular	Quadrat Meckel's	Incus Malleus Anterior ligament of malleus Spine of sphenoid Sphenomandibular ligament Genial tubercle of mandible	Tensor tympani Muscles of mastication Mylohyoid Anterior belly of digastric Tensor veli palatine	Trigeminal (V) Mandibular division	First aortic arch artery (transitory)
2	Hyoid	Reichert's	<ul style="list-style-type: none"> Stapes Styloid process of temporal bone Styloid process of temporal bone Stylohyoid ligament Lesser horn and upper part of body of hyoid bone 	<ul style="list-style-type: none"> Stapedius Stylohyoid muscle Facial muscles, include. <ul style="list-style-type: none"> Buccinator Platysma Posterior belly digastric 	Facial (VII)	Stapedial artery (transitory)
3	Third		Greater horn and lower part of body of hyoid bone	Stylopharyngeus	Glossopharyngeal (IX)	Common carotid artery
4	Fourth		Thyroid cartilage Corniculate cartilage Cuneiform cartilage	Pharyngeal and extrinsic laryngeal muscles, levator veli palatini	Vagus (X) Pharyngeal branch	<ul style="list-style-type: none"> Proximal part of subclavian artery on the right Arch of aorta between origins of left common carotid and left subclavian arteries
6	Sixth		Arytenoid cartilages	Intrinsic laryngeal muscles	Vagus (X) Recurrent laryngeal branch	Part between the pulmonary trunk and dorsal aorta becomes ductus arteriosus on left, disappears on right

30. Ans. (b) 3rd pharyngeal arch

Ref: Gray's Anatomy, 41st ed. pg. 607

- The common carotid and first part of internal carotid artery is derived from **3rd pharyngeal arch**
- The common carotid arteries differ on the right and left sides with respect to their origins. **On the right**, the common carotid arises from the brachiocephalic artery as it passes behind the sternoclavicular joint.
- **On the left**, the common carotid artery comes directly from the arch of the aorta in the superior mediastinum. The right common carotid, therefore, has only a cervical part whereas the left common carotid has cervical and thoracic parts.

31. Ans. (b) 2nd branchial arch

Ref: Gray's Anatomy, 41st ed. pg. 449

- The stylohyoid ligament is a fibrous cord extending from the tip of the styloid process to the lesser cornu of the hyoid bone. It gives attachment to the highest fibres of the middle pharyngeal constrictor and is intimately related to the lateral wall of the oropharynx. Below, it is overlapped by hyoglossus.
- The ligament is derived from the cartilage of the **second branchial arch**, and may be partially calcified.

32. Ans. (a) 1

Ref: Gray's Anatomy, 41st ed. pg. 607

Refer to table of Q. 12

33. Ans. (a) Stylohyoid ligament

Ref: Gray's Anatomy, 41st ed. pg. 607

Refer to table of Q. 12

34. Ans. (b) 2nd branchial arch

Ref: Inderbir Singh's Embryology, 9th ed. pg. 116-117, 7th ed. pg. 119-120

- At first there are 6 arches. The 5th arch disappears.
- **Upper half and lesser cornu of hyoid bone is derived from 2nd arch.**
- **Lower half and greater of hyoid bone is derived from 3rd arch.**
- Palatine tonsil derived from 2nd branchial pouch.

35. Ans. (b) II

Ref: I.B. Singh, 9th ed. pg. 116

Refer to table of Q. 12

36. Ans. (d) Cricothyroid

Ref: I.B. Singh, 9th ed. pg. 116

- Cricothyroid muscle is derived from fourth branchial arch. It is the only intrinsic laryngeal muscle not derived from 6th branchial arch
- **Nerve supply:** Superior laryngeal nerve

37. Ans. (d) Thyroid

Ref: I.B. Singh, 9th ed. pg. 116-17

- Superior parathyroid is derived from 4th branchial pouch
- Inferior parathyroid and thymus develop from 3rd branchial pouch
- **Most of the thyroid gland develops from thyroglossal duct (endodermal duct at foramen cecum).**

38. Ans. (d) 1st and 2nd branchial arch

Ref: P.L. Dhingra, 6th ed. pg. 11

- The auricle develops from fusion of mesenchyme of **1st and 2nd branchial arch.**
- External ear canal develops from the ectoderm of 1st branchial cleft.
- Tympanic membrane is derived from all the three germ layers contributed by 1st pharyngeal/ branchial arch.

39. Ans. (c) Branchial pouch 3rd

Ref: Netter's Essential Histology, 2nd ed. pg. 227

- **TH**ird branchial pouch forms the **TH**ymus and Inferior parathyroid glands.
- Fourth branchial pouch forms superior parathyroid glands and ultimobranchial body.
- Aberrant development of third and fourth branchial pouches results in *Di-George syndrome*. It leads to thymic and inferior parathyroid gland hypoplasia. The infant develops recurrent pneumonia episodes and hypocalcemia.
- 2nd branchial pouch forms tonsils.
- 1st branchial pouch *ventral* part forms tongue
- 1st branchial pouch *dorsal* part forms tubotympanic recess, Eustachian tube, middle ear cavity and inner part of Eustachian tube.

40. Ans. (b) 2nd pouch

Ref: Netter's Essential Histology, 2nd ed. pg. 227

Tonsil is derived from 2nd branchial pouch.

41. Ans. (d) Palatine tonsils

Ref: I.B. Singh, 9th ed. pg. 1118; Fundamental Anatomy By Walter Carl Hartwig, pg. 185

- First pharyngeal pouch is located between 1st and 2nd pharyngeal arch
- **Palatine tonsil is a derivative of 2nd pharyngeal pouch**
- Eustachean tube, Middle ear, mastoid antrum and tympanic membrane is derived from 1st pharyngeal pouch.

42. Ans. (b) **Dorsal part of 1st cleft**

Ref: *Netter's Essentials of Human Embryology*, 3rd ed. pg. 235

- The dorsal part of 1st cleft forms the *external auditory canal* while the *ventral part of first cleft obliterates*.
- The 2nd to 4th clefts form temporary cervical sinuses and failure to obliterate leads to branchial cleft cyst.

43. Ans. (c) **Sinovaginal bulb**

Ref: *Human Embryology: The Ultimate USMLE step 1*, pg. 45

- In females, the paired embryonic paramesonephric duct forms the uterine tubes, uterus, cervix and superior part of vagina.
- The **lower 3rd of vagina** develops from **sinovaginal bulbs**, which are paired evaginations of the wall of the urogenital sinus.
- At around 15 weeks of embryologic development, the **mullerian system** which forms the **upper 2/3rd of vagina**, fuses with the invaginating cloaca or **urogenital sinus** to form the **lower 1/3rd of vagina**.
- These two parts of vagina, i.e. paramesonephric duct part and sinovaginal bulb part canalize to form a single, complete vaginal canal.

44. Ans. (d) **Prochordal plate**

Ref: *Netter's Clinical Anatomy*, 3rd ed. pg. 39

- Hypoblast and epiblast are 2 germ layers in the second week of embryonic development.
- The *hypoblast* gives rise to prochordal plate which is the future site of mouth and forms the cranio-caudal axis.
- Notochord is formed by *epiblast* cells.
- Epiblast is also the source of all three germ layers.
- *First germ layer* to be formed is the *endoderm*.^Q
- *Remnants of notochord* are nucleus pulposus and apical ligament of atlas.

45. Ans. (a) **CVS**

Ref: *Netter's Clinical Anatomy*, 3rd ed. pg. 35

- CVS is the first fully functional organ system in fetus and first to attain maturity from functional perspective.

46. Ans. (c) **Week 3**

Ref: *Netter's Clinical Anatomy*, 3rd ed. pg. 39

- Gastrulation is defined as formation of 3 germ layers in 3rd week of embryonic development.
- The 3rd week of development is also called stage of trilaminar germ disk.
- *Gastrulation begins* with formation of primitive streak by proliferation of epiblast cells near the caudal end of embryonic disk. Primitive disc regresses by fourth week.

47. Ans. (b) **Endoderm**

Ref: *Netter's Atlas of Embryology*, 2012 ed. pg. 47

- Epiblast is the source of all three germ layers and *endoderm* is the *first germ layer* to be formed.

48. Ans. (b) **Epiblast**

Ref: *Netter's Atlas of Neurosciences*, 3rd ed. pg. 126

- Notochord is formed by epiblast cells and it provides central axis to the embryonic disc. It induces the overlying ectodermal cells to become neuro-ectodermal cells and form the neural tube.

49. Ans. (a) **Segmental organization of embryo is craniocaudal direction**

Ref: *Netter's Atlas of Human Embryology*, 2012 ed. pg. 10

- *Homeobox (HOX)* gene is involved in *segmental organization of embryo in cranio-caudal* direction. The mutation in gene leads to formation of appendages in wrong locations.
- *Sonic hedge-hog gene* is involved in patterning in A-P axis. The mutation in this gene leads to holoprosencephaly.

50. Ans. (a) **Neural crest**

Ref: *Netter's Atlas of Neurosciences*, 3rd ed. pg. 133

Derivatives of neural crest (mnemonic: N.O.P.E)

- MelaNocytes
- SchwaNn cells
- Adrenal medulla (ChromaffiN cells)
- Odontoblasts
- Parasympathetic ganglia of gut
- Parafollicular cells of thyroid
- Pia and arachnoid matters
- Endocardial cushions and aortopulmonary septum in heart

Extra Mile

Derivatives of neuroectoderm:

- All CNS neurons astrocytes, oligodendrocytes, ependymocytes, neurohypophysis and pineal gland.

51. Ans. (a) Foregut

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 207

Derivatives of Foregut

- Part of mouth including the tongue to 2nd part of duodenum (up to major duodenal papilla)
- Liver, pancreas, biliary channels
- Respiratory system

Derivative of Midgut

- From 2nd part of duodenum to right 2/3rd of transverse colon

Derivatives of Hindgut

- From left 1/3rd of transverse colon to upper part of anal canal
- Part of urogenital system derived from the primitive urogenital sinus

52. Ans. (a) Superior vesical artery

Ref: Netter's Atlas of Human Embryology, 2012 ed. pg. 86

Structure name	Derivative
Obliterated umbilical artery	Medial umbilical ligament
Proximal part of umbilical artery	Superior vesical artery
Inferior epigastric artery	Lateral umbilical fold
Left umbilical vein	Ligamentum teres
Right umbilical vein	Disappears
Ductus venosus	Ligamentum venosum
Urachus	Median umbilical ligament
Vitello-intestinal duct	Meckel's diverticulum

53. Ans. (d) Umbilical vein

Ref: Langeman's, 8th pg. 264, 259

Please refer to above explanation.

54. Ans. (b) Ligamentum venosum

Ref: Langeman's, 8th pg. 264, 259

55. Ans. (a) Coronary sinus

Ref: Netter's Atlas of Human Embryology: 2012 ed. pg. 96

Heart tube embryonic derivatives

Embryonic structure	Gives rise to
• Proximal 1/3rd of bulbus cordis	Primitive trabeculated left ventricle
• Middle 1/3rd of bulbus cordis	Right and left ventricular outflow tract
• Distal 1/3rd of bulbus cordis (truncus arteriosus)	Ascending aorta and pulmonary trunk
• Left horn of sinus venosus	Coronary sinus
• Right horn of sinus venosus	Smooth part of right atrium
• Right common cardinal nerve and right anterior cardinal nerve	SVC (superior vena cava)

56. Ans. (b) 2

Ref: Netter's Atlas of Human Embryology: 2012 ed. pg. 88

- There are six pairs of aortic arches which develop in cephalo-caudal direction.
- The 5th aortic arch completely disappears whereas 1st and 2nd disappear partially.
- The stapedial artery is derived from the 2nd aortic arch.
- Inferior alveolar artery is derived from the 1st aortic arch.

57. Ans. (a) Septum primum

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 113

- Fossa ovalis is the remnant of septum primum.
- Foramen ovale is opening between the upper and lower limbs of septum secundum.
- This is a very closely worded question, so get the perspectives right.

58. Ans. (c) 8 months

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 325

Descent of testis

3 rd month	Iliac fossa
7 th month	Deep inguinal ring
7 th month	Transits through inguinal canal
8 th month	Superficial inguinal ring
9 th month	Enters the scrotum

59. Ans. (a) Metencephalon

Ref: Netter's Atlas of Neurosciences, 3rd ed. pg. 136

Parts of developing brain

Myelencephalon	Medulla oblongata
Metencephalon	Pons, cerebellum and 4th ventricle
Mesencephalon	Midbrain and aqueduct of sylvius
Diencephalon	Thalamus, hypothalamus and 3 rd ventricle
Telencephalon	Cerebral hemispheres and lateral ventricles

60. Ans. (a) Metanephros

Ref: Netter's Atlas of Human Embryology: 2012 ed. pg. 162

- Metanephros forms the definitive adult kidney. It gives rise to renal parenchyma. The nephrons form PCT, DCT, Henle's Loop and glomerulus.
- Ureteric bud gives rise to collecting parts of the kidney which is pelvis of kidney, major and minor calyces with collecting tubules.
- Urogenital sinus develops into bladder, urethra and allantois.

61. Ans. (a) Urogenital sinus

Ref: Netter's Atlas of Human Embryology: 2012 ed. pg. 159

Genital Homologues in Male and Female

Choice number	Male	Female
A: Urogenital Sinus	<ul style="list-style-type: none"> Corpus spongiosum Bulbourethral glands of Cowper Prostate gland 	<ul style="list-style-type: none"> Vestibular bulbs Vestibular glands of Bartholin Urethral and paraurethral glands of Skene
B: Urogenital Folds	Ventral shaft of penis (penile urethra)	Labia minora
C: Labio-scrotal Swelling	Scrotum	Labia majora
D: Gubernaculum	Gubernaculum testis	Ovarian and round ligaments

62. Ans. (a) Ureteric bud

Ref: I.B. Singh, 9th ed. pg. 252

- During the fifth week of gestation, the mesonephric duct develops an outpouching, the ureteric bud, near its attachment to the cloaca. This bud, also called the metanephrogenic diverticulum, grows posteriorly and towards the head of the embryo.
- The elongated stalk of the ureteric bud, called the metanephric duct, later forms the ureter. As the cranial end of the bud extends into the intermediate mesoderm, it undergoes a series of branchings to form the collecting duct system of the kidney. It also forms the major and minor calyces and the renal pelvis.

63. Ans. (b) Type B synoviocytes

Ref: Netter's Essential Histology, 2nd ed. pg. 156

Type A synoviocytes	Type B synoviocytes
<ul style="list-style-type: none"> Resemble macrophages and contain extensive golgi apparatus 	<ul style="list-style-type: none"> Specialised fibroblasts producing synovial fluid and contain abundant Rough endoplasmic reticulum

64. Ans. (a) Hyaline

Ref: Netter's Essential Histology, 2nd ed. pg. 133

Hyaline cartilage is blue colored while elastic cartilage is yellow and fibrocartilage is white.

Extra edge

Hyaline cartilage

The most abundant and common cartilage

All long bones are pre-formed in hyaline cartilage except clavicle.

Types (Mnemonic L.A.N.C.E.T-T.B)

- Larynx (Arytenoid lower end, cricoid)
- Articular cartilage
- Nasal cartilage
- Costal cartilage
- Embryonic cartilage
- Tracheal cartilage
- Thyroid cartilage
- Bronchial cartilage

65. Ans. (b) Holocrine gland

Ref: Netter's Essential Histology, 2nd ed. pg. 259

- Tyson glands are located on external surface of prepuce and are holocrine glands.

- Holocrine glands are characterised by *disintegration of entire cell which discharges its secretions*.
- The holocrine glands are found everywhere except palms and soles.
- Sebaceous glands are usually associated with hair follicles except in following locations
 - **Eyelids:** Glands of zeis and meibomian glands
 - **Nipple and areola:** Montgomery tubercle
 - **Tyson glands:** Prepuce

66. Ans. (b) Persistent vitellointestinal duct

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 590

Urinary fistula at umbilicus	Persistent urachus
Faecal fistula at umbilicus	Persistent vitellointestinal duct
Raspberry tumor	Umbilical adenoma
Sister joseph nodule	Metastatic adenocarcinoma at umbilicus

67. Ans. (a) Cleft lip

Ref: Bailey and Love, 26th ed. pg. 634

The formation of *primary plate* is due to *fusion of maxillary and medial nasal processes*. Defective formation leads to cleft lip.

- The formation of *secondary plate* is due to *fusion of lateral palatine process, nasal septum and median palatine process*. Defective formation leads to cleft palate.

68. Ans. (b) Para-axial mesenchyme

Ref: Gray's Anatomy, 41st ed. pg. 212

- The axial skeleton, vertebrae and ribs are derived from paraxial mesenchyme
- The skull is derived from paraxial mesenchyme and neural crest mesenchyme
- The skeletal elements in the limbs are derived from somatopleuric mesenchyme, which forms the limb buds.

69. Ans. (b) Rathke pouch

Ref: Hypothalamic-pituitary Development: Genetic and Clinical Aspect, pg. 2-3

- The anterior pituitary and intermediate lobe of pituitary develops from Rathke's pouch, which is initially derived from the anterior neural ridge, adjacent to cells in the neural plate.
- Neural plate contributes to ventral diencephalon.
- **Posterior lobe** of pituitary develops from the **infundibulum**, an evagination of the ventral diencephalon.

70. Ans. (a) It takes 74 days

Ref: Textbook of Human Embryology, pg. 24

- **Spermatogenesis** - Process of formation of spermatozoa from primitive germ cell (spermatogonia)
- **Spermiogenesis** - Formation of spermatozoa from spermatid.
- Spermatogenesis begins at puberty (oogenesis begins intrauterine life)
- Spermatogenesis continues throughout life (oogenesis stops at menopause)
- **Average time**-74 days
- **Site**- seminiferous tubule
- **Sperm size**- 55-65 μm
- **Parts**- head, neck, middle piece, principal piece, end piece.
- **Acquire motility in**- epididymis.

71. Ans. (b) Primary spermatocyte

Ref: I.B. Singh, 9th ed. pg. 14-15

FMGE Solutions Screening Examination

- Please refer to the image given about how spermatogonium undergoes mitotic division and forms primary spermatocyte, which further forms secondary spermatocyte and spermatid after first and 2nd meiotic division respectively.
- Microscopically primary spermatocyte is largest in size among all.
- **The formation of spermatogonium to spermatozoa takes around 74 days.**

72. Ans. (b) **74 days**

Ref: I.B. Singh, 9th ed. pg. 14-15

Please refer to above explanation.

73. Ans. (c) **Epididymis**

Ref: I.B. Singh, 9th ed. pg. 15

74. Ans. (a) **Stores the spermatozoa**

Ref: I.B. Singh, 9th ed. pg. 15

- Seminal vesicles are two lobulated sacs, situated between the bladder and rectum.
- Each vesicles is about **5 cm long**, and is directed upwards and laterally and is lined by pseudostratified columnar epithelium.
- The lower narrow end forms the duct of the seminal vesicle which joins the ductus deferens to form the ejaculatory duct.
- **The seminal vesicles do not form a reservoir for spermatozoa.**
- Their secretion is slightly alkaline and contains fructose and a coagulating enzyme called the vesiculase.
- The secretion depends on level of testosterone.

75. Ans. (a) **Blastocyst**

Ref: I.B. Singh, 9th ed. pg. 43-44

- After fertilization, the fertilized ovum begins to divide as it migrates through the uterine tube.

- It undergoes cleavage till a 16 cell stage and is called morula.
- Cells of morula differentiate into an inner cell mass which is completely surrounded by an outer layer of cells, which further gives rise to a structure called trophoblast.
- It reaches the blastocyst stage (approximately 110 cells) on about day 5 and it enters the uterus on about day 6.
- Implantation normally begins on day 6 with the syncytiotrophoblast of the embryonic pole of the blastocyst eroding into the endometrium.

76. Ans. (d) **8 weeks of fertilization**

Ref: Dutta's Obstetrics, 7th ed. pg. 41

The prenatal period can be divided into

Period	Product (known as)	Extends
• Ovular/Germinal	Ovum	1 st 2 weeks after ovulation
• Embryonic	Embryo	From fertilization (2 nd week of gestation) to 8 th week of development after fertilization (10 th week AOG)
• Fetal	Fetus	From 8 th week of fertilization (10 th week AOG) till delivery

77. Ans. (d) **From 10th week of gestation**

Ref: Dutta's Obstetrics, 7th ed. pg. 41

Refer to above explanation.

78. Ans. (d) **Descending colon**

Ref: Langman's Medical Embryology, 9th ed. pg. 298

- "Descending colon is a derivative of Hindgut"

Part	Part in adult	Gives rise to	Arterial supply
Foregut	Esophagus to first 2 sections of the duodenum	Esophagus, stomach, duodenum (1 st and 2 nd parts), liver, gallbladder, pancreas, spleen, superior portion of pancreas	Celiac trunk
Midgut	Lower duodenum, to the first two-thirds of the transverse colon	Lower duodenum, jejunum , ileum, cecum, appendix , ascending colon , and first 2/3 rd of the transverse colon	Branches of the superior mesenteric artery
Hindgut	Last third of the transverse colon, to the upper part of the anal canal	Last third of the transverse colon, descending colon , rectum, and upper part of the anal canal	Branches of the inferior mesenteric artery

79. Ans. (c) **Inferior mesenteric artery**

Ref: Langman's Medical Embryology, 9th ed. pg. 298

80. Ans. (d) **Neural crest**

Ref: Keith L. Moore, 5th ed. pg. 318

- The adrenal cortex derives from mesoderm and secretes corticosteroids and androgens
- The adrenal medulla derives from **neural crest cells** and secretes catecholamines (mostly epinephrine).

81. Ans. (a) **Yolk sac**

Ref: I.B. Singh, 9th ed. pg. 252

- Umbilical vesicle (Yolk sac) attains full development and is large at 32 days (4–5 weeks). It can be observed sonographically early in 5th week.
- By 10 weeks, it shrinks to pear shaped 5 mm in diameter and after 20 weeks it is not visible.
- Although umbilical vesicle contains no yolk, it's essential because:
 - Site of origin of primordial germ cells is *endodermal lining of wall of umbilical vesicle*.
 - In 3rd week blood first develops in vascularized extraembryonic mesoderm covering the wall of umbilical vesicle, and continues to form there until hemopoietic activity begins in liver during 6th week
 - Endoderm which is derived from epiblast, gives rise to *epithelium of trachea, bronchi, lungs and digestive tract (form primordial gut in 4th week)*.

82. Ans. (c) **6**

Ref: Internet Source

- Hyoid bone has a body, two greater and two lesser cornua or horns.
- The hyoid bone develops from 2nd & 3rd pharyngeal arches, the lesser cornu from 2nd the greater cornu from 3rd and body from fused ventral, ends of both.
- Ossification proceeds from 6 centers i.e. a pair for body and one for each cornu. Ossification begins in the greater cornu towards the end of intrauterine life, in body shortly after birth and in lesser cornu around puberty.

83. Ans. (c) **Mesoderm**

Ref: BDC, Vol-2 pg. 382

- *Trigone of bladder is formed by the absorption of mesonephric ducts and is mesodermal in origin.*

84. Ans. (b) **2 arteries, 1 vein**

Ref: I.B. Singh, 9th ed. pg. 59

Refer to Explanation of Question 25

85. Ans. (a) **2 arteries, 1 vein**

Ref: I.B. Singh, 9th ed. pg. 59

Just a repeat question, from a different exam.

86. Ans. (a) **Leydig cell**

Ref: I.B. Singh, 9th ed. pg. 14-16

- **Leydig cell** secretes testosterone
- **Sertoli cells** help in maturation of spermatozoa
- **Epididymis**: store sperm
- **Seminal vesicle**: Secretes thick alkaline fluid.

87. Ans. (b) **Brush bordered columnar epithelium**

Ref: BDC, 6th ed. vol. II pg. 288-89

MICROVILLI

- When microvilli are of same height & arranged regularly, they are termed as **striated** border, as observed in small intestine.
- *If they are of irregular height, they will constitute the **brush border** as seen in gall bladder and proximal convoluted tubules of kidney - (Gray's anatomy).*

88. Ans. (d) **Thymus**

Ref: Gray's, 41st ed. pg. 619

- **Corpuscle** means any small body.
- **Hassall's corpuscles** are spherical or ovoid bodies found in the medulla of the thymus, composed of concentric arrays of epithelial cells which contain keratohyalin and bundles of cytoplasmic filaments.

Extra Mile

Some Other Known Corpuscles

- **Lamellated corpuscle** a type of large encapsulated nerve ending found throughout the body, concerned with perception of sensations.
- **Malpighian corpuscles**: Found in Nephrons (kidney) and in spleen (white pulp)
- **Meissner's corpuscle**: A type of medium sized encapsulated nerve ending in the skin, chiefly in the palms and soles.
- **Paciniform corpuscles** a type of rapidly adapting lamellated corpuscles responding to muscle stretch and light pressure.
- **Red corpuscle**: Red Blood Cells
- **White corpuscle**: White Blood Cells

89. Ans. (b) **Kidney**

Please refer to above explanation

90. Ans. (b) **Spleen**

Ref: BDC, 6th ed. vol. II pg. 297

The **Cords of Billroth** are also known as **splenic cords** or **red pulp cords**. They are found in the red pulp of the spleen between the sinusoids consisting of fibrils and connective tissue cells with a large population of monocytes and macrophages. *These cords contain half of the human body's monocytes.*

91. Ans. (b) **Thymus**

Ref: BDC, 6th ed. vol. II pg. 147

T cells originate in the bone marrow but mature in the thymus. So, T stands for 'Thymus'.

- Thymus and bone marrow are primary lymphoid organs.
- Lymph node and spleen are secondary lymphoid organs.

UPPER LIMB

92. Ans. (d) **Radial head**

Ref: Gray's Anatomy 41st ed. P 839

- The arrow here points towards radial head.
- The radial head articulates with humeral capitulum

FIGURE: The proximal end of the left radius, anterior view. Key 1. head; 2. radial tuberosity; 3. shaft; 4. neck

93. Ans. (b) **Trapezius**

Ref: Gray's Anatomy 41st ed. P 810, 786.e1

- **Protraction:** Involves moving the scapula away from midline (Abduction)
- **Retraction:** Involves moving the scapula towards the midline (Adduction) and is done by middle part of trapezius and Rhomboids muscle

Muscles of Scapular Stabilization:

- **Trapezius:**
 - Retraction (middle part)
 - Elevation (superior part)
 - Depression (Inferior part)
 - Upward rotation (superior + middle)
- **Rhomboid:** Retraction
- **Levator scapulae:** Elevation
- **Serratus anterior and Pectoralis major:** Protraction

94. Ans. (b) Nerve to serratus anterior

Ref: Gray's Anatomy 41st ed. P 819

- Winging of scapula is due to paralysis of **serratus anterior muscle**.
- **Nerve supplying serratus anterior muscle:** Long thoracic nerve (C5, 6, 7). Therefore long thoracic nerve palsy can also lead to winging of scapula.
- **Vascular supply:** Serratus anterior is supplied by **superior and lateral thoracic arteries**, and by branches from the thoracodorsal artery after it divides in latissimus dorsi.

FIGURE: Winging of scapula

95. Ans. (a) Pronation

Ref: Gray's Anatomy 41st ed. P 846-48

- Pronator teres muscle is involved in pronation of forearm, by rotating the radius medially on the ulna.
- Proximally movements at the humeroradial joint and distally at radioulnar joints pronate and supinate the hand.
- In pronation, the radius turns anteromedially and obliquely across the ulna.
 - Proximal end remains lateral to the ulna while its distal end lies medially and the interosseous membrane becomes spiralled.
- If there is fracture at this pronator muscle insertion area → it may be detached → Forearm acquired supination.
- The movement pronation is restricted.

96. Ans. (a) Radial tuberosity

Ref: Gray's Anatomy 41st ed. P 824

- The shown muscle in the image is biceps brachii.
- It has two proximal heads (hence the name). Their attachments are:
 - **Short head:** Tip of coracoid process
 - **Long head:** Supraglenoid tubercle of scapula
- **Insertion:**
 - Radial tuberosity and fascia of forearm via bicipital aponeurosis
- **Innervation:** Musculocutaneous nerve (C5, C6)
- **Action:** Supination of forearm and flexion of shoulder joint

97. Ans. (c) Atavistic epiphysis

Ref: Clinical Anatomy, Kulkarni 2nd ed. P 73

TYPES OF EPIPHYSIS

- **Pressure:** Seen at the end of long bones subjected to pressure. E.g. Femur, head of humerus, condyles of tibia and femur.
- **Traction:** Formed due to pull of muscles. E.g. Mastoid process, tibial tuberosity, tubercles, trochanters.
- **Atavistic:** Functional in lower animals. Degenerated in humans e.g. Coracoid process of scapula, os trigonum of talus
- **Abberant:** It is an extra epiphysis. E.g. Proximal end of 1st metacarpal bone.

98. Ans. (a) Ulnar nerve

Ref: Gray's Basic Anatomy E-book, P 399

Carpal Tunnel Anatomy

- Posterior border
 - Carpal bones
- Anterior border
 - Transverse carpal ligament
- Boundaries
 - Proximally—pisiform and tubercle of navicular
 - Distally—hook of hamate and tubercle of trapezium
- Contents
 - Flexor digitorum superficialis
 - Flexor digitorum profundus
 - Flexor pollicis longus
 - Median nerve

99. Ans. (a) Ulnar nerve

Ref: Gray's Anatomy review E-book, P 336

FMGE Solutions Screening Examination

44

Clinical Correlates: Guyon's Canal Syndrome

- Guyon's canal (ulnar tunnel) is formed by the pisiform, hook of the hamate, and pisohamate ligament, deep to the palmaris brevis and palmar carpal ligament and transmits the ulnar nerve and artery.
- Guyon's canal syndrome is an entrapment of the ulnar nerve in the Guyon's canal.
- **Symptoms:** Pain, numbness, and tingling in the ring and little fingers, followed by loss of sensation and motor weakness.
- **Rx:** Surgical decompression of the nerve.

100. Ans. (a) C5-C6

Ref: Gray's Anatomy, 41st ed. pg. 792

- **Biceps jerk (C5, 6)** The elbow is flexed to a right angle and slightly pronated. A finger is placed on the biceps tendon and struck with a percussion hammer; this should elicit flexion and slight supination of the forearm.

Extra Mile

- **Triceps jerk (C6–8)** The arm is supported at the wrist and flexed to a right angle. Triceps tendon is struck with a percussion hammer just proximal to the olecranon; this should elicit extension of the elbow.
- **Radial jerk (C7, 8)** The radial jerk is a periosteal, not a tendon reflex. The elbow is flexed to a right angle and the forearm placed in the mid pronation/supination position. The radial styloid is struck with the percussion hammer. This elicits contraction of brachioradialis, which causes flexion of the elbow.

101. Ans. (d) 164

Ref: Vishram Singh, vol-1: 2nd ed. pg. 22

- Angle of humeral torsion is 164 degrees in contrast to femoral torsion of 15 degrees.
- The angle of humeral torsion is due to *angulation* between the *long axis of articular surface of the upper and lower ends of humerus*. This is because the upper end appears to have rotated laterally

102. Ans. (c) Hamate

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 80

The largest carpal bone is capitate and the carpal bone with Hook is Hamate.

Extra edge

- Proximal row of carpals (Lateral to Medial): Scaphid, Lunate, Triquetral and Pisiform
- Distal row of carpals: Trapezium, Trapezoid, Capitate and Hamate
- Pisiform bone is a *sesamoid* bone lying in the tendon of *flexor carpi ulnaris*.
- Mnemonics to remember carpal bones "*She Looks Too Pretty, Try To Catch Her*"

103. Ans. (a) Capitate

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 80

- The carpal bones are cartilaginous at birth. Capitate is the first bone to ossify at 1 year and pisiform the last one to ossify at 12 years.

Extra Mile

- Scaphoid is boat-shaped. Its neck or waist subdivides the scaphoid into proximal and distal segments. A tubercle projects from its lateral side. It lies in the floor of anatomical snuff-box, where it can be palpated.
- Lunate is shaped like lunar crescent (shape of half moon).
- Triquetral is pyramidal in shape.
- Pisiform is pea-shaped. It is a sesamoid bone in the tendon of flexor carpi ulnaris.
- Trapezium is quadrilateral and bears a crest and groove (for lodging tendon of flexor carpi radialis). It takes part in the first carpometacarpal joint, which imparts unique mobility to human thumb.
- Trapezoid is irregular like a baby's shoe.
- Capitate bears a big head. It is largest carpal bone.
- Hamate has a hook-shaped process.

104. Ans. (d) Hamate

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 80

Proximal row of carpals (Lateral to Medial): Scaphoid, Lunate, Triquetral and Pisiform.

105. Ans. (c) Scaphoid

Ref: BDC, 6th ed. vol. I pg. 26

- The scaphoid is a BOAT SHAPED carpal bone and has a tubercle in its lateral side.
- Scaphoid bone is the most commonly fractured carpal bone.
- Lunate (crescent shaped) is the 2nd most commonly fractured carpal bone.
- Scaphoid fracture is usually caused by a fall on an outstretched hand with the weight landing on the palm.
- Scaphoid bone forms the floor of the anatomical snuff box.
- It articulates with the following bones: radius, lunate, capitate, trapezium, and trapezoid.

106. Ans. (a) Triquetral

Ref: BDC, 6th ed. vol. I pg. 25; Snell's 8th ed. pg. 402

PISIFORM

- It is a sesamoid bone in the tendon of flexor carpi ulnaris.
- *Its dorsal surface presents a smooth, oval facet, for articulation with the triquetral*
- The palmar surface is rounded and rough, and gives attachment to the transverse carpal ligament, and to the Flexor carpi ulnaris and Abductor digiti quinti.

107. Ans. (d) **C7**

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 18

- Brachial plexus is composed of anterior rami of spinal nerves C5 to T1.
- C5 and C6 join to form the *upper trunk*
- Root C7 forms the *middle trunk*
- Root C8 and T1 join to form the *lower trunk*

108. Ans. (b) **Axillary nerve**

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 30

The damage to axillary nerve leads to regimental badge anaesthesia.

Axillary nerve injury leads to *deltoid* and *teres minor* paralysis. The manifestations are:

- Loss of rounded contour of shoulder
- Sensory loss in skin covering lower part of deltoid.
- Loss of abduction from 15° to 90° is due to deltoid paralysis.

109. Ans. (b) **Anconeus**

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 73

- The screwing movement is due to action of muscle anconeus.
- The anconeus muscle is a small triangular muscle located at the elbow. It *originates* at the *dorsal side of the lateral epicondyle* of the humerus and *inserts* at the *olecranon of ulna*.
- It is *supplied* by motor branch of *radial nerve* (C6-C8) which arises at the radial sulcus of the humerus.

110. Ans (b) **Deep palmar arch**

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 20

- Radial artery ends as **deep palmar arch** while the ulnar artery ends as **superficial palmar arch**.
- Branches of branchial artery which *terminates* as *radial and ulnar* artery:
 - Muscular artery
 - Profunda brachii artery (accompanies the radial nerve in spiral groove)
 - Superior and inferior ulnar collateral artery

111. Ans (c) **Subacromial bursa**

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 48

The subacromial bursa is the *largest bursa* of the body

FMGE Solutions Screening Examination

46

112. Ans. (a) Ulnar

Ref: BDC, 6th ed. vol. I pg. 93; Gray, 822,29,37

- Nerve passing through medial epicondyle is ulnar nerve. Very often when we hit our elbow on any surface, the current like feeling in arm, is due to ulnar nerve injury.
- **Medial epicondyle fracture causes injury to ulnar nerve.**
 - Ulnar nerve palsy causes partial claw hand.
 - **Claw hand**-sensory loss of medial 1 ½ digits.
 - Weakness of grip (paralysis of intrinsic muscle)
 - Loss of flexion of MCP (lumbricals and interossei)
 - Loss of adduction of thumb

113. Ans. (d) 2nd part of axillary artery

Ref: BDC, 6th ed. vol. I pg. 73

- The extreme mobility of shoulder may result in kinking of axillary artery.
- To compensate this, an arterial anastomosis exists between branches of 1st part of subclavian artery and 3rd part of axillary artery (NOT 2nd part axillary artery).
- It also provides collateral circulation when the subclavian artery is obstructed (Eg: by a cervical rib or fibrous band)
- **This anastomosis involves:**
 - Suprascapular artery and deep branch of transverse (superficial) cervical arteries- both arising from thyrocervical trunk of 1st part of subclavian artery

- Subscapular artery & its circumflexscapular branch (arising from 3rd part of axillary artery).

114. Ans. (b) Radial artery

Ref: BDC, 6th ed. vol. I pg. 122; Gray's 41st ed. pg. 790

- The anatomical snuffbox is formed by the tendons of extensor pollicis longus and brevis, and abductor pollicis longus.
- It has the radial artery running in the floor of the snuffbox, and the radial nerve passing to the dorsum of the hand.
- **Boundaries of snuff box:**
 - **Postero-medial border** is the tendon of the extensor pollicis longus.
 - **Antero-lateral border** is a pair of parallel and intimate tendons of the **extensor pollicis brevis** and the **abductor pollicis longus**.
 - The **proximal border** is formed by the styloid process of the radius.
 - The **distal border** is formed by the approximate apex of the schematic snuffbox isosceles.

Anatomical snuff box

115. Ans. (b) Radial artery

Ref: BDC, 6th ed. vol. I pg. 22, 5th ed. pg. 102

Please refer to above explanation.

116. Ans. (c) Extensor pollicis longus

Ref: Gray's 41st ed. pg. 790

117. Ans. (a) Teres major palsy

Ref: BDC, 4th ed. Vol. I / 62, 171; Gray's 41st ed. /831-33

- Axillary nerve (C5, C6) is injured due to surgical neck fracture or due to shoulder dislocation.

Motor injury	Sensory injury
<ul style="list-style-type: none"> • Deltoid muscle palsy: loss of rounded contour of shoulder • Weakness of abduction • Teres minor palsy 	<ul style="list-style-type: none"> • Lateral cutaneous nerve of arm • Sensory loss over lower half of deltoid (<i>regimental batch area</i>)

Note: *Teres Major* is supplied by lower subscapular nerve.

118. Ans. (b) **Axillary**

Ref: Gray's 41st ed. pg. 831e-2; Keith L. Moore 5th ed. pg. 760

- Anterior shoulder dislocation can cause injury to axillary nerve
- Axillary nerve passes inferior to the humeral head and winds around the surgical neck of the humerus. The axillary nerve is usually injured during fracture of this part of the humerus.
- It may also be damaged during dislocation of the gleno-humeral joint and by compression from the incorrect use of crutches.

119. Ans. (a) **Flexor digitorum profundus**

Ref: Gray's, 41st ed. pg. 851

- **Composite or hybrid muscles** are those muscles which have more than one set of fibers but perform the same function and are usually supplied by different nerves for different set of fibers
- The muscles of the anterior compartment are innervated mostly by the median nerve, but one and a half muscles are innervated by the ulnar nerve which are FLEXOR CARPI ULNARIS and HALF OF FLEXOR DIGITORUM PROFUNDUS.

OTHER HYBRID/COMPOSITE MUSCLES

- **Adductor magnus** : Adductor part is innervated by OBTURATOR NERVE whereas the Hamstring part is innervated by SCIATIC NERVE
- **Biceps femoris** : Its long head is supplied by the TIBIAL BRANCH OF SCIATIC NERVE whereas the short head is supplied by the COMMON PERONEAL NERVE. This reflects the composite derivation from the flexor and extensor musculature.
- **Pectineus**: Its anterior set of fibers are supplied by the femoral nerve, whereas posterior set of fibers are supplied by the obturator nerve.
- **Iliopsoas**: It is a composite muscle performing flexion at the hip.

120. Ans. (c) **Palmaris longus**

Ref: BDC, 6th ed. vol. I pg. 113

- **Palmaris longus** passes **superficial** to flexor retinaculum.
- **Structures Deep to flexors retinaculum:**
 - Flexor digitorum superficialis (FDS)
 - Flexor digitorum profundus (FDP)
 - Flexor pollicis longus (FPL)
 - Flexor carpi radialis
 - Median nerve
- **Structures Superficial to flexor retinaculum:**
 - **Palmaris longus**
 - Ulnar nerve and artery
 - Palmar cutaneous branches of median and ulnar nerves

121. Ans. (a) **Ulnar nerve**

Ref: BDC, 6th ed. vol. I pg. 113

- Ulnar nerve passes above (superficial) to flexor retinaculum especially the palmar cutaneous branch of ulnar nerve.

122. Ans. (a) **C5, C6**

Ref: BDC, 6th ed. vol. I pg. 55-56; Clinical Anatomy By Harold Ellis, 11th ed. pg. 189-190

Brachial Plexus in a Nutshell

- **Five roots** derived from the anterior primary rami of C5, 6, 7, 8 and T1; link up into:
- **Three trunks** formed by the union of
 - C5 and 6 (upper);
 - C7 alone (middle);
 - C8 and T1 (lower)

Which split into:

- **Six divisions** formed by each trunk dividing into an anterior and posterior division; which link up again into:
- **Three cords**
 - A lateral, from the fused anterior divisions of the upper and middle trunks;
 - A medial, from the anterior division of the lower trunk;
 - A posterior, from the union of all three posterior divisions.

Division is remembered as "RTDC"

"The **roots** lie between the anterior and middle scalene muscles. The **trunks** traverse the posterior triangle of the neck. The **divisions** lie behind the clavicle. The **cords** lie in the axilla"

The cords continue distally to form the main nerve trunks of the upper limb thus:

- The lateral cord continues as the *musculocutaneous nerve*;
- The medial cord, as the *ulnar nerve*;
- The posterior cord, as the *radial nerve* and the *axillary nerve*;
- A cross-communication between the lateral and medial cords forms the *median nerve*.

Note

- 5 BRANCHES of Posterior cord and their root nerve:
 - Upper subscapular Nerve (C5, C6)
 - Lower subscapular Nerve (C5, C6)

FMGE Solutions Screening Examination

- Nerve to latissimus dorsi (C6, 7, 8)
- **AXILLARY NERVE (C5, C6) → SUPPLIES DELTOID AND TERES MINOR**
- Radial nerve (C5 To T1)

123. Ans. (b) **Lateral cord**

Ref: BDC, 6th ed. vol. I pg. 55-56

124. Ans. (c) **C5, C6, C7, C8, T1**

Ref: BDC, 6th ed. vol. I pg. 55-56

125. Ans. (b) **Long thoracic nerve**

Ref: BDC, 6th ed. vol. I pg. 55-56;
3rd ed. Vol. I pg. 45-50; 180, 181

- Winging of scapula is due to damage of long thoracic nerve due to paralysis of serratus anterior muscle.
- **Serratus anterior** helps in *vertical overhead abduction* (assisted by trapezius), *forward punch* (assisted by pectoralis minor) & *forced inspiration*.
- *Its paralysis leads to winging of scapula.*
- Nerve Supply of Serratus anterior- **Long Thoracic Nerve (Nerve of Bell)** (C5, C6, C7)
- **Action of Serratus anterior muscle**
 - Rotates the scapula so that glenoid cavity is raised upward & forward- Helps in *Vertical over head abduction* (in this action assisted by *Trapezius muscle*).
 - Draws the scapula forward around the thoracic wall so *paralysis leads to winging of scapula.*

- Also used when arm is pushed forward in horizontal position as in *forward punch* (helped by *Pectoralis minor* in this action).
- Steadies the scapula during weight carrying.
- Helps in *forced inspiration* (Accessory muscle of inspiration).
- Because of greater pull exerted on the inferior angle, inferior angle passes laterally and forward and the glenoid cavity is raised upward & forward; in this action the muscle is assisted by trapezius.

126. Ans. (a) **Serratus anterior muscle**

Ref: Gray's Anatomy, 41st ed. pg. 819

- Winging of scapula is due to paralysis of **serratus anterior muscle**.
- **Nerve supplying serratus anterior muscle: Long thoracic nerve (C5, 6, 7).** Therefore long thoracic nerve palsy can also lead to winging of scapula.
- **Vascular supply:** Serratus anterior is supplied by **superior and lateral thoracic arteries**, and by branches from the thoracodorsal artery after it divides in latissimus dorsi.

FIGURE: Winging of scapula

127. Ans. (a) **Serratus anterior muscle**

Ref: BDC, 6th ed. vol. I pg. 55-56;
3rd ed. Vol. I pg. 45-50; 180, 181

128. Ans. (d) **Trapezius**

Ref: Gray's, 41st ed. pg. 817

Dropped Shoulder and Winged Scapula

- The position of the scapula on the posterior wall of thorax is maintained by the tone and balance of the muscles attached to it.
- If one of these muscles is paralyzed, the balance is upset, as in dropped shoulder, which occurs with paralysis of the trapezius or winged scapula caused by paralysis of serratus anterior.

129. Ans. (a) **First rib**Ref: Gray's, 41st ed. pg. 816-817

- **Origin of trapezius muscle is from:**
 - External occipital protuberance
 - Superior nuchal line
 - Ligament nuchae,
 - C₁ spine and
 - Spines of T₁ to T₁₂ vertebrae.
- Insertion of trapezius muscle is on lateral third of clavicle (upper fibers), medial border of acromion process (middle fibers), and upper margin of spine of scapula (lower fibers).

130. Ans. (b) **Abductor pollicis palsy**Ref: BDC, 6th ed. vol. I pg. 109-110, 120

- In ulnar nerve palsy grip is weak due to paralysis of intrinsic muscles (*all interossei, lateral 3rd & 4th lumbricals, hypothenar and adductor pollicis muscles*).
- Sensory supply of ulnar nerve is medial 1½ fingers.
- *Abductor pollicis is supplied by median nerve.*
- **Finger drop** i.e. loss of extension of metacarpophalangeal joint is seen in Radial & Posterior interosseous nerve palsy

Signs of Ulnar Nerve palsy (remembered as BCDEF)

- **Book test/Fromet sign:** While holding the book between thumb and rest of hand, there is overaction of flexor pollicis longus due to adductor pollicis nerve palsy.
- **Claw hand:** Clawing of medial 2 digits
- **Card test:** for testing palmar interossei, i.e. adduction of fingers. (PAD)
- **aDDuctor pollicis paralysis:** Adduction of thumb lost
- **Egawa's test:** To test dorsal interossei i.e. abduction of fingers (DAB).
- **Froment sign**

Extra Mile

- In low ulnar nerve palsy forearm muscles are spared but the clawing is more (as compared to high ulnar n. palsy) this phenomenon is known as **ulnar paradox**.
- Lower the lesion, more the clawing.

131. Ans. (c) **Median nerve**Ref: BDC, 6th ed. vol. I pg. 126-127, Vol-1 pg. 109,159;
Clinical anatomy, Vishram Singh / 58

- Median nerve is the main nerve of the front of the forearm. It also supplies the muscles of thenar eminence.
- Median nerve aka *labourer's nerve* as it supplies most of the long muscles of the front of forearm.

Extra Mile

- **Deformities that may occur due to median nerve paralysis:**
 - Carpal tunnel syndrome
 - Pointing index finger
 - Ape thumb deformity aka ape hand deformity
 - Claw hand (median + ulnar)
- **Deformities that may occur due to radial nerve paralysis**
 - Wrist drop
 - Saturday night palsy
- **Deformities that may occur due to ulnar nerve paralysis**
 - Ulnar claw hand
 - Cubital tunnel syndrome

132. Ans. (c) **Median and ulnar both**Ref: BDC Vol-1 pg. 109,159; Clinical anatomy,
Vishram Singh/ 58**Please refer to above explanation**133. Ans. (c) **Median nerve**Ref: BDC Vol-1 Pg. 109,159; Clinical anatomy,
Vishram Singh/ 58

- Median nerve is the main nerve of the front of the forearm. It also supplies the muscles of thenar eminence.
- The ape hand deformity or ape thumb deformity of hand is due to paralysis of thenar muscles which is supplied by median nerve.

Presenting Feature of Ape Thumb Deformity

- Thumb is laterally rotated and adducted
- Loss of thenar eminence
- Loss of opposition of thumb

134. Ans. (b) **Median nerve**Ref: BDC, 6th ed. vol. I pg. 126

- Median nerve is the main nerve of the front of the forearm. It also supplies the muscles of thenar eminence.
- Carpal tunnel syndrome occurs as a result of compression of the median nerve. The median nerve runs from your forearm through a passageway in the wrist (carpal tunnel) to the hand. It provides sensation to the palm, side of the thumb and fingers, with the exception of the little finger. It also provides nerve signals to move the muscles around the base of the thumb

135. Ans. (a) **Abductor pollicis longus**Ref: BDC, 6th ed. vol. I pg. 126-128

- Median nerve is formed by combination of lateral cord (C5, 6, 7) and medial cord (C8, T1)
- Median nerve is the main nerve of the front of the forearm. It also supplies the muscles of thenar eminence.

FMGE Solutions Screening Examination

All the muscles of anterior compartment of forearm is innervated by Median Nerve except: FLEXOR CARPI ULNARIS, HALF OF FLEXOR DIGITORUM PROFUNDUS.

- Muscles of the extensor compartment are innervated by Radial Nerve. **Abductor Pollicis Longus belongs to this group of muscles.**

136. Ans. (a) **Teres major**

Ref: BDC, 6th ed. vol. I pg. 68-69, 73

- The rotator cuff is a group of tendons and muscles in the shoulder, connecting the upper arm (humerus) to the shoulder blade (scapula). The rotator cuff tendons provide stability to the shoulder; the muscles allow the shoulder to rotate.

The Muscles in the Rotator Cuff Include

- Teres minor
- Infraspinatus
- Supraspinatus
- Subscapularis
- Each muscle of the rotator cuff inserts at the scapula, and has a tendon that attaches to the humerus. Together, the tendons and other tissues form a cuff around the humerus.

Mnemonic: SITS [Supraspinatus, Infraspinatus, Teres minor, Subscapularis].

Teres major is not a part of rotator cuff muscles.

137. Ans. (a) **Supraspinatus muscle**

Ref: BDC, 6th ed. vol. I pg. 68-69

- Four of the Intrinsic shoulder muscles collectively forms the Rotator cuff muscles.
- Injury or disease may damage the musculotendinous rotator cuff, producing instability of the glenohumeral joint. Trauma may tear or rupture one or more of the tendons of the SITS muscles; and **supraspinatus** is most commonly involved.

138. Ans. (c) **Coracobrachialis**

Ref: Gray's, 41st ed. pg. 819-821

- The coracobrachialis is an elongated muscle in the superomedial part of the arm. The coracobrachialis helps flex and adduct the arm and stabilize the glenohumeral joint.
- With the deltoid and long head of the triceps, it serves as a shunt muscle, resisting downward dislocation of the head of the humerus, as when carrying a heavy suitcase.
- The median nerve and/or the brachial artery may run deep to the coracobrachialis and be compressed by it.
- Nerve supply 2 Musculocutaneous nerve.

139. Ans. (a) **Musculo cutaneous nerve**

Ref: BDC, 6th ed. vol. I pg. 88

- Short head of biceps comes under anterior compartment of arm. All the muscles of the anterior compartment of arm are innervated by musculo-cutaneous nerve.
- Posterior compartment muscles are innervated by radial nerve.

140. Ans. (d) **Long head of triceps brachii**

Ref: BDC, 6th ed. vol. I pg. 96-97

- The **triceps brachii muscle** is the large muscle on the avoid back of the upper limb.
- It originates from the infraglenoid tubercle of scapula and inserts at the elbow joint in olecranon process of ulna.
- It is the muscle principally responsible for extension of the elbow joint (straightening of the arm).

Since it has 3 heads, all of them have different origin:

- **Long head:** Infraglenoid tubercle of scapula
- **Lateral head:** Above the radial sulcus
- **Medial head:** Below the radial sulcus

Insertion: Olecranon process of ulna

141. Ans. (b) **Deltoid**

Ref: Gray's Anatomy, 41st ed. pg. 113

Unipennate	<ul style="list-style-type: none"> • Extensor digitorum longus • Flexor pollicis longus • Soleus
Bipennate	<ul style="list-style-type: none"> • Rectus femoris • Dorsal interossei • Gastrocnemius
Multipennate	<ul style="list-style-type: none"> • Deltoid
Circumpennate	<ul style="list-style-type: none"> • Tibialis anterior

142. Ans. (a) **Radial nerve injury**

Ref: BDC, 6th ed. vol. I pg. 98

- Radial nerve gets injured in cases of humerus shaft fracture.
- Ulnar nerve injury may take place when there is damage to medial epicondyle of humerus and in cases of tardive ulnar palsy.
- Median nerve damage can be secondary to compression (for ex- carpal tunnel syndrome), which may lead to gun stock deformity, ape thumb deformity.

Extra Mile

- **Median nerve aka labourer's nerve** as it supplies most of the long muscles of the front of forearm.
- **Ulnar nerve aka musician's nerve** as it controls the fine movements of hand.

143. Ans. (c) **Supraspinatus**

Ref: BDC, 6th ed. vol. I /47; Gray's Anatomy, 39th ed/ 841

Boundaries of Axilla

- Anterior wall: Pectoralis major, Pectoralis minor, Clavipectoral fascia
- **Posterior wall: Subscapularis, Teres major, Latissimus dorsi**
- Medial wall: First 4 ribs & their associated intercostal muscles, Serratus anterior
- Lateral wall: Intertubercular (bicipital groove), Biceps tendon.

144. Ans. (c) **Superior**

Ref: Clinical Anatomy, 11th ed. pg. 160-161

The axillary lymph nodes (some 20–30 in number) drain not only the lymphatics of the breast, but also those of the pectoral region, upper abdominal wall and the upper limb, and are arranged in five groups:

- **Anterior**—lying deep to pectoralis major along the lower border of pectoralis minor;
- **Posterior**—along the subscapular vessels;
- **Lateral**—along the axillary vein;
- **Central**—in the axillary fat;
- **Apical** (through which all the other axillary nodes drain)—immediately behind the clavicle at the apex of the axilla above pectoralis minor and along the medial side of the axillary vein.

Clinicians and pathologists often define metastatic axillary node spread simply into three levels:

- Level I—nodes inferior to pectoralis minor
- Level II—nodes behind pectoralis minor
- Level III—nodes above pectoralis minor.

145. Ans. (b) **Radioulnar joint**

Ref: BDC, 6th ed. vol. I pg. 153-154; Clinically Oriented Anatomy by Keith, Moore, 5th ed/ 865

- During supination radius rotates laterally and palm faces anteriorly
- During pronation, radius rotates medially and palm faces posteriorly
- This movement takes place around distal radioulnar joint.

FMGE Solutions Screening Examination

52

146. Ans. (a) **Pronator teres**

TABLE: Cubital fossa boundaries

• Medial boundary	• Pronator teres
• Lateral boundary	• Brachioradialis
• Base	• Line joining the two epicondyles of humerus
• Apex	• Point joining lateral and medial boundaries
• Floor	• Brachialis, supinator
• Roof	• Skin, superficial fascia (containing medial cubital vein, lateral and medial cutaneous nerve of forearm), deep fascia, bicipital aponeurosis

Cubital fossa (Left hand)

147. Ans. (d) **Ulnar nerve**

Ref: BDC, 6th ed. vol. I pg. 94

Contents of Cubital Fossa

- Median nerve
- Brachial artery (termination and beginning of radial and ulnar arteries)
- Biceps tendon
- Radial nerve and Radial collateral artery

148. Ans. (b) **Ulnar nerve**

Ref: BDC, 6th ed. vol. I pg. 94

149. Ans. (c) **Serratus anterior**

Ref: Gray's, 41st pg. 749

- Triangle of auscultation is bounded by:

- Medially: Trapezius
- Laterally: Scapula
- Inferiorly: Latissimus dorsi

LOWER LIMB

150. Ans. (d) **Biceps Femoris muscle**

Ref: Gray's Anatomy 41st ed. P 1324.e2

- The posterior compartment includes semitendinosus, semimembranosus and biceps femoris
 - Note: Biceps femoris is the only muscle of the thigh that is attached distally to the fibula, and has no tibial attachment
- Biceps femoris muscle is supplied by tibial and common peroneal nerve.
- While in posterior descent, sciatic nerve is crossed by the long head of biceps femoris and divides it into the tibial and common fibular (peroneal) nerves proximal to the knee.
- The short head of biceps femoris is supplied by the lateral (common fibular/peroneal) component.
- Long head of biceps femoris is supplied by tibial component.

**TABLE:** Movement, muscles and segmental innervation in the lower limb

Joint	Movement	Muscle	Innervation
HIP	Flexion	Psoas major	Spinal nn. L1–3
		Iliacus	Femoral n.
		Pectineus	Femoral n. or accessory obturator n.
		Rectus femoris	Femoral n.
		Adductor longus	Obturator n.
		Sartorius	Femoral n.
	Extension	Gluteus maximus	Inferior gluteal n.
		Adductor magnus	Obturator and tibial nn.
		Semitendinosus, semimembranosus, biceps femoris	Tibial and common fibular nn.
	Medial rotation	Iliacus	Femoral n.
		Gluteus medius and minimus	Superior gluteal n.
		Tensor fasciae latae	Superior gluteal n.
	Lateral rotation	Superior and inferior gemelli	Nerve to obturator internus and nerve to quadratus femoris, respectively
		Quadratus femoris	Nerve to quadratus femoris
		Piriformis	Nerve to piriformis
		Obturator internus	Nerve to obturator internus
		Obturator externus	Obturator n.
		Sartorius	Femoral n.
	Adduction	Gracilis	Obturator n.
		Adductor longus	Obturator n.
		Adductor magnus	Obturator and tibial nn.
		Adductor brevis	Obturator n.
		Pectineus	Femoral n. or accessory obturator n.
	Abduction	Tensor fasciae latae	Superior gluteal n.
		Gluteus medius and minimus	Superior gluteal n.
		Piriformis	Nerve to piriformis

151. Ans. (d) Adductor brevisRef: Gray's Anatomy 41st ed. P 1364**53**

- Adductor brevis is muscle of medial compartment of thigh. Muscles of this compartment are:

- **Muscles:**

- Adductor longus
- Adductor brevis
- Adductor magnus (Adductor portion)
- Gracilis

- **Action**

Adduction of HIP joint

- **Nerve supply:**

Obturator nerve

152. Ans. (c) **Peroneus longus muscle**

Ref: Gray's Anatomy 41st ed. P 1324.e2

- Eversion of foot is the movement of foot when side of the sole is turned out laterally.

- Muscles causing eversion:
 - Peroneus/Fibularis longus
 - Peroneus/Fibularis brevis
 - Peroneus/Fibularis tertius

TABLE: Ankle muscles, its actions and nerve supply

Ankle	Dorsiflexion	Tibialis anterior	Deep fibular n.
		Extensor digitorum longus	Deep fibular n.
		Extensor hallucis longus	Deep fibular n.
		Fibularis tertius	Deep fibular n.
	Plantar flexion	Gastrocnemius	Tibial n.
		Soleus	Tibial n.
		Flexor digitorum longus	Tibial n.
		Flexor hallucis longus	Tibial n.
		Fibularis longus	Superficial fibular n.
		Tibialis posterior	Tibial n.
	Inversion	Tibialis anterior	Deep fibular n.
		Tibialis posterior	Tibial n.
	Eversion	Fibularis longus	Superficial fibular n.
		Fibularis tertius	Deep fibular n.
		Fibularis brevis	Superficial fibular n.

153. Ans. (a) **Common peroneal nerve**

Ref: Neuromuscular Diseases: A Practical Approach to Diagnosis and Management By Schwartz, P 134

- **Book states:** "In leg the common peroneal nerve is most often affected nerve". Nerves may be damaged at the time of fracture or afterwards from the effects of movement or of reduction of a dislocation.
- Iatrogenic injuries occur from penetrating injury to nerves. These usually occur during intramuscular injection of drugs, for example, a sciatic nerve injury may occasionally follow drug injections into the buttock. The femoral nerve is also vulnerable in the thigh. Attempted cannulation of veins or arteries, especially in the antecubital fossa where the median nerve is vulnerable, may cause a severe nerve injury.

154. Ans. (b) **Inguinal ligament**

Ref: Gray's Basic Anatomy E-book, P 280

FEMORAL TRIANGLE

A triangular depressed area situated in the upper part of the medial aspect of the thigh just below the inguinal ligament.

BOUNDARIES

Superiorly (base): The inguinal ligament

Laterally: Medial border of sartorius

Medially: Medial border of adductor longus

Apex: Continuous with adductor canal

Anterior wall: Fascia lata

Posterior wall: Consists of iliopsoas, pectineus and adductor longus from lateral to medial side.

155. Ans. (b) **Obturator nerve**

Ref: Gray's Basic Anatomy E-book, P 205

Obturator nerve is a branch of lumbar plexus.

Related to ala of sacrum.

Forms the lateral boundary of ovarian fossa.

Emerges out of the obturator foramen and divides into anterior and posterior.

Branches of Obturator Nerve

A. Anterior division: Gives off:

- **Muscular branches to 3 muscles:** Adductor longus, adductor brevis and gracilis
- **Articular branch** to the hip joint
- **Cutaneous branch** to the skin of the medial side of the thigh.

B. Posterior division: Gives off:

- **Muscular branches** to 2 muscles
- Obturator externus and adductor magnus (pubic part)
- **Articular branch** to the knee joint.

156. Ans. (c) **Deep peroneal nerve**

Ref: *Anatomy of Foot and Ankle*, pg. 12

Nerve	Motor Innervation	Sensory Distribution
Common peroneal (L4, L5, S1, S2)	Deep and superficial peroneal	Articular branches to knee; anterolateral aspect proximal leg (via lateral sural nerve)
Deep peroneal	Tibialis anterior, EDL, EHL, peroneus tertius Lateral branch: EDB	Medial branch: Dorsal first web space lateral hallux, medial second toe. Lateral branch: Tarsal and metatarsal joints
Superficial peroneal	Peroneus longus and brevis	Anterolateral distal two thirds of leg; dorsum of foot and toes

157. (a) **Talus**

Ref: *Snell's Clinical Anatomy*, pg. 354

Ref states: "Numerous important ligaments are attached to talus, but no muscles are attached to this bone"

Extra Mile

SUPERFICIAL GROUP OF MUSCLES IN THE POSTERIOR COMPARTMENT OF LEG (SPINAL SEGMENTS IN BOLD ARE THE MAJOR SEGMENTS INNERVATING THE MUSCLE)

Muscle	Origin	Insertion	Innervation	Function
Gastrocnemius	Medial head-posterior surface of distal femur just superior to medial condyle; lateral head-upper posterolateral surface of lateral femoral condyle	Via calcaneal tendon, to posterior surface of calcaneus	Tibial nerve [S1, S2]	Plantar flexes the foot and the knee
Plantaris	Inferior part of lateral supracondylar line of femur and oblique popliteal ligament of knee	Via calcaneal tendon, to posterior surface of calcaneus	Tibial nerve [S1, S2]	Plantar flexes the foot and the knee
Soleus	Soleal line and medial border of tibia; posterior aspect of fibular head and adjacent surfaces of neck and proximal shaft; tendinous arch between tibial and fibular attachments	Via calcaneal tendon, to posterior surface of calcaneus	Tibial nerve [S1, S2]	Plantar flexes the foot

158. Ans. (b) **Sartorius**

Ref: Gray's Anatomy, P 630

- The **anterior superior iliac spine** is a bony projection of the iliac bone and an important landmark of surface anatomy.
- It provides attachment for the inguinal ligament, and sartorius muscle.

159. (a) **Posterior tibial nerve**

Ref: Mac Glamry's Textbook of Foot and Ankle Surgery, pg. 196

- Posterior tibial muscle is supplied by L5, S1 (posterior tibial nerve)
 - **Action:** Inversion of the foot at the ankle.
 - **Test:** The patient holds his foot in the inverted position while the examiner pushes outward toward eversion.
- Anterior tibial muscle is supplied by L4, 5 (deep peroneal nerve)
 - **Action:** Dorsiflexion of the foot at the ankle.
 - **Test:** The patient dorsiflexes the foot and the examiner try to push the foot downward towards plantar extension.

160. (d) **Vastus medialis**

Ref: Gray's Anatomy, 41st ed. pg. 1319, 1339

- Adductor canal is also known as subsartorial canal or *hunter's canal*.
- It is an intramuscular space situated below the Sartorius muscle in anteromedial aspect of the distal 2/3rd of the thigh.

Boundary

- **Anterolaterally** by vastus medialis
- **Posteromedially** by adductor longus and adductor magnus.
- Its anteromedial boundary (*often referred to as the roof*) is a strong and dense fascia that extends from the medial surface of vastus medialis to the medial edge of the adductors longus and magnus, overlapping in its stride the femoral vessels in the adductor canal.

**Contents of adductor canal:**

- Femoral artery and its branch, descending genicular artery
- Femoral vein
- Saphenous nerve
- Nerve to vastus medialis

161. Ans. (c) Posterior division of L2, L3, L4 ventral rami

Ref: Gray's Anatomy, 41st ed. pg. 1322

- The femoral nerve is the nerve of the anterior compartment of the thigh.
- It arises from the **posterior divisions of the second to fourth lumbar ventral rami**, descends through psoas major and emerges on its lateral border to pass between it and iliacus.

Table: Root values

- Femoral nerve (L2–4)
- Obturator nerve (L2–4)
- Sciatic nerve (L4, L5, S1–3)
- Tibial nerve (L4, L5, S1–3)
- Common fibular nerve (L4, L5, S1, S2)
- Gluteal nerves (L4, L5, S1, S2)

162. Ans. (a) Iliacus

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 191

Boundaries of femoral triangle

Upper border formed by: Inguinal ligament

Lateral border formed by: Sartorius

Medial border formed by: Lateral border of adductor longus

Contents of femoral triangle

A = Iliacus

B = Psoas major

C = Pectineus

D = Adductor longus

**163. Ans. (b) Flexion of knee**

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 288

- Biceps femoris is present in posterior compartment of thigh and forms hamstrings. It is responsible for flexion of knee.
- The other hamstrings are semitendinosus and semimembranosus. All these muscles originate from the ischial tuberosity and are innervated by tibial part of sciatic nerve (L5, S1 and S2).

164. Ans. (a) Inferior gluteal nerve

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 279-280

- The chief extensor of thigh at hip joint is gluteus maximus and helps in rising from sitting position.
- It is supplied by inferior gluteal nerve (L5, S1, S2). (*mnemonic: M.I.G- 512*)
- Gluteus medius and minimus are powerful abductors of thigh and are supplied by superior gluteal nerve (L4, 5, S1).

165. Ans. (a) Peroneus tertius

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 864

- Peroneus tertius is an evertor of foot.
- Tibialis anterior muscle is an invertor of foot.
- Dorsiflexors of foot are-
 - Tibialis anterior
 - Extensor hallucis longus
 - Extensor digitorum longus
 - Peroneus tertius

166. Ans. (a) Tibial nerve

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 832

- **Origin:** Anterior part of the popliteal groove on lateral surface of lateral femoral condyle

Popliteus Muscle

FMGE Solutions Screening Examination

- **Insertion:** Posterior surface of tibia in a fan-like fashion, just superior to the popliteal line
- **Action:** Rotates knee medially and flexes the leg on the thigh
- **Innervation:** Tibial nerve (L4, L5, S1)
- **Arterial supply:** Medial inferior genicular branch of popliteal artery and muscular branch of posterior tibial artery

167. Ans. (a) Paralysis of gluteus maximus

Ref: Maheswari Orthopaedics, 5th ed. pg. 135

- When a person stands on one leg, the tendency of unsupported side to sag down is *counteracted* by *gluteus medius and minimus*. These two muscles form the abductor mechanism of hip.

- In case the *abductor mechanism is defective*, unsupported side of the pelvis drops and is called *Positive Trendelenburg sign*. It is seen in:
 - Paralysis of gluteus medius and minimus
 - Congenital dislocation of Hip
 - Ununited fracture
 - Coxa vara

168. Ans. (d) Superior gluteal nerve

Ref: BDC 6th ed. vol. II / 68-69, 70; Keith L. Moore 5th ed./619-621

- **Trendelenburg's sign** is found in people with weak or paralyzed abductor muscles of the hip, namely gluteus medius and gluteus minimus.
- **Superior gluteal nerve**, if injured, paralyzes the 3 muscles: **gluteus medius, gluteus minimus** and tensor fascia latae and hence leads to positive **Trendelenburg test**.
- These 3 muscles, especially the gluteus medius raises the unsupported hip during walking, which otherwise will be pulled down by the gravity.
- In Trendelenburg test this action of gluteus medius (superior pelvic tilt of contralateral hip) is absent and we actually observe that there is a downward drop of the unsupported hip- due to unopposed action of gravity.
- This leads to Lurching gait in the patient.

Extra Mile

- Trendelenburg test becomes positive in congenital dislocation of hip/ long standing fracture of neck of femur.
- Inferior gluteal nerve supplies gluteus maximus.

169. Ans. (a) Gluteus medius, minimus

Ref: BDC 6th ed. vol. II / 69-70; Keith L. Moore 5th ed. / 619-621

Please refer to above explanation.

170. Ans. (c) Genicular branch of obturator nerve

Ref: Netter's Atlas of Neurosciences, 3rd ed. pg. 194

- The capsule of knee joint is supplied by genicular branch of *obturator nerve* which pierces the oblique popliteal ligament.
- The *genitofemoral nerve* mediates the *cremasteric reflex*.

171. Ans. (b) Lateral head of gastrocnemius

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 580

- Fabella is a small sesamoid bone present in tendon of origin of lateral head of gastrocnemius.

172. Ans. (a) Tibial nerve

Ref: Gray's Anatomy, 41st ed. pg. 1324e1-e2

Points to know about soleus:

- Soleus muscle is located immediately deep (anterior) to gastrocnemius.
- **Origin:** Upper third of fibula and soleal line of tibia.
- **Insertion:** inserted with gastrocnemius into calcaneal tendon.
- **Action:** Flexes foot.
- **Nerve supply:** Soleus is innervated by two branches from the tibial nerve, S1 and S2.
- **Vascular supply:**
 - The superior arises from the popliteal artery at about the level of the soleal arch, and
 - The inferior arises from the proximal part of the fibular artery or sometimes from the posterior tibial artery.

Extra Mile

TABLE: The movements and muscles tested to determine the location of a lesion in the lower limb

Movement	Muscle	Upper motor neuron	Spinal nerve level	Reflex	Nerve
Hip flexion	Iliopsoas	++	L1, 2		Femoral
Hip adduction	Adductors	+	L2, 3	(+)	Obturator
Hip extension	Gluteus maximus		L5, S1		Inferior gluteal
Knee flexion	Hamstrings	+	S1		Sciatic
Knee extension	Quadriceps femoris		L3, 4	++	Femoral
Ankle dorsiflexion	Tibialis anterior	++	L4		Deep fibular
Ankle eversion	Fibularis longus and fibularis brevis		L5, S1		Superficial fibular
Ankle inversion	Tibialis posterior		L4, 5		Tibial
Ankle plantar flexion	Gastrocnemius/ soleus	+	S1, 2	++	Tibial
Great toe extension	Extensor hallucis longus		L5		Deep fibular

173. Ans. (a) Thickening of fascia lata

Ref: Gray's Anatomy, 41st ed. pg. 1337-38

- The iliotibial tract is a **thickened portion of the deep fascia of the thigh (fascia lata)**. This tract runs from the lateral aspect of the iliac crest to Gerdy's tubercle and produces the flattened appearance of the lateral thigh.
- The attachment on Gerdy's tubercle is on the **anterior aspect of the lateral condyle** that is usually approximately **1 cm inferior to the joint line** and about 2 cm superolateral to the tibial tuberosity.
- The upper end of the tract splits into two layers, where it encloses and anchors tensor fasciae latae and receives, posteriorly, most of the tendon of **gluteus maximus**.

**FIGURE:** Important muscles of the limb

174. Ans. (b) **Gluteus maximus**

Ref: Grays Anatomy, 41st ed. pg. 1318

The muscles of the gluteal region include:

- Three named gluteal muscles and
- The deeper short lateral rotators of the hip joint

Gluteus maximus lies most superficially

- **Origin:** Iliac, sacrum and coccyx
- **Insertion:** Gluteal tuberosity, iliotibial band
- **Function:** It is a powerful extensor of the hip joint, acting more often to extend the trunk on the femur than to extend the limb on the trunk.
- Therefore **used for changing position from sitting to standing.**

Gluteus medius and minimus

- **Attachment:** Proximally to the outer surface of the ilium and distally to the greater trochanter of the femur
- **Function:**
 - They are **abductors of the hip**;
 - Their most important action is to stabilize the pelvis on the femur during locomotion, and they are helped in this function by tensor fasciae latae.

FIGURE: Gluteal and lateral rotators, posterior view

175. Ans. (c) **Inferior epigastric artery**

Ref: BDC, 6th ed. vol. II pg. 49-50

The branches of the femoral artery are: **3 superficial branches** and **5 deep branches**

SUPERFICIAL BRANCHES (Mn: triple S)

- **Superficial epigastric artery**—For skin and fascia of lower part of anterior abdominal wall.
- **Superficial iliac circumflex artery**—For skin along iliac crest.

- **Superficial external pudendal artery**—For skin of external genital organ.

DEEP BRANCHES

Mnemonic: Deep branches: Put My Dog Down Please!

- Profunda Femoris
- Muscular Branches
- Deep external pudendal branches
- Descending genicular arteries
- Perforating Branches
- The **superficial epigastric artery** arises from the front of the femoral artery about 1 cm. below the inguinal ligament. It distributes branches to the superficial subinguinal lymph glands, the superficial fascia, and the integument; it anastomoses with branches of the inferior epigastric artery
- The **superficial iliac circumflex artery** the smallest of the cutaneous branches. It divides into branches which supply the integument of the groin, the superficial fascia, and the superficial subinguinal lymph glands
- The **superficial external pudendal artery** arises from the medial side of the femoral artery to be distributed to the integument on the lower part of the abdomen, the penis and scrotum in the male, and the labium majus in the female, anastomosing with branches of the internal pudendal artery.
- The **deep external pudendal artery** in male supplies to the integument of the scrotum and perineum and in the female to the labium majus.
- **Muscular branches** are supplied by the femoral artery to the Sartorius, Vastus medialis, and Adductores.
- The **profunda femoris artery** (*profunda femoris*) is a large vessel arising from the lateral and back part of the femoral artery. The terminal part of the profunda is sometimes named the **fourth perforating artery**.

176. Ans. (c) **Iliotibial tract**

Ref: BDC, 6th ed. vol. II pg. 68

- **Gluteus maximus:**
 - **Origin:** **iliac crest**, posterior gluteal line of ilium and area above and behind it, sacrum, coccyx, sacrotuberous ligament.
 - **Insertion:** Gluteal tuberosity and iliotibial tract.
 - Major 3/4th part inserted into iliotibial tract.
 - 1/4th part inserted into Gluteal tuberosity.

177. Ans. (c) **Gluteus minimus**

Ref: BDC, 6th ed. vol. II pg. 67-68

- Iliotibial band is the thickened band of fascia lata. It receives insertion of three muscles:
 - Tensor fasciae latae
 - Gluteus maximus
 - Few fibers of vastus lateralis

178. Ans. (a) **Sartorius**

Ref: BDC, 6th ed. vol. II pg. 53

- Sartorius muscle is the longest muscle of the body.
- It is also known as tailor's muscle (Sartor = tailor)

179. Ans. (b) **Rectus femoris**

Ref: BDC, 6th ed. vol. II pg. 54

- Rectus femoris arises by two tendons: One, the anterior or straight head, from the anterior inferior iliac spine; the other, the posterior or reflected head, from a groove above the brim of the acetabulum and the capsule of hip joint.
- The two unite at an acute angle, and are inserted into the base of the patella.

180. Ans. (a) **Semimembranous**

Ref: BDC, 6th ed. vol. II pg. 83

Hamstring muscles are

- Semimembranosus
- Semitendinosus
- Long head of biceps femoris and
- Ischial head of adductor magnus.

181. Ans. (a) **Superior gluteal nerve**

- Gluteus medius and minimus are supplied by superior gluteal nerve whereas gluteus maximus is supplied by inferior gluteal nerve.

Extra Mile

TABLE: Important muscles and their nerve supply

Nerve supply	Muscle
• Superior gluteal nerve	• Gluteus medius • Gluteus minimus • Tensor fascia lata
• Inferior gluteal nerve	• Gluteus maximus
• Nerve to obturator internus	• Obturator internus • Gemellus superior
• Nerve to quadratus femoris	• Gemellus inferior • Quadratus femoris

182. Ans. (b) **Inferior gluteal nerve**

Ref: BDC, 6th ed. vol. II pg. 69;
Gray's Anatomy 40th ed. pg. 1384

183. Ans. (c) **Nerve to quadratus femoris**

Ref: BDC, 6th ed. vol. II pg. 69;
Grays Anatomy 40th ed. pg. 1384

- Quadratus femoris and gemellus inferior muscle are arranged together. Nerve which is bifurcating to supply quadratus femoris muscle, supplies gemellus inferior muscle as well

Extra Mile

- Nerve supply of piriformis: Ventral rami to S1 and S2
- Nerve supply of obturator externus muscle: Posterior division of obturator nerve

184. Ans. (d) **Nerve to obturator externus**

Ref: BDC, 6th ed. vol. II pg. 74

Mnemonic to Remember this Often Asked Question

N. to obturator internus	Not
Tendon of obturator internus.	Tonight
Pudendal vessels and nerve.	Please

185. Ans. (d) **Nerve to obturator externus**

FMGE Solutions Screening Examination

62

186. Ans. (b) Quadriceps femoris

Ref: BDC, vol II pg. 155

- Quadriceps femoris is the main and only extensor of knee.
- It produces locking action as a result of medial rotation of the femur during the last stage of extension.
- To reverse this lock popliteus muscle comes into action and does so by the lateral rotation of femur

Remember: Lock is: Quadriceps femoris muscle and, Key is popliteus muscle.

TABLE: Muscles producing movements at the knee joint

Movement	Principal muscles
A. Flexion	<ul style="list-style-type: none"> • Biceps femoris • Semitendinosus • Semimembranosus
B. Extension	Quadriceps femoris
C. Medial rotation of flexed leg	<ul style="list-style-type: none"> • Popliteus • Semimembranosus • Semitendinosus
D. Lateral rotation of flexed leg	• Biceps femoris

Extra Mile

- Quadriceps femoris includes: Rectus femoris, Vastus Lateralis, Vastus Medialis, Vastus Intermedius.
- Rectus femoris is also known as "kicking muscle"

187. Ans. (a) Popliteus

Ref: BDC, vol II pg. 155

Please refer to above explanation

188. Ans. (c) Talus

Ref: BDC, 6th ed. vol. II pg. 30

- Talus has no muscle attachment.
- Talus also has a precarious blood supply because blood enters it distally ie. Retrograde blood supply.
- Remember incus in ear also has no muscle attachment.

189. Ans. (c) Common peroneal nerve

Ref: BDC 6th ed. vol. II pg. 29; Snell's Anatomy, pg. 273

Common peroneal nerve is palpated against the neck of the fibula. It is a superficial nerve hence; it is unprotected as compared to tibial nerve. It may be injured in the fracture of neck of the fibula or due to a pressure of a tightly applied plaster cast. It is also affected in leprosy where it gets thickened and tender.

Clinical significance

Common peroneal nerve injury causes paralysis of dorsiflexors of the ankle joint and the evertors of the foot supplied through its superficial and deep peroneal nerve branches respectively. The paralysis of the muscles may result in 'foot drop', where the patient walks on his toes.

190. Ans. (b) Linea semilunaris

Ref: Gray's, 41st edn pg.1080-81; Keith L Moore clinical Anatomy, 4thed. pg.193-4

HELSELBACH'S TRIANGLE

- **Medial border:** Lateral margin the rectus sheath, also called linea semilunaris
- **Superolateral border:** Inferior epigastric vessels
- **Inferior border:** Inguinal ligament, sometimes referred to as Poupart's ligament.

191. Ans. (d) **Inferior**

Ref: Gray's, 41st pg. 1080-81

192. Ans. (b) **Supplies skin over the medial aspect of thigh**

Ref: Clinical Anatomy, 11th ed. pg. 251

- The femoral nerve supplies the skin of the medial and anterior aspects of the thigh via its medial and intermediate cutaneous branches.
- The lateral aspect is supplied by the lateral cutaneous nerve of the thigh (L2-3).
- As its name suggests, it is purely sensory.
- It arises from L2 and L3, travels downward lateral to the psoas muscle, crosses the iliacus muscle (deep to fascia), passes either through or underneath the lateral aspect of the inguinal ligament, and finally travels onto innervate the lateral thigh.

193. Ans. (a) **L_{4,5}, S₁**

Ref: BDC, 6th ed. vol. II pg. 173

Nerve	Root value
• Sciatic nerve	L _{4,5} S _{1,2,3}
• Tibial nerve	L _{4,5} S _{1,2,3}
• Common peroneal nerve	L _{4,5} S _{1,2}
• Superior gluteal nerve	L _{4,5} S ₁
• Inferior gluteal nerve	L ₅ S _{1,2}
• Nerve to quadratus femoris	L _{4,5} S ₁
• Nerve to obturator internus	L ₅ S _{1,2}
• Superior gemellus	L _{4,5} S ₁
• Inferior gemellus	L _{4,5} S _{1,2}
• Posterior cutaneous nerve of thigh	S _{1,2,3}
• Pudendal nerve	S _{2,3,4}
• Perforating cutaneous nerve	S _{2,3}

194. Ans. (b) **S₁, S₂, S₃**

Ref: BDC, 6th ed. vol. II pg. 173

195. Ans. (b) **L₄L₅S₁S₂S₃**

Ref: BDC, 6th ed. vol. II pg. 173-74

196. Ans. (b) **S₂S₃S₄**

Ref: BDC, 6th ed. vol. II pg. 173-174

THORAX AND ABDOMEN

197. Ans. (a) **Azygos vein**

Ref: Gray's Anatomy 41st ed. P 955

Mediastinal Surface of Right Lung

On the mediastinal surface of the right lung, you find these structures:

- **Azygos vein and its arch** (posterior and over the root of the lung).

- **Vagus nerve** posterior to the root of the lung.
- **Esophagus** posterior to the root.
- **Phrenic nerve** anterior to the root of the lung.
- **Cardiac impression:** Related to right atrium.
- **Below hilum and in front of pulmonary ligament:** Groove for IVC.

198. Ans. (c) **Left intercostal artery**

Ref: Gray's anatomy 41st ed. P 976

- The superior mediastinum lies between the manubrium sternum anteriorly and the upper four thoracic vertebrae posteriorly, and is bounded laterally by the mediastinal pleura.
- It accommodates the thymus, trachea, esophagus, aortic arch, pulmonary trunk, brachiocephalic trunk, left common carotid and subclavian arteries (the vertebral artery sometimes arises from the aortic arch between them), the internal thoracic arteries, the left superior intercostal, hemiazygos, internal thoracic and inferior thyroid veins, and numerous lymph nodes, including those from the tracheobronchial, paratracheal and brachiocephalic groups.

199. Ans. (d) **Pulmonary veins are intersegmental**

Ref: Gray's Basic Anatomy E-book, P 87

Characteristics of Bronchopulmonary Segments

- It is a subdivision of a lung lobe.
- It is pyramidal in shape, its apex lies toward the root, while its base lies on the lung surface.
- It is surrounded by connective tissue septa.
- It has a segmental bronchus, a segmental artery, lymph vessels, and autonomic nerves.
- The segmental vein lies in the intersegmental CT septa between the segments.
- A diseased segment can be removed surgically, because it is a structural unit.

200. Ans. (b) **Left coronary artery**

Ref: Gray's Anatomy Review E-book, P 80

Left anterior descending artery is a branch of left coronary artery.

Arterial supply of heart coronary arteries

201. Ans. (c) **Lower border of rib**

Ref: Snell's Clinical Anatomy, pg. 41

- There are 11 **intercostal spaces** within the thoracic wall. The spaces are filled in by 3 layers of intercostal muscles and their related fasciae and are bounded superiorly and inferiorly by the adjacent ribs.
- The **costal groove** is located along the inferior border of each rib (upper aspect of the intercostal space) and provides protection for the vein which is most superior and the nerve which is inferior in the groove (VAN).

202. Ans. (c) **Lateral thoracic vein**

Ref: Anand's Human Anatomy for Students, pg. 148

- The lymphatics of upper limb are arranged in superficial and deep lymphatic vessels
- **Superficial lymphatics:** These run along cephalic vein and basilic vein. Vessels running along cephalic vein drain into infraclavicular and apical group of lymph nodes. Vessels along the basilic vein drain into supratrochlear group of lymph nodes.
- **Deep lymphatic vessels:** These run along the radial, ulnar and brachial arteries. They drain into lateral group of axillary lymph nodes.
- **Axillary group of lymph nodes:** They are 20 to 30 in number and are divided into five groups.

1. **Anterior group:** Lie along lateral thoracic vein
2. **Posterior group:** Lie along subscapular vein
3. **Lateral group:** Lie along axillary vein.
4. **Central group:** Are embedded in the fat of axilla
5. **Apical group:** Lie at the apex of the axilla, medial to axillary vein

FIGURE: Axillary group of lymph nodes

203. Ans. (d) 11

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 89

- The 11th and 12th ribs are *floating ribs* as they are free at their ends.
- The 8th, 9th and 10th ribs are *false ribs* as they are joined to form cartilage of rib immediately above.
- The first 7 pair of ribs are *true ribs*.

204. Ans. (d) 8th

Ref: BDC, 6th ed. Vol 1 pg. 196-97

- **True ribs:** Ribs directly articulating with sternum through costal cartilage. **They are ribs 1 to 7**
- **False ribs:** Ribs that do NOT articulate directly with sternum. **Ribs 8 to 12th.**

205. Ans. (d) 40

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 90

- The xiphoid process unites with the body at about 40 years.
- The manubrio-sternal joint persists as cartilaginous throughout life.
- The body is completely ossified by 25 years.

206. Ans. (b) Tail of Spence

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 182

- The *axillary tail of spence of breast* pierces the *deep fascia* through the *foramen of langer* and comes to lie in the axilla.

207. Ans. (a) Breast

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 11

- The lymphatic plexus below the areola is the *Sub-areolar plexus of sappey*.
- 75% of breast lymphatics drain to axillary lymph nodes.

Extra Mile

Quadrant wise breast lymphatic drainage

- **Lateral quadrant:** Axillary nodes and supraclavicular through the pectoral, interpectoral and deltopectoral.
- **Medial quadrant:** Parasternal nodes.
- **Lower quadrant:** Inferior phrenic (abdominal) nodes.

208. Ans. (b) Left upper lobe

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 943

- Left upper lobe is divided into apical lobe and lingular lobe.

- The *Lingula* is a part of the *Left upper lobe of lung*
- It forms left cardiac border.

209. Ans. (b) Latissimus dorsi

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 38

- *Latissimus dorsi* is supplied by thoracodorsal nerve. It takes part in violent expiratory efforts.
- *Serratus anterior muscle* is supplied by long thoracic nerve of bell. It takes part in laboured inspiration.

210. Ans. (c) Anterior interventricular groove

Ref: BDC's Human Anatomy, 6th ed. Vol: 1 pg. 264-65

- The entire heart is supplied by two coronary arteries, arising from the ascending aorta. They run in coronary sulcus.
- Anterior interventricular groove is supplied by left coronary artery.

Right Coronary Artery Supplies

- Right atrium
- A large part of right ventricle EXCEPT the area surrounding the anterior interventricular groove
- Posterior part of interventricular septum, and
- Whole of the conducting system of the heart except a branch of the AV bundle.

Left Coronary Artery Supplies

- Left atrium
- A large part of left ventricle except the area surrounding the posterior interventricular groove and a small part of the right ventricle surrounding the anterior interventricular groove.
- Anterior part of the Interventricular septum
- A part of the left branch of the AV bundle.

211. Ans. (c) **LA**

Ref: BDC, 6th ed. vol. I pg. 253; Snell's Anatomy, pg. 137

- **Right ventricle** is located between RA and LV. It doesn't form any boundary of heart
- **Right atrium** forms the right border
- **Left atrium** is located posteriorly. Forms the base of heart
- **Left ventricle** forms the left border. Apex is formed by LV.

212. Ans. (d) **Right ventricle**

Ref: BDC, 6th ed. vol. I pg. 253; Keith L. Moore 5th ed. pg. 147

BORDERS OF HEART

- **Right border** (slightly convex): Formed by the right atrium, SVC and the IVC.
- **Left border (nearly horizontal)**: Formed by the left ventricle and slightly by the left auricle.
- **Inferior border** (oblique, nearly vertical), formed mainly by the right ventricle and slightly by the left ventricle.
- **Superior border**: Formed by the right and left atria and auricles in an anterior view.

213. Ans. (b) **10 cm**

Ref: BDC's Human Anatomy, 6th ed. Vol: 1 pg. 280

TRACHEA

- The trachea is **10 to 15 cm** in length
- Diameter varies: About **2 cm** in males and about **1.5 cm** in females.

Some Important Lengths to Remember

- Length of esophagus 25 cm
- Length of ureters- 25 cm

- Length of male urethra- 20 cm
- Length of female urethra- 4 cm
- C- shaped rings in trachea- 16–20

214. Ans. (b) **2 cm**

Ref: BDC, 6th ed. vol. I pg. 280

Please refer to above explanation

215. Ans. (b) **Cricopharyngeus**

Ref: BDC, 6th ed. vol. I pg. 282

- The first constriction present at the root of the neck is bounded by Cricopharyngeus muscle. Foreign body most commonly lodges here because of its strong constriction.

The Esophagus Shows 4 Constrictions at the Following Levels

1. At its beginning, **15 cm** from the **incisor teeth**
2. Where it is crossed by the aortic arch, **22.5 cm** from the **incisor teeth**
3. Where it is crossed by the left bronchus, **27.5 cm** from the **incisor teeth**
4. Where it pierces the diaphragm **37.5 cm** from the **incisor teeth**.

Extra Mile

- Most common foreign body which lodges in esophagus is food particle.

216. Ans. (d) **None**

Ref: Snell Anatomy 7th ed. pg. 499; BDC, 6th ed. vol. I /180

- All the given options are accessory muscles of respiration.
- Muscles used for forceful breathing are accessory muscles of respiration.

Accessory muscle for inspiration	Accessory muscle for expiration
<ul style="list-style-type: none"> • SCM • Serratus anterior • Serratus posterior • Pectoralis major • Pectoralis minor • Erector spinae • Scalene 	<ul style="list-style-type: none"> • Internal intercostals • Innermost intercostals • Transverse thoracis • Lattissimus dorsi • Abdominal muscle

217. Ans. (a) **Diaphragm**

Ref: Snell Anatomy, 7th ed. pg. 499; BDC 6th ed. vol. I pg. 212-13

- Diaphragm is major respiratory muscle
- Inspiration is an active process and requires contraction of inspiratory muscles.

- During quiet breathing expiration is a passive process.
- During inspiration all the 3 dimensions of the thoracic cavity expand
 - **Vertical-75% (by diaphragm)**
 - AP 25% (external intercostals and internal intercostals)
 - Transverse
 - Increase in vertical diameter is brought about by downward movement of diaphragm—which account for 70% of the thoracic expansion.

218. Ans. (a) Phrenic nerve

Ref: BDC, 6th ed. Vol 1 pg. 192

NERVE SUPPLY OF DIAPHRAGM

- **Motor supply:** Phrenic nerve
- **Sensory supply:**
 - Peripheral part: Lower 6 intercostal nerves
 - Central part: Phrenic nerve

219. Ans. (c) Azygos vein

Ref: BDC 6th ed. vol. I / 221-222; Keith L. Moore 5th ed. / 105

POSTERIOR INTERCOSTAL VEINS

- One in each of the 11 spaces

- **On the right:**
 - 1st drains into Rt. innominate vein (A)
 - 2nd, 3rd & sometimes the 4th unite to form Rt. Superior Intercostal vein (B) which drains into azygos vein.
 - From 5th to 11th & subcostal veins drain into azygos vein (C).
- **On the left:**
 - 1st drains into Lt. innominate vein (A)
 - 2nd, 3rd & sometimes the 4th join to form Lt. Superior intercostal vein which drains into Lt innominate vein (B)
 - 5th, 6th, 7th & 8th form *superior hemiazygos vein* to azygos vein (D)
 - 9th, 10th, 11th & subcostal form *inferior hemiazygos veins* drain to azygos vein (E).

220. Ans. (c) Left superior intercostal vein

Ref: BDC 6th ed. vol. I / 221-222; Keith L. Moore 5th ed. / 105

- The right superior intercostal vein is typically the final tributary of the azygos vein, before it enters the SVC.
- The left superior intercostal vein, however, usually empties into the *left brachiocephalic vein*.

ABDOMEN

221. Ans. (c) Left Gastroepiploic Artery

Ref: Gray's Anatomy 41st ed. P 1116

- The shown artery in the image is left gastroepiploic artery, the largest branch of splenic artery.
- **Origin and course:** Arises near splenic hilum and runs anteroinferiorly between the layers of the gastrosplenic ligament into the upper gastrocolic omentum → descends and anastomose with right gastroepiploic artery.
- **Size:** Up to 8 cm long (longer than right gastroepiploic artery)
- Supplies gastric fundus and body.

FIGURE: Arteries around stomach

FMGE Solutions Screening Examination

68

222. Ans. (b) Splenorenal ligament

Ref: Gray's Anatomy 41st ed. P 1181

- Most lateral and narrowest portion of pancreas is pancreatic tail
- **Length:** 1.5 – 3.5 cm
- Lies between layers of splenorenal ligament

223. Ans. (d) Clavicle

Ref: Gray's Anatomy 41st ed. P 799-800

- Clavicle/collar bone is the connection between sternum and scapula
- **Sternal/Medial end:** Attaches to manubrium of sternum and first costal cartilage
- **Acromial end/Lateral end:** Attaches to acromion on scapula → supports shoulder

	Sternoclavicular joint	Acromioclavicular joint
Type	Saddle type of synovial joint	Plane type of synovial joint
Bone forming	Sternal end of clavicle and manubrium of sternum	Lateral end of clavicle with acromion process of scapula
Ligaments	Costoclavicular ligament between 1 st rib and clavicle	Coracoclavicular ligament—very strong—between coracoid process of scapula and clavicle. Two parts—Conoid and Trapezoid ligaments

Contd...

224. Ans. (b) Short gastric arteries

Ref: Grey Henry, Anatomy of Human Body, P 606

- The **short gastric arteries** also known as *vasa brevia* consist of five to seven small branches, which *arise* from the end of the splenic artery (aka lienal artery), and from its terminal divisions.
- They pass from left to right, between the layers of the gastrolial ligament, and are distributed to the greater curvature of the stomach, anastomosing with branches of the left gastric and left gastroepiploic arteries

225. Ans. (c) 3rd part

Ref: Gray's Anatomy Review E-book, P 183,

226. Ans. (c) **Red pulp**

Ref: *General Anatomy E-book*, P 170

The **Cords of Billroth** also known as **red pulp cords** or **splenic cord** are found in the red pulp of the spleen between the sinusoids, consisting of fibrils and connective tissue cells with a large population of monocytes and macrophages.

The white pulp consists of thick layer of lymphocytes surrounding the arteries that have left the trabeculae. They form a periarterial sheath which contains mainly T cells. The sheaths expand to form well developed lymphoid nodules called malphigian nodules.

227. Ans. (d) **Sudeck's point**

Ref: *Yamada's Textbook of Gastroenterology*, Vol I, P 104

- **Watershed area:** It is the medical term referring to regions of the body that receive dual blood supply from the most distal branches of two large arteries.
- **Griffith's critical point:** A potential watershed area present between superior and inferior mesenteric arterial system. It is located at the splenic flexure.
- **Sudeck's point:** Located at the watershed area between inferior mesenteric artery and internal iliac artery. This point is located near the rectosigmoid junction.

228. Ans. (a) **L2**

Ref: *Netter's Clinical Anatomy*, 3rd ed. pg. 202

- Portal vein starts at level of **L2 vertebra** and is formed by *junction of superior mesenteric vein and splenic vein*. It is 8 cm long and lies behind the neck of pancreas.
- Normal portal vein pressure is 5–10 mm Hg.

229. Ans. (d) **Coronary ligament**

Ref: *Netter's Clinical Anatomy*, 3rd ed. pg. 205

Derivatives of Dorsal Mesogastrium

Greater omentum
Gastrosplenic ligament
Gastrophrenic ligament
Lienorenal ligament

Derivatives of Ventral Mesogastrium

Lesser omentum
Falciform ligament
Coronary ligament
Right and left triangular ligament

230. Ans. (b) **Right suprarenal gland**

Ref: *Vishram singh Anatomy: Volume 2: 2nd ed.* pg. 97

Structures forming the pancreatic bed

- Splenic vein
- Aorta and superior mesenteric artery
- Left renal vessels and left kidney
- Left supra-renal gland
- Left crus of diaphragm

Extra Mile

Structures forming the tonsillar bed

1. Buccopharyngeal fascia
2. Superior constrictor muscles
3. Palatopharyngeus
4. Glossopharyngeus Nerve
5. Pharyngo-basilar fascia

231. Ans. (c) **Left gastric artery**

Ref: *Netter's Clinical Anatomy*, 3rd ed. pg. 181

The branches of celiac artery are:

- **Common hepatic artery** which gives rise to
 - Right gastric artery
 - Cystic artery
 - Right and left hepatic artery
 - Gastroduodenal artery
- **Left gastric artery:** *Smallest branch* of celiac artery and runs along the lesser curvature of stomach
- **Splenic artery** is the *largest branch* of celiac artery and gives rise to:
 - Pancreatic branches
 - Short gastric branches
 - Left gastroepiploic artery

FMGE Solutions Screening Examination

Extra Mile

Branches of superior mesenteric artery

Supplies all derivatives of mid gut from major duodenal papilla to right 2/3rd of transverse colon

Branches of inferior mesenteric artery

Superior rectal artery
Sigmoid artery
Left colic artery

- Posteriorly both kidney and adrenals are guarded by psoas major muscle.
- Spleen is anterolateral to left adrenal gland.

Extra Mile

- Each gland, although weighing only **4 to 6 gm**, has three arteries supplying it:
 - **SUPERIOR:** A branch from the phrenic artery;
 - **MIDDLE:** A direct branch from the aorta;
 - **INFERIOR:** A branch from the renal artery.
- **VENOUS DRAINAGE:**
 - IVC on RIGHT
 - RENAL VEIN on the LEFT.
 - *The stubby right suprarenal vein, coming directly from the inferior vena cava, presents the most dangerous feature in performing an adrenalectomy.*

236. Ans. (a) **4 gram**

Ref: BDC, 6th ed. vol. II pg. 326

237. Ans. (d) **T12**

Ref: BDC, 6th ed. vol. II pg. 333

- Diaphragm has several openings for the passage of structures from thorax to abdomen.

TABLE: Main openings in the diaphragm and their levels

Opening	Level	Structure Passing
AORTIC OPENING- osseoponeurotic opening (not a true opening) <i>Str passing: "Remember ATA"</i>	T12	<ul style="list-style-type: none"> • Aorta • Thoracic duct • Azygous vein
ESOPHAGEAL OPENING- lies in muscular part of diaphragm	T10	<ul style="list-style-type: none"> • Esophagus • Gastric or vagus nerve • Esophageal branch of left gastric artery
VENA CAVAL OPENING- lies in central tendon of diaphragm	T8	<ul style="list-style-type: none"> • Inferior vena cava • Right phrenic nerve branches

Extra Mile

- Only motor nerve to diaphragm- PHRENIC NERVE (C3, C4, C5)
- It is the principle muscle of inspiration

Extra Mile

Structures and level of piercing in diaphragm: (Mn: I ate, 10 Eggs, At 12)

- IVC: T8
- Esophagus: T10
- Aorta: T12

238. Ans. (d) **Vagus nerve**

Ref: BDC, 6th ed. vol. II pg. 333

232. Ans. (c) **IVC opening**

- IVC passes through **tendon opening** and tendon is noncontracting part of muscle. Therefore constriction of diaphragm will not cause constriction of IVC.

233. Ans. (b) **Jejunum**

Ref: BDC, 6th ed. vol. II pg. 264

- Jejunum has valvulae conniventes, which are spaced regularly, concentrically giving a ladder effect.
- **Ileum:** Featureless or very thin valvulae conniventes
- **Caecum:** Rounded gas shadow in right iliac fossa
- **Large bowel:** Haustral folds, spaced regularly.

234. Ans. (b) **Semilunar**

Ref: BDC, 6th ed. vol. II pg. 326

- Left adrenal gland is **crescentic/semilunar**
- Right adrenal gland is **pyramidal in shape**
- The average weight of adrenal gland: **4-6 g**

235. Ans. (a) **Greater sac of stomach forms anterior border**

Ref: Clinical Anatomy, 11th ed. pg. 151

- The suprarenal glands cap the upper poles of the kidneys and lie against the crura of the diaphragm.
- **The left is related anteriorly to the stomach across the lesser sac**, the right lies behind the right lobe of the liver and tucks medially behind the inferior vena cava.

239. Ans. (b) **Caval opening**

Ref: BDC, 6th ed. vol. II pg. 333

240. Ans. (b) **Phrenic nerve**

Ref: BDC, 6th ed. vol. II pg. 333, 5th ed. pg. 336

241. Ans. (d) **Cisterna chyli**

Ref: *Clinically Oriented Anatomy by Keith, Moore, 5th ed. pg. 387; Gray's Anatomy 40th ed. pg. 180*

- The **cisterna chyli** is a normal anatomical structure seen as saccular area of dilatation in the lymphatic channels that is located in the **retrocrural space**, usually to the immediate right of the abdominal aorta. It originates at the level of L1/2 vertebral body and extends 5-7 cm in the caudocephalad axis.
- **Thoracic duct originates from the chyle cistern in the abdomen and ascends through the aortic hiatus in the diaphragm.** Thoracic duct ascends in the posterior mediastinum among the thoracic aorta on its left, the azygos vein on its right, the esophagus anteriorly, and the vertebral bodies posteriorly. At the level of the T4, T5, or T6 vertebra, the thoracic duct crosses to the left, posterior to the esophagus, and ascends into the superior mediastinum.
- **Note:** Although thoracic duct derives from cisterna chyli, it is the thoracic duct that passes through diaphragm and not the cisterna chyli.

242. Ans. (a) **Inferior vena cava**

Ref: Gray's 41st ed. pg. 1021, 1027, 1167

- Most of the venous system has valves to prevent backflow of blood in order to maintain venous return.
- IVC has only one valve present at the junction where it drains into right atrium. This valve is named **Eustachean valve**
- The **besian valve** is present in coronary sinus.
- Veins contain valves to help keep blood flowing toward the heart at all times.
- Veins which are valveless can be remembered as: **IPSS**
 - Internal jugular vein
 - Pulmonary vein, Portal vein
 - Superior vena cava
 - Sinuses of brain

243. Ans. (d) **Inferior vena cava**

Ref: Gray's, 41st ed. pg. 127-128; Repeat question
Please refer to above explanation

244. Ans. (a) **Aorta**

- Aorta is an elastic artery with diameter ~ 25 mm.
- Systemic arteries can be subdivided into two types-muscular and elastic-according to the relative compositions of elastic and muscle tissue in their tunica

media as well as their size and the makeup of the internal and external elastic lamina.

- The larger arteries (>10 mm diameter) are generally elastic and the smaller ones (0.1-10 mm) tend to be muscular.

245. Ans. (d) **L5**

Clinically Oriented Anatomy by Keith, Moore, 5th ed / 340

- The IVC begins anterior to the **L5 vertebra** by the union of the common iliac veins.
- This union occurs approximately 2.5 cm to the right of the median plane, inferior to the bifurcation of the aorta and posterior to the proximal part of the right common iliac artery.
- Renal vein at the level of **L1**
- **Portal veins form at L1**
- Hepatic veins form at **T8**

246. Ans. (a) **L1**

Ref: *Clinically Oriented Anatomy by Keith, Moore, 5th ed. pg. 340*

247. Ans. (a) **Duodenum**

Ref: BDC, 5th ed. Vol II pg. 268

- Brunner's gland is found in duodenum above sphincter of oddi.
- Main function of these glands is to produce mucus rich alkaline secretion which protects duodenum from gastric acidic contents.
- It also facilitates activation of intestinal enzymes which helps in absorption.

248. Ans. (a) **Mucinus alkaline**

Ref: BDC, 5th ed. Vol II pg. 268

- Brunner's glands are also known as duodenal glands.
- These are small compound tubuloacinar glands which secrete mucus that protects duodenum from gastric acidic contents.
- They also facilitate activation of intestinal enzymes which helps in absorption.

Extra Mile

- The gastric glands situated in the fundus and body of stomach contain parietal/oxyntic cells which secrete acid, mucus, pepsin and other digestive enzymes.

249. Ans. (d) **Duodenum**

Ref: BDC, 6th ed. vol. II pg. 303

VISCERAL RELATIONS OF SPLEEN

- Spleen forms visceral relation with the following nearby organs:
 - Fundus of the stomach
 - The anterior surface of the left kidney
 - Splenic flexure of the colon and
 - The tail of the pancreas

250. Ans. (b) **Quadratus lumborum**

Ref: BDC, 6th ed. vol. II pg. 313-314

- The kidneys are reddish brown and measure approximately 10 cm in length, 5 cm in width, and 2.5 cm in thickness.
- **Superiorly:** The kidneys are associated with the diaphragm, which separates them from the pleural cavities and the 12th pair of ribs.
- **Posterior surfaces** of the kidney are related to the **quadratus lumborum muscle**. The subcostal nerve and vessels and the iliohypogastric and ilioinguinal nerves descend diagonally across the posterior surfaces of the kidneys.

- **Anterior surface** The kidneys are associated with liver, duodenum, ascending colon and supra renal glands.
- *The right kidney is separated from the liver by the hepatorenal recess. The left kidney is related to the stomach, spleen, pancreas, jejunum, and descending colon*

251. Ans. (c) **Head of pancreas**

Refer to above explanation.

252. Ans. (c) **Intestinal looping**

Ref: BDC, 6th ed. vol. II pg. 313-314

THE RELATIONS OF THE RIGHT KIDNEY

- **Anteriorly**—suprarenal gland, liver, second part of duodenum, right colic flexure
- **Posteriorly**—diaphragm, 12th rib, costodiaphragmatic recess of the pleura, psoas muscle, quadratus lumborum muscle, transversus abdominis muscle

THE RELATIONS OF THE LEFT KIDNEY

- **Anteriorly**—suprarenal gland, spleen, stomach, pancreas, left colic flexure, coils of jejunum
- **Posteriorly**—diaphragm, costodiaphragmatic recess of the pleura, 11th and 12th rib, psoas muscle, quadratus lumborum muscle, transversus abdominis muscle.

253. Ans. (b) **Inferior mesenteric artery**

Ref: Gray's, 41st ed. pg. 1206

The embryonic kidneys are close together in the pelvis. In approximately 1 in 600 fetuses, the inferior poles (rarely, the superior poles) of the kidneys fuse to form a horseshoe kidney. This U-shaped kidney usually lies at the level of **L3-L5 vertebrae** because the root of the **inferior mesenteric artery** prevents normal ascent of the abnormal kidney. Horseshoe kidney usually produces no symptoms; however, associated abnormalities of the kidney and renal pelvis may be present, obstructing the ureter.

254. Ans. (c) **Collecting tubule and duct**

Ref: BDC, 6th ed. vol. II pg. 315-16

- **The kidney consists of an outer renal cortex and an inner renal medulla that contains the renal pyramids which drain into → Calyx → Pelvis.**
- Cortex forms a continuous smooth outer zone with a number of projections (cortical columns) that extend down between the pyramids.
- It contains the renal corpuscles and the renal tubules except for parts of the loop of Henle which descend into

the renal medulla. *It also contains blood vessels and cortical collecting ducts.*

- The renal cortex is the part of the kidney where ultrafiltration occurs.

255. Ans. (c) Sigmoid colon

Ref: BDC, 6th ed. vol. II pg. 261

- Third part of duodenum extends in the right and left upper quadrant. Organs like pancreas, transverse colon, stomach, right kidney are also in the same quadrants and in close association with the duodenum while Sigmoid colon is present in the left lower quadrant, hence has no association with duodenum.
- Duodenum is 25 cm long and is divided into the following four parts:
 - First or superior part- 5cm
 - Second descending part- 7.5 cm
 - Third or horizontal part – 10 cm (longest part)
 - Fourth or ascending part- 2.5 cm (shortest part)
- Course of third part of duodenum
 - This part is about 10 cm long.
 - It extends from L1 to L3.
 - It is retroperitoneal and fixed.
- Visceral relations
 - Anteriorly, Superior mesenteric vessels and Root of mesentery
 - Posteriorly, right ureters, right psoas major, right testicular or ovarian vessels, Inferior vena cava, abdominal aorta with origin of inferior mesenteric artery
 - Superiorly: Head of the pancreas with uncinat process.
 - Inferiorly: Coils of jejunum.

256. Ans. (c) Third part

Ref: BDC, 6th ed. vol. II pg. 261

257. Ans. (b) T10

Ref: BDC, 6th ed. vol. II pg. 198

- Dermatome of umbilicus is at T10.
- T10 segment also supplies to:
 - Appendix: T9 - T10
 - Stomach: T6 - T10
 - Testis/Ovary: T10
 - Intestine: T9 -T11

258. Ans. (b) Retrocaecal

Ref: BDC, 6th ed. vol. II pg. 269-70

- Most common position of vermiform appendix is retrocaecal, (12 O'clock- 65%) followed by pelvic (4 O'clock position).

TABLE: Types of appendix and their relative position

Appendix	Position	Prevalence /comment
Retrocaecal	12 O' clock	65%; most common
Pelvic	4 O' clock	30%; 2 nd most common
Subcaecal	6 O' clock	2.5%; points towards midinguinal point
Preileal	2 O' clock or splenic	1 %; points towards spleen & lie in front of ileum
Postileal	2 O' clock or splenic	0.5%; point towards spleen & lie behind ileum
Paracolic	11 O' clock	

259. Ans. (c) Postileal

Ref: BDC, 6th ed. vol. II pg. 269-70

260. Ans. (c) Inferior Pancreatoduodenal vein

Tributaries of Portal Vein

- Left Gastric vein
- Right Gastric vein
- Superior Pancreatoduodenal vein
- Splenic vein
- Superior mesenteric vein
- Inferior mesenteric vein
- Cystic vein

Extra Mile

- Hepatic portal vein is a blood vessel that conducts blood from GIT and spleen to the liver.
- Liver receives 75% of its blood through hepatic portal vein, and the remainder from hepatic artery proper.
- Note: blood leaves the liver to the heart in the hepatic vein.

261. Ans. (b) Cystic duct, liver, common hepatic duct

Ref: Gray's Anatomy, 41st ed. pg. 1175

The Calot's Triangle Aka Hepatobiliary Triangle or Cystohepatic Triangle.

- **Boundaries** (Cystic duct, Liver, Common hepatic duct):
 - **Medial:** Common hepatic duct
 - **Infero-lateral:** Cystic duct
 - **Superior:** Inferior surface of liver
- **Content of Calot triangle –Cystic artery.**

262. Ans. (c) Inferior surface of liver

Ref: Gray's Anatomy, 39th ed. pg. 1229

Please refer to above explanation

263. Ans. (a) Portal vein

Ref: Gray's Anatomy, 41st ed. pg. 1175

Contents of Calot's Triangle

- Cystic artery (Main)
- Right hepatic artery
- Lymph node of Lund

264. Ans. (b) Termination of portal vein

- The kidneys occupy the epigastric, hypochondriac lumbar and umbilical regions
- Vertically they extend from the upper border of twelfth thoracic vertebra to the centre of the body of third lumbar vertebra.
- The right kidney is slightly lower than the left and the left kidney is a little nearer to the median plane than the right.
- The transpyloric plane passes through the upper part of the hilum of the right kidney; and through the lower part of the hilum of the left kidney.

Structures at the Level of Transpyloric Plane

- Origin of superior mesenteric artery.
- Origin of portal vein.
- Hilum of left kidney.
- Origin of renal artery.
- Termination of spinal cord.
- Level of duodenojejunal flexure

265. Ans. (a) Whole system is valve less

Ref: BDC, 4th ed. Vol. II/268-71, Gray's 39th ed / 1218-19

- In adults, the portal vein and its tributaries have no valves.
- In fetal life and for a short postnatal period valves are demonstrable in its tributaries, but they usually get atrophied.
- Rarely some persist in an atrophic form into adulthood.

266. Ans. (a) Fundus

Ref: Gray's, 41st ed. pg. 1120

- Chief cells are usually **fundal** in position.
- Chief (Peptic) cells are the source of digestive enzymes like pepsin and lipase.
- These cells are cuboidal with round nucleus and contain lots of zymogen granules.
- **Parietal/Oxyntic cells** produce HCl and the intrinsic factor.
- These cells are oval with centrally placed nucleus.
- They are mainly located in the apical half of the **body** of gland, reaching as far as the **neck**.
- Surface mucus cells are distributed in the **gastric pit**-region of the gastric mucosa.

- Mucus neck cells are abundant in the neck region as the name is also suggesting.
- Neuroendocrine cells are situated mainly in the deeper / basal parts of the glands, along with the chief cells.

Also know: Gastric cells secretion

Goblet cell: Mucus (protect stomach lining)

Parietal cell: Gastric acid (HCL), intrinsic factor

Chief cell: Pepsinogen

D cell: Somatostatin

G cell: Gastrin

ECL cell: Histamine

267. Ans. (b) 7 ounce

Ref: BDC, 6th ed. vol. II pg. 294

- On an average the spleen is 1 inch or 2.5 cm thick, 3 inches or 7.5 cm broad, 5 inches or 12.5 cm long and 7 ounces in weight.

Some Must Know Weights

- Weight of liver: 1.5 kg.
- Weight of thyroid gland: 25 gm
- Weight of prostate: 8 gm.

268. Ans. (c) Lower 1/3rd

Ref: BDC, 6th ed. vol. II pg. 407-408

ANATOMY OF RECTUM

- This is continuous with the sigmoid colon at the midpiece of the sacrum.
- It has a length of about 12 cm.
- It descends along the **sacro-coccygeal concavity** as the **sacral flexure**.
- It eventually joins the **anal canal** at the **anorectal junction**, 2 to 3 cm in front of the **coccygeal tip**.
- The bend at this point is known as the **perineal flexure of the rectum**.
- The rectum is covered by **peritoneum**:
 - UPPER 1/3rd: on anterior surface and sides ,
 - MIDDLE 1/3rd: anterior surface
 - LOWER 1/3rd: not covered by peritoneum →thus making it more mobile.
- The lower part of the rectum is dilated as the **rectal ampulla**.
- The upper part has 3 **transverse rectal folds** (upper and lower on the left, the middle on the right).
- The upper part of the rectum above the middle fold may contain faeces, but the lower part only contains faeces in **chronic constipation** or **during the call to defecate**.
- The rectum ends antero-inferior to the tip of the coccyx, immediately before a sharp posteroinferior angle (**the anorectal flexure of the anal canal**) that occurs as the gut perforates the pelvic diaphragm (levator ani). The

roughly 80°degree anorectal flexure is an important mechanism for fecal continence, being maintained during the resting state by the tonus of the puborectalis muscle and by its active contraction during peristaltic contractions if defecation is not to occur.

- With the flexures of the **rectosigmoid junction superiorly** and the **anorectal junction inferiorly**, the rectum has an S shape when viewed laterally.

269. Ans. (b) 12 cm

Ref: BDC, 6th ed. vol. II pg. 407-408

270. Ans. (c) Seminal vesicles

Ref: BDC, 6th ed. vol. II pg. 408

- **Rectum** is a 12 cm structure which is in continuation of sigmoid colon and terminates at anal canal.

TABLE: Relationship of rectum

	Anterior	Posterior	Laterally
Males	<ul style="list-style-type: none"> • Base of bladder • Seminal vesicles • Rectovesical pouch • Ileum • Ductus deferens • Terminal ureter • Prostate gland 	<ul style="list-style-type: none"> • S3-S5 vertebrae • Coccyx • Median sacral artery and vein • Middle rectal artery • Superior rectal artery and vein 	<ul style="list-style-type: none"> • Sigmoid colon • Ileum • Pelvic plexuses • Coccygeus muscle • Levator ani muscle
Females	<ul style="list-style-type: none"> • Uterus • Vagina • Rectouterine pouch • Ileum • Sigmoid colon 	Same as for male	Same as for male

271. Ans. (a) Squamous cell

Ref: Keith L. Moore, 5th ed. pg. 447-48

- The anal canal is divided into three parts. The zona columnaris is the upper half of the canal and is lined by simple columnar epithelium. The lower half of the anal canal, below the pectinate line, is divided into two zones separated by **Hilton's white line**.
- The two parts are the zona hemorrhagica and zona cutanea, lined by stratified squamous non-keratinized and stratified squamous keratinized, respectively.

272. Ans. (c) Posteriorly

Ref: Gray's, 41st ed. pg. 1148, 1153

Refer to above explanation.

273. Ans. (c) **Inferior mesenteric artery**

Ref: BDC, vol II pg. 286-287

- **Superior pancreaticoduodenal artery** from gastroduodenal artery and the **inferior pancreaticoduodenal from superior mesenteric artery** supplies the head of the pancreas.
- Pancreatic branch of splenic artery also supplies the neck, body and tail.
- Inferior mesenteric artery supplies the left one third of transverse colon, the descending colon, sigmoid colon, rectum and upper part of anal canal.

274. Ans. (b) **Splenic artery**

Ref: Clinically Oriented Anatomy by Keith, Moore, 5th ed. pg. 252-253

- The stomach has a rich arterial supply arising from the celiac trunk and its branches.
- Most blood is supplied by anastomoses formed along the lesser curvature by the right and left gastric arteries, and along the greater curvature by the right and left gastro-omental arteries.
- Fundus of the stomach is supplied by splenic artery mainly.
- **Branches of splenic artery:**
 - Posterior gastric
 - Short gastric arteries
 - Left gastroepiploic artery
- Out of the three, the fundus of stomach is supplied by short gastric artery and left gastroepiploic artery. But major contribution is by short gastric arteries.
- This was a controversial question, but given these choices the best answer is splenic artery.

275. Ans. (a) **Gonadal artery**

Ref: Gray's, 41st ed. pg. 1047

Ventral Branches of Abdominal Aorta and Level

- Celiac trunk - T₁₂
- Superior mesenteric artery - L1
- Inferior mesenteric artery - L3

Paired/Lateral Branches of Abdominal Aorta

- Inferior phrenic artery
- Middle suprarenal artery
- Renal arteries

Testicular or Ovarian Artery

- Four paired lumbar arteries

Branches of External Iliac Artery

- Inferior epigastric artery
- Deep circumflex iliac artery
- Femoral artery

276. Ans. (d) **Gonadal artery**

Ref: Clinically Oriented Anatomy by Keith, Moore, 5th ed. pg. 252-253

NEUROANATOMY, HEAD AND NECK

277. Ans. (d) **Mandibular branch**

Ref: Gray's Anatomy 41st ed. P 502

Branches of facial nerve on face:

- **Temporal branch:** Aka frontal branch; supplies muscles of forehead and orbicularis oculi muscle
- **Zygomatic branch:** Supplies upper cheek and orbicularis oculi muscle
- **Buccal branch:** Emerges from anterior border of parotid gland below parotid duct to supply buccinator and muscles of upper lip and nostril.
- **Mandibular branch:** Emerges from anterior border of parotid gland to supply muscles of lower lip.
- **Cervical branch:** Emerges from lower border of parotid gland, it descends in the neck to supply platysma muscle + depressor anguli oris muscle.
- **Book states:** "There are two marginal mandibular branches. They run forward under platysma towards angle of mandible. The branches supply risorius and the muscles of the lower lip and chin, and filaments communicate with the mental nerve"

Extra Mile

- Orbicularis oris muscle is also supplied by mandibular branch of facial nerve

278. Ans. (b) Labial nasal artery

Ref: Gray's Anatomy 41st ed. P 498

- External carotid artery gives rise to facial artery branch, which has several branches over face.
- **Superior labial**—supplies to upper lip and antero-inferior part of nasal septum.
- **Inferior labial**—supplies to lower lip.
- **Lateral nasal**—to the ala and dorsum of nose.
- **Angular**—supplies the lacrimal sac and orbicularis oculi.

279. Ans. (a) Tragal pointer

Ref: Gray's Anatomy 41st ed. P 412

Surgical Landmark of Parotid Gland

- **Tympano-mastoid suture in posterior canal wall:** 5–8 mm medial mastoid segment of facial nerve
- **Digastric ridge in mastoid tip:** Leads antero-medially to mastoid segment of facial nerve
- **Groove between mastoid and bony EAC meatus:** Bisected by facial nerve
- **Tragal pointer:** 1 cm antero-infero-medial is facial nerve
- **Root of styloid process:** Lateral to it lies facial nerve
- **Superior border of posterior belly of digastric:** Superior and parallel to it lies facial nerve

280. Ans. (d) Medial pterygoid

Ref: Gray's Anatomy 41st ed. P 552

- **Trismus/Lock jaw** is painful reflex muscle spasm. It occurs due to spasm of muscle of mastication and leads to inability to open the oral cavity
- Trismus occurs due to involvement of masseter or medial pterygoid muscle or due to sub mucosal fibrosis.
- **Note:** Infection of pterygomandibular region can cause trismus, which usually affects medial pterygoid muscle.

281. Ans. (c) Buccinator

Ref: Gray's Anatomy 41st ed. P 495

- It is a thin quadrilateral muscle of cheek, occupies the interval between maxilla and mandible.
- It compresses the cheek against the teeth and gums during mastication and assists the tongue in directing the food between teeth.

Classically the muscles of mastication are:

- Masseter
- Medial Pterygoid
- Lateral Pterygoid
- Temporalis

Accessory muscles of mastication

- Anterior belly of digastric
- Mylohyoid muscle
- Geniohyoid muscle
- Buccinator

282. Ans. (d) **Second maxillary molar**

Ref: Gray's Anatomy 41st ed. P 411, 505

Parotid Duct/Stensen Duct

- It is a 5 cm long duct of parotid gland that originates from anterior border of upper part of parotid gland by the confluence of two main tributaries.
- **Course:** It then passes horizontally across masseter, midway between angle of mouth and zygomatic arch. Down the course it also crosses through buccal fat and buccinators muscle opposite the crown of upper third molar tooth.
- It then opens on a small papilla opposite the second upper molar crown.

283. Ans. (d) **Fornix**

Ref: Gray's Anatomy 41st ed. P 356

- The mammillary bodies are hemispherical, pea-sized eminences, lying side by side, anterior to the posterior perforated substance, each with nuclei enclosed in fascicles of fibres derived largely from the fornix.

The **fornix** is a white matter structure leaving the **hippocampus** that projects mainly to the **mammillary bodies** (hypothalamus) which, in turn, mainly projects to the **thalamus** via mammillothalamic tracts.

- Mammillary body is important for recollective memory.
- **Note:** Damage to mammillary bodies due to thiamine deficiency, is important in pathogenesis of Wernicke-Korsakoff syndrome.

284. Ans. (a) **Arcuate fasciculus**

Ref: Gray's Anatomy 41st ed. P 391, 393

- Arcuate fasciculus is a white matter tract which connects Broca's area and Wernicke's area through the temporal, parietal and frontal lobes.
- It allows coordinated, comprehensive speech.
- **Note:** If damaged → Conduction Aphasia (auditory comprehension and speech articulation is present, but patient finds it difficult to repeat the heard speeches)

Extra Mile

1. **Uncinate fasciculus** connects frontal to temporal lobe
2. **Superior longitudinal fasciculus:** Connects the frontal, occipital, parietal, and temporal lobes
3. **Arcuate fasciculus:** Connects gyri in frontal to temporal lobes
4. **Inferior longitudinal fasciculus:** Connects occipital to temporal pole
5. **Cingulum:** Connects frontal and parietal lobes to the parahippocampal gyrus and adjacent temporal gyri

285. Ans. (b) **Elevation, intorsion, adduction**

Ref: Gray's Anatomy E-book: 41st ed. P 673

Muscle	Primary function	Secondary function	Tertiary function
SR	Elevation	Intorsion	Adduction
IR	Depression	Extorsion	Adduction
SO	Intorsion	Depression	Abduction
IO	Extorsion	Elevation	Abduction

- All superiors are intorters
- All rectus are adductors (except lateral rectus)
- All obliques are abductors

286. Ans. (c) **Abducens**

Ref: Textbook of Clinical Neuroanatomy 2015 ed. P 191

Abducens nerve passes through cavernous sinus. Other nerves like CN III, IV, V1 and V2 run in the wall of cavernous sinus.

Cavernous sinus

287. Ans. (c) **Left gastric artery and inferior phrenic nerve**

Ref: Gray's anatomy for students E-Book. P 222

Blood Supply of the Esophagus

- The upper third of the esophagus is supplied by the inferior thyroid artery
- The middle third by branches from the descending thoracic aorta
- The lower third by branches from the left gastric artery
- The veins from the upper third drain into the inferior thyroid veins, from the middle third into the azygos veins, and from the lower third into the left gastric vein, a tributary of the portal vein.

288. Ans. (b) **Greater auricular nerve**

Ref: Gray's Clinical Neuroanatomy E-book, P 315

Sensory nerves of the face

289. Ans. (d) **Fastigii**

Ref: Gray's Anatomy E-book, P 337

- Cerebellar nuclei is deep seated nuclei.

Cerebellar Nuclei (Nuclei = Deep Cluster of Neurons)

- **Dentate nucleus**
 - Largest, communicates through cerebellar peduncle
 - Carries information important for coordination of limb movements (along with the motor cortex and basal ganglia)
- **Emboliform nucleus** (medial side of the nucleus dentatus)
 - Regulates movements of ipsilateral extremity
- **Globose nucleus**
 - Regulates movements of ipsilateral extremity
- **Fastigial nucleus**
 - Regulates body posture
 - It is related to the flocculonodular lobe

290. Ans. (c) Abducens

- All the extraocular muscles are supplied by CN III except lateral rectus and superior oblique.
- Lateral rectus supplied by—CN VI
- Superior oblique supplied by—CN IV

Remember- LR6; SO₄

291. Ans. (a) 1 anterior and 2 posterior

Ref: Gray's Anatomy, 41st ed. pg. 770

- The spinal cord and its roots and nerves are supplied with blood by both longitudinal and segmental vessels.
- Three major longitudinal vessels, **a single anterior and two posterior spinal arteries** (each of which is sometimes doubled to pass on either side of the dorsal rootlets) originate intracranially from the vertebral artery and terminate in a plexus around the conus medullaris.

292. Ans. (d) Anterior spinal artery

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 83-84

- The anterior 2/3rd of spinal cord is supplied by a single median anterior spinal artery which is a branch of vertebral artery.
 - The posterior 1/3rd is supplied by posterior spinal arteries (branches of vertebral artery).
 - Radicular arteries supply the nerve roots of spinal cord.
- Additional arterial supply is via the **anterior and posterior segmental medullary arteries**—small vessels which enter via the nerve roots. The largest anterior segment medullary artery is the artery of **Adamkiewicz**. It arises from the inferior intercostal or upper lumbar arteries and supplies the inferior 2/3rd of the spinal cord.

293. Ans. (b) Postauricular muscle

Ref: Gray's Anatomy, 41st ed. pg. 628

- Each temporal bone consists of four components: the squamous, petromastoid and tympanic parts and the styloid process.
- The squamous part has a shallow mandibular fossa associated with the temporomandibular joint. The petromastoid part is relatively large; its petrous portion houses the auditory apparatus and is formed of compact bone.
- The **auricularis posterior** consists of two or three fleshy fasciculi that arise by short aponeurotic fibres from the mastoid part of the temporal bone and insert into the poniculus on the eminentia conchae.

294. Ans. (c) **Genioglossus**

Ref: Lippincott's Illustrated, Review of Anatomy and Embryology, pg. 214

- All the intrinsic and extrinsic muscles of the tongue are innervated by hypoglossal nerve (CN XII) except the palatoglossus muscle which is innervated by vagus nerve (CN X).
- If there is damage to ipsilateral CN XII, it produces the dysarthria and fasciculations within the tongue musculature.
- The ipsilateral deviation of tongue is due to unopposed muscular contraction of contralateral **genioglossus muscle**.
- **Mn:** "The tongue licks the wound" (this will help you remember that the tongue deviates to the ipsilateral side in a lower motor lesion of CN XII)

295. Ans. (d) **Arch of aorta**

Blood Supply of Thyroid Gland

- Superior thyroid artery is first anterior branch of external carotid artery and enters the gland near superior pole as a large anterior superficial branch and a smaller posterior branch.
- Inferior thyroid artery, a branch of thyrocervical trunk of subclavian artery passes behind the carotid sheath running medially reaching the posterolateral aspect of the gland.
- Thyroidea ima artery, a branch of aorta or brachiocephalic artery enters the isthmus or lower pole of one of the lateral lobes (3%).
- Tracheal and oesophageal branches serve blood supply to retained thyroid gland after thyroidectomy.

296. Ans. (c) **C5-T1**

- Thyroid gland is located in anterior triangle of the neck and weighs 20 grams. Gland lies against C5 to T1 vertebra.
- Isthmus extends from 2–4th tracheal rings

297. Ans. (c) **6**

Ref: Netter's Atlas of Neurosciences, 3rd ed. pg. 247

- There are 2 *cerebellar hemispheres* with each divided into 3 lobes, thus making 6 lobes in all.
- The anterior is separated from middle lobe by *fissure primura*.
- There are 4 pairs of cerebellar nuclei.

D: **Nucleus Dentatus**

E: **Nucleus emboliformis**

F: **Nucleus fastigii**

G: **Nucleus globosus**

298. Ans. (a) **Flocculonodular lobe**

Ref: Netter's atlas of Neurosciences, 3rd ed. pg. 409

- The flocculonodular lobe is the *smallest lobe*.

- Most *primitive* part of cerebellum is archi-cerebellum and most *recent* part is neo-cerebellum.

299. Ans. (a) First part of subclavian artery

Ref: Netter's atlas of neurosciences, 3rd ed. pg. 110

- Subclavian artery is divided into three parts by **scaleneus anticus muscle (Mn: VIT CD)**

Branches from 1st part	Branches from 2nd part	Branches from 3rd part
<ul style="list-style-type: none"> • Vertebral artery 	<ul style="list-style-type: none"> • No branch on left side 	<ul style="list-style-type: none"> • Dorsal scapular branch
<ul style="list-style-type: none"> • Internal thoracic artery 	<ul style="list-style-type: none"> • Gives costocervical trunk on right side 	
<ul style="list-style-type: none"> • Thyrocervical trunk 		
<ul style="list-style-type: none"> • Costocervical branch on left side 		

300. Ans. (b) Dorsal scapular artery

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 504

- Dorsal scapular artery is a branch of 3rd part of subclavian artery.

301. Ans. (d) Internal carotid artery

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 420

- The free floating structure in cavernous sinus is cranial nerve VI and internal carotid artery.
- The cranial nerves III, IV, V1, V2 and post ganglionic fibers pass through the wall of the cavernous sinus.

302. Ans. (c) Basilar artery

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 426

Branches of Basilar artery (mnemonic: P.A.L.S)	Branches of Vertebral artery
<ul style="list-style-type: none"> • Posterior cerebral artery • Pontine artery • Anterior inferior cerebellar artery • Labyrinthine artery • Superior cerebellar artery 	<ul style="list-style-type: none"> • Post inferior cerebellar artery (<i>largest branch</i>) • Anterior spinal artery (<i>single artery and runs in anterior median fissure</i>) • Posterior Spinal Artery • Basilar Artery

303. Ans. (b) Ascending pharyngeal artery

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 487

- The smallest branch of external carotid artery is the ascending pharyngeal artery.

- The common carotid artery divides at the level of upper border of thyroid cartilage(C4 Level) into the internal and external carotid artery.

304. Ans. (d) **Lower border of S2**

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 420

- The subarachnoid space extends up to *lower border of S2* where the dura fuses with filum terminale and obliterates the subarachnoid space.
- The *spinal cord* extends from *upper border of atlas* to *lower border of L1* or upper border of L2. The spinal cord ends in a sharp tip called conus medullaris.
- The *conus* is continuous with *filum terminale*, which is a fine connective tissue element which descends up to the dorsum of the *first coccygeal ligament*.

305. Ans. (a) **Greater auricular nerve**

Ref: Netter Atlas of Neurosciences, 3rd ed. pg. 176

The skin of face is supplied by trigeminal nerve branches except for small area over the parotid gland and angle of mandible which is supplied by greater auricular nerve (C2, C3).

306. Ans. (c) **CN 3**

Ref: Netter's Atlas of Neurosciences, pg. 265

The cranial nerves carrying parasympathetic fibers are 3, 7, 9, 10.

Extra Mile

• CN having longest intraosseous course	Facial nerve
• CN having longest extracranial course	Vagus nerve
• Thinnest and most slender cranial nerve	Trochlear
• Only one to originate from the dorsal surface	
• Longest intracranial course	
• Thickest and largest cranial nerve	Trigeminal
• Largest branch of trigeminal is mandibular nerve.	
False localising sign in raised ICP	Abducens
Longest intra-osseous course	Facial
Cranial nerve with both motor and sensory components	5, 7, 9, 10

307. Ans. (c) **CN 8**

Ref: Netter's Atlas of Neurosciences, pg. 265

- Cranial nerve 3 is pure motor nerve and performs ocular movement.
- Cranial nerve 5 performs mastication and is sensory to face.
- Cranial nerve 9 is a mixed nerve and carries taste from posterior 1/3rd of tongue and performs swallowing with help of stylopharyngeus.
- CN 8th is pure sensory. Associated with hearing and balancing

308. Ans. (b) **Arachnoid and pia mater**

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 25

- Meninx* implies all three layers—dura, arachnoid and inner pia matter.
- The dura mater is called *pachymeninx*.
- The middle arachnoid and inner pia matter is called as *leptomeninges*.
- The arachnoid does not follow the convolutions of brain and looks like a loose fitting sac. Multiple arachnoid granulations pass through subarachnoid space and blends with pia matter.

309. Ans. (b) **Temporal lobe from fronto-parietal areas**

Ref: Netter's Atlas of Neurosciences, 3rd ed. pg. 52

The Sylvian fissure separates the temporal lobes inferiorly from the fronto-parietal lobes.

310. Ans. (c) **Left and right brachiocephalic veins**

Ref: *Atlas of Human Anatomy*, 6th ed. pg. 59

- Superior vena cava is formed by junction of 2 brachiocephalic veins and has No valves.
- Inferior vena cava is formed by union of 2 common iliac veins.
- Portal vein is formed by union of superior mesenteric vein and splenic vein.
- External jugular vein is formed by union of posterior division of retromandibular vein and posterior auricular vein.

311. Ans. (a) **Circulus iridis major**

Ref: *Parson's Diseases of the Eye*, 22nd ed. pg. 13

- The source of bleeding in hyphaema with blunt trauma to eye is circulus iridis major.

312. Ans. (a) **TM joint**

Ref: *Kulkarni Clinical Anatomy*, 2nd ed. pg. 24

TM joint	Bi-condylar joint
Atlanto-occipital joint	Ellipsoid joint/bi-axial joint
Interphalangeal joint	Hinge joint/uniaxial joint
Inter-metatarsal joint	Plane joint

Extra edge

- **Bi-condylar joints:** Knee joint and temporomandibular joint
- **Pivot joint/Trochoid joint:** Superior and inferior radioulnar joint, median atlanto-axial joint

313. Ans. (a) **Middle meningeal artery**

Ref: *Netter's Clinical Anatomy*, 3rd ed. pg. 460

Structures transmitted via foramen ovale (M.A.L.E.)

- Mandibular nerve-V3
- Accessory meningeal artery
- Lesser petrosal nerve
- Emissary vein

Extra edge

Foramen rotundum	Maxillary nerve V2
Foramen Lacerum	Internal carotid artery Lesser petrosal nerve Greater petrosal nerve Deep petrosal nerve
Foramen spinosum	Middle meningeal artery Nervus spinosus (Meningeal Branch of mandibular nerve) Posterior trunk of middle meningeal vein
Carotid canal	Internal carotid artery Venous and sympathetic plexus around the artery

Since lots of questions are asked on the topic of base of skull, students are expected to memorise this diagram by drawing it yourself.

314. Ans. (b) Foramen rotundum

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 352

Trigeminal nerve branches transmitted via—

V1 (Ophthalmic nerve)	Superior orbital Fissure
V2 (Maxillary nerve)	Foramen Rotundum
V3 (Mandibular nerve)	Foramen Ovale

315. Ans. (d) Cervical vertebra

Ref: Kulkarni Clinical Anatomy, 2nd ed. pg. 330

- Foramen transversarium is found only in cervical vertebra and transmits the vertebral artery.
- Another feature peculiar to cervical vertebra is bifid spinous process which is absent in C7 and has a small body.

Extra edge

Flexion and extension of neck	Atlanto-occipital joint
Rotational movement of neck	Atlanto-axial joint

316. Ans. (d) Nerve of wrisberg

Ref: Netter's Atlas of Human Anatomy, 5th ed. pg. 62

Nerve and its Details

Arnold nerve (choice A)	Auricular branch of vagus (alderman nerve)
Jacobson nerve (choice B)	Tympanic branch of glossopharyngeal nerve

Contd...

Criminal nerve of grassi (choice C)

Branch of right posterior vagus that passes to left behind oesophagus ending in gastric cardia
It is cut in highly selective vagotomy to avoid recurrent peptic ulceration

Nerve of wrisberg (choice D)

Sensory component of facial nerve which carries taste sensation from anterior 2/3 of tongue

Extra Mile

Vidian nerve	Nerve of pterygoid canal
Nerve of latarjet	Branch of anterior gastric nerve and supplies the pylorus. It is left intact in highly selective vagotomy so that the function of gastric emptying remains intact.

317. Ans. (d) 4

Ref: Netter's Atlas of Neurosciences, 3rd ed. pg. 53

- The primary sensory cortex lies in the post central gyrus and is area 1, 2, 3
- Area 4 is the primary voluntary cortex.

Brodman Areas of Cerebral Cortex

1, 2, 3	Primary sensory cortex lies in Post central gyrus
4	Primary voluntary cortex lies in precentral gyrus
17	Primary visual cortex and lies in calcarine cortex
18, 19	Visual association cortex

Contd...

22	Wernicke's area (Superior Temporal lobe)
41	Primary auditory area
44, 45	Broca area (inferior frontal gyrus)

318. Ans. (c) Cingulate gyrus

Ref: Netter's Correlative Imaging of Neuroanatomy, pg. 147

The limbic system is composed of following contents:

- Cingulate gyrus
- Hippocampus
- Fornix
- Mammillary bodies

The limbic system manages the emotional behaviour, sexual behaviour and food habits.

319. Ans. (b) Motor to 9, 10, 11 cranial nerve nucleus

Ref: Netter's Atlas of Neurosciences, 3rd ed. pg. 251

The cells in nucleus ambiguus contain *motor neurons* concerned with three cranial nerves

1. Rostral pole = *Glossopharyngeal*
2. Middle part = *Vagus*
3. Caudal pole = *Spino-accessory*
 - Axons arising from nucleus ambiguus pass laterally and slightly ventrally to exit the medulla just dorsal to the inferior olive.
 - These axons then course with the three cranial nerves: IX (glossopharyngeal), X (vagus) and XI (spinoaccessory) to innervate the striated muscles of the soft palate, pharynx, larynx, and upper part of the esophagus.

320. Ans. (a) Optic nerve

Ref: Gray's Anatomy, 41st ed. pg. 310

- The cranial nerves are individually named and numbered, using Roman numerals, in a rostro-caudal sequence, reflecting their order of attachment to the brain. They are named as follows:

TABLE: Cranial nerves

CN number	CN name	Attachment/Comments
I	Olfactory nerve	Arises from the olfactory epithelium in the nasal cavity and terminates directly in cortical and subcortical areas of the frontal and temporal lobes
II	Optic nerve	The axons of the optic nerve (II) pass into the optic chiasma, where medially positioned axons decussate; all of the axons emerge as the optic tract, which terminates in the lateral geniculate nucleus of the thalamus
III	Oculomotor nerve	Arise in, and are attached to, the midbrain.
IV	Trochlear nerve	
V	Trigeminal nerve	
VI	Abducens nerve	
VII	Facial nerve	Attaches to the brainstem at, or close to, the pontomedullary junction.
VIII	Vestibulocochlear N.	
IX	Glossopharyngeal N.	
X	Vagus nerve	Attached to the medulla
XI	Spinal accessory nerve	
XII	Hypoglossal nerve	Arises from cervical levels C1–C5/C6, enters the cranium through the foramen magnum and then exits via the jugular foramen, together with the glossopharyngeal and vagus nerves.
		Attached to the medulla

321. Ans. (c) **Greater auricular nerve**

Ref: Dhingra, 6th ed. pg. 4

Nerve supply of Auricle/Pinna

- **Lateral Surface**
 - Greater auricular nerve (most part)
 - Auriculotemporal nerve (supplies anteriorly, Tragus, some part of helix)
 - CN- X and CN- VII (Concha)
- **Medial Surface**
 - Upper 1/3 by Lesser occipital N.
 - **Lower 2/3 by Greater Auricular N.**
 - Concha/Root of auricle by Auricular br. Of vagus N. + Facial nerve

322. Ans. (a) **Maxillary process**

Ref: BDC, Vol-3 pg. 355-356

- The facial nerve leaves the skull by passing through the **stylomastoid foramen**.
- Branches and Distribution:
 - Within the facial canal:
 - ♦ **Greater petrosal nerve**- to the eye (lacrimal gland)
 - ♦ **The nerve to the stapedius**- to the stapedius muscle in middle ear
 - ♦ **The chorda tympani**- to the tongue
 - At its exit from the stylomastoid foramen it gives out branches to Posterior auricular, **Digastrics** and stylohyoid.
 - It has terminal branches within the **parotid gland** also like, temporal, Zygomatic, Buccal, Marginal mandibular and Cervical.

323. Ans. (d) **In relation with upper 2nd molar tooth**

Ref: Clinical Anatomy by Systems by Richard S. Snell / 55

Gland	Type of Gland	Duct	Duct opening
Parotid	Serous	Stensons duct	Vestibule of mouth opposite second upper molar
Sub-mandibular	Mixed but predominantly serous	Whartons duct	On the floor of mouth on summit of sublingual papilla at the side of frenulum of tongue
Sublingual	Mixed but predominantly mucus	Bartholins duct	On the floor of mouth on summit of sublingual papilla

324. Ans. (c) **Deviation of tongue**

- Facial nerve gives sensory supply to tongue.

- Chorda tympani nerve is a sensory branch of facial nerve (CN VII) which gives taste sensation of anterior 2/3rd of tongue.
- Glossopharyngeal nerve (CN IX) gives the taste sensation from posterior 2/3rd of tongue.
- Motor supply to tongue is by hypoglossal nerve (CN XII). Injury to hypoglossal nerve paralyzes ipsilateral half of tongue.
- If CN XII is functioning normally, tongue protrudes evenly in midline.
- If CN XII is paralyzed: When tongue is protruded, its tip deviates towards the paralyzed side because of unopposed action of genioglossus muscle on the normal side of tongue.(TDS)

325. Ans. (a) **Lateral pterygoid**

Ref: Gray's, 41st ed. pg. 507-508

- The primary function of the lateral pterygoid muscle is to pull the head of the condyle out of the mandibular fossa along the articular eminence to protrude the mandible.
- **The effort of the lateral pterygoid muscles acts in helping lower the mandible and open the jaw** whereas unilateral action of a lateral pterygoid produces contralateral excursion (a form of mastication), usually performed in concert with the medial pterygoids.
- Unlike the other three muscles of mastication, the lateral pterygoid is the only muscle of mastication that assists in depressing the mandible i.e. opening the jaw. At the beginning of this action it is assisted by the digastric, mylohyoid and geniohyoid muscles.

326. Ans. (a) **Facial nerve**

Ref: BDC, 5th Ed. vol. III pg. 252-253

- Basically, facial nerve supplies the taste sensation of anterior 2/3rd of the tongue, but since this option is given with this question, the best suited option is facial nerve.

According to BDC

- Sensory supply of anterior 2/3rd of the tongue is by facial nerve (CN VII).
- **Its lingual branch is for general sensation.**
- **Chorda tympani branch is for taste**
- **Sensory supply for posterior 1/3rd** - glossopharyngeal nerve/ CN IX (general and taste sensation both).
- **Posterior most or vallecula** is supplied by vagus nerve (internal laryngeal branch).

327. Ans. (d) **CN XI**

Ref: BDC, 5th ed. Vol-III pg. 252-253

- Sensory supply of anterior 2/3rd of the tongue is by facial nerve (CN VII).

- Its lingual branch is for general sensation.
- Corda tympani branch is for taste
- Sensory supply for posterior 1/3rd - glossopharyngeal nerve/ CN IX (general and taste sensation both).
- Posterior most or vallecula is supplied by vagus nerve (*internal laryngeal branch*).

328. Ans. (a) **Lingual nerve**

Please refer to above explanation

329. Ans. (a) **Pons**

Ref: BDC, 6th ed. Vol-III pg. 364, 70, 71

- CN 3rd and 4th cranial nerve attach to midbrain
- CN 5th, 6th, 7th, and 8th attach to Pons
- CN 9th, 10th, 11th and 12th from medulla
- Vestibular component of vestibulocochlear nerve (CN 8th) arises from junction of pons and medulla.

Extra Mile

- Acoustic neuroma is most common cerebellopontine angle tumor.
- Earliest CN involved is CN 5th, which is followed by 8th, 9th, 10th, 7th and 6th.

330. Ans. (c) **Trochlear**

Ref: BDC, 6th ed. Vol-II pg. 364

TROCHLEAR (IV) NERVE

- **Smallest cranial nerve** (Keith Moore -1137)
- **Most slender cranial nerve** (Snell-335)
- Only nerve to emerge from dorsal (posterior) surface of brain stem (mid brain)
- Passes anteriorly around the brain stem, running the longest intracranial (subarachnoid) course
- Nerve crosses the midline within the midbrain, emerges from its dorsal aspect and immediately decussates with the nerve of opposite side
- It supplies superior oblique, the only extra ocular muscle that uses pulley/trochlea to redirect its line of action

331. Ans. (a) **3rd CN palsy (oculomotor)**

Ref: BDC 6th ed. Vol-III pg. 361-62

- Eyelid is comprised of 4 muscles:

TABLE: Muscles, their innervation and function

Muscle	CN innervation	Function
• LPS	III	Opens the eyelid
• Muller's muscle	T1 (NOT a CN; sympathetic nerve)	Opens eyelid when LPS tired
• Frontalis	VII	Closes the eyelid
• Orbicularis oculi	VII	Closes the eyelid

- CN III palsy leads to drooping of eyelid (Ptosis).
- CN VII palsy may also cause ptosis.

Extra Mile

- All the extraocular muscles are supplied by CN III except lateral rectus and superior oblique.
- Lateral rectus supplied by- CN VI
- Superior oblique supplied by- CN IV

Remember— LR6; SO₄

332. Ans. (b) **Sympathetic nerve**

Ref: BDC, 6th ed. Vol-III pg. 74

Please refer to above explanation

333. Ans. (a) **Superior oblique**

Ref: BDC, 6th ed. Vol-III pg. 360-62

- Remember the mnemonics LR6 SO4 and all other by CN III
- Superior oblique is supplied by CN IV (trochlear nerve).
- Refer to above answer for more detailed explanation.

334. Ans. (c) **Trochlear nerve**

Ref: BDC 6th ed. Vol-III pg. 362

- **Trochlear nerve** is the only cranial nerve to emerge dorsally from the brain stem.
 - *It has the longest intracranial course* and it is the most slender cranial nerve in terms of axon contents.
- Largest cranial nerve: Trigeminal N. (CN 5th)
- CN which has most extensive distribution beyond head and neck: Vagus Nerve (CN 10th).
- Most frequently paralyzed CN: Facial Nerve (CN 7th)- due to wide intraosseous course.
- Pure sensory CN: CN 1, 2, 8

FMGE Solutions Screening Examination

90

- Pure motor CN: CN 3, 4, 6, 11, 12
- Mixed CN: CN 5, 7, 9, 10

335. Ans. (d) Vagus nerve

Ref: BDC, 6th ed. Vol-III pg. 379-81

- The “criminal nerve” of Grassi is the first gastric branch of the posterior vagus nerve. This nerve may branch proximal or distal to the celiac division of the posterior vagus nerve.
- The importance of this nerve is during Truncal vagotomy, since failure to transect the nerve of Grassi proximal to its origin will result in an incomplete vagotomy.

336. Ans. (c) Recurrent laryngeal nerve

Ref: BDC, Vol: 3 pg. 171, 172, 173, 176.

- It is recurrent laryngeal nerve that pierces the thyroid gland.

Must know about Thyroid

- The gland consists of 2 lobes that are joined to each other by the isthmus
- The gland extends against vertebrae C5, C6, C7 and T1
- It weighs about 25 g.
- The thyroid gland is supplied by the superior and inferior thyroid arteries.
 - The superior thyroid artery is the first anterior branch of the external carotid artery.
 - The inferior thyroid artery is a branch of thyro cervical trunk
- Nerve supply
 - Nerves are derived mainly from the middle cervical ganglion and partly also from the superior and inferior cervical ganglia.
- It is made of following two types of Secretory cells
 - Follicular cells lining the follicles of the gland secrete T3 and T4.
 - Parafollicular cells (C cells) are fewer and lie in between the follicles. They secrete thyrocalcitonin.

Extra Mile

What is the function of thyrocalcitonin?

- It promotes deposition of calcium salts in skeletal and other tissues, and tends to produce hypocalcaemia.

337. Ans. (c) Trigeminal nerve

Ref: Gray's 41st ed. pg. 667, BDC, 6th ed. Vol-III pg. 206-7

TABLE: Structures passing through superior orbital fissure

Superior orbital fissure		
Upper part/ Lateral	Middle part (through tendinous ring)	Lower/Medial part
<ul style="list-style-type: none"> • Superior Ophthalmic vein • Lacrimal nerve • Frontal nerve • Trochlear nerve <p>Mn – “Superior LFT”</p>	<ul style="list-style-type: none"> • Nasociliary nerve • Oculomotor nerve • Abducent nerve <p>Mnemonic – “NOA”</p>	<ul style="list-style-type: none"> • Inferior Ophthalmic vein • Sympathetic nerves around internal carotid artery <p>Mn: Inferior sympathy</p>

Extra Mile

Structures passing through Inferior orbital fissure

- Zygomatic branch of maxillary nerve
- Infraorbital nerve & vessels
- Rami of Pterygoid ganglion
- Communicating vein b/w inferior ophthalmic & pterygoid plexus of veins.

Mn-“ZIPC”

338. Ans. (a) 2

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 442

Structures transmitted via the superior orbital fissure

- Cranial nerve III, IV, V1 (ophthalmic nerve) and VI
- Inferior ophthalmic vein

The optic nerve is transmitted via the optic canal. The optic canal transmits optic nerve, ophthalmic artery and central retinal vein.

339. Ans. (a) **Superior ophthalmic vein**

Ref: Gray's, 41st ed. pg. 667

340. Ans. (a) **Mandibular nerve**

Ref: Keith L. Moore, 5th ed. pg. 899

341. Ans. (c) **Both**

Ref: Gray's, 41st ed. pg. 667

342. Ans. (a) **Sphenoid bone tumor**

Ref: Gray's Anatomy, pg. 801-805

TABLE: CN injury and their cause

Cranial Nerve	Usual cause
CN III, IV, first division of V	Invasive sphenoid bone tumor
CN VII, VIII	Petrous bone tumor
CN V, VII, VIII	Acoustic neuroma, Meningioma
CN IX, X, XI, XII	Parotid gland and carotid body tumor and Metastasis

343. Ans. (c) **C3, C4, C5**

Ref: Grey's, 38th ed. pg. 1265

TABLE: Phrenic nerve

Root value	Anterior primary rami of C3, C4, C5 (chiefly C4) Mnemonic. "C3,4,5 keeps the diaphragm alive"
Relations	Front of scalenus anterior and behind prevertebral fascia in neck Behind brachiocephalic vein and front of subclavian artery in thorax entry Passes in front of hilum of lung Rt. Phrenic: Pass through vena caval opening (T8) Lt. phrenic: Muscular part of diaphragm
Supply	Motor: Diaphragm Sensory: Pleura diaphragmatic, pericardium (fibrous & parietal), coronary and falciform ligament of liver, IVC, adrenals and gallbladder.

344. Ans. (c) **Cleft lip and cleft palate both**

Ref: Clinical Anatomy, Vishram Singh, pg. 306

- The cleft lip and palate are the most common congenital anomalies of the head and neck, occurring in 1 per 750 live births.

345. Ans. (c) **Loose subaponeurotic layer**

Ref: BDC, 6th ed. Vol-III pg. 61-63

The 5 layers of scalp can be remembered as **SCALP**:

- Skin:** Consist of hair follicles, sebaceous gland and sweat glands.
- Sub Cutaneous layer: Contains blood vessels, nerves of the scalp
- Aponeurotic layer aka **galea aponeurotica**. It is a tough layer of dense fibrous tissue which runs from the frontalis muscle anteriorly to the occipitalis posteriorly
- Loose subaponeurotic tissue** containing the emissary veins and allowing free movement of layers 1 to 3 as a unit. Layer 4 is a "**dangerous area**" because it allows spread of infection even, by way of the emissary veins, to intracranial structures.
- Pericranium, is the periosteum of the skull bones providing nutrition.

346. Ans. (d) **Galea aponeurotica**

Ref: BDC, 6th ed. Vol-III pg. 61-63

347. Ans. (b) **Frontal process of maxilla**

Ref: BDC, 6th ed. Vol-III pg. 28

Orbit wall	Formed by
• Medial wall Mn – "uSMLE"	Sphenoid (body) , Maxilla (frontal process), Lacrimal bone, Ethmoid (orbital plate)
• Lateral wall Mn – "ZyGS"	Zygomatic (frontal process) Greater wing of Sphenoid
• Roof	Frontal bone and Lesser wing of sphenoid
• Floor Mn – "Pa Ma Zy"	Palatine (orbital process), Maxilla, Zygomatic

348. Ans. (d) **Trigeminal nerve**

Ref: Gray's, 41st ed. pg. 315-16, 20-21

- Muscles of soft palate are supplied by pharyngeal plexus (of cranial accessory & vagus nerves) and mandibular division (V2) of trigeminal nerve.**
- General sensation by lesser palatine branch of maxillary division (V2) of trigeminal nerve & glossopharyngeal nerve.
- Secretomotor parasympathic post ganglionic fibers through lesser palatine nerves (pterygopalatine ganglion) & otic ganglion.
- Taste by facial nerve (through lesser palatine nerve)**
- Hard palate is supplied by greater palatine & nasopalatine branches of maxillary nerve in place of lesser palatine nerve. All 3 (greater, lesser & naso) palatine nerves pass through pterygopalatine ganglion.
- Palate is supplied by trigeminal (maxillary, mandibular), facial, glossopharyngeal, cranial accessory & vagus nerves.

FMGE Solutions Screening Examination

92

349. Ans. (a) Genioglossus

Ref: BDC, 5th ed. pg. 252

- Genioglossus is a fan shaped, *bulkiest muscle of tongue*.
- It is originated from upper genial tubercle of mandible and inserted into tip of tongue and into hyoid bone.
- **Function** -It retracts and depresses the tongue. It is also known as life saving muscle because it pulls the posterior part of tongue forwards and protrudes the tongue forwards.

Extra Mile

- **MOTOR:** All the extrinsic and intrinsic muscles of tongue are supplied by hypoglossal nerve EXCEPT palatoglossus, which is supplied by the cranial root of accessory nerve through the pharyngeal plexus.
- **SENSORY:** Anterior 2/3rd by facial nerve (lingual branch); posterior 1/3rd glossopharyngeal. Posterior most or vallecula is supplied by vagus nerve.

350. Ans. (d) Posterior cricoarytenoid

Ref: Dhingra, 5th pg. 300

- Posterior cricoarytenoid is the most important muscle of the larynx as it is the only abductor of vocal cord.
- Paralysis of posterior cricoarytenoid will lead to adduction of vocal cord, which may lead to dyspnea resulting in death.

351. Ans. (a) Trachea bifurcates

Ref: BDC, 6th ed. Vol.II pg. 280-81

- Trachea *begins* at lower border of cricoid cartilage opposite to the *lower border of C6 vertebra*.
- Trachea extends up to upper border of T5
- Tracheal bifurcation (carina) is at T4-T5 level.
- Length of trachea is 10-12 cm
- Thyroid cartilage is over 3, 4 & 5 tracheal rings

At C6 vertebral level: Landmark is Cricoid cartilage

- Larynx ends; Trachea begins
- Pharynx ends; Esophagus begins
- Inferior thyroid artery crosses posterior to carotid sheath.
- Middle cervical sympathetic ganglion behind inferior thyroid artery
- Inferior laryngeal nerve enters the larynx.
- Vertebral artery enters the transverse foramen of C6.

352. Ans. (a) Cricothyroid

Ref: BDC, Vol: 3 pg. 242, 244

- All intrinsic muscles of the larynx are supplied by the recurrent laryngeal nerve except cricothyroid which is supplied by external laryngeal nerve.

- Recurrent laryngeal nerve supplies posterior cricoarytenoid, lateral cricoarytenoid, transverse and oblique arytenoids, aryepiglotticus, thyroarytenoid, thyroepiglotticus muscle.

Extra Mile

TABLE: MUST KNOW about laryngeal muscles movements

Movement	Muscles
Abduction of vocal cords	Posterior cricoarytenoids only
Adduction of the vocal cords	Lateral cricoarytenoids and transverse arytenoids, thyroarytenoid
Tensor of vocal cords	Cricothyroid
Relaxor of vocal cord	Thyroarytenoid
Elevation of larynx	Thyrohyoid, mylohyoid
Depression of larynx	Sternohyoid, sternohyoid

353. Ans. (b) Stylopharyngeus

Ref: Gray, 39th ed. pg. 584

- All the muscles of pharynx are supplied by pharyngeal plexus except the stylopharyngeus muscle, which is supplied by glossopharyngeal nerve.

Extra Mile

- All the muscles of soft palate are also supplied by pharyngeal plexus EXCEPT the tensor veli palatine muscle, which is supplied by Nerve to medial pterygoid (Branch of mandibular nerve).

354. Ans. (a) Stylopharyngeus

Please refer to above explanation

355. Ans. (d) C₃ to C₆

Ref: Gray, 41st ed. pg. 586

- In adult male at rest, larynx lies at the level of the bodies of C₃ to C₆ vertebra. Although it is somewhat higher in adult females and children.
- In infants between 6-12 months, the tip of epiglottis (the highest part of the larynx) is a little above the junction of the dens and body of axis (C₂) vertebrae.

356. Ans. (c) Lambdoid suture

Ref: Gray, 41st ed. pg. 418-419

- Anterior fontanel is formed by frontal bone and parietal bone. It is diamond shaped and closes at 18 months.
- Posterior fontanel is formed by parietal bone and occipital bone. It is triangular shaped and closes immediately after birth or within 2-3 months.

357. Ans. (d) **Tympanomandibular**

Ref: Gray's, 41st ed. pg. 541

TABLE: Ligaments of TM Joint

Main	Accessory
Fibrous capsule	Sphenomandibular
Lateral or Temporo mandibular	Stylomandibular

358. Ans. (b) **C3**

Ref: Gray's Anatomy, 39th ed. pg. 444, 634

- The hyoid bone may be felt a few centimeters below and behind the chin, especially if the neck is extended. It may be palpated between finger and thumb and moved from side to side.
- The hyoid bone lies approximately at the level of the third cervical vertebra.**

359. Ans. (b) **2nd to 4th**

Ref: Gray's, 41st ed. pg. 470

- Thyroid gland lies against C₃, C₆, C₇ & T₁ vertebra
- Isthmus extends from 2nd to 4th tracheal ring
- Each lobe extends from middle of thyroid cartilage to 4th/5th tracheal ring.

360. Ans. (b) **Inferior thyroid artery**

Ref: Gray's, 41st ed. pg. 472

- Both upper & lower parathyroid glands are supplied by the inferior thyroid artery

Vascular Supply and Lymphatic Drainage of Parathyroid Gland

- Inferior thyroid arteries provide primary blood supply to posterior aspect of thyroid gland and parathyroid glands (which are situated there in posterior aspect of thyroid gland).

- Parathyroid veins drain into thyroid plexus of veins of thyroid gland & trachea.
- Lymphatics drain with those of thyroid into deep cervical lymph nodes & paratracheal lymph nodes.

Innervations and Functions

- Since the gland is hormonally regulated, the nerve supply is sympathetic vasomotor, vaso constrictor and not secreto motor.
- Parathyroid activities regulated by variations in blood calcium level: It is inhibited by a rise in calcium levels and stimulated by a fall in calcium level.

Extra Mile

- The superior parathyroid glands usually lie at the level of inferior border of cricoids cartilage.
- The inferior glands are usually within thyroid fascia 1 cm below the inferior thyroid arteries behind the lower poles.
- Color of thyroid gland:** deep red color
- Color of parathyroid gland:** Brownish yellow color

361. Ans. (b) **Peripheral ganglia**

Ref: Gray's, 41st ed. pg. 231, 303

Lower motor neuron (LMN): It consists of-

- Anterior horn cells or homologous cells in brainstem
- Anterior spinal nerve root
- Peripheral nerve

362. Ans. (c) **Mandible**

Ref: Gray's, 38th ed. pg. 431

- Pneumatic Bone:** Some cranial bones have air filled cavities for making skull light weight, resonance of voice & air conditioning.
- Maxilla, Mastoid, Ethmoid, Sphenoid & Frontal bones are pneumatic bones.

TABLE: Types of bone

Sesamoid bones	Pneumatic bone (Mn: It has Maximum Spherical Front Mass)	Membranous (Dermal) bone
<ul style="list-style-type: none"> Patella Pisiform Fabella 	<ul style="list-style-type: none"> Ethmoid Maxilla Sphenoid Frontal Mastoid (temporal) 	<ul style="list-style-type: none"> Skull vault bones Facial bones

363. Ans. (b) **Frontal bone**

Ref: Gray, 38th ed. pg. 436

- Pneumatic bones are bones which contain air filled cavities for making the skull light weight, and aid resonance of voice and air conditioning. These include: Frontal, Ethmoid, Maxilla, Sphenoid and mastoid.

Extra Mile

- **Sesamoid bones** are patella, pisiform and fabella.
- **Membranous (dermal) bones** are skull vault bones and facial bones.

364. Ans. (d) **Inferior parietal gyrus**Ref: Gray's, 41st ed. pg. 313

- The sense of taste (SVA-special visceral efferent) is transduced by gustatory hair (**neuroepithelium**), taste buds and is conveyed via **three** of the twelve cranial nerves.
 - The facial nerve carries taste sensations from the anterior two thirds of the tongue (**excluding** the circumvallate papillae) and **soft palate**.
 - The glossopharyngeal nerve carries the taste sensations from the posterior one third of the tongue (**including** the circumvallate papillae) and,
 - A branch of the vagus nerve carries some taste sensations from the back of the oral cavity (i.e. posterior-most tongue, pharynx and epiglottis).
- Impulses generated by the gustatory taste hairs on the superior surface of the tongue, travel from the tongue to medulla oblongata, to the thalamus, **ending up in the gustatorial area of the cortex of the parietal lobe (inferior gyrus) of the cerebrum**.
- The axons from these cranial nerves ascend in the spinal cord without crossing over. These fibers terminate in the medulla, ventral posterior medial (VPM) nucleus of the thalamus, and then project to the somatosensory cortex within the brain.
- Thus, a lesion of the nucleus tractus solitarius (NTS) or **solitario-thalamic tract** results in loss of taste from the ipsi-lesional, the same side as the lesion, half of the tongue.

365. Ans. (c) **Lateral geniculate body**

- The optic radiation also known as **geniculo-calcarine tract** is a collection of axons from relay neurons in the **lateral geniculate nucleus** of the thalamus carrying visual information to the visual cortex (also called striate cortex) along the calcarine fissure. There is one such tract on each side of the brain.
- A distinctive feature of the optic radiations is that they split into two parts on each side:
 - The fibers from the inferior retina must pass into the temporal lobe by looping around the inferior horn of the lateral ventricle. These fibers, which carry information from the superior part of the visual field, are called Meyer's loop. A lesion in the temporal lobe that results in damage to Meyer's loop causes a characteristic loss of vision in a superior quadrant.
 - The fibers from the superior retina (carrying fibres

from the inferior visual field) travel straight back to the occipital lobe in the **retrolenticular** limb of the internal capsule to the visual cortex. They carry information from the inferior part of the visual field and, taking the shorter path, are less susceptible to damage.

366. Ans. (d) **Exophthalmos**Ref: Gray's, 41st ed. pg. 469

- Horner syndrome presents with a triad of:
 1. Ptosis
 2. Miosis
 3. Anhydrosis
- There is apparent **enophthalmos** (and not exophthalmos). This enophthalmus is due to paralysis of the **orbitalis** muscle of the orbit, which normally keeps the eyeball prominent. Its nerve supply is sympathetic -T1 and when paralyzed leads to appearance of sunken eyeball.
- Most cases are idiopathic, but it could be due to brainstem lesions, carotid dissection, or neoplasm compressing upon the sympathetic chain (E.g., Pancoast tumor).
- Symptoms of horner's syndrome are secondary to sympathetic nerve (T1) lesion.

367. Ans. (a) **Maxillary**Ref: Gray's Anatomy, 39th ed. pg. 477, 479

- The maxillae are the largest of the facial bones, other than the mandible, and jointly form the whole of the upper jaw. Each bone forms the greater part of the floor and lateral wall of the nasal cavity, and of the floor of the orbit
- "Orbital surface of maxilla is smooth and triangular, and forms most of the floor of the orbit"
- **The seven bones that articulate with orbit are:**
 - Frontal bone (Roof)
 - Lacrimal bone (Medial wall of orbit)
 - Ethmoid bone (Medial wall of orbit)
 - Maxillary bone (Floor of orbit)
 - Palatine bone (Floor of orbit)
 - Sphenoid bone (Lateral wall of orbit)
 - Zygomatic (Lateral wall of orbit)

Extra Mile

- **Maxilla is also the most common fracture of orbital floor.**
- The floor (inferior wall) is formed by the orbital surface of maxilla, the orbital surface of Zygomatic bone and the orbital process of palatine bone.

Note: The nasal bone does not form part of the orbit.

368. Ans. (a) **Cavernous sinus**Ref: Gray's Anatomy, 40th ed. Ch; 29

- The upper most segment of the facial vein, above its junction with the superior labial vein, is also called the angular vein.
- Any infection of the mouth or face can spread via the angular veins to the cavernous sinuses resulting in thrombosis.

369. Ans. (c) Right sided pain, touch, temperature

Ref: Gray's, 41st ed. pg. 299, 309

- First order neuron carrying pain, touch, temperature enter the spinal cord, relay in same side.
- Second order neurons cross over to other side and travel up in anterior and lateral spino-thalamic tract and enter the medulla.
- Same fibers are now known as spinal lemniscus and they relay at thalamus. *So spinal lemniscus on the left contain pain touch temperature from right side of the body.*

370. Ans. (d) Inferior oblique

Ref: Gray's, 41st ed. pg. 671, Gray's, 39th ed. pg. 693

- All the rectus muscles are attached to the orbital apex.
- Aside from rectus muscles, superior oblique also attaches to orbital apex, while inferior oblique has no attachment with orbital apex.

371. Ans. (b) Trochlear

Ref: Gray's, 41st ed. pg. 671

- Superior oblique muscle is supplied by trochlear nerve.
- Its actions are: aBduct, Intort & Depress ("BID") eye in primary position.

372. Ans. (b) Lateral cartilage

Ref: Gray's, 41st ed. pg. 560

Nasal septum is an osseocartilagenous structure contributed by

Part of septum	Main structure	Contributory structures
Bony septum	<ul style="list-style-type: none"> • Vomer • Ethmoid (perpendicular plate) 	<ul style="list-style-type: none"> • Nasal spine of frontal bone • Nasal crests of maxillary, nasal & palatine bones • Rostrum & crest of sphenoid
Cartilaginous septum	<ul style="list-style-type: none"> • Septal cartilage 	<ul style="list-style-type: none"> • Inferior nasal cartilage (Septal process)

373. Ans. (b) Thalamus

Ref: Textbook of Neuroanatomy pg. 82,83

Basal ganglia include following nuclei-

- Caudate nucleus
- Putamen
- Globus pallidus

- Subthalamic nucleus
- Substantia nigra

Lenticulate nucleus = putamen + globus pallidus

Function of basal ganglia—Planning and programming of movements.

374. Ans. (b) Purkinje cells

Ref: Gray's, 41st ed. pg. 335-336

- The cerebellar cortex contains five types of neurons: Purkinje, Granule, Basket, Stellate and Golgi Cells.

375. Ans. (c) Purkinje cells

Ref: Gray's, 41st ed. pg. 335-336

- The axons of purkinje cells are the only output through cerebellar cortex.
- However, it should be kept in mind that the output from the cerebellum is through deep nuclei, and purkinje cells axons generally pass to deep nuclei.

376. Ans. (a) Lower border of L1

Ref: IB Singh, 8th ed. pg. 31

- Spinal cord begins at foramen magnum and, in adults, ends at lower border of L1.
- In newborn, spinal cord ends at L3 vertebrae.

377. Ans. (c) L3

Ref: IB Singh, 8th ed. pg. 31

378. Ans. (d) X

Ref: BDC, 5th ed. vol 3 pg. 78

Parapharyngeal space contains

- Carotid vessel
- Jugular vein
- Last 4 cranial nerves (9,10,11,12)
- Sympathetic chain

FIGURE: Parapharyngeal space

379. Ans. (b) **Fasciculus gracilis**

Ref: Gray's, 41st ed. pg. 296-97, 311

NERVE PATHWAYS

- **Posterior**-Fasciculus gracilis, fasciculus cuneatus
- **Lateral**-Lateral spinothalamic, anterior and posterior spinocerebellar, spino-olivary, spinotectal
- **Anterior**-Anterior spinothalamic

380. Ans. (b) **C7**

Ref: BDC, 5th ed Vol. III pg. 43

- The C7 vertebra is also known as the vertebra prominens because of its long spinous process.
- Atypical cervical vertebrae are: 1, 2, and 7 (atlas, axis and vertebra prominens respectively)

381. Ans. (b) **Atlanto-axial joint**

Ref: Gray's, 38th ed. pg. 521

- **Atlanto-occipital** (between skull and C1) joint permits *nodding of head* (as when indicating approval or yes)
- **Atlantoaxial joint** permits the head to be **turned from side to side** i.e. rotation (as indicating disapproval, the NO movement).

382. Ans. (a) **Posterior longitudinal ligament**

Ref: Gray's, 38th ed. pg. 512; Keith Moore, 4th ed. pg. 483

- Structures pierced during lumbar puncture (from outside in) are:- Skin → subcutaneous tissue → Supraspinous & interspinous ligament → Ligament flavum → Dura mater → Arachnoid mater.

383. Ans. (b) **Carotid tubercle on C6 vertebra**

Ref: Gray's, 41st ed. pg. 414, Color Atlas of Human Anatomy, pg. 446

- Chassaignac's tubercle (carotid tubercle) is the other name of anterior tubercle of transverse process of C6 vertebra.
- It is the longest tubercle of Cervical (C6) Vertebra.

PELVIS AND PERINEUM

384. Ans. (a) **Dilatation of Superior rectal vein**

Ref: Gray's Anatomy 41st ed. P 1153, 1158

- Source of bleeding in haemorrhoids are usually the internal haemorrhoids which are symptomatic anal cushions and lie in 3, 7 and 11 o'clock position (*left-lateral, right-posterior and right-anterior quadrants of the wall of the canal*).
- **Book states:** "the cushions help to seal the anal canal and contribute to the maintenance of continence to flatus and fluid. The anal cushions are important in the pathogenesis of haemorrhoids."
 - Haemorrhoids develop due to degeneration of the supporting connective tissue of anal cushion.
 - This degeneration causes downward displacement of cushions and abnormal venous dilatation.
- The superior haemorrhoidal veins draining the upper half of the anal canal above the dentate line, pass upwards to become the rectal veins: these unite to form the **superior rectal vein**, which later becomes the **inferior mesenteric vein**.
- In the middle anal canal, there are 6–10 vertical mucosal folds and the anal columns. These columns mainly contain the superior rectal vein, artery and some middle and inferior rectal vessels.

Extra Mile

- Dilated veins in the subepithelial tissue below the dentate line contribute to an external haemorrhoidal venous plexus

385. Ans. (c) **Bulbourethral artery**

Ref: *Gray's Anatomy for Students E-book, P 516*

- Blood supply to the skin of the penis is from the left and right superficial external pudendal arteries, which arise from the femoral artery.
 - The superficial external pudendal arteries branch into dorsolateral and ventrolateral branches, which collateralize across the midline.
 - In addition, branches in the skin form an extensive subdermal vascular plexus.
- The blood supply to the ventral penile skin is based on the posterior scrotal artery, a superficial branch of the deep internal pudendal artery.
- The blood supply to deep structures of the penis is derived from a continuation of the internal pudendal artery, after it gives off the perineal branch. Three branches of the internal pudendal artery flow to the penis, as follows:
 - **Bulbourethral artery:** Artery of the bulb passes through the deep penile (Buck) fascia to enter and supply the bulb of the penis and penile (spongy) urethra.
 - The dorsal artery travels along the dorsum of the penis between the dorsal nerve and deep dorsal vein and gives off circumflex branches that accompany the circumflex veins; the terminal branches are in the glans penis.
 - **Cavernosal artery:** Deep penile artery is usually a single artery that arises on each side and enters the corpus cavernosum at the crus and runs the length of the penile shaft, giving off the helicine arteries, which are an integral component of the erectile process.

386. Ans. (c) **Genital branch of genitofemoral nerve**

Ref: *Gray's Anatomy Review E-book, P 221*

- The **cremaster muscle** is a muscle that covers the testis and the spermatic cord.
- The cremaster muscle is supplied by the cremasteric artery which is a branch of inferior epigastric artery.
- The cremaster muscle is innervated from the genital branch of the genitofemoral nerve. It receives distinctly different innervation and vascular supply in comparison to the internal oblique.

387. Ans. (c) **Spiral artery**

Ref: *Gray's Anatomy E-book, P 172*

- Spiral artery, a branch of radial artery, chiefly supplies endometrium.
- Endometrium and myometrium are supplied mainly by ovarian and uterine artery.

FMGE Solutions Screening Examination

98

388. Ans. (a) **Pudendal nerve**

Ref: Netter's Clinical Anatomy, 3rd ed. pg. 252

Alcock's canal/pudendal canal is a fascial tunnel in the lateral wall of ischioanal fossa and contains the pudendal nerve and internal pudendal vessels.

389. Ans. (b) **S2**

Anatomic level of some important structures:

- **Posterior Superior Iliac Spine (PSIS): S2**
- **Anterior Superior Iliac Spine (ASIS): S1**
- **Pylorus and Celiac trunk: L1**
- **Inferior mesenteric artery: L3**
- **Umbilicus: Between L3 and L4**

Extra Mile

TABLE: Vertebral body level as landmark for the viscera
(Table extracted from Gray's Anatomy 41st ed.)

Vertebral body level	Viscera
C6	Cricoid cartilage, start of oesophagus
C7-T1	Lung apex
Upper T4	Aorta reaches vertebral column; medial part of scapular spine
T4-5 disk	Sternal plane/angle of Louis
Upper T5	<ul style="list-style-type: none"> • Tracheal bifurcation • Concavity of aortic arch • Azygos vein—superior venacava junction • Bifurcation of pulmonary trunk • Upper border of heart
Upper T8	<ul style="list-style-type: none"> • Inferior angle of scapula • Lower border of heart • Inferior vena cava crosses diaphragm • Central tendon of diaphragm
Upper T11	<ul style="list-style-type: none"> • Lower border of lung • Cardia of stomach • Upper border of kidney

Extra Mile

Vertebral body level	Viscera
Mid L1	<ul style="list-style-type: none"> • Lowest level of pleura • Pylorus; transpyloric plane • Hilum of left kidney • Origin of renal arteries and superior mesenteric artery • Pancreas (neck) • Spinal cord termination
Mid L2	Pancreas (head); duodenojejunal flexure
Mid L3	Lower border of kidney
Mid L4	Bifurcation of aorta
Mid L5	Formation of inferior vena cava

390. Ans. (d) **4**

Ref: Gray's Anatomy, 41st ed. pg. 729

- The coccyx is a small, **asymmetrical**, triangular bone of the spine, the distal most.
- It usually **consists of four fused rudimentary vertebrae**, although the **number varies from three to five**, and the first is sometimes separate.
- The bone is directed downwards and ventrally from the sacral apex.

FIGURE: Coccyx, anterior view

391. Ans. (d) **Bulbocavernosus**

Ref: BDC Vol II pg. 429-32; Keith Moore, 7th ed. 493-32

STRUCTURES FORMING PERINEAL BODY

- Levator Ani (Pubo and Iliococcygeus)
- Bulbo- Spongiosus

- Superficial and Deep Transverse perinei
- Sphincters i.e. External anal sphincter and sphincter urethrae

Clinical Significance

In episiotomy all muscles of perineal body except two sphincter (i.e. sphincter urethrae and external anal sphincter) are cut

UROGENITAL DIAPHRAGM

- Sphincter urethrae
- Deep Transverse Perinei
- Perineal membrane (Inferior fascia of urogenital diaphragm)
- Superior fascia of urogenital diaphragm

PELVIC DIAPHRAGM: TRUE PELVIC FLOOR

- Levator ani
 - Muscles (Iliococcygeus and Pubococcygeus)
- Ischiococcygeus

392. Ans. (d) **Ischiococcygeus**

Refer to above explanation

393. Ans. (d) **Puborectalis**

Refer to above explanation

394. Ans. (c) **Glandular tissue and fibromuscular stroma**

Ref: Gray's Anatomy, 39th ed. pg. 1302

- The anterior part of the prostate is composed mainly of fibromuscular stroma, which is continuous with detrusor fibers.
- Toward the apex of the gland, this fibromuscular tissue blends with striated muscle from the levator.
- Puboprostatic ligaments also blend with this area.

395. Ans. (c) **60 g**

Ref: William's OB, 23rd ed. Ch 1

- William's states "In nonparous women, the uterus averages 50 to 70 g, whereas in parous women it averages 80 g or more"
- Since this question is asking just the normal weight of uterus, 60 gm is most appropriate given the option.

UTERUS

- Shape- pyriform
- Size- 7.5 cm long × 5 cm broad × 2.5 cm thick
- Weight- 60 g
- Position- 90 degree with the long axis of vagina
- Angulation- anteverted, anteflexed

396. Ans. (b) **Anteverted, anteflexed**

Ref: Gray's, 41st ed. pg. 1294

397. Ans. (b) **Cervix is lined by transitional epithelium**

Ref: Gray's, 41st ed. pg. 295

- The epithelial lining of cervix is varied. Ectocervix is composed of non keratinized stratified squamous epithelium and endocervix is composed of simple columnar epithelium.
- Blood supply of cervix-descending cervical branch of uterine artery.

Extra Mile

- **Size of cervix-** 2.5 cm (25 mm)
- MC site of cervical CA is squamocolumnar junction.
- Lining of vagina: Nonkeratinized stratified squamous epithelium (same as mouth, tongue, pharynx, esophagus, cornea and conjunctiva)
- **Lining of urinary pathway:** Transitional epithelium

398. Ans. (b) **Urinary bladder**

Ref: Gray's, 41st ed. pg. 1261

Please refer to above explanation

Extra Mile

- **Gallbladder:** Columnar epithelium with brush border (microvilli are irregularly placed)
- **Thyroid:** Cuboidal epithelium
- **Stomach:** Columnar epithelium

399. Ans. (a) **Abdominal aorta**

Ref: Clinically Oriented Anatomy by Keith, Moore, 5th ed. pg. 387; Gray's Anatomy, 40th ed. Ch. 62

- The ovarian artery/testicular arises from the abdominal aorta.
- The ovarian arteries are branches of the abdominal aorta and originate below the renal arteries. That's the reason it is sometimes also referred as "water under the bridge"
- The ovarian veins emerge from the ovary as a plexus (pampiniform plexus) in the mesovarium and suspensory ligament.
- **Abdominal aorta divides into right and left common iliac artery at the level of L4 (Gray's),** which further divides into internal and external iliac arteries supplying the organs of pelvis.
- **Length of right iliac artery:** 5 cm^Q
- **Length of left iliac artery:** 4 cm^Q

400. Ans. (b) **Left renal vein**

Ref: BDC, Vol: 2 pg. 236

VENOUS DRAINAGE OF TESTIS

- The veins emerging from the testis form the pampiniform plexus.
- Out of this plexus finally one vein forms in each side:
 - **On the right side:** Drains into the inferior vena cava
 - **On the left side:** Drains into the left renal vein.
- Femoral vein drains into external iliac vein.

Remember: IVC is on right side, so the right side testicular vein drains here."

And left side testicular vein drains into left renal vein.

401. Ans. (a) **Left renal vein**

Ref: BDC, Vol. II pg. 236

Please refer to above explanation

402. Ans. (a) **IVC**

Ref: BDC, 6th ed./ Vol. II pg. 236

The right gonadal vein (ovarian/testicular) and the right adrenal vein both directly drain into inferior vena cava. In contrast the left adrenal and left gonadal veins drain into left renal veins, which then drains into inferior vena cava.

Extra Mile

- The hemiazygos receive the venous drainage from the lateral body wall on the left side of the thorax and abdomen. No visceral organs drain directly to azygos or hemiazygos veins.
- Inferior mesenteric vein receives venous drainage from the lower part of the intestinal tract

403. Ans. (a) **Superior rectal artery**

Ref: Gray's, 41st ed. pg. 1224-25

- Common iliac artery bifurcates into internal and external iliac artery at the level of sacroiliac joint.
- Length of internal iliac artery: ~4 cm.

Mnemonic to Remember the Branches of the Internal Iliac Artery

- *I Love Going Places In My Very Own Underwear!*

Mnemonic

- **I:** iliolumbar artery
- **L:** lateral sacral artery
- **G:** gluteal (superior and inferior) arteries
- **P:** (internal) pudendal artery
- **I:** inferior vesicle (uterine in females) artery
- **M:** middle rectal artery
- **V:** vaginal artery
- **O:** obturator artery
- **U:** umbilical artery
- Also, the first three arteries (iliolumbar, lateral sacral and superior gluteal arteries) are all branches of the posterior trunk of the internal iliac artery, whilst the remainder are branches of the anterior trunk.
- **Superior rectal artery is a branch of inferior mesenteric artery.**
- **Inferior epigastric artery is a branch of external iliac artery.**

404. Ans. (a) **Superior rectal artery**

Ref: Gray's, 41st ed. pg. 1088, 1138

Branches of Inferior Mesenteric Artery

- **Left colic artery:** supplies descending colon
- **Sigmoid artery:** supplies sigmoid colon
- **Superior rectal artery: terminal branch of IMA**
- Marginal branches

Note

- **Middle rectal artery:** branch of internal iliac artery (anterior branch)
- **Inferior rectal artery:** branch of internal iliac artery
- **Inferior epigastric artery:** branch of external iliac artery

405. Ans. (a) **Ovaries**

Ref: Gray's, 41st ed. pg. 1304

- The **internal iliac lymph nodes** surround the internal iliac artery and its branches (the *hypogastric vessels*), and receive the lymphatics corresponding to the distribution of the branches of it.
- They receive lymphatics from all the pelvic viscera, from the deeper parts of the perineum, including the

membranous and cavernous portions of the urethra, and from the buttock and back of the thigh.

- **It does not receive lymph from the ovary, testis, or superior half of the rectum.**
- The gonads drain to the paraaortic lymph nodes, while the superior half of the rectum drains to the pararectal lymph nodes.

406. Ans. (b) Deep inguinal nodes

Ref: Gray's, 41st ed. pg. 1284

- Glans Penis drained by → Deep Inguinal and external iliac nodes.
- Rest of the Penis → Internal Iliac nodes

407. Ans. (c) 20 cm

Ref: BDC, 5th ed. Vol II pg. 378

- Male urethra is 18-20 cm long that extends from the internal urethral orifice in the bladder to the meatus at the end of penis.
- **It is divided into 4 segments:**
 - Prostatic urethra
 - Membranous urethra
 - Bulbar urethra
 - Penile urethra

408. Ans. (a) L1 & L2

Ref: Gray's, 41st ed. pg. 1259-60284

NERVE SUPPLY OF URINARY BLADDER

- They consist of both sympathetic and parasympathetic components, each of which contains both efferent and afferent fibres.
- Parasympathetic fibres arise from the second to the fourth sacral segments of the spinal cord and enter

the pelvic plexuses on the posterolateral aspects of the rectum as the pelvic splanchnic nerves or nervi erigentes.

- **The sympathetic fibres are derived from the lower three thoracic and upper two lumbar segments of the spinal cord.**

409. Ans. (b) Genitofemoral nerve

Ref: Clinically Oriented Anatomy by Keith, Moore, 5th Ed, /223

CREMASTERIC REFLEX

Efferent: genital branch of genitofemoral nerve

Afferent: Femoral branch of genitofemoral nerve

- Contraction of the cremaster muscle is elicited by lightly stroking the skin on the medial aspect of the superior part of the thigh with an applicator stick or tongue depressor.
- **The ilioinguinal nerve supplies this area of skin.** The rapid elevation of the testis on the same side is the cremasteric reflex. This reflex is extremely active in children
- A hyperactive cremasteric reflex may simulate undescended testes.

410. Ans. (c) Medial

Ref: Clinically Oriented Anatomy by Keith, Moore, 5th Ed / 223

- Cremasteric reflex is elicited by lightly stroking the skin on the **medial aspect of the superior part of the thigh** with an applicator stick or tongue depressor.

411. Ans. (d) Ilioinguinal nerve

A simplified description of the **contents of spermatic cord** in the male are:

- **3 Arteries:** Cremasteric artery, deferential artery, **testicular artery**
- **3 Nerves:** Genital branch of the genitofemoral nerve (L1/2), autonomic and visceral afferent fibres. **Remember** ilioinguinal nerve is outside the spermatic cord but travels next to it.
- **3 Fascial layers:** External spermatic, cremasteric, and internal spermatic fascia.
- **3 other structures:** Pampiniform plexus of vein, Vas deferens (ductus deferens), Testicular Lymphatics

Clinical significance: The spermatic cord is sensitive to torsion, in which the testicle rotates within its sac and blocks its own blood supply. Testicular torsion may result in irreversible damage to the testicle within hours. A collection of serous fluid in the spermatic cord is named 'funiculocele'. The contents of the abdominal cavity may protrude into the inguinal canal, producing an indirect inguinal hernia.

412. Ans. (c) Internal iliac artery

ANSWERS TO BOARD REVIEW QUESTIONS

413. Ans. (a) Deep peroneal nerve

- The deep fibular (peroneal) nerve runs through extensor digitorum longus and down the interosseous membrane. Then it crosses the tibia and enters the dorsum of the foot.
- It innervates the muscles in the anterior compartment of the leg and the dorsum of the foot.
- It also supplies a small region of skin between the first (big) and second toes

Muscles of Scapular Stabilization

- Trapezius:
 - Retraction (M)
 - Elevation (S)
 - Depression (I)
 - Upward rotation (S, M)
- Rhomboid—retraction
- Levator scapulae—elevation
- Pectoralis major—protraction
- Serratus anterior—Protraction

414. Ans. (b) Middle fibre of trapezius

- Retraction of scapula is done for middle fibres of trapezius muscles

415. Ans. (c) T10

- Dermatome of area around umbilicus is supplied by T10
- Area around umbilicus is supplied by T4

416. Ans. (c) **Thyroid cartilage**

- The thyroid cartilage in males are more prominent and longer than females, giving rise to adam's apple.

417. Ans. (c) **3 weeks**

Ref: Langmann's, 10th ed ch: 17

418. Ans. (c) **Right 4th aortic arch**

Ref: High-yield Embryology Ronald W. Dudek 4th ed page 41, Embryology for Medical Students By Sudhir Sant 2nd ed page 121, Langmann's 10th ed ch: 12, Human Embryology 8 Ed By Singh / 228

ANSWERS TO IMAGE-BASED QUESTIONS

493. Ans. (a) **Pituitary**

494. Ans. (a) **Long thoracic nerve**

Nerve involved	Muscle
Long thoracic Nerve	Serratus anterior
Musculocutaneous Nerve	Coracobrachialis muscle
Lateral anterior thoracic Nerve	Pectoralis major muscle
Thoracodorsal Nerve	Latissimus Dorsi

495. Ans. (a) **Coraco-acromial ligament**

The image shows a ligament *extending* from the coracoid process to the acromion process.

496. Ans. (c) **Sural nerve**

The image shows sural nerve

497. Ans. (d) **Nerve originates from nerve roots L5-S2**

- The image shows pain in the distribution of sciatic nerve which can occur due to disc prolapse. Such pain is worsened on standing.
- Arterial claudication pain is worsened on walking.
- The sciatic nerve originates from lumbosacral plexus L4-S3
 - Tibial division
 - Originates from anterior preaxial branches of L4, L5, S1, S2, S3
 - Peroneal division
 - Originates from postaxial branches of L4, L5, S1, S2

498. Ans. (d) **All of the above**

Mnemonic for Branches for External Carotid Artery

Some anatomists like freaking out poor medical students

S : superior thyroid artery

A : ascending pharyngeal artery
L : lingual artery
F : facial artery
O : occipital artery

P : posterior auricular artery
M : maxillary artery
S : superficial temporal artery

499. Ans. (b) **B**

The following diagram and its branches should be remembered.

500. Ans. (c) Radial tuberosity

- The shown muscle in the image is biceps brachii muscle which is inserted at radial tuberosity and at fascia of forearm.

Biceps Brachii

- Origin**
- Short head:** Tip or coracoid process of scapula
- Long head:** Supraglenoid tubercle of scapula
- Insertion:** Tuberosity of radius and fascia of radius and fascia of forearm via bicipital aponeurosis
- Action:** Supinates forearm and, when it is supine, flexes forearm
- Innervation:** Musculocutaneous nerve (C5 and C6)

501. Ans. (b) Pterion

Physiology

MOST RECENT QUESTIONS 2019

1. What is the cause of diastolic notch?
 - a. Passive filling of blood in ventricles
 - b. Rapid ejection phase
 - c. Peripheral resistance
 - d. Isovolumic contraction
2. Why is sugar added to ORS?
 - a. Enhance acceptability
 - b. Enhance salt absorption
 - c. Enhance shelf life
 - d. Enhance taste
3. Which of the following is correct about Isovolumetric relaxation?
 - a. AV valves are closed
 - b. Corresponds to QT interval
 - c. C wave of JVP
 - d. Semilunar valves open
4. Adequate oxygen delivery at cellular level is present in which type of hypoxia?
 - a. Histotoxic
 - b. Hypoxic
 - c. Stagnant
 - d. Anaemic
5. If radius of a vessel is doubled then the blood flow is increased by?
 - a. 8 times
 - b. 16 times
 - c. 32 times
 - d. 256 times
6. Normal anion gap value is ___ mmol/L?
 - a. 4-6
 - b. 6-12
 - c. 12-24
 - d. 24-50
7. Comment on the breathing pattern of a patient with prolonged inspiratory spasms that resemble breath holding?
 - a. Biot breathing
 - b. Apneustic breathing
 - c. Cheyne stokes breathing
 - d. Kussmaul breathing

CELL AND NERVE-MUSCLE PHYSIOLOGY

8. Which of the following is not seen in Intracellular Fluid? *(Recent Pattern Question 2018-19)*
 - a. Calcium
 - b. Magnesium
 - c. Potassium
 - d. Protein

9. Which of the following is not a calcium binding protein? *(Recent Pattern Question 2018-19)*
 - a. Calbindin
 - b. Calmodulin
 - c. Troponin
 - d. Clathrin

10. Inverse stretch reflex is mediated via *(Recent Pattern Question 2018-19)*
 - a. Golgi tendon
 - b. Muscle spindle
 - c. Unmyelinated C fibers
 - d. Dorsal Column

11. Organelle having DNA is ___? *(Recent Pattern Question 2018-19)*
 - a. Mitochondria
 - b. Golgi complex
 - c. SER
 - d. RER

12. Delivery of stimulus above threshold intensity leads to a constant amplitude of AP and is known as:
 - a. All or none law *(Recent Pattern Question 2018-19)*
 - b. Electrotonic potential
 - c. Absolute refractory period
 - d. Relative refractory period

13. Which is correct about malignant Hyperthermia in adults? *(Recent Pattern Question 2018)*
 - a. Increase Calcium Transport via L type calcium channels in T-tubule
 - b. Increase Calcium Transport via T type calcium channels in T-tubule
 - c. Decrease Calcium Transport via L type calcium channels in T-tubule
 - d. Decrease Calcium Transport via T type calcium channels in T-tubule

14. Which of the following ion plays a role in exocytosis? *(Recent Pattern Question 2018)*
 - a. Sodium
 - b. Potassium
 - c. Calcium
 - d. Magnesium

15. Dense bodies are found in smooth muscle at which of the following sites? *(Recent Pattern Question 2018)*
 - a. A band
 - b. Z line
 - c. M line
 - d. H band

16. Which of the following is not a molecular motor? *(Recent Pattern Question 2018)*
 - a. Dynein
 - b. Kinesin
 - c. Myosin
 - d. Actin

17. Which is correct about function of antiporter?

- a. Both molecules go in (Recent Pattern Question 2018)
- b. One molecule goes in and other molecule goes out
- c. Both molecules go out
- d. One molecule goes in and two exit out

18. Which of these is true about SGLT1?

(Recent Pattern Question 2018)

- a. Secondary active transport of glucose in brain
- b. Secondary active transport of glucose in intestine
- c. Secondary active transport of in prostate
- d. Secondary active transport of glucose in rods and cones

19. Which of the following has maximum smooth muscle as compared to wall thickness?

(Recent Pattern Question 2018)

- a. Respiratory bronchiole b. Alveoli
- c. Terminal bronchiole d. Alveolar ducts

20. During a 100 m sprint which of the following is used by the muscle for meeting energy demands?

(Recent Pattern Question 2018)

- a. Phosphofructokinase b. Phosphocreatine
- c. Glucose 1-phosphate d. Creatine phosphokinase

21. Golgi tendon is innervated by which nerve fibre?

(Recent Pattern Question 2017)

- a. Ia b. Ib
- c. II d. III

22. Pain and temperature is carried by:

(Recent Pattern Question 2017)

- a. Anterior spinothalamic tract
- b. Lateral spinothalamic tract
- c. Dorsal column pathway
- d. Ventral column pathway

23. SGLT1 is located on: (Recent Pattern Question 2017)

- a. Brain b. Liver
- c. Intestine d. RBC

24. Steroid synthesis occurs in which organelle?

(Recent Pattern Question 2017)

- a. Lysosome
- b. Smooth endoplasmic reticulum
- c. Rough endoplasmic reticulum
- d. Lysozyme

25. Fiber mainly affected by local anesthesia:

(Recent Pattern Question 2017)

- a. A beta b. A delta
- c. B fibers d. C fibres

26. Which is true about rheobase?

(Recent Pattern Question 2017)

- a. Minimum time required to produce action potential
- b. Maximum time required to produce action potential
- c. Minimum strength of stimulus to produce action potential
- d. Maximum strength of stimulus to produce action potential

27. Which of these sends K^+ inside cells:

(Recent Pattern Question 2016)

- a. Insulin b. Glucagon
- c. TSH d. FSH

28. Placenta to fetus glucose is transported by:

(Recent Pattern Question 2016)

- a. Endocytosis b. Active transport
- c. Facilitated diffusion d. Simple diffusion

29. During excitatory synaptic transmission all are true EXCEPT: (Recent Pattern Question 2016)

- a. Release Ach b. Calcium influx increase
- c. Decrease K^+ efflux d. Increase chloride influx

30. Maximum excitation of cell occurs in which phase?

(Recent Pattern Question 2016)

- a. Depolarization b. Hyperpolarization
- c. After hyperpolarization d. Repolarization

31. Which is true about paracrine communication?

- a. Action across synaptic cleft
- b. Directly from cell to cell
- c. By diffusion in interstitial fluid
- d. By circulating body fluids

32. The electrogenic Na/K ATPase plays a critical role in cellular physiology by?

- a. Using energy in ATP to extrude 3 Na^+ out of cells in exchange for taking two K^+ into the cell
- b. Using energy in ATP to extrude 3 K^+ out of cells in exchange for taking Na^+ into the cell
- c. Using the energy in moving Na^+ into the cell or K^+ outside the cell to make ATP
- d. Using energy in moving Na^+ outside of cell or K^+ inside the cell to make ATP

33. All of the following are calcium binding proteins in muscles EXCEPT?

- a. Troponin I
- b. Calmodulin
- c. Dystrophin
- d. Calcineurin

34. Which of the following is a correct statement?

- a. Desmosomes help to attach the cells to basal lamina
- b. Hemi-desmosomes help to attach cells to each other
- c. Tight junctions permit passage of some solutes between cells
- d. Gap junctions prevent the movement of proteins in the plane of cell membrane

35. All are true about body fluids and electrolytes EXCEPT?

- a. Intracellular fluid constitutes 40% of body weight
- b. Interstitial fluid constitutes 15% of body weight
- c. Insensible losses are 400-800 ml per day
- d. Chloride inside cells is more than outside cells

36. Motor neuron of spinal cord is?

- a. Unipolar cell b. Bipolar cell
- c. Pseudo-unipolar cells d. Multi-polar cells

- 37. A person after Saturday night partying falls asleep with one arm under the head. When he awakens the arm is weak and it tingles and hurts. True reason for this is?**
- A fibers are more susceptible to hypoxia than B fibers
 - A fibers are more sensitive to pressure than C fibers
 - C fibers are more sensitive to pressure than A fibers
 - Motor fibers are more affected by sleep than sensory fibers
- 38. All are true about cardiac muscle EXCEPT?**
- Phase 1 of depolarization is due to opening of voltage gated sodium channels
 - Phase 2 of depolarization is due to slow opening of voltage gated calcium channels
 - Phase 3 of repolarization is due to K^+ efflux
 - Tetany of cardiac muscle is never seen
- 39. Which of the following is responsible for skeletal muscle relaxation?**
- Dystrophin
 - Tropomyosin
 - Myosin
 - Actin
- 40. Which of the following is a unique feature of smooth muscle?**
- Tetany
 - Plasticity
 - Excitation contraction coupling
 - Not recalled
- 41. All are second messengers EXCEPT?**
- cAMP
 - DAG
 - IP₃
 - Guanylyl cyclase
- 42. Transport of Na^+ with sugar from enterocytes is example of?**
- Diffusion
 - Active transport
 - Facilitated diffusion
 - Secondary active transport
- 43. Permeability of which of the following ion leads to resting membrane potential?**
- Chloride
 - Potassium
 - Sodium
 - Calcium
- 44. Decrease extracellular calcium leads to?**
- Decrease excitability of nerves
 - Decrease membrane stability of nerves
 - Increase amount of depolarization needed
 - Increase amount of repolarization
- 45. Which of the following is a neurotransmitter at pre-ganglionic area?**
- ATP
 - Epinephrine
 - Norepinephrine
 - Acetylcholine
- 46. Resting membrane potential of RODS?**
- 70 mV
 - 50 mV
 - 40 mV
 - 30 mV
- 47. RMP of RBC?**
- 90 mV
 - 70 mV
 - 60 mV
 - 12 mV
- 48. Nerve fibers first affected in case of hypoxia?**
- A fibers
 - B fibers
 - C fibers
 - D fibers
- 49. Fastest conducting nerve fiber is?**
- Alpha
 - Beta
 - Gamma
 - Epsilon
- 50. Which of the following fiber is preganglionic?**
- Myelinated A alpha and A delta
 - Unmyelinated A beta and A gamma
 - Myelinated B fibres
 - Unmyelinated C fiber
- 51. True about neuropaxia:**
- Neuronal degeneration
 - Disruption of conduction
 - Disrupted axon and sheath
 - Structural change of nerve
- 52. Exchange between lung capillaries and alveoli is?**
- Facilitated diffusion
 - Passive diffusion
 - Filtration
 - Active transport
- 53. Which of the nerve fiber carry pain:**
- A-Alpha
 - A-Beta
 - A-Gamma
 - C-fibers
- 54. Tickling and itching is carried by which pathway?**
- Lateral spinothalamic tract
 - Anterior spinothalamic tract
 - Posterior spinothalamic tract
 - Dorsal column
- 55. All of the following muscle bands are covered by actin filament EXCEPT?**
- A band
 - H band
 - I band
 - Z band

RENAL PHYSIOLOGY

- 56. Glucose is absorbed from?**
(Recent Pattern Question 2018-19)
- Upper part of PCT
 - Ascending limb of LOH
 - Cortical Collecting duct
 - Medullary collecting duct
- 57. Correct about solute excretion in water diuresis?**
(Recent Pattern Question 2018-19)
- First increases then decreases
 - First decreases and then increases
 - Increased all through
 - Remains unchanged
- 58. Pressure diuresis lowers arterial pressure because it?**
(Recent Pattern Question 2017)
- Lowers blood volume
 - Lowers renal release of renin
 - Lowers systemic vascular resistance
 - Causes renal vasodilation

59. **Thiazide diuretics act on:** (*Recent Pattern Question 2017*)
 a. PCT mainly b. DCT mainly
 c. Loop of henle d. All part of tubule
60. **Maximum vitamin C concentration is seen in?** (*Recent Pattern Question 2017*)
 a. Adrenal b. Liver
 c. Kidney d. Lung
61. **Normal GFR is:**
 a. 25 mL/min b. 50 mL/min
 c. 125 mL/min d. 90 mL/min
62. **Which cells in the kidney are involved in acid secretion?**
 a. Lacin cells b. Principal cells
 c. Intercalated cells d. Granular cells
63. **Macula densa is responsible for?**
 a. Tubulo-glomerular feedback
 b. Glomerulo-tubular feedback
 c. Reno-renal reflex
 d. Maintaining filtration fraction
64. **All of the following increase vasopressin secretion EXCEPT?**
 a. Vomiting b. ECF volume shrinkage
 c. Alcohol d. Tumor
65. **Which of the following is the principal buffer in plasma?**
 a. Haemoglobin
 b. Carbonic acid
 c. Compounds containing histidine
 d. H_2PO_4
66. **Which cells in the kidney produce 1,25 dihydroxy-cholecalciferol?**
 a. Granular cells
 b. Proximal convoluted tubule cells
 c. Mesangial cells
 d. Peritubular cells
67. **Percentage of GFR to renal plasma flow:**
 a. 20% b. 38%
 c. 50% d. 60%
68. **Which of the following combination is true about hormone and its site of action in renal tubules?**
 a. Aldosterone in collecting ducts
 b. Angiotensin in distal tubule
 c. ANP in loop of Henle
 d. ADH in proximal tubule
69. **Aldosterone acts at:**
 a. Collecting duct
 b. Glomerulus
 c. Proximal convoluted tubule
 d. Loop of Henle
70. **CO_2 is mainly transported in blood in which form:**
 a. Dissolved form
 b. HCO_3
 c. Carbamino compound
 d. Gas form
71. **The tubuloglomerular feedback is mediated by:**
 a. Sensing of water concentration in the macula densa
 b. Sensing of Na^+ concentration in macula densa
 c. Sensing of sugar concentration in macula densa
 d. Sensing of NaCl concentration in macula densa
72. **In proximal convoluted tubule H^+ is exchanged for?**
 a. HCO_3^- b. K^+
 c. Cl^- d. Na^+
73. **Osmotic diuretics act on?**
 a. PCT mainly
 b. DCT mainly
 c. Ascending limb of loop of henle
 d. Collecting duct
74. **HCO_3 is absorbed through?**
 a. PCT b. DCT
 c. Loop of Henle d. Collecting duct
75. **RAAS mechanism is mainly regulated by:**
 a. Beta stimulation b. Alpha blocker
 c. Aldosterone antagonism d. $\text{Na}^+ \text{K}^+ \text{ATPase}$
76. **Osmotic difference in renal calyx is maintained by?**
 a. Water b. Sodium
 c. HCO_3 d. Ammonia
77. **25(OH) cholecalciferol is converted to 1,25-dihydroxy-cholecalciferol in:**
 a. Skin b. Lung
 c. Liver d. Kidney
78. **Water is maximally reabsorbed in?**
 a. Collecting duct b. Loop of Henle
 c. Distal convoluted tubule
 d. Proximal convoluted tubule
-
- ## GASTROINTESTINAL PHYSIOLOGY
-
79. **Esters of fat-soluble vitamins are digested by:** (*Recent Pattern Question 2018-19*)
 a. Pancreatic lipase b. Cholesterol Esterase
 c. Colipase d. Carboxypeptidase
80. **Enterokinase is an activator of:** (*Recent Pattern Question 2018-19*)
 a. Trypsinogen b. Trypsin
 c. Chymotrypsin d. Antitrypsin
81. **Histamine is secreted by:** (*Recent Pattern Question 2018-19*)
 a. Enterochromaffin cell b. Parietal cell
 c. Oxyntic cell d. Chief cell
82. **Colipase is an enzyme found in _____?** (*Recent Pattern Question 2018*)
 a. Saliva b. Bile
 c. Pancreatic juice d. Succus entericus
83. **Parietal cell secretes** (*Recent Pattern Question 2016*)
 a. Pepsin b. Mucin
 c. Acid d. Gastrin

- 84. Function of secretin is? (Recent Pattern Question 2016)**
a. Relax pyloric sphincter
b. Increase gastric acid secretion
c. Increase gastric motility
d. Bicarbonate secretion from pancreas
- 85. D xylose absorption test is used to assess which of the following conditions: (Recent Pattern Question 2016)**
a. Colon cancer
b. PUD
c. Celiac disease
d. Ulcerative colitis
- 86. A 41-year-old patient presented with chronic diarrhea from last 3 months. A D xylose absorption test will reveal which of the following: (Recent Pattern Question 2016)**
a. Carbohydrate malabsorption due to mucosal disorder
b. Carbohydrate malabsorption due to chronic pancreatitis
c. Fat malabsorption due to mucosal disorder
d. Fat malabsorption due to chronic pancreatitis
- 87. All of the following are false about gastric juice secretion EXCEPT?**
a. 20% in gastric phase
b. 70% in cephalic phase
c. 70% in gastric phase
d. 20% in intestinal phase
- 88. Hydrochloric acid is produced by?**
a. G-cell
b. D-cell
c. Oxyntic cells
d. Chief cells
- 89. Which of the following statements is true about gastric emptying?**
a. Increased by Secretin
b. Decreased by Cholecystokinin
c. Decreased by Gastrin
d. Increased by GIP
- 90. Gastric emptying is maximum affected by:**
a. Lipids
b. Amino acid
c. Carbohydrates
d. Fiber
- 91. All are correct about stomach EXCEPT:**
a. Parietal cells secrete intrinsic factor
b. Pylorus has more acid secreting cells
c. Lots of goblet cells are present in mucous lining
d. Chief cells secrete pepsinogen
- 92. Starch is hydrolyzed in the mouth by:**
a. Mucin
b. Ptyalin
c. Pancreatic amylase
d. Lipase
- 93. Fecal mass is mainly derived from:**
a. Undigested food
b. Digested food
c. Intestinal secretion
d. Intestinal absorption
- 94. Most sensitive taste sensation is:**
a. Salt
b. Bitter
c. Sweet
d. Acid
- 95. D cells of Islet of Langerhans of pancreas secrete?**
a. Insulin
b. Glucagon
c. Gastrin
d. Somatostatin
- 96. The rate of absorption of sugars by the small intestine is highest for?**
a. Pentose
b. Disaccharides
c. Hexoses
d. Polysaccharides
- 97. Chymotrypsinogen is activated into chymotrypsin by?**
a. Trypsin
b. Pepsin
c. Enterokinase
d. Bile salts
- 98. Enterogastric reflex is stimulated by all, EXCEPT?**
a. Alkaline content of small intestine
b. Hyper-osmolality of chyme
c. Distension of duodenum
d. Intense pain
- 99. Transporter of iron into enterocytes is?**
a. Ferroportin
b. Transferrin
c. Heparidin
d. Divalent metal transporter
- 100. All are functions of CCK EXCEPT?**
a. Gall bladder contraction
b. Contraction of sphincter of oddi
c. Stimulation of pancreatic secretion
d. Inhibits gastric emptying
- 101. CCK is produced by?**
a. Neuro-endocrine cells in the gut
b. Entero-endocrine cells in the gut
c. Interstitial cells of Cajal
d. Hepatocytes
- 102. All are principal digestive enzymes produced by exocrine pancreas EXCEPT?**
a. Trypsinogen
b. Lipase
c. Lactase
d. Amylase
- 103. All are correct about somatostatin hormone EXCEPT?**
a. Paracrine action in GIT
b. Produced by D cells
c. Growth hormone inhibiting hormone
d. Gastro-ileal reflex
- 104. Incorrect about bilirubin?**
a. Conjugation by UDPq Glucoronyl transferase in liver
b. Breakdown by glucuronidase in gut to increase free pool of unconjugated bilirubin
c. Normally excreted in urine
d. Can cross blood brain barrier
- 105. Initiation of basic electrical Rhythm of intestine is by?**
a. Interstitial cells of Cajal
b. Entero-chromaffin cells
c. Auerbach plexus
d. Meissner plexus

ENDOCRINE AND REPRODUCTIVE PHYSIOLOGY

106. Sperm remains in epididymis for ____ hours?

(Recent Pattern Question 2018-19)

- a. 24
- b. 48
- c. 72
- d. 96

107. All are Glucogenic hormones except?

(Recent Pattern Question 2018-19)

- a. ADH
- b. Glucagon
- c. Thyroxine
- d. Glucocorticoids

108. Active form of Vitamin D3 is:

(Recent Pattern Question 2018-19)

- a. Calcitriol
- b. Calciferol
- c. Calcidiol
- d. Ergocalciferol

109. Inhibin-A is produced by?

(Recent Pattern Question 2018-19)

- a. Sertoli cell
- b. Leydig cell
- c. Hilus cell
- d. Placenta

110. Which hormone receptor has 4 subunits and 2 units for tyrosine kinase receptor binding?

(Recent Pattern Question 2018-19)

- a. Insulin
- b. Glucagon
- c. T3
- d. ADH

111. Name the hormone marked on the picture:

(Recent Pattern Question 2018-19)

- a. Inhibin A
- b. Inhibin B
- c. Progesterone
- d. DHEAS

112. The blood levels of 1,25 dihydroxycholecalciferol is positively regulated by: (Recent Pattern Question 2018)

- a. PTH
- b. Calcium
- c. Magnesium
- d. 25 OH cholecalciferol

113. Which acts on intracellular receptor:

(Recent Pattern Question 2016)

- a. TSH
- b. FSH
- c. Glucagon
- d. Epinephrine

114. During spermatogenesis Sertoli cells secrete

(Recent Pattern Question 2016)

- a. FSH
- b. LH
- c. Inhibin
- d. Testosterone

115. Somatostatin is secreted by:

- a. Alpha cells
- b. Beta cells
- c. Gamma cells
- d. Delta cells

116. Adrenal medulla secretes all EXCEPT?

- a. Cortisol
- b. Epinephrine
- c. Nor epinephrine
- d. Dopamine

117. Adrenal medulla secretes:

- a. Neuro hormones
- b. Cortisol
- c. Aldosterone
- d. Vasopressin

118. All of the following are actions of cortisol EXCEPT:

- a. Increase blood amino acid
- b. Decrease liver amino acid
- c. Decrease blood amino acid
- d. Increase liver amino acid

119. Milk ejection is facilitated by:

- a. Prolactin
- b. Oxytocin
- c. Growth hormone
- d. ACTH

120. Which of the following promotes formation of growth hormone?

- a. Cortisol
- b. REM sleep
- c. Glucose
- d. Glucagon

121. Prolactin secretion is not stimulated by:

- a. Levodopa
- b. Sleep
- c. Estrogen
- d. Pregnancy

122. TSH is produced by:

- a. Anterior pituitary
- b. Post pituitary
- c. Hypothalamus
- d. Thyroid gland

123. T4 to T3 conversion in peripheral tissues done by?

- a. Thyroxine peroxidase
- b. D1 Deiodinase
- c. D2 Deiodinase
- d. D3 Deiodinase

124. Which of the following is a negative feedback hormone?

- a. ACTH
- b. Growth hormone
- c. TSH
- d. GnRH

125. True statement about Melatonin are all EXCEPT:

- a. Secreted by pituitary gland
- b. Secreted by pineal gland
- c. Associated with sleep mechanism
- d. Can be used to treat jet lag

126. Separation of first polar body occurs at the time of:

- a. Menstruation
- b. Ovulation
- c. Fertilization
- d. Implantation

127. Sperm head contains:

- a. Axoneme
- b. Mitochondria
- c. Nucleus
- d. None

128. Sertoli cell secretes which hormone:

- a. Testosterone
- b. Inhibin.
- c. LH
- d. FSH

- 129. All are true about capacitation EXCEPT:**
 a. Changes that occur in sperm to penetrate ova
 b. Occurs in female genital tract
 c. Occurs in male genital tract
 d. Sperm loses its cholesterol content in the process
- 130. Defect in leptin leads to:**
 a. Obesity
 b. Anorectic
 c. Both
 d. None
- 131. GLUT receptor on pancreas is?**
 a. GLUT 1
 b. GLUT 2
 c. GLUT 4
 d. GLUT 5
- 132. Insulin increases glucose uptake in?**
 a. Small intestine
 b. Skeletal muscle
 c. RBC
 d. Kidney
- 133. Diagnosis of ovulation can be done by all EXCEPT?**
 a. Study of cervical mucus
 b. Rise in basal body temperature in the second half of cycle
 c. Endometrial histology
 d. Measuring Serum progesterone on day 14 of the cycle
- 134. Release of which one of the following hormones is an example of neuroendocrine secretion?**
 a. Growth hormone
 b. Cortisol
 c. Oxytocin
 d. Thyroxine
- 135. All are true about testosterone EXCEPT?**
 a. Produced by Leydig cells
 b. Produced from Androstenedione secreted by adrenal cortex
 c. Carbon 17 steroid
 d. Secretion under control of LH
- 136. Correct about menstrual cycle?**
 a. Proliferative phase by progesterone
 b. Secretory phase by Estrogen
 c. Superficial 1/3rd of endometrium is shed
 d. Menstrual blood is predominantly arterial
- 137. Inhibin regulates?**
 a. FSH
 b. LH
 c. GnRH
 d. Testosterone
- 138. All hormones peak at term EXCEPT?**
 a. Estriol
 b. Progesterone
 c. Prolactin
 d. hCG
- 139. Spinnbarkeit refers to?**
 a. Cervical mucus
 b. Uterine gland thickness
 c. Cervical os appearance
 d. Proliferation of breast alveoli

- 141. Respiratory quotient of the brain is?**
(Recent Pattern Question 2017)
 a. 0.6–0.7
 b. 0.7–0.8
 c. 0.8–0.9
 d. 0.9–1.0

- 142. Mean pulmonary artery pressure:**
 a. 25 mm Hg
 b. 8 mm Hg
 c. 16 mm Hg
 d. 20 mm Hg

- 143. pO₂ pressure at sea level:**
 a. 140
 b. 150
 c. 160
 d. 180

- 144. Which is correct regarding lungs in an upright posture?**
 a. V/Q ratio is high at the apex of the lung
 b. V/Q ratio is low at the apex of the lung
 c. V/Q ratio is equal at apex and base
 d. None of the above

- 145. Which of the following statement is true about functional residual capacity?**
 a. Tidal volume + Volume Expired forcefully
 b. Volume remaining after forced expiration
 c. Tidal volume + Volume inspired forcefully
 d. Volume remaining after normal expiration

- 146. Production of Surfactant is by:**
 a. Alveolar macrophages
 b. Type I Pneumocytes
 c. Type II Pneumocytes
 d. Clara cells

- 147. Bronchial secretions contain?**
 a. Immunoglobulin G
 b. Immunoglobulin M
 c. Immunoglobulin A
 d. Immunoglobulin E

- 148. Peripheral chemoreceptors are stimulated by?**
 a. CO₂
 b. Hydrogen ions
 c. pH
 d. Oxygen

- 149. The main danger during deep sea diving is due to?**
 a. Oxygen and nitrogen
 b. Oxygen only
 c. Nitrogen only
 d. CO₂ and nitrogen

- 150. At high altitude acclimatization happens due to?**
 a. Increased hemoglobin content and RBC
 b. Increased reticulocyte index
 c. Decreased pulmonary ventilation
 d. Decreased ability of tissues to use oxygen.

- 151. Which of the following is true about hypoxic hypoxia?**
 a. Due to inadequate carrying capacity
 b. Due to inability to utilize oxygen
 c. Due to inadequate gas exchange
 d. Due to slow circulation

- 152. Over-inflation of lung is prevented by?**
 a. Chemo-receptor
 b. Hering-Breuer reflex
 c. Surfactant
 d. Clara cells

- 153. Oxygen hemoglobin dissociation curve shifts to right in all of the following conditions EXCEPT:**
 a. Hyperthermia
 b. Decreased pH
 c. Decreased H⁺
 d. Increase CO₂

RESPIRATORY PHYSIOLOGY

- 140. Transpulmonary pressure is the difference between?**
(Recent Pattern Question 2017)
 a. The bronchus and atmospheric pressure
 b. Pressure in alveoli and intrapleural pressure
 c. Atmosphere and intrapleural pressure
 d. Atmosphere and intraalveolar pressure

- 154. PCO_2 increase leads to:**
- Shift of Oxy-Hb dissociation curve to left
 - Shift of Oxy-Hb dissociation curve to right
 - Shift of Oxy-Hb dissociation curve upwards
 - Shift of Oxy-Hb dissociation curve downwards
- 155. S shaped curve of oxygen hemoglobin dissociation curve is due to?**
- Atmospheric pressure decreases affinity of O_2 binding with Hemoglobin
 - Binding of oxygen to hemoglobin decreases affinity of Hb for CO_2
 - Falling of pH decreases oxygen affinity for Hemoglobin
 - Binding of oxygen molecule increases affinity of binding other oxygen molecule
- 156. Which of the following is not responsible for causing a right shift of the oxygen dissociation curve:**
- Increased carbon dioxide
 - Temperature
 - Exercise
 - Alkalosis
- 157. Pulmonary Chemo-reflex is characterized by?**
- Reflex bradycardia
 - Rise in blood pressure
 - Reflex tachycardia
 - Pulmonary oligemia
- 158. What will happen to respiration if both vagi are cut?**
- Becomes slow and deep
 - Becomes fast and shallow
 - Increase in depth of respiration
 - Increase in rate of breathing
- 159. "Obstructive sleep apnea" is defined as temporary pause in breathing during sleep lasting at least?**
- 40 seconds
 - 30 seconds
 - 20 seconds
 - 10 seconds
- 160. Damage to pneumotaxic centre will cause?**
- Apneusis
 - Apnea
 - Slower breathing with greater tidal volume
 - Faster breathing with lesser tidal volume
- 161. Damage to J receptors in lungs will result in?**
- Apnea followed by Rapid shallow breathing
 - Hyperpnea followed by rapid shallow breathing
 - Cardiac arrest
 - Hering Breuer reflex
- 162. Myoglobin binds to _____ molecules of oxygen?**
- 1
 - 2
 - 3
 - 4
- 163. Normal ventilation/perfusion ratio is?**
- 0.8
 - 1.2
 - 1.6
 - 2.0
- 164. Normal respiratory minute volume is ?**
- Tidal volume \times Respiratory rate
 - Tidal volume/Respiratory rate
 - TLC/Respiratory rate
 - FRC/Respiratory rate
- 165. Which of the following statement is true about inspiratory capacity:**
- Tidal volume + volume expired forcefully
 - Volume remaining after forced expiration
 - Tidal volume + volume inspired forcefully
 - Volume remaining after normal expiration
- 166. Which of the following is seen in placenta?**
- Bohr effect
 - Double Bohr effect
 - Hamburger phenomenon
 - Haldane effect
- 167. Cut off limit for deoxygenated hemoglobin for appearance of cyanosis is?**
- >4 gm%
 - >5 gm%
 - <2 gm%
 - <4 gm%
- 168. Which is the site of generation of respiratory rhythm?**
- Botzinger complex
 - Pre-Botzinger complex
 - Dorsal respiratory group of neurons in medulla
 - Ventral respiratory group of neurons in medulla

CARDIOVASCULAR AND CIRCULATORY PHYSIOLOGY

- 169. Which is true about heart sound?** *(Recent Pattern Question 2017)*
- First heart sound has maximum frequency
 - First heart sound has maximum duration
 - First heart sound is due to semilunar valve closure
 - Second heart sound is due to AV valve closure
- 170. Purkinje fibers are** *(Recent Pattern Question 2016)*
- Nerve fibers
 - Modified muscle fibers
 - Modified connective tissue fibers
 - Retinal fibers
- 171. Forward blood flow in the fetal venous system is in this phase** *(Recent Pattern Question 2016)*
- Preload
 - After load
 - Systolic volume
 - All of the above
- 172. What is the reason for increased interstitial fluid?** *(Recent Pattern Question 2016)*
- Increase hydrostatic pressure, increase oncotic pressure
 - Decrease hydrostatic pressure, decrease oncotic pressure
 - Increase hydrostatic pressure, decrease oncotic pressure
 - Decrease hydrostatic pressure, increase oncotic pressure

173. All of the following statements are false EXCEPT:

- a. Right ventricle work more than left ventricle
- b. Left ventricle works more than right ventricle
- c. Both ventricle work equal
- d. Maximum ventricular filing occurs in isovolumetric contraction

174. All are true EXCEPT:

- a. SA is dominant pacemaker
- b. AV node shows fast conduction
- c. Purkinje fibres have fastest conduction
- d. AV nodal delay is 0.1 sec.

175. All of the following statements are false about stroke volume EXCEPT:

- a. Determined by after load
- b. Determined by pre-diastolic volume
- c. Decreases by increase in heart rate
- d. Increased by increase in heart rate

176. Severe HTN cut off is

- a. >140 mm Hg
- b. >150 mm Hg
- c. >160 mm Hg
- d. >170 mm Hg

177. In JVP, "a- wave" is due to:

- a. Atrial relaxation
- b. Atrial filling
- c. Atrial contraction
- d. Ventricular relaxation

178. Which of the following is true about Coronary blood flow?

- a. Stable throughout the cardiac cycle
- b. Maximum during diastole
- c. Maximum during systole
- d. Regulated by sympathetic vasodilatory activity

179. Repolarization in isolated muscle piece fiber proceeds from?

- a. Epicardium to endocardium
- b. Endocardium to epicardium
- c. Left to right
- d. Right to left

180. Sympathetic Stimulation causes all of the following, EXCEPT

- a. Increase in heart rate
- b. Increase in blood pressure
- c. Increase in total peripheral resistance
- d. Increase in venous capacitance

181. Incorrect about ECG?

- a. Normal axis of heart is -30 to +110 degrees
- b. ST segment is 0.40 seconds
- c. Holter is ambulatory recording
- d. AV nodal delay is 0.1 seconds

182. Which represent ventricular systole?

- a. Start of P to end of T wave
- b. End of P to end of T wave
- c. Middle of R to end of T wave
- d. Start of q to end of S wave

183. Dicrotic notch corresponds to?

- a. Closure of AV valves
- b. Closure of Aortic and pulmonic valves
- c. Opening of AV valves
- d. Opening of Aortic and pulmonic valves

184. Which of the following is correct about Frank starling law?

- a. Explains the increase in heart rate produced by exercise
- b. Explains the increase in cardiac output when venous return is increased
- c. Explains the decrease in heart rate in spinal shock
- d. Explains the decrease in heart rate by Valsava manoeuvre

185. Cardiac output is measured by all EXCEPT?

- a. Doppler
- b. Oscillometry
- c. Thermo-dilution method
- d. Fick's principle

186. All are true about circulating changes in exercising muscle EXCEPT?

- a. Complete flow stops on maximal tension reaching 70%
- b. Blood supply increases by 30 times between contractions
- c. Dilation of arterioles and pre-capillaries
- d. Peripheral resistance increases

187. Dromotropy is?

- a. Increase in Rate of transmission
- b. Increase in Force of contraction
- c. Increase in RMP potential
- d. Increase in action potential duration

188. Not a component of JVP?

- a. A wave bigger than V wave
- b. C wave is called as Dicrotic notch
- c. X wave is seen ventricular systole
- d. Y descent in ventricular diastole

189. Traube Hering waves are due to?

- a. Fluctuation in BP with respiration
- b. Fluctuations in JVP with respiration
- c. Fluctuation in CVP with respiration
- d. Fluctuation in ICP with respiration

190. Which of the following has maximum cross sectional area

- a. Aorta
- b. Artery
- c. Venule
- d. Arteriole

191. Normal arm to tongue circulation time is

- a. 5 seconds
- b. 10 seconds
- c. 15 seconds
- d. 30 seconds

CNS AND PNS PHYSIOLOGY

192. Resistance against passive stretch is called?

(Recent Pattern Question 2018-19)

- | | |
|-------------|---------------|
| a. Tone | b. Spasticity |
| c. Rigidity | d. Paratonia |

193. Which structure connects the Broca's area and Wernicke area?

(Recent Pattern Question 2018-19)

- | | |
|-----------------------|------------------------|
| a. Arcuate fasciculus | b. Anterior commissure |
| c. Corpus callosum | d. Fornix |

194. Reward centre in the brain is?

(Recent Pattern Question 2018-19)

- | | |
|----------------|---------------------------|
| a. Amygdala | b. Thalamus |
| c. Hippocampus | d. Ventral tegmental area |

195. Which part of thalamus is related to motor control?

(Recent Pattern Question 2018-19)

- a. Ventrolateral thalamus
- b. Ventral posteromedial
- c. Ventral posterolateral
- d. Superior and inferior colliculi

196. In case a small stimulus causes more pain, it is called

(Recent Pattern Question 2018-19)

- | | |
|---------------------|--------------|
| a. Hypersensitivity | b. Causalgia |
| c. Hyperalgesia | d. Allodynia |

197. Stretch stimulus is mediated by which of the following receptors?

(Recent Pattern Question 2018)

- | | |
|------------------|-------------------|
| a. Merkel's disc | b. Meissner |
| c. Pacinian | d. Muscle spindle |

198. During sleep which hormone is increased?

(Recent Pattern Question 2017)

- | | |
|--------------|-------------|
| a. Serotonin | b. Dopamine |
| c. GABA | d. Ach |

199. Which is true about sleep cycle?

(Recent Pattern Question 2017)

- a. REM is half of sleep cycle
- b. Muscle tone is absent in REM sleep
- c. NREM is 25% of sleep cycle
- d. Muscle tone is absent in NREM sleep

200. mGluR 4 is associated with which taste?

(Recent Pattern Question 2016)

- | | |
|-----------|----------|
| a. Sweet | b. Sour |
| c. Bitter | d. Umami |

201. Which cells secrete glutamate in cerebellum?

(Recent Pattern Question 2016)

- | | |
|------------------|-----------------|
| a. Stellate cell | b. Basket cells |
| c. Granular cell | d. Golgi cell |

202. Excitatory neurotransmitter of brain is?

(Recent Pattern Question 2016)

- | | |
|--------------|--------------|
| a. GABA | b. Aspartate |
| c. Glutamate | d. Glycine |

203. Not a part of basal ganglia is?

- | | |
|-----------------------|-----------------------|
| a. Caudate nucleus | b. Corpus striatum |
| c. Lenticular nucleus | d. Sub-Fornical organ |

204. True about GABA:

- a. Excitatory neurotransmitter
- b. Inhibitory to neuron
- c. Facilitatory neurotransmitter
- d. Stimulatory to neuron

205. Brain contains which neurotransmitter:

- | | |
|-------------|---------------|
| a. Tyrosine | b. Glutamate |
| c. Serine | d. Tryptophan |

206. All of the following cells are present in cerebellar cortex EXCEPT:

- | | |
|------------------|------------------|
| a. Granular cell | b. Purkinje cell |
| c. Golgi cell | d. Bipolar cell |

207. Posterior pre-frontal cortex contains which of the following areas?

- | | |
|--------------------|----------------------------|
| a. Wernicke's area | b. Broca's area |
| c. Brodmann's area | d. Limbic association area |

208. Broca's area is located at?

- | | |
|----------------------------|----------------------------|
| a. Inferior frontal gyrus | b. Superior temporal gyrus |
| c. Inferior temporal gyrus | d. Superior frontal gyrus |

209. Which of the following vascular occlusion is the most common cause of hemiplegia?

- | | |
|-----------------------------|---------------------------|
| a. Basilar artery | b. Vertebral artery |
| c. Anterior cerebral artery | d. Middle cerebral artery |

210. Auditory receptor is present in:

- | | |
|----------------------------|----------------------------|
| a. Broca's area | b. Cingulate gyrus |
| c. Superior temporal gyrus | d. Inferior temporal gyrus |

211. Damage to preoptic nuclei of brain leads to?

- a. Decrease heart rate, decrease arterial pressure
- b. Increase heart rate, increase arterial pressure
- c. Increase heart rate, decrease arterial pressure
- d. Decrease heart rate, increase arterial pressure

212. Which is the Longest duration NREM Stage?

- | | |
|------------|----------------------|
| a. Stage 1 | b. Stage 2 |
| c. Stage 3 | d. Spread throughout |

213. Teeth grinding is seen in which stage of sleep:

- | | |
|-----------|-----------|
| a. NREM 1 | b. NREM 2 |
| c. NREM 3 | d. NREM 4 |

214. The alpha rhythm appearing in EEG has the following characteristic feature?

- a. Produces 20-30 waves per second.
- b. Disappear when a patient opens eyes
- c. Associated with deep sleep
- d. Replaced by slower, larger waves during REM sleep

215. Hippocampal formation includes all, EXCEPT?

- | | |
|-----------------------|----------------------|
| a. Dentate gyrus | b. Subiculum |
| c. Amygdaloid nucleus | d. Entorhinal cortex |

216. The inability to perceive the texture & shape an object occurs in lesion of?

- a. Lateral Spinothalamic tract
- b. Nucleus gracilis
- c. Spino-reticular tract
- d. Nucleus cuneatus

PHYSIOLOGY OF BLOOD

- 241. All of the following proteins are synthesized by the liver EXCEPT:**
 a. Haptoglobin b. Antithrombin-III
 c. Von willebrand factor d. Hemopexin
- 242. During second trimester of pregnancy, erythropoiesis occurs in the fetus primarily in?**
 a. Liver b. Spleen
 c. Red bone marrow d. Lymph nodes
- 243. Which one of the following is NOT a function of albumin?**
 a. Osmoregulation b. Solubilization of glucose
 c. Transport of hormones d. Transport of bilirubin
- 244. Which of the following is major mechanisms causing heat loss from a normal person when the environmental temperature is 21°C?**
 a. Conduction b. Convection
 c. Radiation d. Evaporation
- 245. Shivering is caused by?**
 a. Stimulation of fibers coming from anterior hypothalamus
 b. Stimulation of fibers coming from posterior hypothalamus
 c. Stimulation of fibers coming from intermediate lobe of hypothalamus
 d. Stimulation of median eminence
- 246. Which of the following plasma proteins is not synthesized primarily in liver?**
 a. Angiotensinogen b. C-reactive protein
 c. Angiotensin converting enzyme
 d. Fibrinogen
- 247. Normal plasma osmolality (in mOsm/kg) is:**
 a. 100-125 b. 200-225
 c. 275-300 d. 300-325
- 248. The chief intracellular ion in our body is?**
 a. K⁺ b. Na⁺
 c. Ca²⁺ d. Mg²⁺
- 249. Half-life of serum albumin is?**
 a. 10 days b. 21 days
 c. 36 days d. 60 days
- 250. Serum bilirubin is composed of?**
 a. Conjugated plus direct reacting bilirubin
 b. Conjugated plus indirect reacting bilirubin
 c. Conjugated plus indirect reacting plus delta bilirubin
 d. Conjugated plus direct reacting plus delta bilirubin
- 251. Peyer's patches are seen in?**
 a. Stomach b. Duodenum
 c. Ileum d. Jejunum
- 252. Oxytocin will not do the following action?**
 a. Milk production
 b. Milk let down
 c. Contraction of myoepithelial cells
 d. Vasoconstriction
- 253. Rough and smooth texture of surface can be detected by:**
 a. Merckel's disc b. Pacinian corpuscle
 c. Ruffini's end organ d. Meissner's corpuscles
- 254. All are true about hormone and their mechanisms except?**
 a. Insulin: increase tyrosine kinase activity
 b. ANP: increase cGMP levels in cells
 c. Thyroid hormone: stimulate nuclear receptors
 d. Angiotensin II: increase cAMP levels in cells
- 255. GM-CSF can stimulate all cell lines EXCEPT?**
 a. Granulocyte b. Megakaryocyte
 c. Erythrocyte d. Monocyte
- 256. Mechanism of action of Nitric oxide is through which second messenger?**
 a. cAMP b. cGMP
 c. PIP d. IP3/DAG

BOARD REVIEW QUESTIONS

- 257. Interleukin involved in anaphylaxis?**
 a. IL-1 b. IL-4
 c. IL-6 d. IL-11
- 258. Purkinje cells are?**
 a. Unipolar cells b. Bipolar cells
 c. Pseudo-unipolar cells d. Multipolar cells
- 259. Flickering of eyelids is?**
 a. Myotonia b. Myokymia
 c. Myoclonus d. Myaesthesia
- 260. IPSP (inhibitory post synaptic potential) is produced by?**
 a. Chloride transport b. Sodium transport
 c. Potassium transport d. Calcium transport
- 261. Young Helmholtz theory deals with?**
 a. Color vision
 b. Saccades
 c. Pursuit movements
 d. Detect of shape and texture of object
- 262. Dicrotic notch corresponds to?**
 a. Closure of AV valves
 b. Closure of Aortic and pulmonic valves
 c. Opening of AV valves
 d. Opening of Aortic and pulmonic valves
- 263. Para haemophilia is deficiency of?**
 a. Factor 5 b. Factor 7
 c. Factor 8 d. Von willebrand disease
- 264. Sounds of korotkoff are heard during?**
 a. BP recording b. Lung auscultation
 c. Cardiac auscultation d. ICP monitoring
- 265. Which of the following has the highest cross sectional area in the body**
 a. Arteries b. Arterioles
 c. Capillaries d. Venules
- 266. Membrane fluidity is increased by:**
 a. Stearic acid b. Palmitic acid
 c. Cholesterol d. Linoleic acid

- 267. RMP of RBC is mainly due to:**
a. K leak channels b. Na-K pump
c. Na leak channels d. Cl⁻ leak channels
- 268. Number of ATP required for myosin head detachment:**
a. 1 b. 1.5
c. 2 d. 2.5
- 269. Optimum length corresponds to sarcomere length:**
a. 2–2.2 μm b. 3–3.2 μm
c. 5–5.5 μm d. 10–100 μm
- 270. Windkessel effect is seen in:**
a. Large elastic vessel b. Capillaries
c. Capacitance vessel d. Venules
- 271. Duration of 2nd heart sound:**
a. 0.15 sec b. 0.12 sec
c. 0.10 sec d. 0.08 sec
- 272. Resting membrane potential of rods**
a. –70 mV b. –50 mV
c. –40 mV d. –30 mV
- 273. The most susceptible fibre to hypoxia is**
a. A b. B
c. C d. All are equally sensitive
- 274. Burning pain is carried by which type of fibres**
a. A alpha b. A delta
c. A beta d. C
- 275. Permeability of which of the following ion leads to resting membrane potential:**
a. Chloride b. Potassium
c. Sodium d. Calcium
- 276. Glucose linked uptake transporter present on sperms?**
a. GLUT 2 b. GLUT 3
c. GLUT 4 d. GLUT 5
- 277. Which of the following is the principal buffer in interstitial fluid?**
a. Haemoglobin
b. Carbonic acid
c. Albumin
d. Compounds containing histidine
- 278. Damage to pneumotaxic centre will cause?**
a. Apnoea
b. Apnea
c. Slower breathing with greater tidal volume
d. Faster breathing with lesser tidal volume
- 279. Myoglobin binds to _____ molecules of oxygen?**
a. 1 b. 2
c. 3 d. 4
- 280. Normal ventilation/perfusion ratio is**
a. 0.8 b. 1.2
c. 1.6 d. 2.0
- 281. Normal respiratory minute volume is**
a. Tidal volume X respiratory Rate
b. Tidal volume/ Respiratory Rate
c. TLC/ Respiratory Rate
d. FRC/ Respiratory Rate
- 282. Guardian angel against obesity?**
a. Adiponectin b. Leptin
c. Ghrelin d. Pro-opiomelanocortin
- 283. Vitamin D is synthesized in**
a. Proximal tubule kidney b. Lacin cells kidney
c. Granular cells kidney d. Distal tubule kidney
- 284. Growth in fetal period is determined by?**
a. IGF-1 b. IGF-2
c. Insulin d. Growth Hormone
- 285. Clonus is due to**
a. Upper motor neuron damage
b. Lower motor neuron damage
c. Extrapyramidal damage
d. Cerebellar damage
- 286. Clasp knife effect is seen in**
a. Flaccidity b. Rigidity
c. Spasticity d. All of the above
- 287. Corpus striatum is formed by?**
a. Caudate and putamen
b. Caudate and subthalamic nucleus
c. Caudate and lenticular nucleus
d. Caudate and subthalamic nucleus
- 288. Inverse stretch reflex is _____?**
a. Monosynaptic reflex
b. Bi-Synaptic Reflex
c. Polysynaptic reflex
d. Occurs when Ia spindle fibres are inhibited
- 289. Inhibin regulates?**
a. FSH b. LH
c. GnRH d. Testosterone
- 290. Hormone with shortest half life?**
a. Corticosterone b. Renin
c. Aldosterone d. Nor-epinephrine
- 291. SAN is innervated by**
a. Nucleus ambiguus
b. Nucleus tractus solitarius
c. Edinger westphal nucleus
d. Celiac ganglion
- 292. Peyer's patches are seen in**
a. Stomach b. Duodenum
c. Ileum d. Jejunum
- 293. Most sensitive taste sensation is**
a. Salt b. Bitter
c. Sweet d. Sour
- 294. HCO_3^- is absorbed through**
a. Cortical collecting duct
b. Medullary collecting duct
c. PCT
d. DCT
- 295. Herring breuer reflex is an increase in:**
a. Duration of inspiration b. Depth of inspiration
c. Duration of expiration d. Depth of expiration

- 296. Gastric emptying is maximum affected by:**
 a. Lipids b. Amino acid
 c. Carbohydrates d. Fiber
- 297. Mean pulmonary capillary pressure:**
 a. 25 mm Hg b. 7 mm Hg
 c. 16 mm Hg d. 20 mm Hg
- 298. Glucagon is secreted by:**
 a. Alpha cells b. Beta cells
 c. Gamma cells d. Delta cells
- 299. Which of the following contains C-18**
 a. Testosterone b. Estrogen
 c. Androgen d. Progesterone
- 300. Corpus luteum is maintained by**
 a. Progesterone b. LH
 c. FSH d. Estrogen
- 301. Sertoli cells play a key role in which of the following process**
 a. Spermiogenesis
 b. Testosterone secretion
 c. Secretion of seminal fluid
 d. Gonadogenesis
- 302. Capacitance of sperms takes place in**
 a. Seminiferous tubules b. Epididymis
 c. Vas deferens d. Uterus
- 303. Intrauterine growth of fetus is affected by all EXCEPT**
 a. Growth hormone b. Insulin
 c. Thyroxine d. Glucocorticoids
- 304. Fuel for sperm motility**
 a. Glucose b. Fructose
 c. Fatty acids d. Prostatic acid phosphatase
- 305. ACE is produced by**
 a. Lung endothelium b. Liver sinusoids
 c. Alveolar macrophages d. Kupffer cells
- 306. Paneth cells are seen in**
 a. Crypts of lieberkuhn b. Submucosa of appendix
 c. Carcinoid tumor d. Lungs
- 307. K^+ concentration is maximum in**
 a. Saliva b. Rectal secretions
 c. Bile d. Semen
- 308. Hamburger effect is**
 a. Chloride shift in RBC
 b. CO_2 shift in RBC
 c. Binding of oxygen to Hb in alveoli
 d. Binding of carbon dioxide to Hb in Tissue
- 309. Windkessel effect is**
 a. Elastic recoil of blood vessels
 b. Critical closing volume of lungs
 c. Autoregulation in heart
 d. Starling forces
- 310. CCK causes all EXCEPT**
 a. Gall bladder contraction
 b. Inhibit gastric emptying
 c. Enhance small intestine motility
 d. Enhance small intestine secretions
- 311. Faeces contain?**
 a. Undigested plant fiber b. Bacteria
 c. Water d. All
- 312. Chymotrypsinogen is activated into chymotrypsin by**
 a. Trypsin b. Pepsin
 c. Fatty acids d. Bile salts
- 313. Most important stimulant for bile secretion is**
 a. Cholecystokinin b. Secretin
 c. Bile acid d. Bile salt
- 314. Bilirubin is derived from**
 a. Myoglobin b. Hemoglobin
 c. Muscle d. Cholesterol
- 315. Best test for GFR is with**
 a. Inulin b. Hippuric acid
 c. Creatinine d. PAH
- 316. Elimination of waste product from a normal person requires minimal amount of urine of**
 a. 100 mL b. 500 mL
 c. 800 mL d. 2000 mL
- 317. Which one of the following acts as second messenger**
 a. Mg^{++} b. Cl^-
 c. Ca^{++} d. PO_4
- 318. Delta cells of pancreas secretes**
 a. Glucagon b. Insulin
 c. Somatostatin d. Pancreatic polypeptide
- 319. Malpighian corpuscles are seen in**
 a. Skin b. Kidney
 c. Brain d. Spleen
- 320. Fecal mass is mainly derived from**
 a. Undigested food b. Digested food
 c. Intestinal secretion d. Intestinal absorption
- 321. The main danger during deep sea diving is due to**
 a. Oxygen and nitrogen b. Oxygen only
 c. Nitrogen only d. CO_2 and nitrogen
- 322. Oculo-cardiac reflex leads to**
 a. HR decreased b. HR increased
 c. Apnea d. Hyperpnea
- 323. Time taken for sperm to reach fallopian tube**
 a. Minutes b. 6 hrs
 c. 12 hrs d. 24 hrs
- 324. Area outside blood brain barrier is?**
 a. Anterior pituitary b. Neurohypophysis
 c. Basal ganglia d. Optic chiasma
- 325. RMP of skeletal muscle is**
 a. -50 mV b. -60 mV
 c. -70 mV d. -90 mV

- 326. Minimum strength of current stimulus to produce a response**
- Rheobase
 - Chronaxie
 - All or none law
 - Utilization time
- 327. Most abundant AA in brain?**
- Glutamate
 - Glycine
 - Aspartate
 - Lysine
- 328. System which consist of Ammon's Horn is?**
- Olfactory system
 - Auditory system
 - Limbic system
 - Vestibular system
- 329. Ability to identify objects by touching without looking at them is called as?**
- Stereognosis
 - Kinesthetic proprioception
 - Synthetic sense
 - Allodynia
- 330. Which is a polysynaptic reflex?**
- Light reflex
 - Corneal reflex
 - Withdrawal reflex
 - Gag reflex
- 331. Receptor for inverse stretch reflex?**
- Golgi tendon organ
 - Intra-fusal Fiber
 - Extra-fusal Fiber
 - Alpha motor neuron
- 332. Righting reflexes are mediated by?**
- Cortex
 - Midbrain
 - Pons
 - Medulla
- 333. Basal ganglia does not include?**
- Caudate nucleus
 - Lenticular nucleus
 - Thalamus
 - Globus pallidus
- 334. All cross BBB EXCEPT**
- Insulin
 - Carbon dioxide
 - Urea
 - Bilirubin
- 335. Blood brain barrier is formed by?**
- Foot processes of astrocytes and endothelial cells
 - Foot processes of oligodendrocytes and endothelial cells
 - Foot process of microglia and endothelial cells
 - Foot process of glial cells and endothelial cells
- 336. Incorrect about brown Sequard syndrome?**
- Hemi-section of spinal cord
 - Contralateral loss of proprioception
 - Contralateral loss of pain and temperature
 - Brisk knee jerk on the side of lesion
- 337. In JVP, "a-wave" is due to**
- Atrial relaxation
 - Atrial filling
 - Atrial contraction
 - Ventricular relaxation
- 338. All of the following statements are false EXCEPT**
- Right ventricle work more than left ventricle
 - Left ventricle work more than right ventricle
 - Both ventricle work equal
 - None
- 339. True about nerve fibre 'C' is?**
- Most susceptible to Hypoxia
 - Unmyelinated
 - Preganglionic autonomic
 - Not for temp. & pain sense
- 340. True about Renshaw cell inhibition is**
- Acts on collateral sensation
 - Increases by local anaesthetics
 - Has memory for spinal cord
 - Inhibition of feed back propagation
- 341. Calmodulin activates**
- Muscle phosphorylase
 - Protein kinase
 - 2, 3 DPG
 - Glucokinase
- 342. Autoregulation means**
- Maintains the perfusion
 - Maintains Blood pressure
 - Regulated by local metabolites
 - Well developed in the skin
- 343. Lewis triple response is mediated by**
- Histamine
 - Axon reflex
 - Injury to endothelium
 - None of the above
- 344. True about lipid bilayer of cell wall**
- Asymmetrical arrangement of cell wall component
 - Lateral diffusion of ions
 - Symmetrical arrangement of cell wall components
 - Not made up of amphipathic lipids
- 345. Clathrin is used in**
- Receptor mediated endocytosis
 - Exocytosis
 - Cell to cell adhesion
 - Plasma membrane
- 346. D₂O (Deuterium oxide) is used to measure volume of**
- Blood
 - Total body water
 - Extracellular fluid
 - Intracellular fluid
- 347. Which of these is not a part of extracellular matrix**
- Laminin
 - Fibronectin
 - Integrins
 - Collagen
- 348. All of the following metabolic functions occur in the mitochondria, EXCEPT**
- Beta oxidation of fatty acids
 - Biosynthesis of fatty acids
 - Protein synthesis
 - Citric acid cycle
- 349. A band which disappears on muscle contraction is**
- I
 - H
 - A
 - Z
- 350. Stimulation of post ganglionic sympathetic neurons leads to all EXCEPT**
- Fast EPSP
 - Slow EPSP
 - Fast IPSP
 - Very slow EPSP
- 351. Fine, irregular contraction of individual fibers called**
- Fasciculations
 - Fibrillation
 - Tics
 - Spasm

352. Best method to increase, the muscle strength is

- a. Isometric exercise b. Isotonic exercise
- c. Aerobic isotonic exercise d. Electrical stimulation

353. Strychnine acts by

- a. Exciting all the excitatory synapses in the cord
- b. Blocking inhibitory synapses
- c. Being incorporated as substitute transmitter in monoaminergic synapses
- d. Directly exciting the skeletal muscle fibrosis

354. Fick's Law of Diffusion indicates

- a. Active diffusion along concentration gradient
- b. Passive diffusion along concentration gradient
- c. Active diffusion against concentration gradient
- d. Passive diffusion against concentration gradient

355. Warfarin inhibits following coagulation factors

- a. II, V, VII, IX b. II, VII, IX, X
- c. II, V, IX, X d. II, IX, X, XIII

356. Von willebrand factor is secreted by

- a. Liver b. Kidney
- c. Vascular endothelium d. Adrenals

357. Effect of fetal hemoglobin on O_2 dissociation

- a. Right shift
- b. Left shift
- c. No effect
- d. May be right to left

358. Auditory receptor present in

- a. Broca's area
- b. Cingulate gyrus
- c. Superior temporal gyrus
- d. Inferior temporal gyrus

359. Cardiac index is

- a. Cardiac output/Body surface area
- b. Cardiac output/Blood pressure
- c. Cardiac output/End diastolic BP
- d. Cardiac output X Heart rate

IMAGE-BASED QUESTION

360. Which of the following is QT interval?

- a. A
- b. B
- c. C
- d. D

Answer to Image-Based Question is given at the end of explained question

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTIONS 2019

1. Ans. (c) Peripheral resistance

Ref: Ganong 26th ed. P 530

Dicrotic notch is seen in pulse tracing after closing of aortic valve. The peripheral resistance generates an aberration in tracing while the aortic valves are closing. In simple words it is the pressure exerted by the vascular tree back upon the aortic valve.

2. Ans. (b) Enhance salt absorption

Ref: Ganong 25th ed. P 478

In diarrhoea only salt is lost but sugar is added as it helps to absorb salt and sugar by process of symport. The transporter in the gut is SGLT-1.

3. Ans. (a) AV valves are closed

Ref: Ganong 25th ed. P 539

Isovolumetric relaxation is characterised by initiation of relaxation of heart and venous return is initiated. The blood will however not enter into ventricles since Atrio-ventricular valves are closed.

Choice B, QT interval corresponds to ventricular contraction and relaxation.

Choice C, c wave of JVP occurs in Isovolumetric contraction
Choice D, Semilunar valves opening occurs in ejection phase of cardiac cycle.

4. Ans. (a) AV valves are closed

Ref: Ganong, 25th ed. P 651

- Histotoxic hypoxia refers to a reduction in ATP production by the mitochondria due to a defect in the cellular usage of oxygen while the delivery to tissues is normal. The problem lies with extraction.
- Choice B, Hypoxic hypoxia occurs when the PO_2 of arterial blood falls. This could occur because inspired PO_2 is lower than normal (high altitude) or it could be due to a respiratory problem (e.g., hypoventilation, diffusion impairment caused by pulmonary oedema)
- Choice C, Stagnant hypoxia in terms of oxygen transport there is a decreased blood flow/hypoperfusion and thus the problem resides with the cardiovascular system.
- Choice D will have low delivery due to shortage of oxy-Hb values

5. Ans. (b) 16 times

Ref: Ganong: 26th ed. P 563

- The influence of lumen diameter on resistance is dramatic. This is because resistance is inversely proportional to the radius of the blood vessel (one-half of the vessel's diameter) raised to the fourth power ($R = 1/r^4$).
- This means, that if an artery or arteriole constricts to one-half of its original radius, the resistance to flow will increase 16 times. And if an artery or arteriole dilates to twice its initial radius, then resistance in the vessel will decrease to 1/16 of its original value and flow will increase 16 times.

6. Ans. (b) 6–12

Ref: Harrison 20th ed. page 316

Normal anion gap is Sodium minus sum of chloride and bicarbonate.

$$\text{Anion gap} = Na^+ - (Cl^- + HCO_3^-)$$

It is approximately 6–12 mmol/L with average of 10 mmol/L

7. Ans. (b) Apneustic breathing

Ref: Ganong: 25th ed. Page 656

FMGE Solutions Screening Examination

126

Prolonged inspiratory spasm that resemble breath holding is called apneusis. It occurs in case of damage to pneumotaxic centre with cut vagi.

Bradypnea Slow respirations <10 breaths/min	CVA diabetic coma, head injury, increased ICP, metabolic disorder, opioid overdose, sleep	Cheyne-stokes Increasing depth followed by apnea	Altitude sickness, brain stem injury, CO poisoning, CHF, CVA, increasing ICP, metabolic encephalopathy, uremia
Tachypnea Fast, shallow respirations >24 breaths/min	Anxiety, exercise, fever, shock	Air trapping Increasing expiratory difficulty	Asthma, bronchiolitis obliterans syndrome, chronic bronchitis, emphysema
Hyperpnea Deep, regular, respirations at normal rate	Diabetic ketoacidosis, emotional stress	Obstructive Prolonged expirations	Asthma, COPD
Kussmaul Regular, rapid, deep respirations	Diabetic ketoacidosis, exercise, metabolic acidosis, renal failure	Sighing Regular breathing with frequent deep breaths	Anxiety, asthma, fatigue, hyperventilation syndrome
Hypopnea Shallow, regular, respirations at normal rate	Anxiety, asthma, hyperventilation, obesity, pneumonia, pulmonary edema, sedatives, shock, tonsillitis	Apneustic Prolonged inspiration and expiration	Brain stem lesion, CVA, brain stem injury
Ataxic Irregular, disorganized, varying depth	CVA, medullary brain trauma	Agonal Occasional reflex driven gasps	Anoxia, cardiac arrest, cerebral ischemia, hypoxia
Biot Irregular, disorganized with periods of apnea	Brain trauma, CNS disorder, CVA, opioid overdose, spinal meningitis	Apnea Absence of breathing	CVA, brain trauma, deceased

CELL AND NERVE-MUSCLE PHYSIOLOGY

8. Ans. (a) Calcium

Ref: Ganong 25th ed. page 5

- Potassium, magnesium, and phosphate are the three most common electrolytes in the ICF.

- Intracellular fluid is the place where most of the fluid in the body is contained (40% body weight).

- Magnesium is the second most important intracellular cation after potassium. Less than 1% of total body magnesium is found in red blood cells. It is distributed principally between the bone, muscle, and soft tissues.

9. Ans. (d) Clathrin

Ref: Ganong 25th edition. page 56

- Clathrin plays a role in endocytosis.
- Calcium binding proteins are troponin, Calmodulin, at Calbindin.
- The major role of *calbindin* is to facilitate the vitamin D dependent movement of calcium through the cytosolic compartment of the intestinal or renal cell. It also plays a role in different cell types in protecting against apoptotic cell death
- Troponin* is a calcium binding protein involved in contraction of skeletal muscle.
- Calmodulin* plays a role in smooth muscle contraction.

Extra Mile

Calcineurin is a phosphatase that inactivates calcium channels by dephosphorylating them. It also plays a role in activating T cells and is inhibited by immunosuppressants.

10. Ans. (a) Golgi tendon

Ref: Ganong 25th ed. pg. 232

- Up to a certain point, harder a muscle is stretched the stronger it will contract. However when the tension becomes great enough, contraction ceases and muscle relaxes. This relaxation in response to strong stretch is called inverse stretch reflex.
- The receptor for the same is called Golgi tendon organ. It is a net like connection of knobby nerve endings amongst the fascicles of a tendon.
- There are 3-25 muscle fibers per Golgi tendon organ.
- The fibres from Golgi tendon organ make up I_b group of myelinated rapidly conducting sensory nerve fibers.

11. Ans. (a) Mitochondria

Ref: Ganong 25th edition. page 36

Mitochondria have their own genome and contain DNA. Human mitochondrial DNA has a circular double stranded molecule containing 16,500 base pairs compared to a billion in nuclear DNA. Mitochondria are derived from ovum, their inheritance is maternal. Since the repair mechanism of DNA is poor, mutation rate for mitochondrial DNA is 10 times more than nuclear DNA.

12. Ans. (a) All or none law

Ref: Ganong 25th edition. page 92

- The action potential fails to occur if stimulus is subthreshold. It occurs with constant amplitude regardless of strength of stimulus if the stimulus provided is above the threshold intensity. This is called as "All or none law".
- Anodal current producing hyperpolarization is called electrotonic potential. The magnitude of response decreases as the distance between the stimulating and recording electrodes is increased.
- During Absolute refractory period no stimulus irrespective of strength will excite the nerve. However during relative refractory period, the stronger stimuli can cause excitation.

13. Ans. (a) Increase Calcium Transport via L type calcium channels in T-tubule

Ref: Harrison 19th edition, P 40-41

- The pathophysiology of malignant hyperthermia involves dysregulation of calcium transport primarily caused

by abnormal functioning of Excitation contraction coupling.

- The EC complex is localized to the T-tubules/Sarcoplasmic reticulum of skeletal muscle.
- The T-tubule consists of pentameric L-type Calcium channel (DHPR) which is a voltage gated calcium channel.
- It is triggered by inhalation of volatile inhalational agents and NM blocking agent succinylcholine.
- Clinical manifestation is intraoperative hyperthermia, respiratory acidosis, hyperkalemia and DIC.
- DOC for management is Dantrolene sodium.

Extra Mile

Basic difference between T & L type Ca⁺⁺ channels

L-type Ca ⁺⁺ Channels	T-type Ca ⁺⁺ Channels
<ul style="list-style-type: none"> Long lasting Also known as DHP receptors HVA (High voltage activated receptors) Found in <ul style="list-style-type: none"> Skeletal muscle Smooth muscle Bone (osteoblasts) Ventricular myocytes (responsible for prolonged action potential in cardiac cell; also termed DHP receptors) Dendrites and dendritic spines of cortical neurons 	<ul style="list-style-type: none"> Short acting T for "transient" LVG (Low voltage Gated) Found in <ul style="list-style-type: none"> Neurons Cells that have pacemaker activity Bone (osteocytes)

14. Ans. (c) Calcium

Ref: Ganong 25th edition, P 46

- Exocytosis is a calcium dependent process where vesicles containing material for export are targeted to the cell membrane.
- This area of fusion then breaks down leaving the contents of vesicle outside the cell membrane intact.
- The reverse of exocytosis is called as endocytosis and is mediated by the protein Clathrin.

15. Ans. (b) Z line

Ref: Ganong 25th ed. P 115

- Choices A and D are ruled out as bands are not present in smooth muscles.
- Smooth muscles lack visible cross striations. Actin and myosin are present and they slide on each other to produce contractions.

FMGE Solutions Screening Examination

128

- Instead of Z lines, smooth muscles contain dense bodies in the cytoplasm and are attached to cell membrane. They act by binding alpha actinin to actin filaments.

Smooth muscles are different from cardiac fibers due to the following reasons:

1. Absence of striations
2. Presence of dense bodies at site of Z lines
3. Absent troponins
4. Less extensive sarcoplasmic reticulum
5. Energy generation via glycolysis and few mitochondria

Actin and myosin contractile proteins are not organized into sarcomeres; instead the fibers attach to the dense bodies under the cell membrane

16. Ans. (d) Actin

Ref: Ganong 25th ed. P 39

Molecular motors are involved in movement of proteins, organelles and cell parts to all parts of the cell. There are three super families of molecular motors.

1. Kinesin
2. Dynein
3. Myosin

These molecular motors connect to cargo at one end and actin filaments forming microtubules at the other end.

Extra Mile

Functions of actin

1. Cellular contraction
2. Cell migration
3. Cell signaling
4. Backbone for muscle contraction

17. Ans. (b) One molecule goes in and other molecule goes out

Ref: Ganong 25th ed. P 48

Uniport	Transport only one substance
Symport	More than one substance
Antiport	Exchange substance one for the other

Extra Mile

- Na-H antiporter in distal convoluted tubule
- The malfunction of this antiporter leads to inability to absorb salt leading to salt wasting. The inability to excrete Hydrogen ions leads to metabolic acidosis called Renal tubular acidosis type 1.

18. Ans. (b) Secondary active transport of glucose in intestine

Ref: Ganong Physiology: 25th ed. P 432

SGLT 1 is located in GIT and SGLT 2 in proximal convoluted tubules of kidney.

Extra Mile

Type of SGLT	Major sites	Functions: transport of
SGLT 1	Small intestine, heart, trachea, kidney (S3)	Na, glucose, galactose
SGLT 2	Kidney (S1, S2)	Na, glucose
SGLT 3	Small intestine, uterus, lung, thyroid, testis	Na
SGLT 4	Small intestine, kidney, liver, stomach, lung	Glucose, mannose
SGLT 5	Kidney	Unknown
SGLT 6	Spinal cord, kidney, brain, small intestine	Myoinositol, glucose

19. Ans. (c) Terminal bronchiole

Ref: Ganong 25th ed. P 623

The cellular transition from conducting airways to alveoli (shown below in the image) and the amount smooth muscle decreases progressively.

Between two close options the answer is terminal bronchiole as respiratory bronchiole is more distal and has less cartilage.

20. Ans. (b) Phosphocreatinine

Ref: Ganong 25th ed. P 108-109

During a 100 meter sprint that takes about 10 seconds anaerobic synthesis of ATP occurs. This supply comes from Phosphocreatine.

Distance covered	Contribution from anaerobic pathways
100 meter dash	85%
2 mile race	20%
Long distance race 60 minutes	5%

ENERGY SOURCES IN WORKING MUSCLES

COMPARISON BETWEEN SYSTEMS

Characteristic	ATP-PC*	Lactic acid	Aerobic
Fuel/s	ATP stores and Phosphocreatine	Glycogen	CHO, Fats Then Protein
ATP production per molecule of energy source	Less than 1	Approx. 2	Glucose = 38 Fats = 460
Speed/rate of ATP production	Small amounts instantly	Limited amounts rapidly	Unlimited amount slowly
Intensity	Maximal effort	Near maximal (85–95%)	Sub-maximal (<85%)
Duration	0–10 secs	30 secs–2 minutes	5 minutes +
Oxygen requirements	Nil	Nil	O ₂ required

* ATP-Phosphocreatine

21. Ans. (b) **Ib**

GOLGI TENDON ORGAN is embedded within the musculotendinous junction (90%) and in the tendon itself (10%).

- They are stimulated by: Increased tension at muscle tendon
- **Afferent:** Ib fiber (myelinated).
- Mediates inverse stretch reflex

Extra Mile

Reflex	Afferent fiber	Stimulus	Response
Golgi tendon reflex	Ib	Muscle contraction	Relaxation of the muscle
Stretch reflex	Ia	Muscle is stretched	Contraction of the muscle
Flexor – withdrawal reflex	II, III, and IV	Pain, touch	Ipsilateral flexion, contralateral extension

- Group III/IV afferent fibers are afferent arm of cardiovascular ventilatory reflex responses which are mediated in nucleus tractus solitarius and ventrolateral medulla. They facilitate central fatigue and are important in endurance sports.

22. Ans. (b) **Lateral spinothalamic tract**

SOMATOSENSORY PATHWAYS

- **Dorsal column pathway:** This carries pressure, vibration, proprioception, fine touch and two-point discrimination.
- **Anterior spinothalamic tract:** This carries crude touch and pressure (less role).
- **Lateral spinothalamic tract:** This carries pain and temperature.

23. Ans. (c) **Intestine**

Ref: Ganong, 25th ed. pg. 478; Harper 30th ed. pg. 518

	Major site of expression	Proposed functions
SGLT1	Intestine and kidney	Glucose reabsorption in intestine and kidney
SGLT2	Kidney (PCT)	Low affinity and high selectivity for glucose
SGLT3	Small intestine, skeletal muscle	Glucose activated Na ⁺ channel

Extra Mile

- SGLT2 inhibitors, also called *gliflozins*, are used in the treatment of type 2 diabetes.
- Examples include dapagliflozin, canagliflozin and empagliflozin.

24. Ans. (b) **Smooth endoplasmic reticulum**

- The smooth endoplasmic reticulum is continuous with the rough endoplasmic reticulum and does not contain any ribosomes. Although it has several functions, the sER is specialized for the production of steroid hormones in cells of the adrenal cortex.
- Remember that cholesterol is the main precursor for steroid hormones produced in the adrenal cortex and the gonads.

25. Ans. (b) **A delta**

Ref: Ganong, 25th ed. pg. 95

Susceptibility order of nerve fibers are as follows:

- **Pressure:** $A\alpha > A\beta > A\gamma > A\delta > B > C$
- **Local anesthetic:** Susceptibility order $A\gamma$ & $A\delta \gg A\alpha$ & $A\beta \gg B \gg C$
- **Hypoxia:** Susceptibility order $B > A > C$
- **Paresthesias** (inappropriate sensations such as burning or prickling) usually seen when A-delta is involved.

26. Ans. (c) **Minimum strength of stimulus to produce action potential**

- **Rheobase:** The *minimum strength* of a stimulus, which is able to produce AP in an excitable tissue (e.g. Nerve, muscle), regardless of the duration it takes.
- **Utilization time:** Minimum *time (duration)* for which *the rheobase* has to be applied for excitation of tissue.
- **Chronaxie:** Minimum *time (duration)* for which a stimulus *double the rheobase* has to be applied for excitation of tissue.

27. (a) **Insulin**

Ref: Quantitative Human Physiology; An Introduction. pg. 191-92

Insulin has two major roles: Sends glucose and potassium both intracellular, thereby decreasing their level (i.e. hypoglycaemia and hypokalemia).

28. Ans. (c) **Facilitated diffusion**

Ref: Quantitative Human Physiology; An Introduction. pg. 126-27

Since the transport of glucose to placenta is via GLUT, it is called a facilitated transfer of glucose.

	Simple diffusion	Facilitated diffusion
Energy	Not required	Not required
Carrier molecule	Not involved	Involved
Saturation	Not saturable (No Tm)	Saturable (has a Tm)
Follows	Fick's law of diffusion	Enzyme-substrate kinetics of Michaelis menten
Example:	O ₂ and CO ₂ exchange in alveoli	Glucose transport by glucose transporters (GLUT)

29. Ans. (d) **Increase chloride influx**

Ref: Quantitative Human Physiology; An Introduction. pg. 259-60

FIGURE: Summary of neurotransmission

- Most essential step in neurotransmission: Depolarization of neurons at pre-synapse

TABLE: Concept of EPSP and IPSP

EPSP (Excitatory post-synaptic potential)	IPSP (Inhibitory post-synaptic potential)
Excitatory Neurotransmitter: Glutamate and Aspartate	Inhibitory Neurotransmitter: GABA and Glycine
Due to influx of Calcium, Na ⁺ and closure of K ⁺ channel	Due to influx of Chloride (Cl ⁻) and efflux of K ⁺
<ul style="list-style-type: none"> • Fast EPSP: Na⁺ and Ca⁺ Influx <ul style="list-style-type: none"> ▪ Latency: 0.5 ms • Slow EPSP: K⁺ channel closure <ul style="list-style-type: none"> ▪ Latency: 100 - 500 ms • Late slow EPSP: K⁺ channel closure <ul style="list-style-type: none"> ▪ Latency: 1-5 sec 	<ul style="list-style-type: none"> • FAST IPSP: Cl⁻ entry <ul style="list-style-type: none"> ▪ Latency: 0.5 ms • SLOW IPSP: K⁺ efflux/ closure of channel <ul style="list-style-type: none"> ▪ Latency: 100-500 ms

30. Ans. (c) After hyperpolarization

Ref: Quantitative Human Physiology;
An Introduction, pg. 215-16

- Maximum excitation is seen after hyperpolarization state. In this phase cell is ready for another action potential, **given just the threshold stimulus**.
- Cell is in absolute refractory phase in depolarization phase. In this phase no matter how much stimulus is given, there will be no further AP.
- During repolarization phase, cell is in relative refractory phase. Action potential may ensue, if a **higher strength** of stimulus is provided.

31. Ans. (c) By diffusion in interstitial fluid

Ref: Ganong, 25th ed. pg. 752

Modalities of Communication Between Cells

Action across synaptic cleft	Synaptic transmission
Directly from cell to cell	Gap junctions
By diffusion in interstitial fluid	Paracrine and autocrine
Endocrine	By circulating body fluids

32. Ans. (a) Using energy in ATP to extrude 3 Na⁺ out of cells in exchange of taking two K⁺ into the cell

- Na⁺ K⁺ ATPase catalyse the hydrolysis of ATP to adenosine diphosphate and uses energy to extrude three Na⁺ from the cell and take two K⁺ into the cell for each molecule of ATP hydrolyzed.

- It is therefore said to have a coupling ratio of 3:2
- Its activity is inhibited by Ouabain and related digitalis glycosides which are used for CHF.
- Active transport of sodium and potassium is a major energy consuming process in the body. In body it accounts for 24% of energy utilized by cells and 70% of energy utilized by neurons.

Hormones increasing Na-K ATPase activity are

- Thyroid hormones
- Aldosterone
- Insulin

33. Ans. (c) Dystrophin

Ref: Ganong, 25th ed. pg. 56

Calcium binding proteins are:

- Troponin = Involved in contraction of skeletal muscle and cardiac muscle.
- Calmodulin = Helps in phosphorylation of myosin and muscle contraction
- Calbindin = Vitamin D dependant Calcium binding proteins
- Calcineurin = Calmodulin activated protein which inactivates Ca⁺⁺ channels and *plays role in activating T Cells*. Immunosuppressive drugs can inhibit it.

34. Ans. (c) Tight junctions permit passage of some solutes between cells

Ref: Ganong, 25th ed. pg. 41

- Desmosomes help to hold the cells together. Hence choice A is wrong
- Hemi-desmosomes and focal adhesions attach cells to basal lamina. Hence choice B is wrong
- Gap junction is a cytoplasmic tunnel for diffusion of small molecules <1000 Da between two neighbouring cells. Hence choice D is wrong.
- The function of tight junctions is:
 1. Passage of some ions and solutes in between adjacent cells called as para-cellular pathway.
 2. Prevent movement of proteins in the plane of membrane.

35. Ans. (d) Chloride inside cells is more than outside cells

Ref: Ganong, 25th ed. pg. 5 & 9

Composition of Body Fluids and Electrolytes into Compartments

Intracellular fluid	40%
Interstitial fluid	15%
Blood, plasma	5%

FMGE Solutions Screening Examination

132

Concentration of ions inside/outside mammalian spinal motor neurons in mEq/dl

Ions	Inside cell	Outside cell
Chloride	9	125
Potassium	150	5.5
Sodium	15	150

36. Ans. (d) **Multipolar cells**

Ref: Ganong, 25th ed. pg. 87

Unipolar cells	Invertebrate cells
Bipolar cells	Bipolar cells of retina
Pseudo-unipolar cells	Ganglion cell of dorsal root
Multi-polar cells	Motor neuron of spinal cord Pyramidal cell of hippocampus Purkinje cell of cerebellum

37. Ans. (b) **A Fibers are more sensitive to pressure than C fibers**

Ref: Miller's Anesthesia, P 77, 922

Susceptibility to	Most susceptible	Intermediate	Least susceptible
Pressure	A	B	C
Local anesthesia	$A\gamma > A\delta > A\alpha$	B	C
Hypoxia	B	A	C

38. Ans. (a) **Phase 1 of depolarization is due to opening of voltage gated sodium channels**

Phase 0	Rapid depolarization due to opening of voltage sensitive sodium channels
Phase 1	Rapid repolarization due to closure of sodium channels and opening of one type of K channels
Phase 2	Plateau phase due to slow and prolonged opening of voltage gated calcium channels
Phase 3 and 4	Final repolarization to RMP is due to closure of Ca^{++} channels and a slow delayed increase of K^+ efflux

Since cardiac muscle remains in refractory period until phase 4, tetanic contractions which can occur in skeletal muscle cannot occur in cardiac muscle.

39. Ans. (b) **Tropomyosin**

Ref: Ganong, 25th ed. pg. 101

- Tropomyosin acts as a relaxing protein at rest by covering the sites where myosin binds to action

- Dystrophin is a sarcolemmal protein providing calcium input to sarcoplasmic reticulum. This Ca^{++} is useful in coupling of actin-myosin complex.

40. Ans. (b) **Plasticity**

Ref: Ganong, 25th ed. pg. 118

- Smooth muscle has 20% of myosin content and 100 fold difference in ATP use when compared to skeletal muscle, yet it can generate similar force per cross sectional area. This special feature of smooth muscle is called as plasticity where it behaves like a viscous mass rather than rigid structured tissue.
- An example of plasticity is that urinary bladder tension rises very slowly when urine amount is minimal. But when the amount of urine approximates about 150 ml, the bladder can contract forcefully.

41. Ans. (d) **Guanylyl cyclase**

Ref: Ganong, 25th ed. pg. 59

- Guanylyl cyclase is an enzyme that catalyses the formation of cGMP.
- cGMP is important for vision in both rods and cones.
- Second messengers bring about short term changes by altering enzyme function, triggering exocytosis and can also lead to alteration of transcription of various genes
- Examples of secondary messengers
 - cAMP: Produced by action of adenyl cyclase enzyme and stimulates protein kinase A which catalyses phosphorylation of proteins and altering their activity. For example cholera toxin increases cAMP levels whereas pertussis toxin inhibits it.
 - IP3: Inositol phosphate diffuses into endoplasmic reticulum and triggers calcium release.
 - DAG: Diacylglycerol works with IP3.

42. Ans. (d) **Secondary active transport**

Ref: Ganong, 25th ed. pg. 48 & 51

Secondary active transport	Luminal membrane of mucosal cells in small intestine contain a symport that transports glucose into the cell only if sodium binds to protein and transported into cell at the same time
Active transport	Glucose movement from ECF into cytoplasm of the cell requires carriers and utilises energy and is called as active transport.
Facilitated diffusion	When carrier proteins move substances in the direction of their chemical or electrical gradients, no energy input is required and the process is called as facilitated diffusion

43. Ans. (b) **Potassium**

Ref: Ganong, 22nd ed. BRS Physiology, 4th ed. pg. 11

Ionic Basis of Nerve Resting Membrane Potential

- **RMP:** Resting membrane potential is potential difference across the cell membrane in millivolts, **which is by convention -70 mV**.
- RMP is established by diffusion potential that results from concentration differences of permeable ions.
- Resting membrane potential (-70 mV) is close to equilibrium potential of K^+ and Cl^- (both -85 mV) and far from the equilibrium potential of Na^+ (+65 mV). **That means at rest the nerve membrane is more permeable to K^+ than Na^+**
- Na^+ is actively transported out of neurons and other cells and K^+ is actively transported into cells, **but because K^+ permeability at rest is greater than Na^+ permeability, K^+ channels maintain the resting membrane potential.**

44. Ans. (b) **Decrease membrane stability of nerves**

Ref: Ganong's, 22nd ed. chapter 2.

- A decrease in extracellular Ca^{++} concentration increases the excitability of nerve and muscle cells by decreasing the amount of depolarization necessary to initiate the action potential.
- Conversely, an increase in extracellular Ca^{++} concentration "stabilizes the membrane" by decreasing excitability.

45. Ans. (d) **Acetylcholine**

Ref: Ganong's, 25th ed. pg. 259, 266

- Acetylcholine is released at the nerve terminal of all preganglionic neuron, postganglionic parasympathetic ganglion and a few postganglionic sympathetic ganglion (e.g.: Sweat gland and sympathetic vasodilator fibres).

The remaining sympathetic postganglionic neuron release norepinephrine.

46. Ans. (c) **-40 mV**

- In the dark, the resting membrane potential (RMP) of photoreceptors is -40 mV unlike other neural receptors where the RMP is about -70 to -80 mV. This is due to dark current.
- In the dark, the Na^+ channels in the outer segment of photoreceptors are open as they bind with cGMP. So, Na^+ enters into the cell decreasing the RMP.

47. Ans. (d) **-12 mV**

- Skeletal muscle cells: -95 mV
- Smooth muscle cells: -50 mV
- Astrocytes: -80/-90 mV
- Neurons: -70 mV
- Erythrocytes: -10 to -12 mV

48. Ans. (b) **B fibers**

Ref: Miller's Anesthesia p. 77

- In case of hypoxia, first nerve fibre affected is B fibres.
- Nerve fibres in decreasing order of susceptibility in different situations:
 - **Pressure:** A-B-C (fibre A is most susceptible followed by B and then C in case of Pressure)
 - **Local anesthetics:** A-B-C (fibre A is most susceptible followed by B and C in case of LA)
 - **Hypoxia:** B-A-C (fibre B is most susceptible followed by A and then C in case of Hypoxia)
- **Remember:** A and B fibres are Myelinated and C fibres are unmyelinated.

49. Ans. (a) **Alpha**

Ref: Ganong, 25th ed. pg. 95, Miller's Anesthesia pg. 77

Group		Myelination	Conduction velocity (m/s)	Function
Erlanger and Gasser	Lloyd & Hunt			
A α	I	Heavily myelinated	70–120 maximum	Proprioception Motor supply to skeletal muscle (extrafusal to muscle spindle)
A β	II	Myelinated	25–70	Touch, kinesthetic sense, pressure
A γ	-	Slightly myelinated	15–30	Motor supply to intrafusal muscle fibres (muscle spindle)
A δ	III	Partially myelinated	5–30	Pain, temperature, pressure, touch (cold/foam sharp pain)
B	—	Partially myelinated	3–14	Preganglionic autonomic fibres
C	IV	Un-myelinated	0.2–2	Pain, temperature pressure, post-ganglionic autonomic fibres (Hot temp/slow, visceral pain)

50. Ans. (c) **Myelinated B fibres**

Ref: Ganong, 25th ed. pg. 94

- Myelinated B fibres are preganglionic, autonomic.
- Unmyelinated C fibres are postganglionic.
- Refer to the table in above explanation.

51. Ans. (b) **Disruption of conduction**

Ref: Maheswari Orthopedics, 3rd ed. pg. 51

Neuropraxia refers to physiological disruption of conduction only. No anatomical disruption is seen.

- Both axon and sheath are intact.
- **No structural change or degeneration** occurs in case of neuropraxia.
- Neuronal degeneration is seen in:
 - Crush nerve injury
 - Fetal development
 - Senescence

Extra Mile

Axontemesis

- Axon and myelin sheath disrupted but endoneural perineurium and epineurium sheath is intact.
- Neural degeneration present

Neurontemesis

- Complete division of nerve
- Axon & neural tube (i.e. perineurium, epineurium, and endoneural sheath) are divided.
- Neural degeneration present.

52. Ans. (b) **Passive diffusion**

Ref: Ganong's 25th ed. pg. 634-635

- Exchange of oxygen and CO₂ across the lung capillary and alveoli is passive diffusion.
- Diffusion of O₂ occur from alveoli to capillary (towards the pressure gradient), and diffusion of CO₂ is in opposite direction (from capillary to alveoli).
- Facilitated diffusion requires special carrier proteins.

Extra Mile

- Rate of diffusion is directly proportional to:
 - Pressure gradient
 - Surface area of respiratory membrane
 - Solubility of gas
- Rate of diffusion is inversely proportional to:
 - Thickness of respiratory membrane
 - Molecular weight of gas

53. Ans. (d) **C-fibers**

Ref: Ganong, 25th ed. pg. 94; Guyton Physiology, 11th ed. pg. 576-577

- **Pain** is carried by A δ and C fibres

• **General classification of Nerve Fibers**

- In the general classification, the fibers are divided into types A, B and C.
 - ◆ Type A fibers are further subdivided into α , β , γ , and δ fibers.
- Type A fibers are the typical large and medium-sized myelinated fibers of spinal nerves.
- Type B fibres are Myelinated, Pre-ganglionic autonomic.
- Type C fibers are the small unmyelinated nerve fibers that conduct impulses at low velocities.

Nerve Fibre Type and Function

Fiber type	Function
A fiber	
α	Proprioception; Somatic motor
β	Touch, pressure, motor
γ	Motor to muscle spindle
δ	Pain, cold, touch
B fiber	Preganglionic Autonomic
C fiber	
Dorsal root	Pain, temperature, reflex responses
Sympathetic root	Postganglionic sympathetic

54. Ans. (b) **Anterior spinothalamic tract**

Ref: Guyton, 12th ed. pg. 573-74

- **Fibres** for crude touch (itch and tickle): C- Fibre
- **Pathway** for crude touch: Anterior spinothalamic tract
- Pathway for pain and temperature: Lateral spinothalamic tract
- Pathway for proprioception, fine touch, vibration, joint position is be: Posterior column/Dorsal column.

55. Ans. (b) **H band**

Ref: Ganong's, 25th ed. pg. 101

- **The area between two adjacent Z lines is called a sarcomere**
- The thick filaments, which are about twice the diameter of the thin filaments, are made up of myosin; the thin filaments are made up of actin, tropomyosin and troponin
- **The lighter H bands in the center of the A bands are the regions where, when the muscle is relaxed, the thin filaments do not overlap the thick filaments.**
- The Z lines transect the fibrils and connect to the thin filaments. If a transverse section through the A band is examined under the electron microscope, each thick filament is seen to be surrounded by six thin filaments in a regular hexagonal pattern.
- Here is a quick reminder of all the structures involved in muscle contraction:
 - **Myofibril:** A cylindrical organelle running the length of the muscle fibre, containing actin and myosin filaments.

- **Sarcomere:** The functional unit of the myofibril, divided into I, A and H bands.
- **Actin:** A thin, contractile protein filament, containing 'active' or 'binding' sites.
- **Myosin:** A thick, contractile protein filament, with protrusions known as myosin heads.
- **Tropomyosin:** An actin-binding protein which regulates *muscle relaxation*.
- **Troponin:** A complex of three proteins, regulating muscle contraction.

RENAL PHYSIOLOGY

56. Ans. (a) Upper part of PCT

Ref: Ganong 25th edition. page 680

Glucose, amino acids and bicarbonate are absorbed along with sodium in early portion of proximal tubule. Essentially all of the glucose is reabsorbed and no more than few mg will reappear in urine. The renal threshold for glucose is the plasma level at which glucose appears in the urine. For venous blood is blood level of 180 mg/dL.

57. Ans. (d) Remains unchanged

Ref: Ganong 25th edition. page 686-687

Water diuresis is increased urine flow rate after drinking water. The increased water intake leads to development of reduced secretion of ADH from the neurohypophysis. This decreases the water permeability of collecting duct and distal tubule leading to increased water loss initially followed by constant water load being excreted. *However, there is no change in urinary excretion of solutes in water diuresis unlike osmotic diuresis which leads to increase of urine flow as well as excretion of solutes.*

Comparison of water and osmotic diuresis

Water diuresis	Osmotic diuresis
Increased urine flow rate (No change in urine excretion of solutes)	Increases urine flow rate as well as the excretion of solutes
Causes: <ul style="list-style-type: none"> • Excess ingestion of water • Lack of ADH • Defect in ADH receptors in Distal segment of nephron (nephrogenic diabetes insipidus) 	Causes: <ul style="list-style-type: none"> • Increase plasma glucose level (DM) • Increase level of poorly reabsorbed solutes/anions • Diuretic drugs (Lasix)
Diuresis is mainly due to decrease in water reabsorption in distal segment of nephron. No change to the water reabsorbed proximally	Diuresis is mainly due to decrease in reabsorption of solute in PCT or LOH. Decrease solute reabsorption results in decrease in water reabsorption proximally as well as distally

58. Ans. (a) Lowers blood volume

- Pressure diuresis lowers arterial pressure by lowering blood volume and, thereby, lowering cardiac output.
- All of the other choices do lower arterial pressure, but are not caused by pressure diuresis.

59. Ans. (b) DCT mainly

Diuretic class	Drugs	MOA	Site of action
Osmotic diuretic	Mannitol	Inhibit water and solute reabsorption	All part of tubule, but mainly proximal tubule
Loop diuretics	Furosemide Torsemide	Inhibit Na ⁺ -K ⁺ -2Cl ⁻ co-transport	Thick ascending loop of henle
Thiazide diuretic	Hydrochlorothiazide Benzthiazide Chlorthalidone Indapamide	Inhibit Na ⁺ -Cl ⁻ co-transport	Distal tubule
K ⁺ sparing diuretic	Spironolactone Triamterene Amiloride	Decrease Na ⁺ reabsorption Decrease K ⁺ secretion	Collecting tubule
Carbonic anhydrase inhibitor	Acetazolamide	Inhibit H ⁺ secretion and HCO ₃ reabsorption, which reduces Na ⁺ reabsorption	Proximal tubule

60. Ans. (a) **Adrenal**

Ref: *Modern Nutrition in Health and Disease*, pg. 913

VITAMIN C CONTENT OF HUMAN TISSUES

Organ/Tissue	Vitamin C Concentration	Organ/Tissue	Vitamin C Concentration
Pituitary gland	40–50	Lungs	7
Adrenal gland	30–40	Skeletal muscle	3–4
Eye lens	25–31	Testes	3
Liver	10–16	Thyroid	2
Brain	13–15	Cerebrospinal fluid	3.8
Pancreas	10–15	Plasma	0.4–1
Spleen	10–15	Saliva	9.07–0.09
Kidneys	5–15		

61. Ans. (c) **125 ml/min**

Ref: *Ganong's Physiology*, 23rd ed. pg. 646

- Normal GFR in a healthy person is 125 ml/min. It is best calculated by insulin clearance.

62. Ans. (c) **Intercalated cells**

Ref: *Ganong*, 25th ed. pg. 672

Lacis cells	Are cells that lie between macula densa (Sensor for distal tubule) and renin secreting granular cells
Principal cells	Seen in epithelium of collecting ducts and are involved in sodium absorption and vasopressin mediated water re-absorption
Intercalated cells	Seen in collecting ducts and distal tubules and are concerned with acid secretion and HCO_3^- transport.
Granular cells	Seen in JG apparatus and secrete renin

63. Ans. (a) **Tubulo-glomerular feedback**

Ref: *Ganong*, 25th ed. pg. 682

Tubulo-glomerular feedback	Maintains the constancy of load delivered to distal tubule and the sensor for this response is macula densa
Glomerulo-tubular feedback	Decrease in GFR promotes solute reabsorption in proximal tubule and thick ascending limb of Henle
Reno-renal Reflex	Increase in ureteral pressure in one kidney leads to decrease in efferent nerve activity to contralateral kidney. This permits an increase in excretion of sodium and water
Filtration fraction	Ratio of GFR to renal plasma flow with normal fraction of 0.16–0.20 In hypotension GFR is lesser than renal plasma flow because of efferent arteriolar constriction

64. Ans. (c) **Alcohol**

Ref: *Ganong*, 25th ed. / Table 38-1 pg. 696

Factors Affecting Vasopressin Secretion

Increased vasopressin secretion	Decreased vasopressin secretion
<ul style="list-style-type: none"> • Increased effective osmotic pressure of plasma • Decreased ECF volume • Pain, emotion, stress • Nausea vomiting • Tumours leading to SIADH- oat cell cancer of lung, Carcinoid tumours 	<ul style="list-style-type: none"> • Decreased effective osmotic pressure of plasma • Increased ECF volume • Alcohol

65. Ans. (b) **Carbonic acid**

Ref: *Ganong*, 25th ed. pg. 717; Indu Khurana

Buffers in whole blood

Buffer Type	Buffering capacity (%)
Haemoglobin	35%
Bicarbonate	53% (plasma 35% + RBC 18%)
Organic phosphates	3%
Plasma protein	7%
Inorganic	2%

Most abundant buffer in the body is proteins.
Most important buffer in the body is bicarbonate.

66. Ans. (b) **Proximal convoluted tubular cells**

Ref: *Contemporary Nephrology*, 1st ed. pg. 164 and Indu Khurana

Granular cells	Produce renin
Proximal convoluted cells	Contain 1 α hydroxylase that is essential to produce vitamin D_3
Mesangial cells	Regulate RBC leakage
Peritubular cells	Produce erythropoietin

67. Ans. (a) **20%**

Ref: *Guyton's Physiology*, 11th ed. pg. 316

- GFR Is About 20 Per Cent of the Renal Plasma Flow.
- In an average adult GFR is about 125 ml/min, or 180 L/day.
- Renal plasma flow is 650 ml/min
- The *filtration fraction* is calculated as follows: GFR/Renal plasma flow
Therefore $\frac{125 \text{ ml/min}}{650 \text{ ml/min}} = 0.2$
- The fraction of the renal plasma flow that is filtered (the filtration fraction) averages about 0.2; this means that about 20 per cent of the plasma flowing through the kidney is filtered through the glomerular capillaries.

Extra Mile

- The entire plasma volume is only about 3 liters, whereas the GFR is about 180 L/day, the entire plasma can be filtered and processed about 60 times each day.

68. Ans. (a) Aldosterone in collecting ducts

Ref: Guyton, 10th ed. pg. 290, 304

Hormones and their site of Action

Hormones	Site of action in kidney
Angiotensin II	Constricts afferent arterioles, helps to reduce GFR
Aldosterone	Cortical collecting duct & distal tubules
ADH	Medullary collecting duct
ANP	Collecting duct

69. Ans. (a) Collecting duct

Ref: Ganong, 23rd ed. pg. 648

- Aldosterone is secreted from adrenal cortex.
- Action of aldosterone is localized to distal tubule and collecting duct.
- Mechanism: Stimulates Na⁺K⁺ ATPase at basolateral end, which generate gradient for movement of sodium ion from apical membrane causing an increase in sodium reabsorption.

70. Ans. (b) HCO₃Ref: Ganong, 25th ed. pg. 641-44

- CO₂ is transported in blood in 3 forms:
 - As HCO₃⁻ - CO₂ is **mainly transported** in bicarbonate form ~ 70%. When CO₂ diffuses into RBC, it reacts chemically with water and with help of enzyme carbonic anhydrase it is converted into HCO₃⁻ + H⁺

$$\text{CO}_2 + \text{H}_2\text{O} \rightarrow \text{HCO}_3^- + \text{H}^+$$

2. As dissolved CO₂: 6–7% of CO₂ transport3. As carbamino compound of Hb and other plasma proteins: 20% of CO₂ transport.

71. Ans. (d) Sensing of NaCl concentration in macula densa

Ref: Guyton, 11th ed. pg. 323-324

- To perform the function of auto regulation, the kidneys have a feedback mechanism known as tubulo-glomerular feedback which links changes in sodium chloride concentration at the macula densa (tubular component) with the control of renal arteriolar resistance.
- Macula densa**
 - It is the short segment of renal tubule *at the end of thick ascending limb* & continues into distal tubule.
 - It contains *specialized group of epithelial cells* in the distal tubule *that comes in contact with the efferent and particularly afferent arteriole*.
 - Juxta glomerular apparatus consists of macula densa (in DCT) and JG cells in afferent & efferent arterioles.
 - The macula densa senses the changes in sodium chloride concentration
 - The Na⁺ and Cl⁻ enter the macula densa cells via the Na⁺ -K⁺ -2Cl⁻ cotransporter.

72. Ans. (d) Na⁺Ref: Guyton Physiology, 11th ed. pg. 55

- Sodium-hydrogen counter-transport occurs in several tissues.
- An important example is in the proximal tubules of the kidneys, where sodium ions move from the lumen of the tubule to the interior of the tubular cell, while hydrogen ions are counter transported into the tubule lumen.

73. Ans. (a) PCT mainly

Ref: Renal Physiology, 5th ed. pg. 168

Diuretic class	Drugs	MOA	Site of action
Osmotic diuretic	Mannitol	Inhibit water and solute reabsorption	All part of tubule, but mainly proximal tubule
Loop diuretics	Furosemide Torsemide	Inhibit Na ⁺ -K ⁺ -2Cl ⁻ co-transport	Thick ascending loop of henle
Thiazide diuretic	Hydrochlorothiazide Benzthiazide Chlorthalidone Indapamide	Inhibit Na ⁺ - Cl ⁻ co-transport	Distal tubule
K ⁺ sparing diuretic	Spironolactone Triamterene Amiloride	Decrease Na ⁺ reabsorption Decrease K ⁺ secretion	Collecting tubule
Carbonic anhydrase inhibitor	Acetazolamide	Inhibit H ⁺ secretion and HCO ₃ ⁻ reabsorption, which reduces Na ⁺ reabsorption	Proximal tubule

FMGE Solutions Screening Examination

138

74. Ans. (a) PCT

Ref: Ganong, 25th ed. pg. 713

- 80-90% of bicarbonate is reabsorbed in PCT.
- Absorption of HCO_3^- is indirect (due to secretion of H^+ by PCT)
- $\text{H}^+ + \text{HCO}_3^- \rightarrow \text{H}_2\text{CO}_3 \rightarrow \text{H}_2\text{O} + \text{CO}_2 \rightarrow \text{CO}_2$ diffuses into epithelial cell and generate HCO_3^- ion which is then reabsorbed.

Extra Mile

- **PCT reabsorbs:** Na^+ , Cl^- , HCO_3^- , PO_4^{3-} , K^+ , Glucose and amino acid
- **PCT secretes:** H^+ ion, organic acid and bases (oxalate, urate)
- PCT is highly permeable to water.

75. Ans. (a) Beta stimulation

Ref: Harrison, 19th ed. pg. 1613

- The Renin-Angiotensin-Aldosterone System (RAAS) contributes to the regulation of arterial pressure primarily via the vasoconstrictor properties of angiotensin II and the sodium-retaining properties of aldosterone.

There are Three Primary Stimuli for Renin Secretion

1. Decreased NaCl transport in the distal portion of the thick ascending limb of the loop of Henle.
2. Decreased pressure or stretch within the renal afferent arteriole (baroreceptor mechanism)
3. Sympathetic nervous system stimulation of renin-secreting cells via β_1 adrenoreceptors.

Conversely, RAAS can be Inhibited by

- Increased NaCl transport in the thick ascending limb of the loop of Henle
- Increased stretch within the renal afferent arteriole
- β_1 receptor blockade.

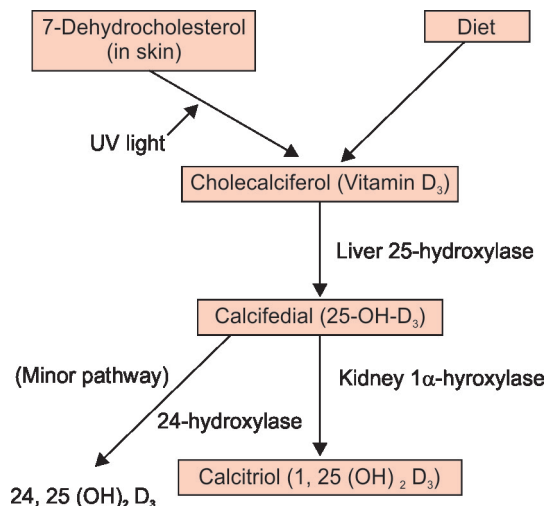

76. Ans. (b) Sodium

Ref: Ganong, 22nd ed. pg. 717

- Hyperosmolarity at renal medulla is due to counter current mechanism acting at loop of henle.
- Maximum osmotic gradient is 1200–1400 mOsm/L found in the inner part of medulla at pelvic tip.
- Prime driving force (initiating event) for the counter-current multiplier system is active reabsorption of Na^+ from thick ascending limb.
- **Renal medullary hyperosmolarity is due to:**
 1. NaCl (most important factor causing hyperosmolarity)
 2. Urea
 3. Potassium

77. Ans. (d) Kidney

Ref: Ganong, 23rd ed. pg. 674

78. Ans. (d) Proximal convoluted tubule

Ref: Ganong, 25th ed. pg. 680, 683

About 2/3rd of filtered water is reabsorbed in the proximal convoluted tubule along with salt absorption. Other molecules absorbed here are bicarbonate, glucose, amino-acids and phosphate.

GASTROINTESTINAL PHYSIOLOGY

79. Ans. (b) Cholesterol Esterase

Ref: Ganong, 25th ed. pg. 482

Cholesterol esterase is a pancreatic lipase activated by bile acids. It causes the following actions

- Hydrolysis of cholesterol esters
- Hydrolysis of esters of fat-soluble vitamins
- Hydrolysis of phospholipids

Most of the fat digestion begins in the duodenum and pancreatic lipase is the most important enzyme. Colipase is activated by trypsin and allows lipase to remain associated with droplets of dietary lipid even in the presence of bile acids.

80. Ans. (a) Trypsinogen

Ref: Ganong, 25th ed. pg 479

- Trypsinogen is converted to active enzyme trypsin by enterokinase when the pancreatic juice enters into the duodenum. Enterokinase contains 41% polysaccharide and this high polysaccharide content prevents the enterokinase from getting digested.
- The trypsin, chymotrypsin and elastase act at interior peptide bonds in the peptide molecules and are called as endopeptidases.

81. Ans. (a) **Enterochromaffin cell**Ref: Ganong, 25th ed. pg. 457

Enterochromaffin cell is responsible for histamine and serotonin secretion. Chief cells produce pepsinogen.

82. Ans. (c) **Pancreatic juice**Ref: Ganong, 25th ed. pg. 461

- *Colipase* is secreted in pancreatic juice in inactive form. It is activated in intestinal lumen by trypsin.
- *Lingual lipase* is secreted by Von Ebner's glands.
- *Intestinal lipase* is secreted in succus entericus. Succus entericus is secreted by small intestine and has a pH of 8.3.

TABLE: Enzymes involved in fat digestion

Area	Juice	Enzyme	Substrate
Mouth	Saliva	Lingual lipase	Triglycerides
Stomach	Gastric juice	• Gastric lipase (weak lipase)	• Triglycerides
		• Pancreatic lipase	• Triglycerides
		• Cholesterol ester hydrolase	• Cholesterol ester
		• Phospholipase A	• Phospholipids
Small intestine	Pancreatic juice	• Phospholipase B	• Lysophospholipids
		• Colipase	• Facilitates action of pancreatic lipase
		• Bile-salt-activated lipase	• Phospholipids
Small intestine	Succus entericus	• Cholesterol esters	• Cholesterol esters
		Intestinal lipase	Triglycerides

83. Ans. (c) **Acid**

Ref: Quantitative Human Physiology; An Introduction. pg. 705

Gastric Cells and their Secretion

Cells	Location in stomach	Their secretion
Parietal cell/Oxyntic cell	Body	HCl and intrinsic factor
Chief cells/Peptic cell	Body	Pepsinogen
G cells	Antrum	Gastrin
Mucus neck cells	Oxyntic glands	Mucus

84. Ans. (d) **Bicarbonate secretion from pancreas**

Ref: Quantitative Human Physiology; An Introduction, pg. 711-712

TABLE: Important differences between GIT hormones (Gastrin, CCK, Secretin, GIP)

	Gastrin	CCK	Secretin	GIP
Site	Main site: G cells (antrum)	I-cells of the proximal two-thirds of small intestine	S-cells: Upper small intestine	K-cells: Proximal intestinal crypts
Actions	Major: <ul style="list-style-type: none"> • Stimulate acid and pepsin secretion • Stimulate gastric motility • Act as growth factor to stimulate mucosal proliferation 	Major: <ul style="list-style-type: none"> • Stimulate pancreatic acinar cell enzyme secretion • Stimulate GB contraction • Relaxes sphincter of oddi • Inhibits gastric acid secretion and gastric emptying • Pyloric sphincter contraction 	<ul style="list-style-type: none"> • Major: Secretion of HCO_3^- from biliary and pancreatic ductular cell and Brunner gland. • Inhibit gastric acid secretion • Stimulate pyloric sphincter • Increases bile flow • Augments the action of CCK 	Major: Stimulate insulin release from pancreas
Major stimulus	Peptides (most potent) Distension of stomach Calcium GRP (gastrin releasing peptides)	Peptides (most potent) Fatty acid (BUT NOT TG)	Acid (most potent) Digestive protein	Glucose, fat and amino acid

85. Ans. (c) **Celiac disease**

Ref: Methods in Disease: Investigating the Gastrointestinal Tract by Victor R Preddy pg. 43

- **D-xylose absorption test** is a medical test performed to diagnose conditions that present with malabsorption of the proximal small intestine *due to defects in the integrity of the gastrointestinal mucosa*.
- D-xylose is a monosaccharide, or simple sugar, that **does not require enzymes** for digestion prior to absorption. Its absorption requires an intact mucosa only.
- In this test, the patient ingests D-xylose (*a nondigestible but absorbable carbohydrate*) by mouth, and then the urinary D-xylose is measured.
- Urine excretion below certain levels (*depending on the amount of D-xylose ingested*) implies poor absorption of D-xylose and, therefore, disease of the small intestine.
- Alternatively, a blood level of xylose is measured 2 hours after the D-xylose is taken by mouth. Low levels in the blood imply poor absorption. Abnormal D-xylose tests are most frequently associated with disorders of the small intestine **such as celiac sprue**.
- Malabsorption can also occur in pancreatic insufficiency, but D-xylose test should be normal.

86. Ans. (a) **Carbohydrate malabsorption due to mucosal disorder**

Ref: Methods in Disease: Investigating the Gastrointestinal Tract by Victor R Preddy pg. 43

- Xylose is a pentose sugar and is absorbed directly from intestinal mucosa.
- D xylose will reveal carbohydrate malabsorption due to mucosal disorder, **but in malabsorption due to pancreatic disease, the D-xylose test should be normal**.
- Due to high false positives and ease of obtaining small intestinal biopsy after endoscopy, intestinal biopsy is the preferred method.

87. Ans. (c) **70% in gastric phase**

Ref: Ganong's, 22nd ed. pg. 484

- Indirect asking for true statement

Phases of Gastric Acid Secretion

- **Cephalic phase:** Accounts for 20% of secretion and occurs when food is not even in mouth. It is stimulated by sight or smell of food. The impulses originate in cortex and reach the glands by dorsal motor nuclei and then through vagus nerves.
- **Gastric phase:** It accounts for around 70% of secretion and occurs when food reaches stomach. It Occurs by vago gastric reflexes, enter entero reflexes by gastrin.

- **Intestinal phase:** Remaining 10% is produced when food is especially in duodenum. It is caused by reflex feed back.

88. Ans. (c) **Oxyntic cells**

Ref: Ganong, 23rd ed. pg. 431-32

Secretion in Stomach

- **Oxyntic cell (parietal cell)** secretes: HCl and intrinsic factor of castle
- Chief cell (zymogen or peptic cell) secrete: pepsinogen
- G cell secrete: Gastrin
- D cell secrete: Somatostatin
- ECL cells secrete: Histamine

89. Ans. (b) **Decreased by cholecystokinin**

Ref: Ganong Review of Medical Physiology, 22nd ed. pg. 484-86

Factors Affecting Gastric Emptying

Decrease emptying	Increase emptying
Cholecystokinin	Carbohydrate rich food leaves stomach in few hours.
Secretin	Protein rich food leaves more slowly & emptying is slowest after fat rich meal.
GIP (Gastric inhibitory peptide)	
Somatostatin	
Hyperosmolality of duodenal contents	

90. Ans. (a) **Lipids**

Ref: Ganong Review of Medical Physiology, 23 ed. Chapter 28

- The presence of fat in the small intestine is the most potent inhibitor of gastric emptying, resulting in relaxation of the proximal stomach and diminished contractions of the distal, "gastric grinder" - when the fat has been absorbed, the inhibitory stimulus is removed and productive gastric motility resumes.
- If the fluid is hypertonic or acidic or rich in nutrients such as fat or certain amino acids, the rate of gastric emptying will be considerably slower and non-exponential.
- Indeed, the rate of gastric emptying of any meal can be predicted rather accurately by knowing its nutrient density.
- Nutrient density is sensed predominantly in the small intestine by osmoreceptors and chemoreceptors, and relayed to the stomach as inhibitory neural and hormonal messages that delay emptying by altering the patterns of gastric motility.

91. Ans. (b) Pylorus has more acid secreting cells

Ref: Ganong, 25th ed. pg. 457

- Pylorus is mostly populated with mucus-secreting cells.

GASTRIC GLANDS

- They can be divided into three groups—the pyloric, principal (in the body and fundus) and cardiac glands.

A. Pyloric Glands

- Pyloric glands are mostly populated with mucus-secreting cells, parietal cells are few and chief cells scarce. In contrast, neuroendocrine cells are numerous, especially G cells, which secrete gastrin when activated by appropriate mechanical stimulation (causing increased gastric motility and secretion of gastric juices).

B. Principal Glands

- Located in body and fundus
- Contain distinct cell types: Chief, parietal, mucous neck, stem and neuroendocrine
- 1. **Chief cells:** Source of pepsinogen, rennin and lipase. Contain zymogens, contain abundant RNA and hence intensely basophilic
- 2. **Parietal (oxyntic) cells:** Are the source of gastric acid and intrinsic factor.
- 3. **Neuroendocrine cells:** Synthesize a number of biogenic amines and polypeptides important for the control of motility and glandular secretion. In the stomach they include cells designated as G cells secreting gastrin, D cells (somatostatin), and ECL (enterochromaffin-like) cells (histamine).

C. Cardiac Glands

- Mucus-secreting cells predominate and parietal and chief cells are few.

92. Ans. (b) Ptyalin

Ref: Guyton's Physiology, 11th ed. pg. 793

- Saliva contains two major types of protein secretion:
 - **Serous secretion**- contains ptyalin, an enzyme for digesting starches.
 - **Mucus secretion**

Gland	Secretion	Content	Function
Parotid gland	Serous type	Ptyalin	Digest starches
Submandibular gland	Serous and mucous type	Mucin	Lubricating and for surface protective purposes
Buccal gland	Only mucus	Mucin	Lubricating

- Saliva has a pH between 6.0 and 7.0, a favorable range for the digestive action of ptyalin.
- But before food and its accompanying saliva become completely mixed with the gastric secretions, as much as 30 to 40% of the starches will have been hydrolyzed mainly to form *maltose*.
- In small intestine the remaining starch Digestion takes place by *Pancreatic Amylase*. Pancreatic secretion is almost identical in its function with the α -amylase of saliva but is several times more powerful.
- Hence, within 15 to 30 minutes after the chyme empties from the stomach into the duodenum and mixes with pancreatic juice, nearly all the carbohydrates will have become digested.

93. Ans. (a) Undigested food

Ref: Ganong, 25th ed. pg. 502

- Fecal mass is derived from undigested food.
- Feces are the particles of waste matter that is left over after the body has processed and absorbed nourishment from the foods we eat.
- It contains water, dietary fiber, inorganic salts, dead cells, bacteria, and anything the body cannot or will not absorb.

94. Ans. (b) Bitter

Ref: Ganong, 25th ed. pg. 224

- There are 5 types of taste sensations commonly recognized by humans. Sweet, umami, salty, sour, and bitter.
- None of these tastes are elicited by single chemical. Also, there are different thresholds for detection of taste that differ among chemicals. **The taste having lowest threshold will be most sensitive (please refer to table)**

Taste	Substance	Threshold for tasting
Salty	Sodium chloride	0.01 M
Sweet	Sucrose	0.01 M
Umami	Glutamate	0.0007 M
Sour	Hydrochloric acid	0.09 M
Bitter	Quinine	0.000008 M

95. Ans. (d) Somatostatin

Ref: Ganong, 25th ed. pg. 154

Somatostatin is found in the D cells of pancreatic islets. It inhibits the secretion of insulin, glucagon, and pancreatic polypeptide and may act locally within the pancreatic islets in a paracrine fashion.

FMGE Solutions Screening Examination

142

96. Ans. (c) Hexoses

Ref: Harrison, 19th ed./Table 26.1 pg. 477

- Hexoses are absorbed most rapidly; Amongst hexoses, glucose and galactose are absorbed more rapidly than others.
- Mannose and pentose are absorbed more slowly.

97. Ans. (a) Trypsin

Ref: Ganong's Physiology, 23rd ed. ch. 27

- Trypsin converts chymotrypsinogens into chymotrypsins and other proenzymes into active enzymes. Trypsin can also activate trypsinogen; therefore, once some trypsin is formed, there is an auto-catalytic chain reaction.
- Trypsin, the chymotrypsins, and elastase act at interior peptide bonds in the peptide molecules and are called **endopeptidases**.
- The powerful protein-splitting enzymes of the pancreatic juice are secreted as inactive proenzymes.
- Trypsinogen is converted to the active enzyme trypsin by enterokinase when the pancreatic juice enters the duodenum.
- Enterokinase contains 41% polysaccharide, and this high polysaccharide content apparently prevents it from being digested itself before it can exert its effect.

98. Ans. (a) Alkaline content of small intestine

Ref: Guyton's, 11th ed. pg. 776, 784-90

Enterogastric reflex inhibits stomach secretions and motility based on the signals from small intestine and colon.

Enterogastric reflex is stimulated by

Duodenal acidic pH

Duodenal distension

Duodenal hypertonicity

Sympathetic stimulation

Intense pain

Increased osmolality of gastric chyme

Inhibited by –

Parasympathetic stimulation

Increased volume and fluidity of gastric content

99. Ans. (d) Divalent metal transporter

Ref: Ganong, 25th ed. pg. 484

- All iron absorption occurs in the duodenum.
- Transport of iron into the enterocytes occurs via divalent metal transporter 1 (DMT1)

- Some is stored in form of ferritin and the rest is transported out of enterocytes by basolateral transporter called ferroportin 1
- In plasma Fe²⁺ is converted to Fe³⁺ and bound to transport protein transferrin

Transferrin saturation	35%
Plasma iron	110-130 mg/dl

100. Ans. (b) Contraction of Sphincter of oddi

Ref: Ganong, 25th ed. pg. 479

Functions of CCK

- CCK mediates digestion in the small intestine by inhibiting gastric emptying and decreasing gastric acid secretion.
- It stimulates the acinar cells of the pancreas to release digestive enzymes which catalyze the digestion of fat, protein, and carbohydrates.
- CCK also causes the increased production of hepatic bile
- Stimulates the contraction of the gall bladder
- Relaxation of the Sphincter of Oddi (Glisson's sphincter), resulting in the delivery of bile into the duodenum.
- Site of CCK release is epithelial cells in the mucosal lining of the small intestine (mostly in the duodenum and jejunum)
- The presence of fatty acids and/or certain amino acids in the chyme entering the duodenum is the greatest stimulator of CCK release.

101. Ans. (b) Entero-endocrine cells in the gut

Ref: Ganong, 25th ed. pg. 470,500

- Site of CCK release is epithelial cells called as I cells in the mucosal lining of the small intestine (mostly in the duodenum and jejunum)

102. Ans. (c) Lactase

Ref: Ganong, 25th ed. pg. 461

The enzymes produced by exocrine pancreas are:

1. Trypsinogen
2. Chymotrypsinogens
3. Elastase
4. Carboxypeptidase A and B
5. Colipase
6. Pancreatic lipase
7. Pancreatic alpha amylase
8. Phospholipase A2

Lactase is produced by cells of intestinal mucosa to breakdown lactose.

103. Ans. (d) Gastro-ileal reflex

Ref: Ganong, 25th ed. pg. 502

- When the food leaves the stomach, caecum relaxes and the passage of chyme through ileocaecal valve increases. This is called as gastro-ileal reflex and is mediated via vagal action.
- Somatostatin is a *growth hormone inhibiting hormone* isolated from hypothalamus and is secreted as paracrine by D cells in pancreatic islets.

Actions of Somatostatin

1. Inhibits VIP, GIP, secretin and motilin
2. Inhibits GH release
3. Inhibits gastric acid secretion and motility
4. Inhibits gall bladder contraction

104. Ans. (c) Normally excreted in urine

Ref: Ganong, 25th ed. pg. 511

- Bilirubin excretion in the urine is seen in obstructive jaundice when conjugated bilirubin regurgitates back into the blood stream since it cannot be excreted secondary to obstruction. This bilirubinuria seen in obstructive jaundice leads to mustard yellow discoloration of the urine. Hence bilirubin in urine indicates a pathology.
- The conjugated bilirubin in normal people is broken down by an enzyme by name of beta-glucuronidase to form unconjugated bilirubin. This is called as enterohepatic cycle. Choice B is correct
- *Conjugation of bilirubin occurs in liver and in case of defective conjugation (Crigler najar syndrome) the levels of unconjugated bilirubin increases to level that it crosses the blood brain barrier and leads to kernicterus. Choice A and D are correct.*

105. Ans. (a) Interstitial cells of Cajal

Ref: Ganong, 25th ed. pg. 496

The basal electrical rhythm is initiated by *interstitial cells of Cajal* which are *stellate mesenchymal parenchymal cells* that send long multiple branched processes into the intestinal smooth muscle.

ENDOCRINE AND REPRODUCTIVE PHYSIOLOGY

106. Ans. (a) 24

Ref: Guyton, 13th ed. pg. 1023

The sperms acquire motility in epididymis and remain there for 18-24 hours. It involves activation of unique set of proteins called CatSper. CatSper forms an alkaline sensitive

calcium channel that becomes more active as the sperms go to acidic vagina. The capacitation occurs in female genital tract.

107. Ans. (a) ADH

Ref: Ganong, 25th ed. pg. 442

Glucagon, thyroxine, cortisol and growth hormone increase blood sugar levels and are glucogenic. ADH regulates water re-absorption via the collecting duct.

108. Ans. (a) Calcitriol

Ref: Ganong, 25th ed. pg. 378

The active metabolite of vitamin D3 is produced in kidney and is called calcitriol or 1,25 dihydroxycholecalciferol. The cells of proximal convoluted tubule produce an enzyme by name of 1 alpha hydroxylase that converts 25 hydroxycholecalciferol into 1,25 dihydroxycholecalciferol.

109. Ans. (d) Placenta

Ref: Ganong, 25th ed. pg. 409, 425:

- *Inhibin A is produced by placenta and corpus luteum.* It is used in quadruple screening for prenatal detection of down Syndrome.
- *Inhibin B inhibits FSH in both males and females. It is produced by Sertoli cells in male and granulosa cells in female.*

110. Ans. (a) Insulin

Ref: Ganong, 25th ed. pg. 434

Insulin receptor is a tetramer made of two alpha and two beta glycoprotein proteins. The alpha subunits bind insulin and are extracellular while beta subunits have tyrosine kinase activity. The growth promoting anabolic effects of insulin are mediated by phosphatidyl inositol kinase pathway.

111. Ans. (b) Inhibin B

Ref: Ganong, 25th ed. pg. 409

The image shows feedback regulation of ovarian function. The marking X is of inhibin B which plays an *inhibitory* role in release of FSH from the anterior pituitary.

In contrast oestrogen from theca interna plays an inhibitory role in control of release of LH and GnRH.

112. Ans. (a) PTH

Ref: Harrison 19th edition, P. 2464

- For formation of active form of vitamin D3, proximal convoluted tubule of kidney is the main site.

FMGE Solutions Screening Examination

144

- The major inducers of activity of 1- α -hydroxylase are PTH and phosphate.
- The repressors of activity of 1- α -hydroxylase are FGF23, calcium and 1,25 (OH) $_2$ D.
- The main concept is that 25 hydroxy D regulates its own enzyme 25 hydroxylase activity and 1,25(OH) $_2$ D regulates its own enzyme 1 α Hydroxylase. The two *do not* regulate each others activity.

113. Ans. (a) TSH

Receptors for Hormones

- **Membrane receptor:** They mainly bind peptide hormones and catecholamines
- **Nuclear receptor:** Bind small molecules that can diffuse across the cell membrane, such as steroids and vitamin D.

Note:

- **Guyton states:** "Amino acid derivatives and peptide hormones interact with cell surface membrane receptors."
- **Steroids, thyroid hormones, vitamin D and retinoids** are lipid soluble and interact with intracellular nuclear receptors.

TABLE: Receptors and their respective hormones

Nuclear receptors (Mn: TOAD)	Thyroxine Estrogen Vitamin A Vitamin D
Cytoplasmic receptors	All steroids except Estrogen
Cell membrane via G protein stimulation	All others like ACTH, LH, FSH, GH

114. Ans. (c) Inhibin

Ref: Ganong Physiology, 24th ed. pg. 419 and 420;
Guyton's Physiology, 11th ed. pg. 1007

- The walls of the seminiferous tubules are lined by **primitive germ cells and Sertoli cells**.
- **Maturation** of spermatozoa takes place in deep folds of the cytoplasm of the sertoli cells.
- Mature spermatozoa are released from the Sertoli cells and become free in the lumens of the tubules. **The sertoli cells secrete androgen binding protein (ABP), inhibin, and MIS.**
- Inhibin inhibits follicle-stimulating hormone (FSH) secretion.
- Inhibin has a strong direct effect on the anterior pituitary gland to inhibit the secretion of FSH and possibly a slight effect on the hypothalamus to inhibit secretion of GnRH.

Extra Mile

- **Testosterone**, secreted by the **Leydig cells**
- **Luteinizing hormone**—by anterior pituitary gland, stimulates the Leydig cells to secrete testosterone.
- **FSH**—also by the anterior pituitary gland, stimulates the **Sertoli cells**; essential for spermatogenesis.

115. Ans. (d) Delta cells

Ref: Guyton's Physiology, 11th ed. pg. 961

- The human pancreas has 1 to 2 million islets of Langerhans cells
- These islets contain three major types of cells: *alpha*, *beta*, and *delta* cells
- **Beta cells**—60% of all the cells of the islets, lie mainly in the middle of each islet and secrete *insulin* and *amylin*.
- **Alpha cells**—about 25% of the total islets- secrete *glucagon*.
- **Delta cells**—about 10% of the total islets- secrete *somatostatin*.

Extra Mile

The hormones secreted act as control of secretion of some hormones by other hormones:

- Insulin inhibits glucagon secretion
- Amylin inhibits insulin secretion
- Somatostatin inhibits both insulin and glucagon secretion.

In addition to these, somatostatin has other functions:

- It decreases the motility of the stomach, duodenum, and gallbladder.
- It decreases both secretion and absorption in the gastrointestinal tract.

Doing so, somatostatin has following effects:

- It extends the time period over which the food nutrients are absorbed into the blood.
- By inhibiting insulin and glucagon secretion, it prevents rapid utilization of nutrients by the tissues.

Remember: Somatostatin is also known as *growth hormone inhibitory hormone*, which is also secreted in the hypothalamus and suppresses anterior pituitary gland growth hormone secretion.

116. Ans. (a) Cortisol

Ref: Ganong, 22nd ed. ch. 20

- **Cortisol is secreted by adrenal cortex not medulla.**
- Norepinephrine, epinephrine, and dopamine are secreted by the adrenal medulla.

117. Ans. (a) Neuro-hormones

Ref: Lange Medical Physiology by Ganong, ch. 20

Adreno-medullary hormones are *catecholamines* secreted from the adrenal medulla by chromaffin cells, neurosecretory cells connected to the central nervous system.

The synthesis, storage (in chromaffin cells) and release of *catecholamines* is co-regulated by synaptic input from their respective pre-synaptic sympathetic neurons, as well as hormonal and local inputs. The adreno-medullary hormones are:

1. Epinephrine
2. Norepinephrine
3. Dopamine

118. Ans. (c) **Decrease blood amino acid**

Ref: Berne & Levy's Physiology, 5th ed. pg. 909 and chapter 20: Lange medical physiology by Ganong 23rd ed.

- Cortisol raises the free amino acids in the serum. It does this by inhibiting collagen formation, decreasing amino acid uptake by muscle, and inhibiting protein synthesis.
- Glucocorticoids promote protein degradation and inhibit entry of amino acids in tissues (Primarily Branch chain amino acids).
- Glucocorticoids also lead to utilization of amino acids by promoting gluconeogenesis directly and by permissive effect on Growth hormone.

119. Ans. (b) **Oxytocin**

TABLE: Hormones from Anterior Pituitary

Hormones	Major functions
Growth hormone	Stimulates protein synthesis and overall growth of most cells and tissues
TSH	Stimulates synthesis and secretion of thyroid hormones (T3 & T4)
Adrenocorticotrophic hormone (ACTH)	Stimulates synthesis and secretion of adrenocortical hormones (cortisol, androgens, and aldosterone)
Prolactin	Promotes development of the female breast and secretion of milk
Follicle-stimulating hormone (FSH)	Causes growth of follicles in the ovaries and sperm maturation in sertoli cells of testes
Luteinizing hormones (LH)	Stimulates testosterone synthesis in Leydig cells of testes; stimulates ovulation, formation of corpus luteum, and estrogen and progesterone synthesis in ovaries

TABLE: Hormones from Posterior Pituitary

Antidiuretic hormone (ADH)/ Vasopressin	Increase water reabsorption by the kidneys and cause vasoconstriction and increased blood pressure
Oxytocin	Stimulates milk ejection from breasts and uterine contractions

120. Ans. (d) **Glucagon**

- GH secretion is regulated by GHRH released from hypothalamus in a pulsatile fashion.
- Large burst of secretion occurs at night during the onset of deep sleep (NREM sleep).

Stimuli that increase secretion of GH	Stimuli that decreases secretion of GH
<ul style="list-style-type: none"> • Hypoglycemia • Exercise • Fasting • Protein meals • Stress • Glucagon • Estrogens, androgens, L-dopa and alpha adrenergics 	<ul style="list-style-type: none"> • Sleep • Glucose • Cortisol • FFA • GH

121. Ans. (a) **Levodopa**

Ref: Ganong's, 23rd ed. pg. 333

TABLE: Factors affecting Prolactin secretion

Increase prolactin	Decrease prolactin
<ul style="list-style-type: none"> • Sleep • Pregnancy; Estrogen • Opioids • TRH • Phenothiazines 	<ul style="list-style-type: none"> • L-Dopa • Apomorphine • Bromocriptine related ergot derivative

122. Ans. (a) **Anterior pituitary**

Ref: Guyton Physiology 11th ed. pg. 907

- Thyroid stimulating hormone is secreted by anterior pituitary after getting stimulus by TRH (thyrotropin releasing hormone) from hypothalamus.

123. Ans. (b) **D₁ Deiodinase**

Ref: Harrison, 18th ed./Figure 341-1

- Deiodination is the foremost pathway of thyroid hormone metabolism.
- Three iodothyronine deiodinases (D1-D3) are identified as seleno-cysteine-containing membrane proteins with their active enzymatic sites located in the cytoplasm.
- D1 and D2 convert T4 to T3.
- D3 has only inner ring deiodination activity and inactivates T4 and T3 to rT3 and T2, respectively

124. Ans. (c) **TSH**

Ref: Guyton & Hall Textbook of Physiology, 11th ed. pg. 939 and chapter 18: Lange medical physiology by Ganong

Increased thyroid hormone in the body fluids decreases secretion of TSH by the anterior pituitary. When the level

FMGE Solutions Screening Examination

146

of thyroid hormone secretion rises to about 1.75 times the normal, the rate of TSH secretion falls essentially to zero. *Almost all this feedback depressant effect occurs even when the anterior pituitary has been separated from the hypothalamus.*

125. Ans. (a) Secreted by pituitary gland

Ref: Ganong's 24th ed. pg. 278; Guyton pg. 1009-1010

- Melatonin is secreted by pineal^Q gland. Its synthesis and secretion is increased remarkably in the dark period of the day and maintained at low levels in the daylight.
- It is associated with sleep mechanism.
- Melatonin based drugs can be used to treat jet lag and insomnia in elderly.
- It also acts as inhibitor of gonadotropic hormone secretion and the gonads become inhibited and even partly involuted.

126. Ans. (b) Ovulation

Ref: Guyton Physiology, 11th ed. pg. 1027

- While still in the ovary, the ovum is in the primary oocyte stage.
- Right before it is released from the ovarian follicle, its nucleus divides by meiosis and a first polar body is expelled from the nucleus of the oocyte.
- The primary oocyte then becomes the secondary oocyte.
- In this process, each of the 23 pairs of chromosomes loses one of its partners, which becomes incorporated in a polar body that is expelled.
- This leaves 23 unpaired chromosomes in the secondary oocyte. It is at this time that the ovum, still in the secondary oocyte stage, is ovulated into the abdominal cavity.

127. Ans. (c) Nucleus

Ref: Guyton Physiology, 11th ed. pg. 997- 998

- Each spermatozoon is composed of a head and a tail
- The head comprises the condensed nucleus of the cell with only a thin cytoplasmic and cell membrane layer around its surface.
- Golgi apparatus form a thick cap called the acrosome which is on the outside of the anterior two thirds of the head.
- The tail of the sperm, called the flagellum, has three major components:
 - A central skeleton constructed of 11 microtubules, collectively called the axoneme
 - A thin cell membrane covering the axoneme
 - A collection of mitochondria surrounding the axoneme in the proximal portion of the tail (called the body of the tail)

128. Ans. (b) Inhibin

Ref: Ganong Physiology, 24th ed. pg. 419 and 420; Guyton's Physiology, 11th ed. pg. 1007

- The walls of the seminiferous tubules are lined by primitive germ cells and Sertoli cells.
- Maturation of spermatozoa takes place in deep folds of the cytoplasm of the sertoli cells.
- Mature spermatozoa are released from the Sertoli cells and become free in the lumens of the tubules. *The sertoli cells secrete androgen binding protein (ABP), inhibin, and MIS.*
- Inhibin inhibits follicle-stimulating hormone (FSH) secretion.
- Inhibin also has a strong direct effect on the anterior pituitary gland to inhibit the secretion of FSH and possibly a slight effect on the hypothalamus to inhibit secretion of GnRH.

Extra Mile

- Testosterone, secreted by the Leydig cells
- Luteinizing hormone- Secreted by anterior pituitary gland, stimulates the Leydig cells to secrete testosterone.
- FSH- also secreted by the anterior pituitary gland, stimulates the Sertoli cells; essential for spermatogenesis.

129. Ans. (c) Occurs in male genital tract

- Capacitation is a process which makes spermatozoa to undergo the physical changes necessary to fertilize an egg in female genital tract.
- Spermatozoa in male genital tract are exposed to floating vesicles from seminiferous tubules which contain large amount of cholesterol that cover up the sperm acrosome, which make the membrane tough.

- After ejaculation, the sperm deposited in vagina swim away from cholesterol vesicle upward into the uterine cavity and hence lose excess cholesterol and *membrane of the head of sperm becomes weaker, which makes the penetration in ova easy.*

130. Ans. (a) **Obesity**

Ref: Guyton Physiology, 11th ed. pg. 871

- Leptin gives a sensation of satiety.
- In case it is defective, person develops irresistible eating tendency, which may lead to obesity.
- *Hypothalamus senses energy storage* through the actions of *leptin*, a peptide hormone *released from adipocytes*, which once released in the circulation occupies its receptors in hypothalamus especially POMC neurons of arcuate nuclei.
- Mutations that render Fat cells unable to produce leptin or mutations that cause defective leptin receptors in the hypothalamus leads to marked hyperphagia and ultimately morbid obesity occurs.

131. Ans. (b) **GLUT 2**

Transporter	Function	Site of action
SGLT1	Absorption of glucose	Small intestine, renal tubules
SGLT2	Absorption of glucose	Renal tubules
Facilitated diffusion		
GLUT1	Basal glucose uptake	Placenta, blood-brain barrier, brain, red cells, kidneys, colon
GLUT2	B-cell glucose sensor; transport out of intestinal and renal epithelial cells	B cells islets, liver, epithelial cells of small intestine, kidneys
GLUT3	Basal glucose uptake	Brain, placenta, kidneys
GLUT4	Insulin – stimulated glucose uptake	Skeletal and cardiac muscle, adipose tissue, other tissues
GLUT5	Fructose transport	Jejunum, sperm
GLUT6	Unknown	Brain, spleen and leukocytes
GLUT7	Glucose 6-phosphate transporter in endoplasmic reticulum	Liver

132. Ans. (b) **Skeletal muscle**

- Insulin increases glucose uptake in skeletal muscle.
- Insulin dependent glucose transportation is mediated by GLUT4 which is expressed in skeletal muscles, cardiac muscles and adipose tissue.
- Both GLUT1 and GLUT4 are expressed in skeletal muscle but GLUT4 is main glucose transporter in the tissue.
- GLUT 1 mediates *basal* glucose uptake, whereas GLUT 4 mediates *insulin stimulated* glucose uptake.

133. Ans. (d) **Measuring serum progesterone on day 14 of the cycle**

Study of cervical mucus	<ul style="list-style-type: none"> • Estrogen makes the mucus thinner and more alkaline, a change that promotes the survival and transport of sperms. • Progesterone makes it thick, tenacious, and cellular. • The mucus is thinnest at the time of ovulation, and its elasticity, or spinnbarkeit, increases such that by mid-cycle, a drop can be stretched into a long, thin thread that may be 8-23 cm or more in length. • In addition, it <i>dries in an arborizing, fern-like pattern</i> when a thin layer is spread on a slide. • After ovulation and during pregnancy, it becomes thick and fails to form pattern.
Basal body temperature	<ul style="list-style-type: none"> • A convenient and reasonably reliable indicator of the time of ovulation is a change, usually a rise in the basal body temperature. The rise starts 1-2 days after ovulation. • A surge in LH secretion triggers ovulation and ovulation normally occurs about 9 hours after the peak of the LH surge at mid-cycle. The ovum lives for approximately 72 hours after it is extruded from the follicle, but it is fertilizable for a much shorter time than this.
Endometrial histology	<ul style="list-style-type: none"> • At the end of menstruation, new endometrium regrows under the influence of estrogens. • The endometrium increases rapidly in thickness from the fifth to 14th day of the menstrual cycle. • As the thickness increases, the uterine glands are drawn out so that they length but they do not become convoluted or secrete to any degree. • These endometrial changes are called proliferative, and this part of the menstrual cycle is sometimes called the <i>proliferative phase</i>. It is also called the pre-ovulatory or follicular phase of the cycle. • After ovulation, the endometrium becomes highly vascularized and slightly edematous under the influence of estrogen and progesterone from the corpus luteum. The glands become coiled and tortuous and they begin to secrete a clear fluid, consequently, this phase of the cycle is called the <i>secretory or luteal phase</i>.

134. Ans. (c) **Oxytocin**

Ref: Ganong, 25th ed. pg. 313

- Oxytocin and vasopressin are typical neural hormones, ie, hormones secreted into the circulation by nerve cells.
- They are secreted from the nerve endings of the supra-optic and paraventricular nuclei of the hypothalamus. These endings are located in the posterior pituitary.

135. Ans. (c) **Carbon 17 steroid**

Ref: Ganong, 25th ed. pg. 421

- Testosterone is a C19 steroid with hydroxyl group at 17 position
- The synthesis occurs from cholesterol in the leydig cells and is formed from androstenedione secreted by adrenal cortex.
- The secretion of testosterone is under the control of LH and the mechanism by which LH stimulates leydig cells involves increased formation of cAMP. This cyclic AMP promotes conversion of cholesterol to pregnenolone and testosterone eventually.

136. Ans. (d) **Menstrual blood is predominantly arterial**

Ref: Ganong, 25th ed. pg. 401

Proliferative phase by progesterone (Choice A)	Incorrect	It is due to estrogen and endometrial thickness increases from 5 th to 14 th days of menstrual cycle.
Secretory phase by estrogen (Choice B)	Incorrect	It is due to progesterone and when corpus luteum regresses, there is coiling of spiral arteries.
Superficial 1/3 rd of endometrium is shed (Choice C)	Incorrect	Whole of the endometrium except basal layer is shed
Menstrual blood is predominantly arterial (Choice D)	Correct	The menstrual blood is predominantly arterial with only 25% being venous and contains prostaglandins and fibrinolysin.

137. Ans. (a) **FSH**

Ref: Ganong, 25th ed. pg. 425

Inhibin is a factor of testicular origin that inhibits FSH secretion.

Testosterone from the testis regulates LH secretion.

138. Ans. (d) **hCG**

Ref: Ganong, 25th ed. /Table 22.5 pg. 412:

Hormone	Time of peak secretion
hCG	First trimester
Relaxin	First trimester
hCS (human chorionic Somatotropin)	Term
Estradiol	Term
Estriol	Term
Progesterone	Term
Prolactin	Term

139. Ans. (a) **Cervical mucus**

Ref: Ganong 25th ed. pg. 402

- The cervical mucus is thinnest at time of ovulation and its elasticity or spinnbarkeit increases such that by mid-cycle one drop can be stretched into a long, thin thread that may be 8-12cm or more in length.
- It dries on a slide in an arborizing fern like pattern.
- After ovulation it becomes thick and fails to form the fern pattern.

RESPIRATORY PHYSIOLOGY

140. Ans. (b) Pressure in alveoli and intrapleural pressure

- Transpulmonary pressure is the difference between *intrapulmonary* (also known as intraalveolar or airway) pressure and *intrapleural pressure*

141. Ans. (d) 0.9–1.0

- Respiratory quotient (RQ) is the ratio in the steady state of the volume of carbon dioxide produced to the volume of oxygen consumed per unit time.
- RQ of the brain is 0.97–0.99; this is *because the principal fuel for the brain is carbohydrates*.

142. Ans. (c) 16 mm Hg

Ref: Guyton's Physiology, 11th ed. pg. 162

- Pulmonary artery systolic pressure averages about 24 mm Hg and diastolic pressure 8 mm Hg, with a *mean pulmonary arterial pressure of only 16 mm Hg*.
- The mean pulmonary capillary pressure averages only 7 mm Hg.
- Mean pressure in the aorta is high, averaging about 100 mm Hg.

143. Ans. (c) 160

- At sea level the atmosphere exerts a total pressure of 760 mm Hg. Since the atmosphere is 21% O₂ (by volume), the partial pressure of oxygen (pO₂) = $0.21 \times 760 = 160$ mm Hg.
- The partial pressure of CO₂ (pCO₂) at sea level is 0.23 mm Hg.

144. Ans. (a) V/Q ratio is high at the apex of the lung

Ref: Ganong, 24th ed. pg. 636–37

- The ratio of pulmonary ventilation to pulmonary blood flow for the whole lung at rest is about 0.8.
- There is marked difference in this ventilation/perfusion ratio in various parts of the normal lung as a result of the effect of gravity.
- The ventilation/perfusion ratios are high in the upper portions of the lungs.
- In an upright posture ventilation (V) is high and perfusion (Q) is low at the apex of lung.
- While on the other hand ventilation is low and perfusion is high at the base of lung.

145. Ans. (d) Volume remaining after normal expiration

Ref: Ganong, 25th ed. pg. 629

LUNG VOLUME

Tidal volume (T.V) N = 500 ml	Air that moves in or out of the lung with each normal inspiration or expiration
Inspiratory reserve volume (IRV) N = 3300 ml	The air inspired with a maximal inspiratory effort in excess of tidal volume
Expiratory reserve volume (ERV) N = 1000 ml	The air expelled with a maximal expiratory effort in excess of tidal volume
Residual volume (RV) N = 1200 ml	The amount of air remaining in the lungs even after forced expiration

LUNG CAPACITIES

Inspiratory capacity (I.C) = (TV + IRV) N = 3800 ml	Total amount of air that can be breathed in.
Vital capacity; VC = TV + IRV + ERV N = 4800 ml	Maximum amount of air that can be expelled out force fully after a maximal (deep) inspiration
Functional residual capacity FRC = ERV + RV N = 2200 ml	It is the volume of air remaining in the lung after normal expiration (after normal tidal expiration)
Total lung capacity TLC = TV + IRV + ERV + RV N = 6000 ml. (4.2–6 lit)	The amount of air present in the lung after a maximal inspiration. This is the maximum volume to which the lungs can be expanded.

146. Ans. (c) Type II Pneumocytes

Ref: Guyton, 11th ed pg. 474,

- The smaller type II pneumocytes are often more numerous than type I pneumocytes, but they contribute less than 10% of the surface area.
- They are rounded cells which protrude from the alveolar surface, particularly at the angles between alveolar profiles.
- In the human lung they are often associated with interalveolar pores of Kohn. Their cytoplasm contains numerous characteristic secretory lamellar bodies, which they can recycle.
- Ultrastructurally, the lamellar bodies are comprised of concentric whorls of phospholipid-rich membrane, the precursors of alveolar surfactant.
- “*Surfactant is stored in lamellar bodies and secreted in the form of tubular myelin (unrelated to myelin of the nervous system) by type II pneumocytes*. It is recycled by type II pneumocytes, or cleared (phagocytosed) by alveolar macrophages.
- Clara cells of the bronchiolar epithelium serve as progenitor cells. They are nonciliated cuboidal epithelial cells in terminal bronchioles.

FMGE Solutions Screening Examination

150

147. Ans. (c) Immunoglobulin A

Ref: Ganong, 24th ed. pg. 77-78

- The activated B cells proliferate and transform into memory B cells and plasma cells.
- The plasma cells secrete large quantities of antibodies into the general circulation known as immunoglobulins.

Immunoglobulins	Function
IgG	Complement activation
IgA	Localized protection in external secretions (tears, intestinal secretions, etc)
IgM	Complement activation ^a
IgD	Antigen recognition by B cells
IgE	Reagin activity; releases histamine from basophils and mast cells

148. Ans. (d) Oxygen

Ref: Ganong 25th ed. Table 36. 1 pg. 657 & 659 and Guyton's, 11th ed. pg. 516

- The ultimate goal of respiration is to maintain proper concentration of oxygen, carbon dioxide and hydrogen ions in the tissues.
- Excess carbon dioxide or excess hydrogen ions in the blood mainly act directly on the respiratory centre.
- Oxygen, in contrast, does not have a significant direct effect on the respiratory center of the brain in controlling respiration.
- Instead oxygen acts almost entirely on peripheral chemoreceptors located in the carotid and aortic bodies, and these in turn transmit appropriate nervous signals to the respiratory center for control of respiration by detecting O₂ level in blood.

Extra Mile

Central Chemoreceptors

- More powerful, less rapid than peripheral chemoreceptor
- Highly sensitive to changes in PaCO₂ or H⁺
- PaCO₂: most important stimulus for central chemoreceptor.
- High PaCO₂ stimulates respiratory center which then increases alveolar ventilation and vice versa.

149. Ans. (a) Oxygen and nitrogen

Ref: Ganong's, 22nd ed. Chapter 37

Potential problems associated with exposure to increased barometric pressure under water:

- **Oxygen toxicity:** Lung damage, Convulsions
- **Nitrogen narcosis:** Euphoria, Impaired performance
- **High-pressure nervous syndrome:** Tremors, somnolence
- **Decompression sickness:** Pain, Paralysis
- **Air embolism:** Sudden death

150. Ans. (a) Increased hemoglobin content and RBC

Ref: Guyton's Physiology, 11th ed. pg. 539-541

- **Acclimatization:** Adaptation to new temperature or altitude so that hypoxia causes lesser effect to body.
- At high altitude there is low oxygen. When a person remains exposed to low oxygen, the hematocrit rises slowly from a normal value of 40–45 to an average of about 60.

Extra Mile

- A person remaining at high altitudes for days, weeks, or years becomes more and more *acclimatized* to the low pO₂.
- The principle means by which acclimatization comes about are:
 - **Increased** pulmonary ventilation
 - **Increased** numbers of RBC.
 - Increased diffusing capacity of the lungs.
 - increased vascularity of the peripheral tissues, and
 - **Increased** ability of the tissue cells to use oxygen despite low PO₂

- And an increase in hemoglobin concentration from normal of 15 g/dL to about 20 g/dL.
- In addition, the blood volume also increases, often by 20 to 30 per cent.

151. Ans. (c) Due to inadequate gas exchange

Ref: Ganong, 25th ed. pg. 651

- Hypoxic hypoxia is due to *inadequate gas exchange*, in which the oxygen content of arterial blood and PO₂ are reduced. Example: COPD, High altitude.

Types of Hypoxia and causes

Type of hypoxia	Pathophysiology	Example
Anemic Hypoxia	Due to reduced oxygen carrying capacity	Anemia (Reduced RBC, Reduced Hb); CO poisoning
Hypoxic Hypoxia	Due to Inadequate gas exchange	High altitude Respiratory disease (COPD)
Histotoxic Hypoxia	Inability of cells to utilize available O ₂	Cyanide poisoning
Stagnant Hypoxia	Due to slow circulation	Circulatory Shock Congestive heart failure

152. Ans. (b) Hering Breur Reflex

Ref: Ganong, 25th ed. pg. 662

- Hering- Breuer reflex is reflex triggered to prevent over inflation of lung.
- Smooth muscles of lung have pulmonary stretch receptors which respond to excessive stretching of lung during large inspirations.

- The reflex limits the tidal volume while increasing the respiratory frequency
- Hering Breur inflation reflex is increase in duration of expiration produced by steady lung inflation.
- Hering breur deflation reflex is a decrease in duration of expiration produced by steady lung deflation.
- Surfactant prevents collapse of the lung.

153. Ans. (c) **Decreased H^+**

Ref: Ganong, 25th ed. pg. 640-641

OXYGEN HEMOGLOBIN DISSOCIATION CURVE

- Oxygen- hemoglobin dissociation curve is sigmoid 'S' shaped because *binding of one oxygen molecule to heme increases the affinity of second heme molecule for oxygen* and so on.

Factors affecting affinity of Hb for oxygen and causing the shift of curve are:

Left shift	Right Shift
<ul style="list-style-type: none"> • This means the <i>affinity of oxygen to Hb is increased and oxygen is bound more tightly to hemoglobin</i> • Factors leading to left shift are <ul style="list-style-type: none"> ▪ Alkalosis or ↑ pH ▪ ↓ pCO_2 (CO_2 content of blood) ▪ ↓ Temperature (Hypothermia) ▪ ↓ 2,3 DPG 	<ul style="list-style-type: none"> • This means the affinity of O_2 to Hb is decreased which favours release of oxygen to tissue. • Factors leading to right shift are: <ul style="list-style-type: none"> ▪ Acidosis or ↓ pH ▪ ↑ pCO_2 (CO_2 content of blood) ▪ ↑ Temperature (Hypothermia) ▪ ↑ 2,3 DPG

154. Ans. (b) **Shift of Oxy-Hb dissociation curve to right**

Ref: Ganong's Physiology, 23rd ed. pg. 611 and Ganong, 25th ed. pg. 640-41

Refer to the above question. Increased carbon dioxide in blood will lead to respiratory acidosis, and shift curve to right.

155. Ans. (d) **Binding of oxygen molecule increases affinity of binding other oxygen molecule**

Ref: Ganong's, 23rd ed. pg. 610

- S-shape of O_2 -Hb dissociation curve is formed when one oxygen molecule (among the 4 that is supposed to bind with Hb) binds with a hemoglobin molecule with greatest affinity and this binding increases affinity of other heme molecule to bind oxygen.
- Fall in pH due to increase pCO_2 , decreases oxygen affinity of Hb. This phenomenon is known as **Bohr's effect**.
- Binding of O_2 to Hb reduces affinity of Hb to CO_2 . This phenomenon is known as **Haldane effect**.

156. Ans. (d) **Alkalosis**

Ref: Ganong, 25th ed. pg. 640-41

Refer to above explanation

157. Ans. (a) **Reflex bradycardia**

Ref: Ganong, 25th ed. pg. 662

Pulmonary Chemo-Reflex Consists of:

1. Apnea followed by Rapid breathing
2. Bradycardia
3. Hypotension

It is caused by Stimulation of J receptors by intravenous or intra-cardiac administration of chemicals like capsaicin.

158. Ans. (c) **Increase in depth of respiration**

Ref: Ganong, 25th ed. pg. 656

Manifestation after both vagi are cut	Stretching of the lungs during inspiration initiates impulses in afferent pulmonary vagal discharges. These impulses inhibit inspiratory discharge. Hence after Vagotomy the impulses inhibiting inspiratory discharge are absent and this will result in <i>increase of depth of respiration</i> .
Manifestation after Pneumotaxic center is damaged	Pneumotaxic center is dorsal pons which contains neurons active in active inspiration and expiration. When this area is damaged <i>respiration will become slower and tidal volume greater</i> .
Manifestation after both vagi are cut along with damage to Pneumotaxic center	If vagi are cut after damage to pneumotaxic centre, <i>apneusis</i> ^Q (Prolonged inspiratory spasms that resemble breath holding) will develop

159. Ans. (d) 10 seconds

Ref: Harrison, 18th ed. pg. 2186

- Apneas are defined in adults as breathing pauses lasting >10 secs. and hypopneas as events > 10 secs in which there is continued breathing but ventilation is reduced by at least 50% from the previous baseline during sleep.
- Obstructive sleep apnea/hypopnea syndrome is defined as the coexistence of unexplained excessive daytime sleepiness with at least five obstructed breathing events per hour of sleep.
- **Epworth sleepiness score** is used to assess the severity of the problem.

160. Ans. (c) Slower Breathing with greater tidal volume

Ref: Ganong, 25th ed. pg. 656

- Pneumotaxic center is dorsal pons which contains neurons active in active inspiration and expiration.
- When this area is damaged respiration will become slower and tidal volume greater.

161. Ans. (a) Apnea followed by rapid shallow breathing

Ref: Ganong, 25th ed. pg. 592

- Since the C fiber endings are close to pulmonary vessels, they are called as J (Juxta-capillary) receptors.
 - They are stimulated by hyperinflation of the lung.
 - Activation of chemo-sensitive vagal C fibers in the cardio-pulmonary region causes profound bradycardia, hypotension and apnea followed by rapid shallow breathing. This is called as pulmonary chemo-reflex.
- Hering breuer reflexes* are mediated by vagal afferent activity is mediated by slowly adapting receptors and causes shortening of inspiration.
- *Hering Breur inflation reflex* is an increase in duration of expiration produced by steady lung inflation
 - *Hering Breur deflation reflex* is a decrease in duration of expiration produced by marked deflation of lung.

162. Ans. (a) 1

Ref: Ganong, 25th ed. pg. 641

Myoglobin is an iron containing pigment found in skeletal muscle and binds to 1 rather than 4 mol of O₂.

- The lack of cooperative binding is reflected in myoglobin dissociation curve which is rectangular hyperbola.
- The steepness of the curve shows that oxygen is released at low pO₂ values like at exercise.

163. Ans. (a) 0.8

Ref: Ganong, 25th ed. pg. 636

Ventilation = 4.2 L/min

Perfusion = 5.5 L/ min blood flow

Ventilation/perfusion ratio = 0.8

164. Ans. (a) Tidal volume × Respiratory rate

Ref: Ganong, 25th ed. pg. 629

RMV: Respiratory minute volume: 500 mL × 12 breaths/min = 6 L

165. Ans. (c) Tidal volume + Volume inspired forcefully

Functional residual Capacity	It represents the volume of air remaining in the lungs after expiration of a normal breath.
Inspiratory capacity	It is the maximum amount of air inspired from end expiratory level.
Vital lung capacity	Maximum amount of air expired from fully inflated lung.
Total lung capacity	Inspiratory reserve volume + Tidal volume + Expiratory reserve volume+ Residual volume

166. Ans. (b) Double Bohr Effect

Ref: Fetal Medicine 1st ed. pg. 403 and Ganong, 25th ed. pg. 641-2

Double^Q Bohr Effect is seen in placenta as CO₂ liberated by fetus enters the maternal circulation and shifts the maternal O₂ Hemoglobin dissociation curve to the right but shifts fetal curve to the left.

Haldane effect	Increased capacity of deoxygenated hemoglobin to bind and carry carbon dioxide leading to venous blood carrying CO ₂ .
Bohr effect	Decrease in oxygen affinity of hemoglobin when there is a fall in pH of blood.
Hamburger phenomenon	It is also called chloride shift. <ul style="list-style-type: none"> • When RBC's take up carbon dioxide, it is converted into bicarbonate inside the RBC • This bicarbonate is negatively charged and leaves the RBC via anion exchanger^Q 1 /Band 3 protein. • In return chloride enters the RBC. • Hence there is gain of osmotic molecule inside the RBC leading to entry of water into the cell leading the RBC to swell up.

167. Ans. (b) >5 gm%

Ref: Ganong, 25th ed. pg. 642

Cyanosis appears whenever the magnitude of reduced hemoglobin level of blood in capillaries is >5 gm%.

168. Ans. (b) **Pre-botzinger complex**

Ref: Ganong, 25th ed. pg. 656

Prebotzinger complex- located between nucleus ambiguous and lateral reticular nucleus on either side of medulla is the site of generation of respiratory rhythm.

CARDIOVASCULAR AND CIRCULATORY PHYSIOLOGY

169. Ans. (b) **First heart sound has maximum duration**

Heart sound	Frequency	Duration	Associated event
First heart	25–45 Hz	0.15 sec	Closure of A-V valves—onset of ventricular systole
Second heart sound	50 Hz	0.12 sec	Closure of semilunar valves—onset of ventricular diastole
Third heart sound	Low	0.1 sec	First rapid filling phase of ventricular diastole
Fourth heart sound	Below 20 Hz	0.1 sec	Last rapid filling phase of ventricular diastole due to atrial contraction

170. Ans. (b) **Modified muscle fibers**

- Purkinje fibers are **modified myocardial muscle fibres** (NOT nerve fibers) that lead from the A-V node through the A-V bundle into the ventricles.
- These fibers have functional characteristics that are quite **the opposite of those of the A-V nodal fibers** (except for the initial portion of these fibers where they penetrate the A-V fibrous barrier)
- Purkinje fibers are very large fibres**, larger than AV nodal fibers and even larger than the normal ventricular muscle fibers.
- Hence they transmit **action potentials at a velocity of 1.5 to 4.0 m/sec**, which is about **6 times** that in the usual ventricular muscle and **150 times** that in some of the A-V nodal fibres.
- This allows almost instantaneous transmission of the cardiac impulse throughout the entire remainder of the ventricular muscle.

171. Ans. (b) **After load**

Ref: Current Obstetric and Gynecology by Mukherjee pg. 52

- In the normal fetuses, blood flow in the ductus venosus is always antegrade throughout the cardiac cycle.

Forward flow in the venous system is a function of cardiac compliance, contractility and afterload.

- The typical waveform of fetal blood flow in the venous vessels consists of 3 phases related to the cardiac cycle (on Doppler):
 - Peak S wave:** Corresponds to ventricular systole
 - Peak D wave:** Corresponds to early diastole
 - Peak A wave:** Corresponds to atrial contraction.

172. Ans. (c) **Increase hydrostatic pressure, decrease oncotic pressure**

- Starling's hypothesis states that the fluid movement due to filtration across the wall of a capillary is dependent on the balance between the hydrostatic pressure gradient and the oncotic pressure gradient across the capillary.

The four Starling's forces are:

- Hydrostatic pressure in the capillary (P_c)
- Hydrostatic pressure in the interstitium (P_i)
- Oncotic pressure in the capillary (p_c)
- Oncotic pressure in the interstitium (p_i)

The balance of these forces allows calculation of the net driving pressure for filtration.

$$\text{Net Driving Pressure} = [(P_c - P_i) - (p_c - p_i)]$$

173. Ans. (b) **Left ventricle works more than right ventricle**

Ref: Guyton Physiology, 11th ed. pg. 110

- Right ventricular external work output is normally about *one sixth* the work output of the left ventricle because of the six-fold difference in systolic pressures that the two ventricles pump.

174. Ans. (b) **AV node shows fast conduction**175. Ans. (c) **Decreases by increase in heart rate**

Ref: Ganong, 25th ed. pg. 570-71

- Basically it is asking here about the **TRUE** statement among the given choices.
- Stroke volume is indirectly proportional to heart rate
- Stroke volume = cardiac output/heart rate
- As the heart rate increases, stroke volume decreases.
- After load is determined by peripheral resistance. Therefore, it has nothing to do with stroke volume determination.

FMGE Solutions Screening Examination

154

- Stroke volume depends upon end diastolic volume (*NOT pre-diastolic volume*)

176. Ans. (d) >170 mm Hg

Ref: Harrison's, 19th ed. pg. 1616

TABLE: Guidelines for threshold values between normal and high blood pressure

	Clinic measurement (mm Hg)	Home measurement (mm Hg)
Optimal control	<140/85	<130/80
Mild hypertension	140-150/90-100	135-145/85-95
Moderate hypertension	150-170/100-110	145-165/95-105
Severe hypertension	>170/110	>165/105

The question mentioned was severe hypertension, however if the grading of hypertension is asked, then answer must be according to this table:

BP classification	Systolic mm Hg	Diastolic, mm Hg
Normal	<120	and <80
Pre-hypertension	120–129	<80
Stage I HTN	130–139	80–89
Stage II HTN	>140	>90
Isolated systolic HTN	>140	and <90

177. Ans. (c) Atrial contraction

Ref: Harrison's Internal Medicine, 17th ed. Chapter 220, PE of CVS.

NORMAL JVP WAVEFORM

- Classically three upward deflections and two downward deflections have been described.
- The "a" wave corresponds to right Atrial contraction and ends synchronously with the carotid artery pulse. The peak of the 'a' wave demarcates the end of atrial systole.
- The 'c' wave corresponds to right ventricular contraction causing the tricuspid valve to bulge towards the right atrium.
- The 'x' descent follows the 'a' wave and corresponds to atrial relaxation and rapid atrial filling due to low pressure.
- The "x" (x prime) descent follows the 'c' wave and occurs as a result of the right ventricle pulling the tricuspid valve downward during ventricular systole.

- The "v" wave corresponds to venous filling when the tricuspid valve is closed and venous pressure increases from venous return – this occurs during and following the carotid pulse.
- The "y" descent corresponds to the rapid emptying of the atrium into the ventricle following the opening of the tricuspid valve.

Extra Mile

About JVP

Raised JVP, Normal waveform	Raised JVP, absent pulsation:	Large 'a' wave (increased atrial contraction pressure)
Bradycardia Fluid overload Heart Failure	Superior vena cava syndrome Cardiac Tamponade	Tricuspid stenosis Right heart failure Pulmonary hypertension
Cannon 'a' wave (atria contracting against closed tricuspid valve)	Absent 'a' wave (no unifocal atrial depolarization)	Paradoxical JVP (Kussmaul's sign: JVP rises with inspiration, drops with expiration)
Atrial flutter Premature atrial rhythm (or tachycardia) Third degree heart block Ventricular ectopics Ventricular tachycardia	Atrial fibrillation	Pericardial effusion Constrictive pericarditis Pericardial tamponade

- **Large 'v' wave (c-v wave):** Tricuspid regurgitation
- **Slow 'y' descent:** Tricuspid stenosis

178. Ans. (b) Maximum during diastole

Ref: Ganong 25th ed. pg. 611

- The Flow in coronary arteries occurs in the sub-endocardial portion of the left ventricle only during diastole, although the force is sufficiently dissipated in the more superficial portions of the left ventricular myocardium to permit some flow in this region throughout the cardiac cycle.
- Because *no blood flow occurs during systole in the sub-endocardial portion of the left ventricle, this region is prone to ischemic damage* and is the most common site of myocardial infarction.

179. Ans. (b) Endocardium to epicardium

Ref: Ganong's Physiology, 23rd ed. chapter 30

- Depolarization: From endocardium to epicardium
- Repolarization always proceeds from epicardium to endocardium leading to positive T wave in all leads.
- Depolarization of the ventricular muscle starts at the left side of the interventricular septum and moves first to the right across the mid portion of the septum.
- The wave of depolarization then spreads down the septum to the apex of the heart.
- It returns along the ventricular walls to the AV groove, proceeding from the endocardial to the epicardial surface.
- The last parts of the heart to be depolarized are the postero-basal portion of the left ventricle, the pulmonary conus, and the uppermost portion of the septum.
- In isolated myocardial fibre direction of depolarization and repolarization is same

180. Ans. (d) Increase in venous capacitance

Ref: Ganong's Physiology, 23rd ed. chapter 17

SYMPATHETIC STIMULATION

Beta 1 Receptor –

- **SA node:** Increase in heart rate
- **AV node:** Increase in conduction velocity
- **HIS Purkinje system:** Increase in conduction velocity
- **Atria:** Increase in contractility and conduction velocity
- **Ventricle:** Increase in contractility

Alpha 1 Receptor–

- Increase in total peripheral resistance leads to increase in BP.

181. Ans. (b) ST segment is 0.40 seconds

Ref: Ganong, 25th ed. pg. 524

ECG INTERVALS

PR interval	0.12-0.2 sec	Atrioventricular conduction
QRS	0.08 sec-0.1 sec	Ventricular depolarization
QT interval	0.40-0.43 sec	Ventricular action potential
ST segment		Plateau portion of the ventricular action potential

Normal AV nodal delay is due to slow propagation via the AV node and is 0.1 seconds.

182. Ans. (c) Middle of R to end of T wave

Ref: Ganong, 25th ed. pg. 541

Atrial systole	Beginning of P wave and peak of R wave
Ventricular systole	Middle of R wave and end of T wave
Ventricular diastole	End of T wave and beginning of next P wave

183. Ans. (b) Closure of aortic and pulmonic valves

Ref: Ganong, 25th ed. pg. 540

The Dicrotic notch is small oscillations on the falling phase of the pulse wave caused by vibrations set up when the aortic valve snaps shut.

184. Ans. (b) Explains the increase in cardiac output when venous return is increased

Ref: Ganong, 25th ed. pg. 546

- Frank starling law states that energy of contraction is directly proportional to initial length of cardiac muscle fiber.
- Hence in case of more blood coming on to the right side of the heart, the length of muscle fiber will increase and this will result in increase in force of contraction of heart.

185. Ans. (b) Oscillometry

Ref: Ganong, 25th ed. pg. 543

Doppler	Based on acoustics of sound waves
Thermodilution method	Cold Saline is injected into right atrium and temperature change in blood is recorded in pulmonary artery. The temperature change in pulmonary artery shall be inversely related to blood flow.
Fick's principle	Amount of substance taken up by an organ is equal to arterial level of substance minus the venous level of substance times the blood flow.

186. Ans. (d) Peripheral resistance increases

Ref: Ganong, 25th ed. pg. 549

- Blood flow of resting skeletal muscle is low (2-4 ml/100 gm/min)
- When the muscle contracts, it compresses the vessels and when it develops 70% of its maximal tension, blood is completely interrupted.
- Between contractions the flow is increased by 30 times
- This is due to dilatation of arterioles and precapillary sphincters cause of 10-100 times increase in open capillaries

- During exercise there is a net fall in peripheral resistance, due to vasodilation in exercising muscles. Hence the SBP increases moderately and diastolic pressure remains unchanged or falls.

187. Ans. (a) Increase in rate of transmission

Ref: Ganong, 25th ed. pg. 545

Effect on heart rate = Chronotropic action

Effect on force of contraction = Inotropic action

Effect on rate of transmission = Dromotropic action

188. Ans. (b) C wave is called as dicrotic notch

Ref: Ganong, 25th ed. pg. 542

A wave	Atrial systole
C wave	Bulge of tricuspid valve into right atrium during isovolumetric contraction
X descent	Atrial relaxation
V wave	Beginning of isovolumetric relaxation
Y descent	Ventricular relaxation

Dicrotic Notch is seen in Pulse recording.

189. Ans. (a) Fluctuation in BP with respiration

Ref: Textbook of Medical Physiology, 2nd ed. pg. 435

Traube Hering Waves are oscillations in BP that occur with a frequency of 4/min, and are attributable to rhythmic oscillations in intensity of sympathetic vasomotor discharge.

TRAUBE–HERING WAVES

These are formed by fluctuation in BP synchronous with respiration. The wave shows a rise in pressure during inspiration and a fall during expiration. *These waves are produced due to change in vagal and sympathetic activity in different phases of respiration.* The vasomotor centre is stimulated during inspiration by the irradiation of impulses from the inspiratory centres which causes rise in blood pressure. Also during expiration, the intrathoracic pressure becomes less negative, therefore venous return decreases which in turn decreases cardiac output and BP.

Extra Mile

- **Traube semilunar space:** A crescentic space about 12 cm wide, just above the costal margin.
- **Traube sign:** A murmur heard in auscultation over arteries in significant aortic regurgitation.

190. Ans. (c) Venule

Ref: Ganong, 25th ed. pg. 568

- Maximum cross sectional area is of capillaries. But it is not given in choices.

- The second most extensive cross sectional area is of venules.
- However the maximum of percentage of blood volume is in venules + veins and vena cava and constitutes 54% of total blood volume contained.

Vessel	Cross sectional area	% of blood volume contained
Capillary	4500 cm ²	5%
Venule	4000 cm ²	54%
Arteriole	400 cm ²	1%
Artery	20 cm ²	8%
Aorta	4.5 cm ²	2%

191. Ans. (c) 15 seconds

Ref: Ganong, 25th ed. pg. 573

The normal arm to tongue circulation time is 15 seconds and is measured by injecting a bile salt preparation into the arm vein and timing when the bitter taste will appear in the tongue of the patient.

CNS AND PNS PHYSIOLOGY

192. Ans. (a) Tone

Ref: Ganong, 25th ed. pg. 232-33

- The resistance of muscle to stretch is called tone or tonus
- *Spasticity* is found with upper motor neuron injuries and manifests as a marked resistance to the initiation of rapid passive movement. This initial resistance gives way and then there is less resistance over the remaining range of motion (clasp-knife phenomenon).
- *Rigidity* is an increase in tone that persists throughout the passive range of motion. This has been termed “lead pipe” rigidity and is common with extrapyramidal disease, especially Parkinson’s disease.
- *Paratonia* is a phenomenon in which the patient is essentially unable to relax during passive movements. You will note that the resistance is irregular and generally greatest when you change the pattern of movement. Extreme paratonia is common in patients with dementia.

193. (a) Arcuate fasciculus

Ref: Ganong, 25th ed. pg. 292

Arcus Fasciculus connects the Broca’s area to Wernicke’s area. It is a white matter tract and damage to this area will result in conduction aphasia where repetition will be affected.

Extra Mile

194. Ans. (d) Ventral tegmental area

Ref: Harrison, 20th ed. pg. 174

Neurons in forebrain ventral tegmental area and nucleus accumbens are involved in motivated behaviours like laughter, pleasure, addiction and fear. These areas are called reward centre. The mesocortical dopaminergic neurons that project from midbrain to nucleus accumbens and frontal cortex are also involved.

Extra Mile

Highly addictive drugs like morphine, heroin, cocaine increase the Dopamine which acts on D3 receptors in nucleus accumbens and is responsible for addictive behaviour.

195. Ans. (a) Ventrolateral thalamus

Ref: Ganong, 25th ed. pg. 270

Part of thalamus	Function
Ventrolateral and Ventro-anterior nuclei	Motor function. They receive input from basal ganglia and cerebellum and project to motor nucleus.
Medial geniculate body Lateral geniculate body	Specific sensory relay nuclei Medial geniculate relays auditory and lateral geniculate body relays motor information.
Ventral posteromedial Ventral posterolateral	Relay somatosensory information to post central gyrus

196. Ans. (c) Hyperalgesia

- Choice A, hypersensitivity is a non-specific term.
- Choice B, causalgia characterized by severe burning pain in a limb caused by injury to a peripheral nerve.
- Choice C, Hyperalgesia is heightened response to a minimal pain stimulus. Example gently pinching on arm is causing extreme pain reaction.
- Choice D, Allodynia is pain due to a stimulus that does not usually provoke pain example cold air from AC duct is causing sensation of pain

197. Ans. (d) Muscle spindle

Ref: Ganong 25th ed. Table 8.1: P 160

- The stretch stimulus is mediated by muscle spindle and tension by golgi tendon organ.
- Choice A Merkel's disc perceives touch and pressure.
- Choice B Meissner corpuscle perceives tap and flutter at 5–40 Hz.
- Choice C Pacinian corpuscle mediates deep pressure and vibration at 60–300 Hz.

Stimulus	Receptor cell types
Tap, flutter 5–40 Hz	Meissner corpuscles
Motion	Hair follicle receptors
Deep pressure, vibration 60–300 Hz	Pacinian corpuscles
Touch, pressure	Merkel cells
Sustained pressure	Ruffini corpuscles
Stretch	Muscle spindles
Tension	Golgi tendon organ
Thermal	Cold and warm receptors
Chemical, thermal, and mechanical	Polymodal receptors or chemical, thermal, and ical nociceptors
Chemical	Chemical nociceptor
Light	Rods, cones
Sound	Hair cells (cochlea)
Angular acceleration	Hair cells (semicircular canals)
Linear acceleration, gravity	Hair cell (otolith organs)
Chemical	Olfactory sensory neuron
Chemical	Taste buds

198. Ans. (d) Ach

- Awake state:** Increase activity of norepinephrine- and serotonin-containing neurons (locus coeruleus and raphe nuclei) and reduced level of activity in acetylcholine-containing neurons (pontine reticular formation). Reduced GABA release and increase histamine release is also there.
- REM state:** Decrease activity of norepinephrine- and serotonin-containing neurons and increased level of acetylcholine containing neurons.

- **NREM sleep:** Increased release of GABA and reduced release of histamine.

Extra Mile

- **Serotonin: Old concept**—necessary to obtain and maintain behavioral sleep (permissive role on sleep).
- **Serotonin; recent concept**—suggests that during waking, serotonin may complement the action of noradrenaline and acetylcholine in promoting cortical responsiveness and participate to the inhibition of REM-sleep effector neurons of the brainstem (**inhibitory** role on REM sleep).
- Cortical Ach: Greatest during REM sleep > waking and reduced during non-REM (NREM) sleep.

199. Ans. (b) Muscle tone is absent in REM sleep

Physiological process	NREM (slow wave sleep)	REM (paradoxical sleep)
Time spent	75 % of total sleep duration	25% of total sleep duration
Brain activity	Decreases from wakefulness	Increases in motor and sensory areas are similar to NREM
Heart rate BP Blood flow to brain respiration	Decreases from wakefulness	Increases and varies compared to NREM
Sympathetic nerve activity	Decreases from wakefulness	Increases significantly from wakefulness
Muscle tone	Similar to wakefulness	Absent in all muscle except facial and extraocular muscles
Sexual arousal	Occurs infrequently	Greater than NREM
Dreams	Nonrecallable dream	Recallable dream (so called dream)

200. Ans. (d) Umami

Ref: Ganong, 25th ed. pg. 222

- Most taste buds on the tongue and other regions of the mouth **can detect umami taste**, irrespective of their location.
- Biochemical studies have identified the **taste receptors responsible for the sense of umami** as modified forms of **mGluR4, mGluR1** and **taste receptor type 1** (T1R1 + T1R3), all of which have been found in all regions of the tongue bearing taste buds.

201. Ans. (c) Granular cell

Ref: Barr's Human Nervous System, 9th ed. pg. 161

- The granular cells also make excitatory synapses with Purkinje cells.
- The excitatory transmitter is glutamate.
- *All other cerebellar neurons make inhibitory synapses with GABA as the transmitter.*
- The excitatory input to the cortex is modified by intra-cortical circuits that inhibit the Purkinje cells.
- The granular cells are the most numerous cerebellar interneurons with others being the golgi cells and basket cells.
- The axons afferent to the cerebellum make excitatory connections. Before reaching the cortex all the afferent axons give off collateral branches that contact the neurons in cerebellar nucleus.

FIGURE: Neurons in the cerebellar cortex showing excitatory and inhibitory synapses. The diagram represents a longitudinally sectioned folium, with an edge on view of the dendritic tree of the Purkinje cell. Glutamatergic (excitatory) neurons are red: GABA-ergic (inhibitory) neurons are blue

202. Ans. (c) Glutamate

- The most prevalent transmitter is glutamate, which is excitatory at well over 90% of the synapses in the human brain.
- The next most prevalent is Gamma-Aminobutyric Acid, or GABA, which is inhibitory at synapses in the human brain.

203. Ans. (d) Sub-fornical Organ

- The **subfornical organ (SFO)**, situated on the ventral surface of the fornix (the reasoning behind the organ's name), at the interventricular foramina (foramina of Monroe), is one of the circumventricular organs of the brain, meaning that it is highly vascularized and does not have a blood-brain barrier, unlike the vast majority of regions in the brain.
- The SFO is a sensory circumventricular organ responsive to a wide variety of hormones and neurotransmitters, as opposed to a secretory circumventricular organ.

204. Ans. (b) **Inhibitory to neuron**

Ref: Guyton's Physiology, 11th ed. pg. 563

- GABA (gamma-aminobutyric acid) is secreted by nerve terminals in the spinal cord, cerebellum and basal ganglia. It always causes inhibition.

Extra Mile

Hormone	Source	Function
Dopamine	Neurons in substantia nigra	Inhibition
GABA	Nerve terminals in spinal cord, basal ganglia and cerebellum	Inhibition
Glutamate	Presynaptic terminal in CNS and cerebral cortex	Excitation
Serotonin	Nuclei that originate in the median Raphe of Brain stem	Inhibition of pain pathology
Glycine	Synapses in spinal cord	Inhibition

205. Ans. (b) **Glutamate**

Ref: Lange Medical Physiology by Ganong, 23rd ed. ch. 15

- Glutamate is the most abundant excitatory neurotransmitter in the vertebrate nervous system.
- At chemical synapses, glutamate is stored in vesicles. Nerve impulses trigger release of glutamate from the presynaptic cell. Glutamate acts on ionotropic and metabotropic (G-protein coupled) receptors.
- Because of its role in synaptic plasticity, glutamate is involved in cognitive functions such as learning and memory in the brain.
- Excitotoxicity due to excessive glutamate release and impaired uptake occurs as part of the ischemic cascade and is associated with stroke, autism, some forms of intellectual disability, and diseases such as amyotrophic lateral sclerosis, lathyrism, and Alzheimer's disease.
- In contrast, decreased glutamate release is observed in classical phenylketonuria

206. Ans. (d) **Bipolar cell**

- Cerebellar cortex contains 5 types of neuron cells. They are:

- Golgi cells
- Purkinje cells
- Basket cells
- Granule cells
- Stellate cells

207. Ans. (b) **Broca's area**

Ref: Guyton Physiology, 11th ed. pg. 717

	Location	Function
Broca's area	Posterior part of inferior frontal gyrus	Word formation
Limbic Association area	<ul style="list-style-type: none"> Anterior pole of temporal lobe Ventral portion of frontal lobe Cingulate gyrus 	Behavior Emotion motivation
Wernicke's area	Posterior superior temporal lobe	Language comprehension

208. Ans. (a) **Inferior frontal gyrus**

- Broca's area is now typically defined in terms of the pars opercularis and pars triangularis of the *inferior frontal gyrus*, represented in Brodmann's cytoarchitectonic map as areas 44 and 45 of the dominant hemisphere.
- Damage to Broca's area leads to Motor Aphasia

209. Ans. (d) **Middle cerebral artery**

Ref: Harrison's, 17th ed. Chapter 23

- The Middle cerebral artery is by far the largest cerebral artery and is the vessel most commonly affected by cerebrovascular accident (CVA) as it is the direct continuation of the internal carotid artery.
- The MCA supplies most of the outer convex brain surface, nearly all the basal ganglia, and the posterior and anterior internal capsules. Hence it is most commonly affected and its occlusion most commonly leads to hemiplegia.

210. Ans. (c) **Superior temporal gyrus**

Ref: Guyton's Physiology, 9th ed. pg. 658

- Auditory cortex lies principally on the supratemporal plane of the superior temporal gyrus but also extends onto the lateral side of the temporal lobe.

211. Ans. (b) **Increase heart rate, increase arterial pressure**

Ref: Guyton's Physiology 26th ed. pg. 733

- Pre-optic nucleus in hypothalamus plays a role in cardiovascular regulation and it decreases heart rate and arterial pressure.

- But once this area is damaged there is no control over heart rate and arterial pressure. Hence it rises.

Extra Mile

Other functions of preoptic area:

- It acts as temperature sensor
- Serve as a thermostatic body temperature control center.
- Increase thirst
- Sweating

212. Ans. (b) Stage 2

NREM 1

- NREM Stage 1 (N1 – light sleep, somnolence, drowsy sleep – 5–10% of total sleep in adults and lasts 1–7 minutes)
- This is a stage of sleep that usually occurs between sleep and wakefulness, and sometimes occurs between periods of deeper sleep and periods of REM.
- The muscles are active, and the eyes roll slowly, opening and closing moderately.
- The brain transitions from alpha waves having a frequency of 8–13 Hz (common in the awake state) to *theta waves* having a frequency of 4–7 Hz.
- Sudden twitches and hypnic jerks, also known as positive myoclonus, may be associated with the onset of sleep during N1. Some people may also experience hypnagogic hallucinations during this stage.

NREM 2

- NREM Stage 2 (N2 – 45–55% of total sleep in adults and constitutes 10–25 minutes of initial sleep activity and progressively lengthens).
- In this stage, theta activity is observed and sleepers become gradually harder to awaken; the alpha waves of the previous stage are interrupted by abrupt activity called *sleep spindles* (or thalamocortical spindles) and *K-complexes*. Sleep spindles range from 11 Hz to 16 Hz (most commonly 12–14 Hz).
- During this stage, muscular activity as measured by EMG decreases, and conscious awareness of the external environment disappears.

NREM 3

- NREM Stage 3 (N3 – deep sleep, slow-wave sleep – 15–25% of total sleep in adults):
- Formerly divided into stages 3 and 4, this stage is called slow-wave sleep (SWS) or deep sleep.
- The sleeper is less responsive to the environment; many environmental stimuli no longer produce any reactions.
- Slow-wave sleep is thought to be the *most restful form of sleep*, the phase which most relieves subjective feelings of sleepiness and restores the body.
- This stage is characterized by the presence of a minimum of 20% *delta waves* ranging from 0.5 Hz to 2 Hz and having a peak-to-peak amplitude >75 μ V. (EEG standards define delta waves to be from 0 to 4 Hz, but sleep standards in both the original R&K, as well as the new 2007 AASM guidelines have a range of 0.5–2 Hz.)
- This is the stage in which parasomnias such as **night terrors**, **nocturnal enuresis**, **sleepwalking**, and **somniloquy** occur.

Extra Mile

NREM Stage 4 is currently merged into stage 3 by some authors

- NREM stage 4 has similar attributes to stage 3, except there are a greater proportion of EEG delta waves.
- These high voltage, slow EEG waves make up 50% or more of the record.
- This is the deepest stage of sleep; a more intense stimulus is needed to wake someone from stage 4 sleep than any other stage of NREM sleep.
- Children typically spend 20–25% of sleep in stages 3 and 4 slow wave sleep; this decreases to less than 10% by age 60. **Sleepwalking**, **sleep terrors**, and **sleep-related enuresis** episodes generally occur in stages 3 or 4, or during arousals from this stage.

213. Ans. (b) NREM 2

Ref: Ganong, 25th pg. 273–74

Bruxism: tooth grinding occurring during stage 2 of NREM period.

Nightmare

- Vivid, anxiety producing dreams during sleep.
- Patient wakes up and is able to recall the nightmare vividly.
- Occurs in REM.
- Treatment: REM suppressants such as tricyclic antidepressants, SSRIs, benzodiazepines.

Sleep terror (night terror)

- Arousal in the first one-third of the night.
- Invariably start with piercing scream or cry with intense panic.
- No recall on waking up the next day.
- Occurs in NREM period (stages 3 and 4)
- Seen especially in children, more common in boys.
- EEG is advised to rule out seizure (temporal lobe epilepsy).
- No specific treatment required

Sleep walking (somnambulism)

- Rising from bed with walking about in the first-third of the night.
- No recall on waking up the next day.
- Occurs in NREM period (stages 3 and 4).
- Occurs between 4 and 8 years, spontaneous recovery in adolescence.

Sleep talking (Somniloquy) occurs in all stages of sleep

Sleep-related head banging (Jactatio Capitis Nocturna): rhythmic to-and-fro head rocking occurring just before or during sleep.

214. Ans. (b) Disappear when a patient opens eyes

Ref: Ganong 25th ed. / 273

- **Alpha activity** refers to activity in the range of 8–13 Hz.
- **Alpha rhythm** is 8–13 Hz activity occurring during wakefulness over the posterior head regions which is present when the eyes are closed and the patient relaxed and which is attenuated by eye opening or alerting of the patient.

EEG Waves and their Significance

162

Band	Frequency (Hz)	Location	Normally seen in	Pathologically seen in
Delta	<4	Frontally in adults, posteriorly in children; high-amplitude waves	Adult slow-wave sleep	<ul style="list-style-type: none"> Subcortical lesions Diffuse lesions Metabolic encephalopathy Hydrocephalus
Theta	4–7	Found in locations not related to task at hand	Drowsiness in adults (It has been found to spike in situations where as persons is actively trying to repress a response or action).	<ul style="list-style-type: none"> Subcortical lesions Metabolic encephalopathy
Alpha	8–13	Posterior regions of head, both sides, higher in amplitude on dominant side.	Relaxed/reflecting Closing the eyes	<ul style="list-style-type: none"> Coma
Band	Frequency (Hz)	Location	Normally seen in	Pathologically seen in
Beta	13–30	Both sides, symmetrical distribution, most evident frontally; low-amplitude waves	Active thinking, focus, high alert, anxious	<ul style="list-style-type: none"> Benzodiazepines
Gamma	>30	Somatosensory cortex	Displays during cross-modal sensory processing (perception that combines two different senses, such as sound and sight)	<ul style="list-style-type: none"> May be associated with cognitive decline

215. Ans. (c) Amygdaloid nucleus

Ref: Ganong, 25th ed. pg. 288, Atlas of Neuroanatomy, 2nd ed. pg. 203

- The **hippocampal formation** is a compound structure in the medial temporal lobe of brain containing
 - Dentate gyrus
 - Hippocampus proper
 - Subiculum
 - Entorhinal cortex.
- Amygdala primary role in the processing of memory, decision-making, and emotional reactions, the amygdalae are considered part of the limbic system.

216. Ans. (d) Nucleus Cuneatus

Ref: Harrison, 19th ed. pg. 160 and Diagnostic Clinical Neuropsychology, 3rd ed. pg. 32

- Astereognosis is impaired or lost ability to discriminate between various forms, as well as deficits in finger localization and in graphesthesia (ability to recognize palm writing). If a lesion occurs at or above the level of the thalamus, it commonly results in astereognosis,
- Now Since Nucleus cuneatus gets information from T5 upwards including the upper limb, its lesion results in astereognosis.
- The fasciculus gracilis (graceful, like a ballerina's legs) conveys information from the lower part of the body T6 and below.

- Together the fasciculus gracilis and cuneatus are referred to as the posterior columns, because they occupy a position at the posterior of the spinal cord.
- The posterior columns travel up the ipsilateral side of the spinal cord and synapse in the nucleus gracilis and nucleus cuneatus at the level of the medulla. From there, the fibers decussate (cross over) and continue on toward the thalamus in a pathway synapses in the thalamus, and from there the information is relayed to the postcentral gyrus, known as the somatosensory cortex.

217. Ans. (b) Beta

Ref: Ganong's Physiology, 23rd ed. chapter 15

There are two kinds of sleep: Rapid eye movement (REM) sleep and non-REM (NREM) sleep.

NREM Sleep is Divided into Four Stage

A person falling asleep enters

Stage 1	The EEG begins to show a low-voltage, mixed frequency pattern. A theta rhythm (4–7 Hz) can be seen at this early stage of slow-wave sleep. Throughout NREM sleep, there is some activity of skeletal muscle but no eye movements occur
Stage 2	It is marked by the appearance of sinusoidal waves called sleep spindles (12–14 Hz) and occasional high-voltage biphasic waves called K complexes.
Stage 3	A high-amplitude delta rhythm (0.5–4 Hz) dominates the EEG waves
Stage 4	Maximum slowing with large waves is seen in stage 4

REM sleep is so named because of the characteristic eye movements that occur during this stage of sleep.

The high-amplitude slow waves seen in the EEG during sleep are periodically replaced by rapid, low-voltage EEG activity, which resembles that seen in the awake, aroused state (beta wave). For this reason, **REM sleep is also called paradoxical sleep.**

218. Ans. (c) **Rapidly adapting touch receptors**

Ref: Ganong, 25th ed. pg. 161; Basic Clinical Neurosciences 2nd ed. pg. 131

- When a maintained stimulus of constant strength is applied to a receptor, the frequency of the action potentials in its sensory nerve declines over time. This phenomenon is known as **adaptation or desensitization**.
- Receptors can be classified into **rapidly adapting** (phasic) receptors and **slowly adapting** (tonic) receptors.
- *Meissner and Pacinian corpuscles are examples of rapidly adapting receptors*, and Merkel cells and Ruffini endings are examples of slowly adapting receptors. Other examples of slowly adapting receptors are muscle spindles and nociceptors.

Meissner corpuscles	Tactile shapes and surfaces
Merkel disc	Tactile indentation
Hair follicle receptors	Tactile (hairy skin)
Ruffini nerve endings	Stretching
Pacinian corpuscles	Vibration
Muscle spindle	Proprioception
AS mechanical encapsulated	Pinprick
Free nerve endings	Cold/warmth

219. Ans. (b) **Posterior pituitary**

Ref: Ganong, 25th ed. pg. 606

List of brain structures outside the blood brain barrier called circumventricular organs:

1. Posterior pituitary and median eminence of hypothalamus
2. Area postrema (Chemoreceptor trigger zone)
3. Organum vasculosum of lamina terminalis (Osmoreceptor for vasopressin release)
4. Sub-fornical organ

All these structures have fenestrated capillaries and because of permeability are said to be outside the blood brain barrier.

220. Ans. (b) **REM sleep**

Ref: Ganong, 25th ed. pg. 274

- In REM sleep, the high amplitude slow waves in EEG during sleep are periodically replaced by rapid low voltage EEG activity which is identical to awake aroused state.
- Now the point is that the person is sleeping while EEG record is like that of an awake patient. Hence REM sleep is called as paradoxical sleep.

221. Ans. (c) **Akinesia**

Ref: Ganong, 25th ed. pg. 246

Hyperkinetic Movements and Sites of Lesion

Chorea	Lesion in Caudate nucleus
Atheotosis	Lesion in Globus pallidus
Ballism	Lesion in Sub-thalamic nucleus

222. Ans. (a) **Renshaw cell**

Ref: Ganong, 25th ed. pg. 233, 249

Neurons in Cerebellar Cortex

Purkinje cells	Biggest neurons in CNS
Granule cells	Innervate purkinje cells and give rise to parallel fibers
Basket cells	Located in molecular layer and receive excitatory input from parallel fibers.
Stellate cells	Same as basket cells but located more superficially
Golgi cells	Located in granular layer of cerebellum

Renshaw cell is an interneuron in spinal cord which has an inhibitory function and operates via a neurotransmitter called glycine.

FMGE Solutions Screening Examination

164

223. Ans. (a) Upper motor neuron damage

Ref: Ganong, 25th ed. pg. 233

Clonus is characterised by repeated rhythmic contractions of muscle subjected to sudden maintained stretch.

It is Caused by

- Increased Gamma motor neuron discharge
- Spinal cord injury causing damage to Renshaw cell which is an inhibitory inter-neuron.

Conditions in Which Clonus is seen:

1. Amyotrophic lateral sclerosis
2. Stroke
3. Multiple sclerosis
4. Spinal cord damage
5. Hepatic encephalopathy

Clonazepam and botulinum toxin is useful in management of clonus.

224. Ans. (c) Spasticity

Ref: Ganong, 25th ed. pg. 232-33

- A muscle is said to be spastic in case the resistance to stretch is high. A sequence of resistance followed by sudden decrease in resistance is when the limb is moved passively and is known as clasp knife effect since it shows similarity to closing of a pocket knife.
- Ganong also calls it the lengthening reaction since it is the response of the spastic muscle to lengthening.

225. Ans. (b) Damage to cerebellum

Ref: Ganong, 25th ed. pg. 252

- The cerebellum acts as a brake to stop a particular movement.
- In case of cerebellar lesion, the movement of the arm can be stopped and it moves in a wide arc called rebound phenomenon.

Features of Cerebellar Lesion

- Gait ataxia
- Scanning speech
- Dysmetria
- Intention tremor
- Rebound phenomenon
- Dysaidokinesia
- Nystagmus
- Pendular knee jerks

226. Ans. (b) Withdrawal reflex

Ref: Ganong, 25th ed. pg. 235

- In days following development of spinal shock patient will have low threshold for elicitation of withdrawal reflex

- Minimal noxious stimulus to arm will lead to withdrawal of one extremity and marked flexion-extension pattern of other 3 limbs.
- Later the Deep tendon reflexes become brisk
- Application of minor noxious stimulus will lead to evacuation of bladder and rectum called mass reflex.

227. Ans. (a) Caudate and Putamen

Ref: Ganong 25th ed. pg. 244

Corpus Striatum	Caudate nucleus and putamen
Lenticular nucleus	Putamen and globus pallidus

228. Ans. (b) Bi-synaptic reflex

Ref: Ganong, 25th ed. pg. 232

A Golgi Tendon Reflex/Inverse Stretch Reflex

Operates as follows:

- As the tension applied to a tendon increases, the Golgi tendon organ (sensor) is stimulated.
- Nerve impulses (action potentials) arise and propagate along the 1b sensory nerve fibers into the spinal cord.
- Within the spinal cord, the 1b sensory nerve fibers synapse and generate an IPSP (inhibitory postsynaptic potential) on the motor neurons that supply the muscles from which the fibers arise
- The muscle relaxes and excess tension is relieved.

229. Ans. (b) Golgi Tendon organ

Ref: Ganong, 25th ed. pg. 232

Refer to the explanation of above question.

230. Ans. (d) Spinal Cord

Ref: Ganong's Physiology, 23rd ed. chapter 9

- When a skeletal muscle with an intact nerve supply is stretched, it contracts. This response is called the **stretch reflex**.
- The stimulus that initiates the reflex is stretch of the muscle, and the response is contraction of the muscle being stretched.
- The sense organ is a small encapsulated spindle like or fusiform shaped structure called the muscle spindle, located within the fleshy part of the muscle.
- The impulses originating from the spindle are transmitted to the CNS by fast sensory fibers that pass directly to the motor neurons which supply the same muscle.
- The neurotransmitter at the central synapse is glutamate. The stretch reflex is the best known and studied monosynaptic reflex and is typified by the **knee jerk reflex**.

231. Ans. (b) **Fasciculation**Ref: Harrison, 18th ed. pg. 182

Fasciculation: Visible or palpable twitch within a muscle due to the spontaneous discharge of a motor unit.

Tremor: Involuntary, repetitive, oscillatory movements of a part of the body around a fixed point due to alternate contraction and relaxation of groups of muscles with their antagonists.

Chorea: Brief, rapid, jerky, explosive, Non-Repetitive, quasi-purposive involuntary movements chiefly involving face, tongue and limbs.

Myoclonic Jerk: Sudden, rapid, irregular, jerky involuntary movements of a limb due to contraction of a single muscle or a group of muscles.

232. Ans. (c) **Occipital radiation**Ref: Ganong, 25th ed. pg. 190233. Ans. (d) **Basal ganglia**Ref: Ganong, 25th ed. pg. 244234. Ans. (b) **Law of Projection**Ref: Ganong, 25th ed. pg. 171

Law of projection states that irrespective of the site of application of the stimulus in the sensory pathway, the conscious perception of sensation evoked is felt at the site where receptor is present. This forms the basis of the Phantom Limb.

PHYSIOLOGY OF BLOOD235. Ans. (a) **γ -carboxylation of glutamic acid residues to clotting factor 2, 7, 9 and 10**Ref: Ganong 25th ed. P 566-67

- Vitamin K is a necessary cofactor for the enzyme that catalyses the conversion of glutamic acid residues to γ -carboxyglutamic acid residues.
- A total of 6 proteins involved in clotting require conversion before being released into circulation. These are factor 2, 7, 9, 10 and protein C and S.

236. Ans. (d) **4****O₂ TRANSPORT**

Transport occurs via two processes:

- Hemoglobin bound O₂ (99%)
- Dissolved O₂ (1%)

Note:

- 1 Hb can carry 4 oxygen molecules.
- Molecule of oxygen bound to hemoglobin depends on saturation of Hb (SaO₂/SpO₂) with oxygen. SaO₂ depends on PaO₂

CALCULATION OF HB-BOUND O₂

In arterial blood	In venous blood
<ul style="list-style-type: none"> • 97% hemoglobin is saturated with oxygen, at PaO₂ of 95 mm Hg. • With this saturation, 1 g of Hb, contains 1.34 mL of O₂. • Therefore 100 mL of blood contains 20.1 mL of oxygen (when normal Hb = 15 gm%) • When hemoglobin is 100% saturated with O₂, hemoglobin binds 1.39 mL O₂ per gm of Hb [This is known as oxygen capacity (O₂cap) of Hemoglobin] 	<ul style="list-style-type: none"> • At PvO₂ of 40 mm Hg, Hb is only 75% saturated (SO₂ = 75%). • Therefore, 100 mL of venous blood would carry 14.4 mL of O₂

237. Ans. (b) **Hemoglobin**

Ref: Quantitative Human Physiology; An Introduction.
pg. 432-33

- An average weighing adult turns over approx 6 gm of Hb daily
- 1 g of Hb yield ~35 mg of Bilirubin
- Therefore daily bilirubin formation in an adult is approx 250–350 mg

238. Ans. (c) **12th week**

Ref: Diagnostic Pediatric Hematopathology By Maria A. Proytcheva 2011 ed. pg. 6

Fetal liver is the major site for erythropoiesis between 11 and 24 weeks of gestation.

	Primitive hematopoiesis	Definitive hematopoiesis
Hematopoietic site	Yolk sac and vascular endothelium	Fetal liver and fetal bone marrow Hematopoietic niches
Type of Hematopoiesis	Mostly erythroid	Multilineage Hematopoiesis
RBC Characteristics	Remain Nucleated during their entire lifespan	Enucleated RBCs
Cell Size	Macrocytic	MCV decreases with gestational age

Contd...

	Primitive hematopoiesis	Definitive hematopoiesis
Sensitivity to EPO	Increased	Lower sensitivity
Lifespan	Short	Increases with gestation
Hemoglobin type	Embryonic: Gower 1, Gower 2 and Portland	Fetal Hb ($\alpha_2\gamma_2$) and adult Hb ($\alpha_2\beta_2$)

239. Ans. (b) **Carboxylation**

Vitamin	Action	Deficiency Symptoms	Sources
K group	Catalyze γ , carboxylation of glutamic acid residues on various proteins concerned with blood clotting	Hemorrhage	Leafy green vegetables

240. Ans. (d) **Constitutes 5% of body weight**

Ref: Ganong, 25th ed. pg. 561

Serum is different from plasma in the following ways:

- Fibrinogen is not present
- Factor II, V, and VIII are not present
- Higher serotonin content

Plasma constitutes 5% of body weight and choice D is wrong.

241. Ans. (c) **Von Willebrand factor**

Ref: Ganong, 25th ed. pg. 563

Von willebrand factor is synthesized by endothelial cells.

Haptoglobin	Binds and transports free hemoglobin in blood released after intravascular hemolysis
Anti-thrombin III	Protease inhibitor of intrinsic coagulation system
Hemopexin	Binds to porphyrins particularly for heme recycling.

242. Ans. (a) **Liver**

Sites of Haematopoiesis

Yolk sac at 2 weeks	Earliest Hemoglobin to be formed is Gower 1. This is followed by Gower 2 and finally Portland.
In fetus in liver and partly spleen.	HbF appears at 14 weeks
At birth it shifts to the bone marrow	HbA appears at 38 weeks

243. Ans. (b) **Solubilization of glucose**

Ref: Harper, 26th pg. 584

- Bilirubin formed in peripheral tissues is transported to the liver by plasma albumin
- Smaller amounts of cortisol and other hormones are bound to albumin.
- Half-life of albumin is 21 days.

244. Ans. (c) **Radiation**

Ref: Ganong, 25th ed. pg. 317

From the skin, heat is lost to the environment mainly through radiation

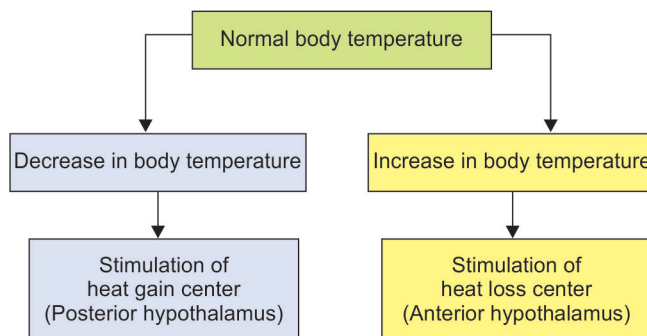

Body heat lost in % (at 21°C) by various means:

Radiation and conduction	70%
Vaporization of heat	27%
Respiration	2%
Urination and defecation	1%

245. Ans. (b) **Stimulation of fibers coming from posterior hypothalamus**

Ref: Essentials of Medical Physiology, 6th ed. pg. 362

- The hypothalamus is said to integrate body temperature information from sensory receptors (primarily cold receptors) in the skin, deep tissues spinal cord, extra-hypothalamic portions of the brain, and the hypothalamus itself.
- The reflex responses activated by cold are controlled from the posterior hypothalamus.
- Those activated by warmth are controlled primarily from the anterior hypothalamus.

- Stimulation of the anterior hypothalamus causes cutaneous vasodilation and sweating, and lesion in this region cause hyperthermia, with rectal temperatures sometimes reaching 43°C (109.4°F).
- The threshold is >37°C for sweating and vasodilation, 36.8°C vasoconstrictions 36°C for non-shivering thermogenesis, and 35.5°C for shivering.

246. Ans. (c) Angiotensin converting enzyme

- The lungs activate the physiologically inactive decapeptide angiotensin I to the pressor, aldosterone-stimulating octapeptide angiotensin II in the pulmonary circulation. The reaction occurs in other tissues as well, but it is particularly prominent in the lungs.
- Large amounts of the angiotensin-converting enzyme responsible for this activation are *located on the surface of the endothelial cells of the pulmonary capillaries*.

247. Ans. (c) 275–300

Ref: Ganong, 25th ed. pg. 310

Urine osmolality = 100-900 mOsm
Plasma osmolality = 275-300 mOsm

248. Ans. (a) K⁺ (Potassium)

Ref: Ganong, 25th ed. pg. 9

Normal serum potassium = 3.5–5.5 mEq/dL
Intracellular potassium = 150 mEq/dL

249. Ans. (b) 21 days
250. Ans. (c) Conjugated plus indirect reacting plus delta bilirubin

Ref: Ganong, 25th ed. pg. 511

251. Ans. (c) Ileum
252. Ans. (a) Milk production

Ref: Ganong 25th ed. / 313

253. Ans. (d) Meissner's corpuscles

Ref: Ganong, 25th ed. pg. 161

Meissner corpuscles	Respond to changes in texture and slow vibrations
Merkel cells	Respond to sustained pressure and touch

Contd...

Ruffini corpuscles	Respond to sustained pressure
Pacinian corpuscles	Respond to deep pressure and fast vibration
Krause end bulb	Sense cold temperature

254. Ans. (d) Angiotensin II: Increase cAMP levels in cells

Ref: Ganong, 25th ed. pg. 53

Thyroid, steroid and retinoic acid	Act via nuclear receptors to increase the transcription of selected mRNA
Insulin	Increase tyrosine kinase activity
ANP	Increase cGMP in the cells
Angiotensin II	Activate phospholipase C and produce diacylglycerol and Inositol phosphate IP3

255. Ans. (d) Monocyte

Ref: Ganong, 25th ed. pg. 171

GM-CSF	Erythrocyte Granulocyte Megakaryocyte
G-CSF	Granulocyte
M-CSF	Monocyte
SCF (Stem cell factor)	Erythrocyte Granulocyte Megakaryocyte Monocyte

256. Ans. (b) cGMP

Ref: Ganong, 25th ed. pg. 154

- Nitric oxide activates guanyl cyclase and it crosses cell membrane with ease. It then leads to production of cGMP.
- Nitric oxide is not stored in any vesicles like other neurotransmitters and is synthesized on demand to post

318. Ans. (c) **Somatostatin**

319. Ans. (b) **Kidney**

320. Ans. (a) **Undigested food**

321. Ans. (a) **Oxygen and nitrogen**

322. Ans. (a) **HR decreased**

323. Ans. (a) Minutes
324. Ans. (b) Neurohypophysis
325. Ans. (d) -90 mV
326. Ans. (a) Rheobase
327. Ans. (a) Glutamate
328. Ans. (a) Olfactory system
329. Ans. (a) Stereognosis
330. Ans. (c) Withdrawal reflex
331. Ans. (a) Golgi tendon organ
332. Ans. (b) Midbrain
333. Ans. (c) Thalamus
334. Ans. (a) Insulin
335. Ans. (a) Foot processes of astrocytes and endothelial cells
336. Ans. (b) Contralateral loss of proprioception
337. Ans. (c) Atrial contraction
338. Ans. (b) Left ventricle work more than right ventricle
339. Ans. (b) Unmyelinated
340. Ans. (d) Inhibition of feed back propagation
341. Ans. (a) Muscle phosphorylase

342. Ans. (a) Maintains the perfusion
343. Ans. (a) Histamine
344. Ans. (a) Asymmetrical arrangement of cell wall component
345. Ans. (a) Receptor mediated endocytosis
346. Ans. (b) Total body water
347. Ans. (c) Integrins
348. Ans. (b) Biosynthesis of fatty acids
349. Ans. (b) H
350. Ans. (a) Fast EPSP
351. Ans. (b) Fibrillation
352. Ans. (b) Isotonic exercise
353. Ans. (b) Blocking inhibitory synapses
354. Ans. (b) Passive diffusion along concentration gradient
355. Ans. (b) II, VII, IX, X
356. Ans. (c) Vascular endothelium
357. Ans. (b) Left shift
358. Ans. (c) Superior temporal gyrus
359. Ans. (a) Cardiac output/Body surface area

ANSWER TO IMAGE-BASED QUESTION

360. Ans. (b) B

PR interval (A)	120–200 msec and represents spread of impulse from SAN to AV node
RR interval (C)	Inversely related to heart rate
QT interval (B)	360–440 msec and represents ventricular depolarization and repolarization

Biochemistry

MOST RECENT QUESTIONS 2019

1. Nitric oxide is synthesized from this amino acid:
 - a. Arginine
 - b. Lysine
 - c. Leucine
 - d. Isoleucine
2. Enzyme deficient in maple syrup urine disease:
 - a. Branched chain alpha keto acid decarboxylase
 - b. Methionine adenosyltransferase
 - c. Fumarylacetoacetate hydrolase
 - d. Tyrosine aminotransferase
3. Amino acid abundant in collagen:
 - a. Glycine
 - b. Lysine
 - c. Leucine
 - d. Isoleucine
4. Which of the following vitamin is most potent anti-oxidant?
 - a. Vitamin D
 - b. Vitamin E
 - c. Vitamin K
 - d. Vitamin B
5. Vitamin which helps in iron absorption:
 - a. Vitamin A
 - b. Vitamin B
 - c. Vitamin C
 - d. Vitamin E
6. Wernicke encephalopathy is due to deficiency of:
 - a. Thiamine
 - b. Biotin
 - c. Niacin
 - d. Hydroxycobalamin
7. Strenuous exercise is not done in this glycogen storage disease:
 - a. McArdle disease
 - b. Anderson disease
 - c. Pompe disease
 - d. Von Gierke disease
8. Each of the following is a physiological uncoupler EXCEPT:
 - a. 2,4 dinitrophenol
 - b. Thyroid hormone
 - c. Unconjugated bilirubin
 - d. Long chain fatty acid
9. In glycolysis which of the following is not involved?
 - a. Pyruvate dehydrogenase
 - b. Phosphofructokinase
 - c. Glucokinase
 - d. Pyruvate kinase
10. First fatty acid to form in fatty acid synthesis:
 - a. Palmitic acid
 - b. Stearic acid
 - c. Oleic acid
 - d. Pantothenic acid

CARBOHYDRATE

11. Urea cycle takes place in:

(Recent Pattern Question 2018-19)

 - a. Nucleus and endoplasmic reticulum
 - b. Mitochondria and Golgi apparatus
 - c. Mitochondria and cytoplasm
 - d. Only mitochondria
12. Which of the following is a physiological uncoupler?

(Recent Pattern Question 2018-19)

 - a. 2,4-Dinitrophenol
 - b. Dinitrocresol
 - c. Aspirin
 - d. Unconjugated bilirubin
13. Gluconeogenesis is mainly seen in:

(Recent Pattern Question 2018)

 - a. Kidney
 - b. Liver
 - c. Spleen
 - d. Heart
14. Glucose-6-phosphate dehydrogenase deficiency causes:

(Recent Pattern Question 2018)

 - a. Megaloblastic anemia
 - b. Hemolytic anemia
 - c. Sick cell anemia
 - d. Microcytic anemia
15. Essential fructosuria is due to the deficiency of which enzyme?

(Recent Pattern Question 2017)

 - a. Aldolase A
 - b. Aldolase B
 - c. Fructokinase
 - d. Glucokinase
16. Identify the glycogen storage disease with exercise induced myoglobinuria: *(Recent Pattern Question 2017)*
 - a. McArdle's disease
 - b. Pompe's disease
 - c. Von gierke disease
 - d. Anderson disease
17. All of the following enzymes catalyze irreversible steps in glycolysis EXCEPT:
 - a. Hexokinase
 - b. PFK-I
 - c. Enolase
 - d. Pyruvate kinase
18. The net ATP yield when one molecule of pyruvate is completely oxidized to CO_2 & H_2O is:
 - a. 10
 - b. 15
 - c. 18
 - d. 30

19. Which of the following enzymes causes Substrate level phosphorylation in Glycolysis:
 - a. Glyceraldehyde 3 Phosphate dehydrogenase
 - b. Pyruvate kinase
 - c. Phosphofructokinase
 - d. Enolase
20. Glucose-6-phosphatase enzyme is absent in:
 - a. Liver
 - b. Kidney
 - c. Brain
 - d. Muscles
21. Which of the following doesn't occur in the mitochondria:
 - a. Cori cycle
 - b. Urea cycle
 - c. FA oxidation
 - d. Kreb's cycle
22. In which cells or tissue, Lactate will convert to pyruvate:
 - a. Muscles
 - b. Liver
 - c. Erythrocytes
 - d. Brain
23. Source of ATP in RBC cells:
 - a. Fatty acid oxidation
 - b. Oxidative phosphorylation
 - c. NADPH paroxidase
 - d. EMP pathway
24. In glycolysis, insulin affects all of the following enzymes EXCEPT:
 - a. Phosphofructokinase
 - b. Pyruvate kinase
 - c. Glucokinase
 - d. Hexokinase
25. Insulin is essential for entry of glucose in which of the following tissue:
 - a. Most neurons in cerebral cortex
 - b. Renal tubular cells
 - c. Skeletal muscles
 - d. Mucosa of small intestine
26. All of the following metabolic pathways occur in both Cytoplasm and Mitochondria, EXCEPT:
 - a. Glycolysis
 - b. Gluconeogenesis
 - c. Heme Synthesis
 - d. Urea cycle
27. Which of the following occurs in both cytoplasm and mitochondria:
 - a. Glycolysis
 - b. Gluconeogenesis
 - c. Glycogenolysis
 - d. Glycogenesis
28. Gluconeogenesis is inhibited by:
 - a. Insulin
 - b. Glucagon
 - c. Glucocorticoids
 - d. GnRH
29. Cytoplasm to Mitochondria substrate shuttle is:
 - a. Glycerophosphate shuttle
 - b. Malate shuttle
 - c. Phosphoenol pyruvate
 - d. Oxaloacetate
30. What is not given in fructose intolerance patient:
 - a. Glucose
 - b. Galactose
 - c. Fructose
 - d. Maltose
31. Aldolase is an enzyme whose substrate is
 - a. Glucose -6-phosphate
 - b. Fructose-6-phosphate
 - c. Fructose
 - d. Fructose-1 biphosphate
32. On weaning off from milk and addition of fruit juices, an infant had frequent attacks of vomiting and tremors. Urine reducing sugar was positive but glucose was negative. The infant is likely to have:
 - a. Fructokinase deficiency
 - b. Galactokinase deficiency
 - c. Glucose -6- phosphatase deficiency
 - d. Aldolase - B deficiency
33. An enzyme involved in the catabolism of fructose to pyruvate in the liver is:
 - a. Glyceraldehydes-3-phosphate dehydrogenase
 - b. Phosphoglucumutase
 - c. Lactate-dehydrogenase
 - d. Glucokinase
34. Which is true for glucoronidation:
 - a. Water solubility is decreased
 - b. Phase II reaction
 - c. Phase I reaction
 - d. Done by CYP enzyme
35. Glucagon receptors are NOT found in which organ:
 - a. Cornea
 - b. Kidney
 - c. Stomach
 - d. Adrenal gland
36. Sodium fluoride is a good in-vitro preservative of glucose in blood samples because it inhibits:
 - a. Enolase
 - b. Hexokinase
 - c. Phosphofructokinase
 - d. Pyruvate dehydrogenase
37. Muscle is NOT involved in which type of glycogen storage disease
 - a. Type 1
 - b. Type 2
 - c. Type 5
 - d. Type 7
38. Enzyme deficiency in Glycogen storage disease type V is?
 - a. Glucose-6-phosphatase
 - b. Acid maltase
 - c. Debranching enzyme
 - d. Myophosphorylase deficiency
39. Regarding HMP shunt, all of the following are true EXCEPT:
 - a. Occurs in the cytosol
 - b. No ATP is produced in the cycle
 - c. It is active in Adipose tissue, Liver and Gonads
 - d. The oxidative phase generates NADH and the Non oxidative phase generates pyruvate.
40. Pentose phosphate pathway produces:
 - a. NADPH
 - b. ATP
 - c. Acetyl CoA
 - d. ADP

**41. What is the composition of lugols solution?**

- a. 4% iodine 10% potassium iodide
- b. 5% iodine and 10% potassium iodide
- c. 2.5% iodine and 5% potassium iodide
- d. 10% iodine and 6% potassium iodide

42. NADPH is used for:

- a. Glycolysis
- b. Lipid synthesis and glutathione reaction
- c. Krebs cycle
- d. All of the above

LIPIDS**43. Principle building block in fatty acid synthesis:***(Recent Pattern Question 2018-19)*

- a. Acetyl CoA
- b. Palmitoyl CoA
- c. Malonyl CoA
- d. Oleate

44. Ideal total cholesterol to HDL cholesterol ratio is:

- a. 1.5
- b. 2.5
- c. 3.5
- d. 4.5

45. Niemann's pick disease is due to deficiency of which enzyme:

- a. Sphingomyelinase
- b. Hexosaminidase-A
- c. Aryl sulphatase
- d. Galactosidase-A

46. Which organelle is involved in the case of sphingomyelin deficiency:

- a. Lysosome
- b. Nucleus
- c. Mitochondria
- d. Cell membrane

47. The most common lysosomal storage disorder is

- a. Gaucher's disease
- b. Tay Sachs's disease
- c. Wolman disease
- d. Niemann pick's disease

48. Enzyme replacement is mostly done for:

- a. Niemann pick's
- b. Gangliosidosis
- c. Gaucher's disease
- d. Phenylketonuria

49. Enzyme deficient in Tay-sach's disease :

- a. α galactosidase
- b. Hexosaminidase A
- c. β galactosidase
- d. β glucosidase

50. The enzyme is the rate limiting enzyme in cholesterol synthesis is:

- a. HMG CoA synthetase
- b. HMG CoA reductase
- c. HMG CoA lyase
- d. Catalase

51. Main LDL receptors is:

- a. APO-A
- b. APO-B-100
- c. APOC-100
- d. APO-100 & APO-E

52. Receptor present in liver for uptake of LDL:

- a. Apo C
- b. Apo A and Apo E
- c. Apo E and Apo B48
- d. Apo B100

53. In primary familial hypercholesterolemia, there is defect in:

- a. LDL-receptors
- b. Apoprotein
- c. Apoprotein B
- d. VLDL

54. Which of the following has maximum cholesterol content:

- a. HDL
- b. LDL
- c. VLDL
- d. Chylomicrons

55. Which of the following lipoprotein transport triglyceride from liver to plasma:

- a. LDL
- b. VLDL
- c. Chylomicrons
- d. HDL

56. What is true regarding medium chain fatty acids:

- a. Don't require pancreatic lipase
- b. Diffuse directly into portal circulation
- c. Not deposited in adipose tissue
- d. All of the above

57. Auto oxidation is seen in:

- a. Cholesterol
- b. Arachidonic acid
- c. Stearic acid
- d. Palmitic acid

58. Which of the following is an Omega-3 fatty acid?

- a. Linoleic acid
- b. α -Linolenic acid
- c. Oleic acid
- d. Arachidonic acid

59. Which one of the following is an example of omega-3 fatty acids:

- a. Gamma Linolenic Acid
- b. Oleic Acid
- c. Docosahexaenoic Acid
- d. Palmitoleic acid

60. All of the following are derivative of omega-6 EXCEPT:

- a. Alpha linolenic acid
- b. Gamma linolenic acid
- c. Arachidonic acid
- d. Linoleic acid

61. Ketones body production occurs in:

- a. Cytoplasm
- b. Mitochondria
- c. Golgi Body
- d. Nucleus

62. Which enzyme activity is increased in starvation:

- a. Pyruvate decarboxylase
- b. Pyruvate kinase
- c. Pyruvate carboxylase
- d. Pyruvate dehydrogenase

63. In 3rd day to 2nd week starvation the body depends on:

- a. Amino acid
- b. Ketone bodies
- c. FA
- d. Glucose

64. Which of the following is a Monounsaturated Fatty acid (MUFA):

- a. Linolenic acid
- b. Oleic acid
- c. Lauric acid
- d. Stearic acid

65. The product of oxidation of odd chain fatty acids is:

- a. Aceto-acetyl CoA
- b. Malonyl CoA
- c. Propionyl CoA
- d. Fumaryl COA

66. Beta oxidation of odd chain fatty acid produces acetyl CoA and _____?

- a. Malonyl CoA
- b. Succinyl CoA
- c. Propionyl CoA
- d. Methylmalonyl CoA

NUCLEIC ACID

173

67. Which of the following X-linked condition presents as urolithiasis with gouty arthritis:

(Recent Pattern Question 2018-19)

- a. Holt oram syndrome
- b. Lesch nyhan syndrome
- c. SCID
- d. Cystic fibrosis

68. Initiator codon in prokaryotes:

(Recent Pattern Question 2018-19)

- a. UAA
- b. UGA
- c. AUG
- d. UAG

69. Correct PCR staging sequence:

(Recent Pattern Question 2018-19)

- a. Denature of DNA → Extension of primer → Annealing of Primer
- b. Annealing of primer → Extension of primer → DNA denature
- c. Denature of DNA → Annealing of primers → Extension of primer
- d. Annealing of primer → DNA denature → Extension of primer

70. Which of the following is NOT seen in DNA:

(Recent Pattern Question 2018-19)

- a. Cytosine
- b. Adenine
- c. Guanine
- d. Uracil

71. Lac operon is:

(Recent Pattern Question 2018)

- a. Repressor
- b. Inducer
- c. Operator
- d. Activator

72. True about DNA polymerase I:

(Recent Pattern Question 2018)

- a. DNA polymerase III activity
- b. 3' – 5' exonuclease activity
- c. 5' – 3' exonuclease activity
- d. All of the above

73. Reverse transcriptase PCR analyzes?

(Recent Pattern Question 2017)

- a. DNA
- b. RNA
- c. Amino acid
- d. Protein particle

74. Ionising radiation damages DNA by which mechanism:

(Recent Pattern Question 2017)

- a. Free radical damage
- b. DNA helicase damage
- c. Mismatch of bases
- d. Bulky adducts formation

75. X chromosome belongs to which group?

(Recent Pattern Question 2017)

- a. A
- b. B
- c. C
- d. D

76. Which is Not true about Cockayne syndrome?

(Recent Pattern Question 2017)

- a. Autosomal recessive
- b. DNA mismatch repair
- c. Related to XP
- d. Usually recurs

77. How many stop codons are seen?

(Recent Pattern Question 2017)

- a. 1
- b. 2
- c. 3
- d. 4

78. Which is true about stop codon?

(Recent Pattern Question 2017)

- a. 3 codon coding for one amino acid
- b. 3 codon coding for whole DNA
- c. 3 codon coding for whole RNA
- d. 3 codon act as terminator codon

79. Anti-codon arm is seen in (Recent Pattern Question 2016)

- a. m-RNA
- b. r- RNA
- c. t-RNA
- d. sn- RNA

80. Alpha helix is which structure

(Recent Pattern Question 2016)

- a. Primary
- b. Secondary
- c. Tertiary
- d. Quaternary

81. Bend of DNA is made of which amino acid

(Recent Pattern Question 2016)

- a. Glycine
- b. Alanine
- c. Cysteine
- d. Lysine

82. Enzyme involved in post-transcriptional capping at 5' end (Recent Pattern Question 2016)

- a. 5 methyl transferase
- b. 7 methyl transferase
- c. 5 methyl reductase
- d. 7 methyl reductase

83. Which of the following nitrogen base is not seen in RNA: (Recent Pattern Question 2016)

- a. Adenine
- b. Thymine
- c. Guanine
- d. Cytosine

84. Which of the following amino acid is common in Purine and pyrimidines?

- a. Alanine
- b. Glutamine
- c. Guanine
- d. Uracil

85. In Pyrimidine synthesis rate limiting enzyme is:

- a. Aspartate transcarbamylase
- b. Carbamoyl phosphate synthetase II
- c. Dihydroorotase dehydrogenase
- d. OMP. Decarboxylase

86. The Watson's Crick double helix model of DNA is

- a. Right handed anti parallel
- b. Left handed anti parallel
- c. Right handed parallel
- d. Left handed parallel

87. Equal number of nucleotide bases are seen between which pair of nucleotides:

- a. A≡G
- b. G=T
- c. G≡C
- d. A=C

- 88. Frame shift mutation:**
- Substitution of amino acid
 - Changed mRNA base at 3rd nucleotide of codon
 - Due to stop codon
 - Deletion of 2 bases
- 89. Frameshift mutation leads to cellular changes to which of the following processes**
- Translation
 - Transcription
 - Replication
 - Spontaneous
- 90. Frame shift mutation DOESN'T occur in multiples of:**
- 2
 - 3
 - 4
 - 5
- 91. Sickle cell disease is present with which mutation:**
- Cross-linked defect
 - Base pair defect
 - Mismatch defect
 - Base pair substitution
- 92. Which of the following is not a part of DNA correction mechanism:**
- Nucleoside correction
 - Pre replication
 - Post replication
 - Base pair correction
- 93. 5' to 3' exonuclease activity is seen in:**
- Proof reading
 - Repair of damaged DNA
 - DNA synthesis
 - DNA polymerase
- 94. Radiation affects:**
- RNA
 - DNA
 - Mitochondria
 - Cytoskeleton protein
- 95. True about Chaperones:**
- For misfolding of protein
 - HSP 70 family of chaperones bind with hydrophobic amino acid
 - HSP 60 and 70 are similar in structure
 - Has no role in unfolding
- 96. DNA repair defect is seen in:**
- Xeroderma pigmentosum
 - Li-fraumani syndrome
 - Retinoblastoma
 - None
- 97. DNA enzyme for aging:**
- Telosomerase
 - Topoisomerase
 - Telomerase
 - DNA polymerase
- 98. Protein synthesis occurs in which part of the cell:**
- Smooth endoplasmic reticulum
 - Rough endoplasmic reticulum
 - Golgi body
 - All of the above
- 99. Protein synthesis occurs in:**
- Golgi bodies
 - Endoplasmic reticulum
 - Mitochondria
 - Peroxisomes
- 100. Protein synthesized in rough Endoplasmic reticulum will first go to:**
- Mitochondria
 - Cytosol
 - Golgi body
 - Lysosome
- 101. Which of the following structure is not affected in protein denaturation?**
- Primary structure
 - Secondary structure
 - Tertiary structure
 - Quaternary structure
- 102. True about Lesch Nyhan Syndrome:**
- Patient have normal intellectual capacity
 - Pyrimidine overproduction is the cause
 - Uric acid stones are frequently formed
 - X- Linked dominant
- 103. All of the following are features of Lesch-Nyhan syndrome EXCEPT:**
- Hyperuricaemia
 - Self-mutilation
 - Mental retardation
 - Immunodeficiency
- 104. The main catabolic product/products of purine nucleotides in humans is which one of the following:**
- Ammonia + CO₂
 - Ammonia
 - Uric Acid
 - CO₂ and Water
- 105. Hyperuricemia occur due to all EXCEPT:**
- Xanthine oxidase
 - Phosphoribosyl pyrophosphate synthetase
 - Glucose 6 phosphatase
 - Hypoxanthine-guanine phosphoribosyl-transferase
- 106. Hypouricaemia is associated with deficiency of which of the following:**
- Xanthine oxidase
 - Von Gierke's disease
 - Hypoxanthine guanine phosphoribosyl transferase
 - Adenine phosphoribosyl transferase
- 107. The technique used for separation and detection of RNA is which one of the following?**
- Northern Blot
 - Southern Blot
 - Eastern Blot
 - Western Blot
- 108. Carrier of genetic material**
- DNA cistrons
 - Codons of m RNA
 - Anti-codons of t RNA
 - None
- 109. All of the following are true regarding cytosolic eukaryotic gene expression EXCEPT:**
- Capping helps in attachment of mRNA to 40 S Ribosome
 - N formyl methionine t-RNA will be the first t-RNA to come into action
 - EF2 shifts between GDP & GTP
 - Releasing factor releases the polypeptide chain from the P site
- 110. Most common RNA is**
- t-RNA
 - m-RNA
 - r-RNA
 - sn-RNA
- 111. RNA silencing is seen with:**
- t-RNA
 - m-RNA
 - Sn-RNA
 - mi-RNA
- 112. SNURPS are:**
- Single nucleotide units for recycling of proteins
 - Small Nuclear Ribo-nucleoproteins
 - Small nuclear units for misfolded proteins
 - Single nuclear unit for recycling of misfolded proteins

113. Lac operon is classically activated by:

- Increased glucose concentration, increased cAMP
- Decreased glucose concentration, decreased cAMP
- Decreased glucose concentration, increased cAMP
- Increased glucose concentration, decreased cAMP

AMINO ACID

114. Hartnup disease can present with:

(Recent Pattern Question 2018-19)

- Pellagra like symptoms
- Nephrolithiasis
- Protein intolerance
- Microcephaly

115. All of the following are derivatives of tryptophan EXCEPT:

(Recent Pattern Question 2018-19)

- Melatonin
- Serotonin
- Niacin
- Creatinine

116. Prostaglandins are derived from:

(Recent Pattern Question 2018-19)

- Stearic acid
- Arachidonic acid
- Glutamic acid
- Aspartic acid

117. Mental retardation is a clinical feature of:

(Recent Pattern Question 2018-19)

- Alkaptonuria
- Albinism
- Hawkinsinuria
- Phenylketonuria

118. Precursor of melanin synthesis:

(Recent Pattern Question 2018-19)

- Tyrosine
- Glycine
- Phenylalanine
- Lysine

119. Collagen contains amino acids Proline, Lysine and:

(Recent Pattern Question 2018-19)

- Glycine
- Isoleucine
- Cysteine
- Methionine

120. Disulfide bonds are formed in which amino acid:

(Recent Pattern Question 2018-19)

- Glycine
- Cysteine
- Proline
- Isoleucine

121. Which is not a biological derivative of tyrosine?

(Recent Pattern Question 2018)

- Melanin
- Melatonin
- Epinephrine
- Dopamine

122. The composition of creatine is:

(Recent Pattern Question 2018)

- Glycine, arginine, methionine
- Glycine and histidine
- Glycine, glutamate, aspartate
- Histidine and methionine

123. All of the following are branched chain amino acids EXCEPT:

(Recent Pattern Question 2018)

- Leucine
- Lysine
- Isoleucine
- Valine

124. Protein folding is done by: (Recent Pattern Question 2017)

- Chaperone
- Endoplasmic reticulum
- Peroxisome
- Lysosome

125. Which is the common amino acid between urea cycle and TCA? (Recent Pattern Question 2017)

- Aspartate
- Alanine
- Asparagine
- Glutamate

126. Which amino acid is acidic? (Recent Pattern Question 2017)

- Aspartic acid
- Valine
- Leucine
- Aspartate

127. Guanidine combines with which amino acid?

(Recent Pattern Question 2017)

- Tyrosine
- Arginine
- Methionine
- Proline

128. Dihydrobiopterin is used in management of which amino acid defect? (Recent Pattern Question 2017)

- Alanine
- Tyrosine
- Phenylalanine
- Tryptophan

129. HbA1c does glycosylation with which amino acid?

(Recent Pattern Question 2017)

- Arginine
- Glutamate
- Valine
- Leucine

130. Test done to check protein purity?

(Recent Pattern Question 2017)

- Mass Spectrophotometry
- SDS -PAGE
- Western blot
- Sanger's technique

131. LDH1 is seen in:

(Recent Pattern Question 2017)

- Liver
- Skeletal muscle
- Heart
- Kidney

132. Non-essential amino acid (Recent Pattern Question 2016)

- Tryptophan
- Tyrosine
- Arginine
- Histidine

133. True about lysine

(Recent Pattern Question 2016)

- Deficient in pulses
- Deficient in cereals
- Nonessential amino acid
- Acidic amino acid

134. Homocysteine is

(Recent Pattern Question 2016)

- Protein D alpha amino acid
- Protein L amino acid
- Non-protein alpha amino acid
- Seen in protein

135. Which of the following releases ammonia

(Recent Pattern Question 2016)

- Aspartate dehydrogenase
- Glutaminase
- Adenosine deaminase
- Aspartate synthetase

136. Carnitine is useful in transport of

(Recent Pattern Question 2016)

- Aromatic amino acid
- Aliphatic amino acid
- Fatty acid
- Glucose

137. PKU is due to deficiency of which enzyme:

(Recent Pattern Question 2016)

- a. Phenylalanine reductase b. Phenylalanine hydroxylase
- c. Tyrosine hydroxylase d. Tyrosine reductase

138. Which protein is abundant in our body:

(Recent Pattern Question 2016)

- a. Collagen b. Albumin
- c. Myoglobin d. Hemoglobin

139. Which is a niacin sparing amino acid:

- a. Tryptophan b. Methionine
- c. Cysteine d. Tyrosine

140. Which vitamin can be synthesized from tryptophan:

- a. Niacin b. Riboflavin
- c. Cobalamin d. Folic acid

141. Disease entity due to deficiency of alpha keto-decarboxylase enzyme:

- a. Hartnup's disease b. Maple syrup disease
- c. Alkaptonuria d. Alport syndrome

142. Limiting amino acid in maize:

- a. Niacin b. Tyrosine
- c. Tryptophan d. Methionine

143. In Alkaptonuria deficiency is:

- a. Phosphofructo kinase b. HMG CoA reductase
- c. Homogentisate oxidase d. Xanthine oxidase

144. First product of tryptophan catabolism is:

- a. Kynurenine b. Bradykinin
- c. PAF d. Xanthurenate

145. Urea is formed from which substrate:

- a. Arginine b. Ornithine
- c. Citrulline d. Aspartate

146. Hydrolysis occurs at which step of urea cycle:

- a. Cleavage of Arginine
- b. Formation of Argininosuccinate
- c. Formation of citrulline
- d. Formation of ornithine

147. Polyamine like putrescine is derived from:

- a. Arginine b. Ornithine
- c. Yohimbine d. Argininosuccinate

148. All are true about selenocysteine EXCEPT:

- a. Considered 21st Amino acid
- b. Coded by UGA
- c. Occurs in glutathione peroxidase
- d. Made of cysteine and methionine

149. Cystinuria is due to the accumulation of:

- a. Cysteine b. Lysine
- c. Ornithine d. Cysteine

150. Cystinuria presents with excess of

- a. Cysteine b. Tyrosine
- c. Glutamine d. Valine

151. Nitric oxide is synthesized from:

- a. L- arginine b. L- citrulline
- c. Lysine d. Tryptophan

152. Smooth muscle relaxant nitric oxide is synthesized from:

- a. Methionine b. Cysteine
- c. Arginine d. Ornithine

153. Carnitine is made-up of:

- a. Leucine b. Lysine
- c. Lysine & methionine d. Arginine

154. β alanine is a product of:

- a. Dihydrouracil b. Carnitine
- c. Kynurenine d. Cyano-cobalamin

155. The structural polysaccharide chitin is a polymer of which of the following:

- a. Galactosamine b. Glucosamine
- c. N. Acetyl Galactosamine d. N-Acetyl Glucosamine

156. The initiation of hemoglobin synthesis requires:

- a. Histidine b. Glycine
- c. Folate d. Iron

157. In Hartnup's disease which of the following is excreted in the urine:

- a. Ornithine b. Glycine
- c. Tryptophan d. Cystine

158. Intestinal flora (bacteria) digests all EXCEPT:

- a. Cellulose b. Lignin
- c. Pectin d. Starch

159. Amino acid which contributes to biosynthesis of purine ribonucleotide are all EXCEPT:

- a. Aspartate b. Histidine
- c. Glutamate d. Glycine

160. Which of the following amino acid is used in biosynthesis of purines?

- a. Alanine b. Glycine
- c. Threonine d. Ornithine

161. Glutathione is composed of:

- a. Glycine b. Cysteine
- c. Glutamate d. All of the above

162. Vitamin C is necessary in the formation of collagen. It is required for the conversion of:

- a. Proline to hydroxyproline
- b. Beta-carotene to vitamin A
- c. Glutamate to gamma-carboxyglutamate
- d. Pyridoxine to pyridoxal phosphate

163. What changes the conformation of alpha helix in collagen

- a. Methionine
- b. Proline
- c. Alanine
- d. Tyrosine

164. Used in Transamination:

- a. Pyridoxal phosphate
- b. NADPH
- c. NADP
- d. FAD

VITAMINS, MINERALS AND ENZYMES

165. Menkes disease is due to deficiency of:

(Recent Pattern Question 2018-19)

- | | |
|-------------|--------------|
| a. Selenium | b. Copper |
| c. Chromium | d. Manganese |

166. G6PD is enzyme of: (Recent Pattern Question 2018-19)

- | | |
|-----------------|--------------------------|
| a. Mitochondria | b. Cell membrane |
| c. Golgi organ | d. Endoplasmic reticulum |

167. Inheritance pattern of G6PD:

(Recent Pattern Question 2018-19)

- | | |
|-------------|-------------|
| a. AR | b. AD |
| c. X-linked | d. Familial |

168. Activator of trypsinogen is mainly by:

- | | |
|---------------------|--------------------|
| a. Chymotrypsinogen | b. Enteropeptidase |
| c. Trypsin | d. Hexokinase |

169. Which of the following is a function of chaperone protein? (Recent Pattern Question 2018-19)

- It degrades proteins that have folded improperly
- It provides a template for how the proteins should fold
- It rescues proteins that have folded improperly and allows them to refold properly
- It degrades proteins that have folded properly

170. In case of cyanide poisoning, antidote of amyl nitrate is given. This is an example of:

(Recent Pattern Question 2018)

- | | |
|------------------------|-----------------------------|
| a. Receptor antagonism | b. Chemical antagonism |
| c. Physical antagonism | d. Physiological antagonism |

171. Synthesis of type I collagen requires which vitamin?

(Recent Pattern Question 2018)

- | | |
|--------------|--------------|
| a. Vitamin A | b. Vitamin C |
| c. Vitamin D | d. Vitamin K |

172. cAMP is formed from: (Recent Pattern Question 2018)

- | | |
|--------|--------|
| a. AMP | b. GMP |
| c. ATP | d. MTP |

173. Among the following, which is the most effective antioxidant: (Recent Pattern Question 2018)

- | | |
|--------------|--------------|
| a. Vitamin A | b. Vitamin C |
| c. Vitamin E | d. Vitamin K |

174. Selenium deficiency causes:

(Recent Pattern Question 2017)

- | | |
|--------------------|-----------------------|
| a. Menke's disease | b. Wilson's disease |
| c. Keshan disease | d. Kashinbeck disease |

175. Which is correct about vitamin K?

(Recent Pattern Question 2017)

- | | |
|------------------------|--------------------------|
| a. Shortest half life | b. Exist in three forms |
| c. All are fat soluble | d. All are water soluble |

176. Peroxidases belong to which enzyme group?

(Recent Pattern Question 2017)

- | | |
|----------------------|----------------|
| a. Oxidase-Reductase | b. Lipase |
| c. Hydrolase | d. Transferase |

177. Impaired Glucose intolerance is caused by deficiency of

(Recent Pattern Question 2016)

- | | |
|-------------|-------------|
| a. Chromium | b. Selenium |
| c. Copper | d. Cobalt |

178. Lactate dehydrogenase enzyme requires which metal

(Recent Pattern Question 2016)

- | | |
|--------------|-----------|
| a. Selenium | b. Copper |
| c. Magnesium | d. Zinc |

179. True about competitive inhibition with first order kinetics

(Recent Pattern Question 2016)

- Km increased, Vmax same
- Vmax increased, Km same
- Km same, Vmax decrease
- Km same, Vmax increase

180. Methylcobalamin is required for which of the following enzymes:

- Homocysteine deaminase
- Homocysteine methyl transferase
- Methionine synthase
- Methionine reductase

181. True about Riboflavin is:

- Deficiency causes Beri Beri
- Consist of flavin group which is required in oxidation-reduction reaction
- Pyridoxal phosphate act as a cofactor
- Green leafy vegetables are major sources

182. Which vitamin is associated with carboxylation reactions:

- | | |
|-------------|-----------------|
| a. Thiamine | b. Riboflavin V |
| c. Biotin | d. Folic acid |

183. In pregnancy, neural tube defect arises in the fetus due to deficiency of which of the following in the mother?

- | | |
|--------------|---------------|
| a. Vitamin | b. Folic Acid |
| c. Vitamin A | d. Vitamin C |

184. Pellagra is due to:

- | | |
|------------------------------|-----------------------------|
| a. Utilization of tryptophan | b. Deficiency of tryptophan |
| c. Deficiency of thiamine | d. Utilization of niacin |

185. Menadione is analog of:

- | | |
|--------------|--------------|
| a. Vitamin K | b. Vitamin A |
| c. Vitamin D | d. Vitamin C |

186. Which of the following is water soluble form of vitamin K:

- | | |
|----------------|------------------|
| a. Menaquinone | b. Phylloquinone |
| c. Menadione | d. Primidone |

187. Water soluble form of Vitamin K

- | | |
|------------------|----------------|
| a. Phylloquinone | b. Menaquinone |
| c. Menadione | d. None |

188. All of the following vitamins are anti-oxidants EXCEPT:

- | | |
|-------------------|------------------|
| a. Beta- carotene | b. Ascorbic acid |
| c. Vitamin E | d. Vitamin K |

189. Which of the following vitamin deficiency is seen with biliary obstruction:

- | | |
|----------------------------|---------------------------|
| a. Vitamin K | b. Vitamin C |
| c. Vitamin B ₁₂ | d. Vitamin B ₂ |

- 190. Of the following which is absent in eggs:**
 a. Vitamin B₁₂ b. Vitamin C
 c. Vitamin A d. Vitamin B₂
- 191. A child with alopecia, hyperpigmentation, hypogonadism and rash of genital area and mouth is likely to suffer from:**
 a. Iron deficiency b. Zinc deficiency
 c. Calcium deficiency d. Copper deficiency
- 192. Toxicity of cholera toxin is due to which one of the following:**
 a. Decrease in activity of Gi protein
 b. Decrease in activity of Gs protein
 c. ADP-ribosylation of Gs alpha sub-unit
 d. ADP-ribosylation of G1 alpha sub-unit
- 193. The normal pH of the human blood is which one of the following:**
 a. 7.0-7.2 b. 7.25-7.35
 c. 7.36-7.44 d. 7.50-7.55
- 194. The best index for calculation of the nutritional value of protein is which one of the following:**
 a. Biological Value b. Net protein utilization
 c. Protein digestibility d. Protein efficiency rates
- 195. Malonyl aciduria is seen in deficiency of:**
 a. Vitamin B₁₂ b. Vitamin B₂
 c. Pyridoxine d. Folic acid
- 196. Sunflower cataract is caused due to:**
 a. Iron deposit b. Sorbitol deposit
 c. Glucose deposit d. Copper deposit
- 197. Marfan's syndrome is due to the defect in:**
 a. Collagen b. Fibrillin
 c. Elastin d. Laminin
- 198. Conversion of norepinephrine to epinephrine:**
 a. Methylation b. Demethylation
 c. Carboxylation d. Decarboxylation
- 199. Conversion of Norepinephrine to Epinephrine**
 a. COMT b. MAO
 c. PENMT d. SAM
- 200. Which enzyme is used to convert phenylalanine to tyrosine:**
 a. Tyrosine synthase
 b. Tyrosine hydroxylase
 c. Phenylalanine hydroxylase
 d. Phenylethanolamine methyltransferase
- 201. Which one of the following is a precursor of tyrosine?**
 a. Epinephrine b. Phenylalanine
 c. DOPA d. Norepinephrine
- 202. Copper containing enzyme is:**
 a. Dopamine hydroxylase
 b. Dopamine decarboxylase
 c. Dopamine carboxylase
 d. Tyrosine hydroxylase
- 203. Enzyme involved with copper as coenzyme**
 a. Lysyl oxidase b. Phenylalanine Hydroxylase
 c. Alcohol dehydrogenase d. None of the above
- 204. Which of the following enzyme requires molybdenum for its activity:**
 a. Cytochrome oxidase b. Xanthine oxidase
 c. Carbonic anhydrase d. Phosphoglucose mutase
- 205. Which of the following elements is required for conversion of pro-collagen to collagen:**
 a. Zinc b. Iron
 c. Selenium d. Copper
- 206. Which of the following ion is used in PCR?**
 a. Mn²⁺ b. Mg²⁺
 c. Ca²⁺ d. Mo
- 207. In Non competitive inhibition of enzyme:**
 a. Decreased Km, increase V_{max}
 b. Increase Km, Increase V_{max}
 c. Normal Km, decrease V_{max}
 d. Normal Km, increase V_{max}
- 208. All enzymes are oxidoreductases EXCEPT:**
 a. Glucokinase b. Peroxidase
 c. Oxidase d. Oxygenase

BOARD REVIEW QUESTIONS

- 209. Cofactor of carbonic anhydrase is?**
 a. Molybdenum b. Zinc
 c. Copper d. Selenium
- 210. How many calories are supplied per gram of dietary fiber?**
 a. 2 calories b. 4 calories
 c. 0 calories d. 10 calories
- 211. In the first minute, what is the main source of energy used by a person who is running?**
 a. Glycogen b. FFA
 c. Phosphagen d. Glucose
- 212. What is not given in a fructose intolerant patient?**
 a. Glucose b. Galactose
 c. Fructose d. Maltose
- 213. Post prandial utilization of glucose is by which enzyme?**
 a. Hexokinase b. Glucokinase
 c. Fructokinase d. All of the above
- 214. True about competitive inhibition?**
 a. Increased V_{max} b. Increased K_m
 c. Decreased V_{max} d. Decreased K_m
- 215. Site of protein synthesis?**
 a. Nucleus b. Cytoplasm
 c. Peroxisomes d. Mitochondria

216. **Enzyme involved in Von Gierke disease is?**
 - a. Muscle glycogen Phosphorylase
 - b. Glucose 6 Phosphatase
 - c. Debranching enzyme
 - d. Branching enzyme
217. **Xanthurenic acid is produced in metabolism of?**
 - a. Tyrosine
 - b. Glycine
 - c. Methionine
 - d. Tryptophan
218. **Ketone body production occurs in?**
 - a. Cytoplasm
 - b. Mitochondria
 - c. Golgi Body
 - d. Nucleus
219. **Which is true for glucuronidation?**
 - a. Water solubility is decreased
 - b. Phase II reaction
 - c. Phase I reaction
 - d. Done by CYP enzymes
220. **Niemann's pick disease is due to deficiency of which enzyme?**
 - a. Sphingomyelinase
 - b. Hexosaminidase-A
 - c. Aryl sulphatase
 - d. Galactosidase-A
221. **1st product of tryptophan catabolism is?**
 - a. Kynurenine
 - b. Bradykinin
 - c. PAF
 - d. Xanthurenate
222. **Urea is formed from which substrate?**
 - a. Arginine
 - b. Pyridine
 - c. Citrulline
 - d. Aspartate
223. **Hydrolysis occurs at which step of urea cycle?**
 - a. Cleavage of Arginine
 - b. Formation of Argininosuccinate
 - c. Formation of citrulline
 - d. Formation of ornithine
224. **What are Aptamers?**
 - a. Antibodies
 - b. Types of m-RNA
 - c. Oligonucleotides
 - d. Ribozymes
225. **Auto oxidation is seen in?**
 - a. Cholesterol
 - b. Arachidonic acid
 - c. Stearic acid
 - d. Palmitic acid
226. **What is the composition of lugols solution?**
 - a. 4% iodine 10% potassium iodide
 - b. 5% iodine and 10% potassium iodide
 - c. 2.5% iodine and 5% potassium iodide
 - d. 10% iodine and 6% potassium iodide
227. **Nitric oxide is synthesized from?**
 - a. L-arginine
 - b. L-citrulline
 - c. Lysine
 - d. Tryptophan
228. **Rate limiting step in cholesterol synthesis is?**
 - a. HMG CoA synthetase
 - b. HMG CoA reductase
 - c. Thiokinase
 - d. Mevalonate kinase
229. **True about bile acids is?**
 - a. 7 α hydroxylase is the rate limiting enzyme in the synthesis
 - b. They are derived from cholesterol
 - c. Cholic acid is primary bile acid
 - d. All of the above
230. **Strongest oxygen radical amongst the following is?**
 - a. O₂⁻
 - b. OH⁻
 - c. H₂O₂
 - d. HClO
231. **LCAT activates?**
 - a. Apo A1
 - b. Apo B100
 - c. Apo C-2
 - d. Apo C-3
232. **GABA is derived from?**
 - a. Glycine
 - b. Glutamine
 - c. Glutamate
 - d. Alanine
233. **Glutamic acid is formed from which of the following amino acid?**
 - a. Threonine
 - b. Proline
 - c. Alanine
 - d. Lysine
234. **Unfolded proteins are handled by?**
 - a. Chaperones
 - b. Histones
 - c. Proteases
 - d. Proteosomes
235. **The primary role of chaperones is to help in?**
 - a. Protein synthesis
 - b. Protein degradation
 - c. Protein de-naturation
 - d. Protein folding
236. **Sorting of protein molecules is performed in?**
 - a. Mitochondria
 - b. Golgi apparatus
 - c. Nucleosome
 - d. Endosome
237. **Pyruvate is converted to which substance to start gluconeogenesis?**
 - a. Oxaloacetate
 - b. Phosphoenol pyruvate
 - c. Cis-aconitate
 - d. Succinate
238. **Wolman disease leads to accumulation of?**
 - a. Cholesterol
 - b. Triglycerides
 - c. Sphingosides
 - d. Cerebrosides
239. **Hydrogen sulphide acts on which complex of cytochrome oxidase?**
 - a. Complex I
 - b. Complex II
 - c. Complex III
 - d. Complex IV
240. **Succinyl CoA is formed by?**
 - a. Valine
 - b. Isoleucine
 - c. Methionine
 - d. All of the above
241. **Insulin storage in body requires which ion?**
 - a. Cu
 - b. Zn
 - c. Mo
 - d. Se
242. **All are Glucogenic amino acids EXCEPT?**
 - a. Valine
 - b. Alanine
 - c. Tryptophan
 - d. Methionine
243. **Vitamin synthesized from amino acid is?**
 - a. Thiamine
 - b. Riboflavin
 - c. Biotin
 - d. Niacin

244. **Beta oxidation of fatty acids occur in?**
 - a. Nucleus
 - b. Mitochondria
 - c. Cytoplasm
 - d. Peroxisomes
 245. **Glucose transport along cell membranes occurs along with?**
 - a. K^+
 - b. Na^+
 - c. Cl^-
 - d. HCO_3^-
 246. **LDH isoenzymes-5 is raised in which organ injury?**
 - a. Lungs
 - b. Brain
 - c. Heart
 - d. Liver and muscles
 247. **Pellagra symptoms are aggravated if diet contains?**
 - a. High amount of leucine
 - b. High amount of lysine
 - c. Low amount of leucine
 - d. Low amount of lysine
 248. **DNA model described by Watson and crick was?**
 - a. Right handed parallel
 - b. Left handed anti parallel
 - c. Right handed anti parallel
 - d. Left handed parallel
 249. **Enzymatic activity is measured in?**
 - a. mg/dl
 - b. microgram/litre
 - c. mg/litre
 - d. mol/second
 250. **Richest source of retinoids is?**
 - a. Cod liver oil
 - b. Halibut liver oil
 - c. Butter
 - d. Margarine
 251. **Which step in TCA cycle is irreversible?**
 - a. Succinate thiokinase
 - b. Alpha ketoglutarate dehydrogenase
 - c. ISO citrate dehydrogenase
 - d. Aconitase
 252. **Succinate dehydrogenase is inhibited by?**
 - a. Fluoroacetate
 - b. Cyanide
 - c. Arsenite
 - d. Malonate
 253. **Pentose pathway is essential for the production of?**
 - a. NAD
 - b. FAD
 - c. NADPH
 - d. NADH
 254. **Which vitamin in large doses decreases triglyceride and cholesterol?**
 - a. Vit B1
 - b. Nicotinic acid
 - c. Vit B12
 - d. Riboflavin
 255. **Which enzyme is deficient in Mc ardle's disease?**
 - a. Liver phosphorylase deficiency
 - b. Muscle phosphorylase deficiency
 - c. Lysosomal alpha-1, 4-glucosidase deficiency
 - d. G6PD deficiency
 256. **Source of ATP in RBCs is?**
 - a. Beta oxidation of fatty acids
 - b. TCA cycle
 - c. Anaerobic glycolysis
 - d. Gluconeogenesis
 257. **ApoE is associated with?**
 - a. Arginine
 - b. Lysine
 - c. Leucine
 - d. Isoleucine
 258. **Which enzyme is deficient in Tay sachs disease?**
 - a. Hexosaminidase A
 - b. Galactosidase
 - c. Glucocerebrosidase
 - d. Sphingomyelinase
 259. **Which is true for malate shuttle?**
 - a. Mitochondria to cytoplasm
 - b. Cytoplasm to mitochondria
 - c. Both (A) and (B)
 - d. None of these
 260. **Oxaloacetate is formed from?**
 - a. Proline
 - b. Glutamate
 - c. Aspartate
 - d. Lysine
 261. **Iron in haemoglobin binds with?**
 - a. Alanine
 - b. Serine
 - c. Histidine
 - d. Glycine
 262. **In acute intermittent porphyria which enzyme is deficient?**
 - a. ALA synthase
 - b. Uroporphyrinogen I synthase
 - c. Uroporphyrinogen II synthase
 - d. Uroporphyrinogen III synthase
 263. **Which of the following enzymess unwinds DNA?**
 - a. Ligase
 - b. DNA primase
 - c. Helicase
 - d. DNA polymerase
 264. **Fluoride inhibits?**
 - a. Enolase
 - b. Aldolase
 - c. Aromatase
 - d. None of these
 265. **Histidine to histamine conversion is by:** (2018)
 - a. Dehydrogenation
 - b. Decarboxylation
 - c. Gamma carboxylation
 - d. Monoamino oxidase
 266. **Vitamin with antioxidant property:** (2018)
 - a. Vitamin E
 - b. Vitamin D
 - c. Vitamin B7
 - d. Vitamin B9
 267. **Which vitamin is supplied from only animal source:** (2018)
 - a. Vitamin C
 - b. Vitamin B₇
 - c. Vitamin B₁₂
 - d. Vitamin D

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTIONS 2019

1. Ans. a) Arginine

- Nitric oxide is synthesized from L-Arginine
- Reaction is catalysed from enzyme nitric oxide synthase.
- **Function:**
 - Similar in reactive oxygen species in their function
 - Potent microbial killer
 - Produced by endothelial cells and by activated macrophages

2. Ans. (a) Branched chain alpha keto acid decarboxylase

- Maple syrup urine disease is an inherited disorder characterized by the deficiency of branched-chain alpha-keto acid decarboxylase complex.
- This enzyme is required for breakdown of specific amino acid in body like valine, isoleucine and leucine.
- Due to the enzyme deficiency, these amino acid is not metabolized and hence there is accumulation in cells and body fluids → producing burnt sugar/maple syrup smelling urine.

3. Ans. (a) Glycine

- Collagen is rich in glycine and proline amino acid.
- Glycine is the smallest amino acid, present in every third position of chain, therefore it fits into the spaces where the three chains of helix comes together.
- This repeating structure, represented as (Gly-X-Y)_n, is an absolute requirement for the formation of the triple helix. While X and Y can be any other amino acid, about 100 of the X positions are proline and about 100 of the Y positions are hydroxyproline. Proline and hydroxyproline confer rigidity on the collagen molecule.

4. Ans. (b) Vitamin E

- Vitamins which act as anti-oxidants are: Vitamin A, C and E (tocopherol)
- Beta Carotene (Vit A) is an anti-oxidant at low PO₂.

These antioxidants are of two types:

1. **Preventive antioxidants:** Reduce the rate of chain initiation. Includes: Catalase, EDTA, DTPA
2. **Chain breaking antioxidant:** Interfere with chain propagation. Includes: SOD, Vitamin E.

5. Ans. (c) Vitamin C

- Vitamin C reduces ferric iron to ferrous form, thereby facilitating the absorption of dietary iron from the intestine.

6. Ans. (a) Thiamine

- The active form of thiamine (Vitamin B1) is thiamine pyrophosphate which is formed by the transfer of a pyrophosphate group from adenosine triphosphate (ATP) to thiamine.
- Thiamine deficiency is diagnosed by an increase in erythrocyte transketolase activity observed on addition of TPP

Deficiency of thiamine leads to:

- **Beriberi:** A severe thiamine deficiency syndrome occurs due to intake of polished rice.
- **Wernicke-Korsakoff syndrome:** Associated with chronic alcoholism, which occurs due to dietary insufficiency or impaired dietary absorption of the vitamin. In some alcoholics there is development of Wernicke-Korsakoff syndrome, a thiamine deficiency syndrome characterized by confusion, ataxia and nystagmus with Wernicke's encephalopathy as well as memory problems, hallucination and dementia.

7. Ans. (a) McArdle disease

- **McArdle disease** is an **AR condition**, one of the **type V glycogen storage disease**.
- Enzyme deficient: Myophosphorylase enzyme
- Due to enzyme deficiency there is inability to breakdown the muscle glycogen and prevents lactate production.
- Patients usually complain of exercise intolerance and muscle pain on exercise. Therefore strenuous exercise is contraindicated.

TABLE: Glycogen-storage diseases

182

Type	Defective enzyme	Organ affected	Glycogen in the affected organ	Clinical features
I. Von Gierke	Glucose 6-phosphatase or transport system	Liver and kidney	Increased amount; normal structure	Massive enlargement of the liver. Failure to thrive, Severe hypoglycemia, ketosis, hyperuricemia, heperlipemia
II. Pompe	α -1, 4-Glucosidase (lysosomal)	All organs	Massive increase in amount; normal structure	Cardiorespiratory failure causes death, usually before age 2
III. Cori	Amylo-1,6-glucosidase (debranching enzyme)	Muscle and liver	Increased amount; short outer branches	Like type I, but milder course
IV. Andersen	Branching enzyme (α -1,4 \rightarrow α -1,6)	Liver and spleen	Normal amount; very long outer branches	Progressive cirrhosis of the liver. Liver failure causes death, usually before age 2
V. McArdle	Phosphorylase	Muscle	Moderately increased amount; normal structure	Limited ability to perform strenuous exercise because of painful muscle cramps. Otherwise patient is normal and well developed
VI. Hers	Phosphorylase	Liver	Increased amount	Like type I, but milder course
VII.	Phosphofructokinase	Muscle	Increased amount; normal structure	Like type V
VIII.	Phosphorylase kinase	Liver	Increased amount; normal structure	Mild liver enlargement. Mild hypoglycemia

Note: Types I through VII are inherited as autosomal recessives. Type VIII is sex linked.

8. Ans. (a) 2,4 dinitrophenol

- Compounds that can uncouple or delink the ETC from oxidative phosphorylation, such compounds are known as uncouplers
- As a result ATP synthesis doesn't occur.
- 2,4 Dinitrophenol is an example of chemical uncoupler.

Chemical uncouplers

<ul style="list-style-type: none"> Chemical uncouplers <ul style="list-style-type: none"> 2, 4 dinitrophenol (has been extensively studied) Dinitrocresol Pentachlorophenol Tri fluoro carbonyl cyanide phenyl hydra zone (FCCP) Aspirin (high doses) 	<ul style="list-style-type: none"> Physiological uncouplers <ul style="list-style-type: none"> Thyroid hormones Long chain fatty acids Unconjugated bilirubin These act as uncouplers only at high concentration
--	--

9. Ans. (a) Pyruvate dehydrogenase

- The enzyme Pyruvate dehydrogenase irreversibly converts pyruvate, the end product of glycolysis, into acetyl CoA, a major fuel for the TCA cycle and the building block for fatty acid synthesis

- Thus, this enzyme pyruvate dehydrogenase is utilized in citric acid cycle and fatty acid synthesis.
- The reaction of pyruvate dehydrogenase, forming acetyl-CoA, is irreversible, and for every two carbon unit from acetyl-CoA that enters the citric acid cycle, there is a loss of two carbon atoms as carbon dioxide before oxaloacetate is reformed.
- This means that acetyl-CoA (and hence any substrates that yield acetyl-CoA) can never be used for gluconeogenesis.

10. Ans. (a) Palmitic acid

- Palmitic acid is the most common fatty acid found in animals, plant and microbes.
- Excess carbohydrates and proteins are converted to palmitic acid.
- Palmitic acid is the first fatty acid synthesized during fatty acid synthesis.
- Note:** First step in fatty acid synthesis is transfer of acetate units from mitochondrial acetyl CoA to the cytosol.

CARBOHYDRATE

11. Ans. (c) Mitochondria and cytoplasm

Ref: Harper's Biochemistry, 30th ed. pg. 294-95

Urea Cycle

- Urea is the end product of nitrogen catabolism in humans
- It takes place in both mitochondria and cytoplasm
- Some reactions of urea synthesis occur in the matrix of the mitochondrion, other reactions in the cytosol
- Synthesis of 1 mol of urea requires 3 mol of ATP plus 1 mol each of ammonium ion and of the amino nitrogen of aspartate.
- **Undergoes 5 steps in urea synthesis:**
 - Steps 1 and 2 take place in mitochondria
 - Steps 3, 4, 5 take place in cytosol

For more details please refer to mother book explanation 121

12. Ans. (d) Unconjugated bilirubin

- Uncouplers inhibit oxidative phosphorylation. They are hydrophobic molecules with a dissociable protein.
- They uncouple the ETC from oxidative phosphorylation
- Physiological uncouplers act only at high dose.

Chemical Uncouplers

- γ 2,4-dinitrophenol (has been extensively studied).
- Dinitroresol
- Pentachlorophenol
- Tri fluoro carbonyl cyanide phenylhydrazine (FCCP).
- Aspirin (high doses)

Physiological Uncouplers

- Thyroid hormones.
 - Long chain fatty acids.
 - Unconjugated Bilirubin.
- These act as Uncouplers only at high concentration

Extra Mile

Inhibitors of Electron Transport Chain

Inhibitors of Oxidative Phosphorylation

- **Complex I:** Rotenone
- **Complex II:** Carboxin
- **Complex III:** Antimycin A
- **Complex IV:** Cyanide, Azide, Carbon monoxide
- **ATP synthase:** Oligomycin
- **ATP-ADP translocase:** Atractyloside (a plant glycoside)

13. Ans. (b) Liver

Ref: Vasudevan Biochemistry 8/e. P 136

SITE OF GLUCONEOGENESIS

- **Major site of gluconeogenesis:** Liver (90%)
- **Secondary site:** Kidney cortex and in small intestine under some conditions. (10%)
- It takes place in the mitochondria and cytoplasm.
- The production of glucose is necessary for use as a fuel source by the brain, testes, erythrocytes, kidney medulla, lens and cornea of the eye and exercising muscles.

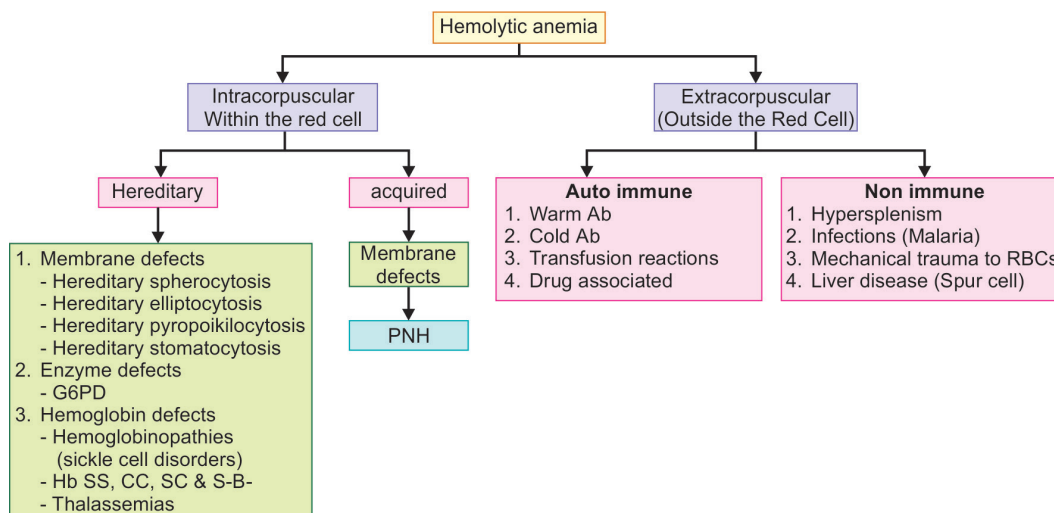

14. Ans. (b) Hemolytic anemia

Ref: Vasudevan Biochemistry, 8th ed. P 426

Extra Mile

- G6PD deficiency causes hemolytic anemia, since RBCs become susceptible to oxidative stress

Other causes of hemolytic anemias are:

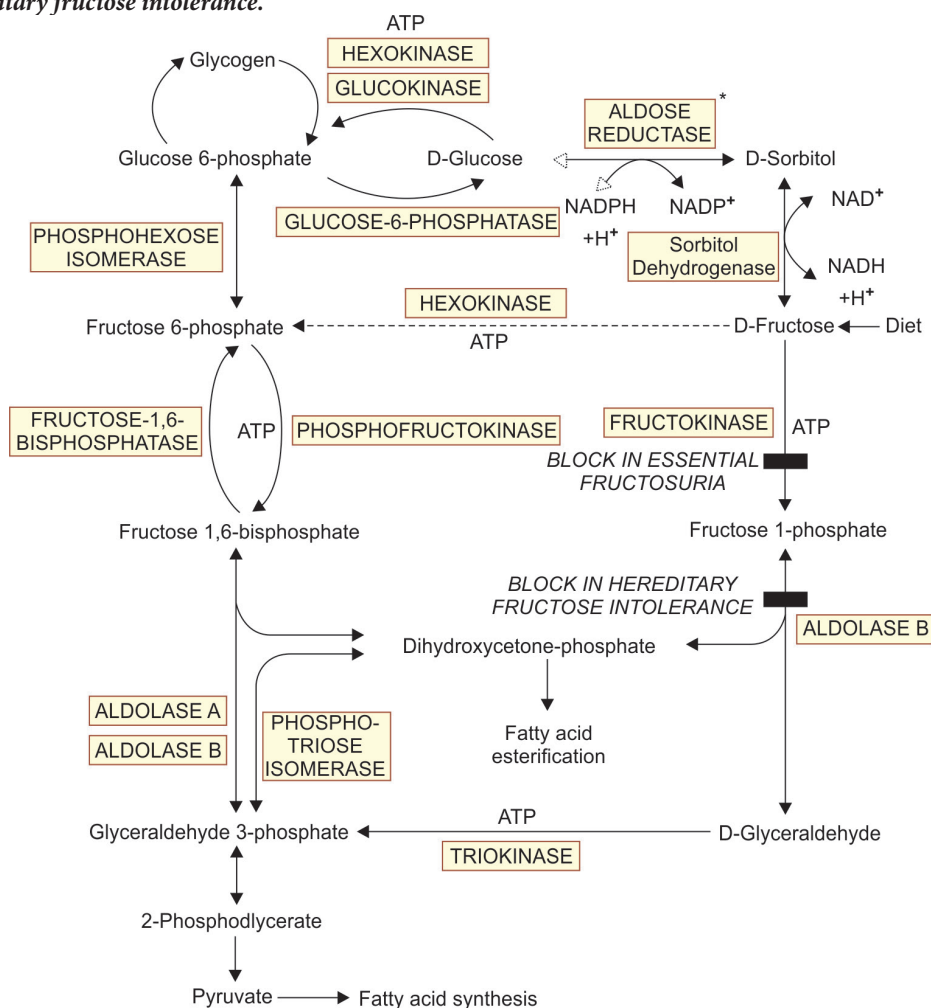

15. Ans. (c) **Fructokinase**

Ref: Harper, pg. 169

"Deficiencies in the enzymes of fructose and galactose metabolism lead to **essential fructosuria** and **galactosemias**."

"Lack of hepatic fructokinase causes **essential fructosuria**, and absence of hepatic aldolase B, which cleaves fructose 1-phosphate, leads to **hereditary fructose intolerance**."

Metabolism of fructose. Aldolase A is found in all tissues, whereas aldolase B is the predominant form in liver. (*, not found in liver)

16. Ans. (a) McArdle's disease

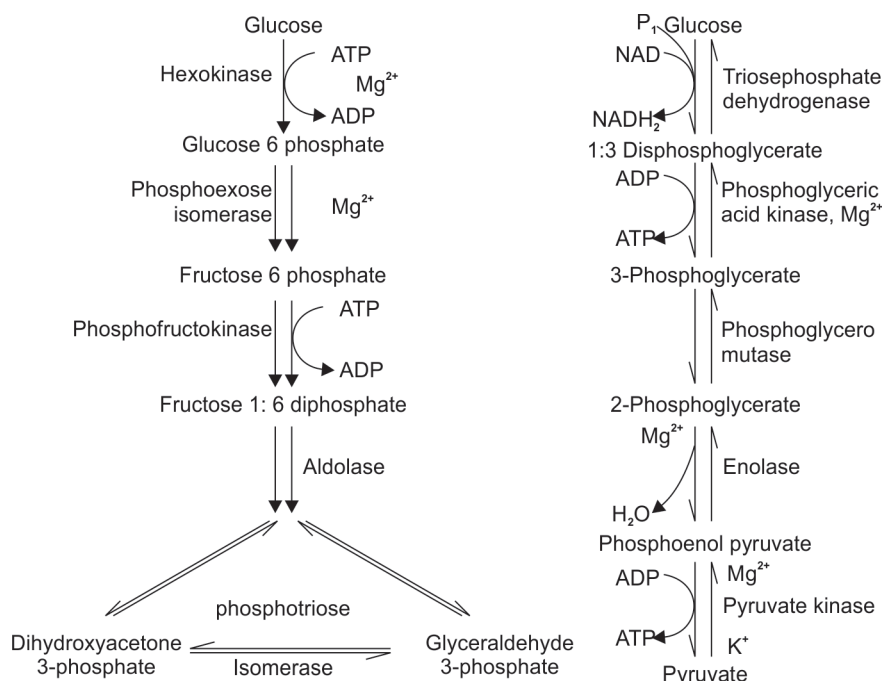

Ref: Harper's Biochemistry, pg. 145

- **Glycogen storage diseases** are a group of inherited disorders characterized by deficient mobilization of glycogen or deposition of abnormal forms of glycogen, leading to muscular weakness or even death.
- **Nelson 20th ed states:** "Approximately 50% patients with GSD type V, report burgundy colored urine after exercise, which is a consequence of exercise-induced myoglobinuria secondary to rhabdomyolysis"

17. Ans. (c) Enolase

Ref: Harper's Biochemistry, 30th edn. pg. 170-171

Reversible steps of glycolysis are catalyzed by	Irreversible steps of glycolysis are catalyzed by
<ul style="list-style-type: none"> • Phosphohexose isomerase • Aldolase • Phosphotriose isomerase • Glyceraldehyde 3-phosphate dehydrogenase • Phosphoglycerate kinase • Phosphoglycerate mutase • Enolase 	<ul style="list-style-type: none"> • Glucokinase/Hexokinase • Phosphofructokinase-I • Pyruvate kinase

18. Ans. (a) 10

Ref: Harper's Biochemistry, 30th edn. pg. 169-170

- In glycolytic pathway, one molecule of glucose gives 2 pyruvate.
- The 2 molecules of pyruvate are further metabolized in citric acid cycle, giving out 20 ATP.
- Since the question here is asking about one molecule of pyruvate, the answer will be the half of 20, i.e. 10.
- **In simple words:** 2 molecules of pyruvate give 20 ATP. Hence one molecule will give 10 ATP.

Step	Coenzyme yield	ATP	Source of ATP
Glycolysis preparatory phase		-2	Phosphorylation of glucose and fructose 6-phosphate uses two ATP from the cytoplasm
Glycolysis pay-off phase		4	Substrate-level phosphorylation
	2 NADH (2 x 2.5)	5	Oxidative phosphorylation-Each NADH produces net 2 ATP due to NADH transport over the mitochondrial membrane

Contd...

Step	Coenzyme yield	ATP	Source of ATP
Oxidative decarboxylation of pyruvate	2 NADH (2 x 2.5)	5	Oxidative phosphorylation
NET ATP TILL PHOSPHORYLATION OF PYRUVATE: 5+5+4 = 14-2 = 12		= 12	
Krebs cycle		2	Substrate-level phosphorylation
	6 NADH (6 x 2.5)	15	Oxidative phosphorylation
	2 FADH ₂ (2 x 1.5)	3	Oxidative phosphorylation
Total yield		32 ATP	From the complete oxidation of one glucose molecule to carbon dioxide and oxidation of all the reduced coenzymes.

- Net generation of ATP in glycolytic pathway: $9 - 2 = 7$
- Oxidative phosphorylation of pyruvate: 5
- Generation of ATP during Citric acid cycle: 20
- Net generation of ATP from one glucose molecule = 32

19. Ans. (b) Pyruvate kinase

Ref: Harper's Biochemistry, 30th edn. pg. 169, 171

- **Substrate-level phosphorylation** is a type of metabolism that results in the formation and creation of adenosine triphosphate (ATP) or guanosine triphosphate (GTP) by the direct transfer and donation of a phosphoryl (PO_3) group to adenosine diphosphate (ADP) or guanosine diphosphate (GDP) from a phosphorylated reactive intermediate.
- Note that the phosphate group does not have to directly come from the substrate. By convention, the phosphoryl group that is transferred is referred to as a phosphate group.
- We use the term substrate level phosphorylation because ATP formation in glycolysis is powered by the addition/removal of phosphate groups (phosphorylation) to molecules of glucose (the substrate). Hence the term substrate-level phosphorylation.

Extra Mile

Some Important Pathways and their Rate Limiting Enzyme

Pathway	Rate limiting enzyme
• Glycolysis	Phosphofructo kinase
• Glycogenesis	Glycogen synthase
• Glycogenolysis	Phosphorylase
• Cholesterol synthesis	HMG - CoA Reductase
• Ketone body formation	HMG - CoA synthase
• Bile acid synthesis	7- α -hydroxylase
• Fatty acid synthesis	Acetyl CoA carboxylase
• Uric acid synthesis	Xanthine oxidase

Examples of Substrate Level Phosphorylation that Occurs

- **The production of 1st ATP** when 1,3 bisphosphoglycerate is converted into 3 phosphoglycerate by the enzyme **phosphoglycerate kinase**
- **Production of 2nd ATP** when phosphoenolpyruvate is converted to pyruvate by the enzyme **pyruvate kinase**.

20. Ans. (d) Muscles

Ref: Harper's Biochemistry, 30th ed. pg. 187

- The conversion of glucose 6-phosphate to glucose is catalyzed by glucose 6-phosphatase is present in liver and kidney, **but absent from muscle and adipose tissue, which cannot export glucose into the bloodstream**. Therefore in order to use muscle glycogen and lactate for gluconeogenesis two separate processes are present in body. They are:
 - **Cori's cycle:** Lactate, formed by glycolysis in skeletal muscle and transported to the liver and kidney where it reforms glucose, which again is available via the circulation for oxidation in the tissues.
 - ◆ **Glucose alanine cycle:** In the fasting state, there is a considerable output of all skeletal muscle, far in excess of its concentration in the muscle proteins that is catabolized. It is formed by transamination of pyruvate produced by glycolysis and glycogen, and is exported to the liver, where, after transamination back is a substrate for gluconeogenesis. This glucose-alanine cycle thus provides an indirect way of utilizing muscle glycogen to maintain blood glucose in the fasting state.

21. Ans. (a) Cori cycle

Ref: Harper's Biochemistry, 30th ed. pg. 190-191

- The Cori cycle is the only one that is not dependent on the mitochondrial enzymes. This cycle is basically the transport of lactate from the muscle to the liver to be converted via gluconeogenesis to glucose to be transported back to the muscle.

Extra Mile

Mitochondria Mn: KEBOK in all cap	Cytoplasm	Both mitochondria and cytoplasm (Mn: HUG for both)
<ul style="list-style-type: none"> • Krebs cycle • ETC • Bet oxidation of FA • Oxidative phosphorylation • Ketogenesis 	<ul style="list-style-type: none"> • Glycolysis • Glycogenesis • Glycogenolysis • HMP Shunt • FA synthesis • Cholesterol synthesis • Bile acid/Salt synthesis 	<ul style="list-style-type: none"> • Gluconeogenesis • Urea synthesis • Heme synthesis

22. Ans. (b) **Liver**

Ref: Harper's Biochemistry, 30th ed. pg. 190-191

- Each day the body has an excess production of about 1500 mmols of lactate (about 20 mmols/kg/day) which enters the blood stream and is subsequently **metabolised mostly in the liver**.
- All tissues can produce lactate under anaerobic conditions but tissues with active glycolysis produce excess lactate from glucose under normal conditions and this lactate tends to spill over into the blood. Lactate is produced from pyruvate in a reaction catalysed by lactate dehydrogenase:

23. Ans. (d) **EMP pathway**

24. Ans. (d) **Hexokinase**

- These are the enzymes of glycolysis whose action is increased by insulin (regulates positively):
 - ♦ Glucokinase
 - ♦ Phosphofructokinase
 - ♦ Pyruvate kinase
- **NOTE:** Insulin doesn't regulate Hexokinase

25. Ans. (c) **Skeletal muscles**

Ref: Harper's Biochemistry, 30th ed. pg. 191-192

- **Insulin** increases the number and activity of GLUT 4 receptor. Thereby facilitating the entry of glucose in tissues having GLUT4 receptor.
- **Tissues with abundant GLUT4 receptor are: Skeletal muscles, Heart and Adipose tissue**
- Thus among the given choices, skeletal muscle is the one which required for entry of glucose.

Extra Mile

TABLE: GLUT receptors, their location and function

Receptor	Location on tissue	Function
GLUT 1	Brain, kidney, colon, placenta, RBC, retina	Glucose uptake
GLUT 2	Liver, pancreatic beta cell, small intestine, Kidney	Rapid uptake or release of glucose
GLUT 3	Brain, kidney and placenta	Glucose uptake
GLUT 4	Heart, skeletal muscles, adipose tissue	Insulin-stimulated glucose uptake
GLUT 5	Small intestine	Absorption of glucose
GLUT 6	Spleen, leukocyte	—
GLUT 7	Liver, endoplasmic reticulum	Glucose transporter in endoplasmic reticulum

26. Ans. (a) **Glycolysis**

Ref: Harper's Biochemistry, 30th ed. pg. 142-144

- **Glycolysis occurs in cytoplasm.**
- **There are two major sites for gluconeogenesis, the liver and the kidneys.**
- The liver accounts for 90% of gluconeogenesis in the body and the remaining 10% occur in the kidney and other tissues of the body.
- The liver and kidneys maintain the glucose level in the blood so that the brain, muscle and red blood cells have sufficient glucose to meet their metabolic demands.

Extra Mile

Cycle occurs in both cytoplasm and mitochondria-

- Gluconeogenesis
- Urea cycle
- Heme synthesis

27. Ans. (b) **Gluconeogenesis**

Ref: Harper's Biochemistry, 30th ed. pg. 142-144

Please refer to above explanation

28. Ans. (a) **Insulin**

Ref: Harper's Biochemistry, 30th ed. pg. 191-192

- Synthesis of glucose from non-carbohydrate source is called Gluconeogenesis.

Hormonal Regulation

- ↑ Glucagon, epinephrine, glucocorticoids.
- ↓ Insulin

- **Aldolase B** is preferentially expressed in the liver, while **aldolase A** is expressed in muscle and erythrocytes and **aldolase C** is expressed in the brain. Slight differences in isozyme structure result in different activities for the two substrate molecules: Fructose 1,6-Biphosphate and fructose 1-phosphate. *Aldolase B exhibits no preference and thus catalyzes both reactions, while aldolases A and C prefer FBP.*
- **Aldolase A** is an enzyme that catalyses a reversible aldol reaction: The substrate, fructose 1,6-bisphosphate (F-1,6-BP) is broken down into glyceraldehyde 3-phosphate and dihydroxyacetone phosphate (DHAP).

- Sucrose is composed of glucose and fructose and hence cannot be tolerated by patients of HFI.

32. Ans. (d) **Aldolase - B deficiency**

Ref: Harper's Biochemistry, 30th ed. pg. 202-203

- **Hereditary fructose intolerance** is an in-born error of fructose metabolism caused by a deficiency of the enzyme aldolase B. individuals affected with Hereditary fructose

intolerance are asymptomatic until they ingest fructose. If fructose is ingested, the enzymatic block at aldolase B causes an accumulation of fructose-1-phosphate. This accumulation has downstream effect on gluconeogenesis and regeneration of adenosine triphosphate (ATP).

- **Symptoms:** vomiting, hypoglycemia, jaundice, hemorrhage, hepatomegaly, hyperuricemia and potentially kidney failure.

33. Ans. (c) **Lactate-dehydrogenase**

Ref: Harper's Biochemistry 30th ed. / 171, 321

- Excess dietary fructose can be converted to pyruvate, this then enters the Krebs cycle and emerges as citrate directed toward free fatty acid synthesis in the cytosol of hepatocytes.

34. Ans. (b) **Phase II reaction**

Ref: Harper's Biochemistry, 30th edn. pg. 586

METABOLISM OF XENOBIOTICS

- In phase 1, the major reaction involved is hydroxylation, catalyzed by enzymes mono-oxygenases or cytochrome P450s. The reactions are:
 - **Hydroxylation**

- Deamination
- Dehalogenation
- Desulfuration
- Epoxidation
- Peroxygenation
- Reduction

- In phase 2, compounds produced in phase 1 are converted to various polar metabolites by conjugation

FMGE Solutions Screening Examination

190

with glucuronic acid, sulfate, acetate, glutathione, or certain amino acids, or by methylation.

- The overall purpose of the two phases of metabolism of xenobiotics is to increase their water solubility (polarity) and thus excretion from the body.

Glucuronidation: UDP Glucuronic acid is the glucuronyl donor, and a variety of glucuronosyl transferases, present in both the endoplasmic reticulum and cytosol, are the catalysts.

- Phase II reactions are:**
 - Glucuronidation:** is probably the most frequent conjugation reaction.
 - Sulfation
 - Conjugation with Glutathione
 - Acetylation
 - Methylation

35. Ans. (a) Cornea

Ref: Harper's Biochemistry, 30th edn. pg. 140

- Glucagon receptors are mainly expressed in liver and in kidney with lesser amounts found in heart, adipose tissue, spleen, thymus, adrenal glands, pancreas, cerebral cortex, and gastrointestinal tract.

36. Ans. (a) Enolase

Ref: Harper's Biochemistry, 30th edn. pg. 170-171

- Enolase**, also known as phosphopyruvate hydratase, is a metallo-enzyme responsible for the catalysis of the conversion of 2-phosphoglycerate to phosphoenol pyruvate, the ninth and penultimate step of glycolysis.
- If the sample for blood glucose is kept for some time, the Red blood cells will start consuming the sugar available and hence the final report shall be lower than actual.
- Sodium fluoride shall inhibit enolase and ensure an accurate result.

37. Ans. (a) Type I

Ref: Harper's Biochemistry, 30th edn. pg. 178-179

Number	Enzyme Deficiency	Eponym	Hypoglycemia	Hepato-megaly	Hyperlipidemia	Muscle symptoms	Development / Prognosis	Other symptoms
GSD type I	Glucose 6-phosphate	Von Gierke's disease	Yes	Yes	Yes	None	Growth failure	Lactic acidosis, hyperuricemia
GSD type II	Acid alpha-glucosidase	Pompe's disease	No	Yes	No	Muscle weakness	Death by age -2 years (infantile variant)	Heart failure
GSD type III	Glycogen de-branching enzyme	Cori's disease of Forbes's disease	Yes	Yes	Yes	Myopathy		
GSD type IV	Glycogen Branching enzyme	Andersen disease	No	Yes, also cirrhosis	No	None	Failure to thrive, death at age -5 years	
GSD type V	Muscle glycogen phosphorylase	McArdi disease	No	No	No	Exercise induced cramps, Rhabdomyolysis		Renal failure by myoglobinuria
GSD type VI	Liver glycogen phosphorylase	Her's disease	Yes	Yes	Yes	None	Growth retardation	Haemolytic anemia
GSD type VII	Muscle phosphofructokinase	Tarui's disease	No	No	No	Exercise-induced muscle cramps and weakness	Delayed motor development, Growth retardation	
GSD type IX	Phosphorylase kinase PHKA2		Yes	Yes	Yes	None		

"Mn: Von Pump Cori And Make Her Tired"

38. Ans. (d) **Myophosphorylase deficiency**

Ref: Harper's Biochemistry, 30th ed. pg. 178-179

Please refer to above explanation.

39. Ans. (d) **The oxidative phase generates NADH and the Non oxidative phase generates pyruvate**

Ref: Harper's Biochemistry, 30th ed. pg. 198-199

- The **pentose phosphate pathway** (also called the **phosphogluconate pathway** and the **hexose monophosphate shunt**) is a process that generates NADPH and pentoses.
- There are two distinct phases in the pathway. The first is the oxidative phase, in which NADPH is generated, and the second is the non-oxidative synthesis of 5-carbon sugars. *This pathway is an alternative to glycolysis.*
- **The PPP occurs exclusively in the cytoplasm**, and is found to be most active in the liver, mammary gland and adrenal cortex in the human. The PPP is one of the three main ways the body creates molecules with reducing power, accounting for **approximately 60% of NADPH production in humans**.
- One of the uses of NADPH in the cell is to prevent oxidative stress.

40. Ans. (a) **NADPH**

Ref: Harper's Biochemistry, 30th ed. pg. 198-199

41. Ans. (b) **5% iodine and 10% potassium iodide**

Solution	Iodine (w/v)	Potassium iodide (w/v)
Aqueous iodine (Iugol's iodine)	5%	10%
Weak iodine solution (tincture of iodine)	2%	2.5%
Strong iodine solution	10%	6%

Uses of Iugol's Iodine

- During colposcopy, Iugol's iodine is applied to the vagina and cervix.: Schiller's test
- Iugol's iodine may also be used to better visualize the muco-gingival junction in the mouth.
- Iugol's solution can also be used in various experiments to observe how a cell membrane uses osmosis and diffusion.
- Oxidizing germicide

42. Ans. (b) **Lipid synthesis and glutathione reaction**

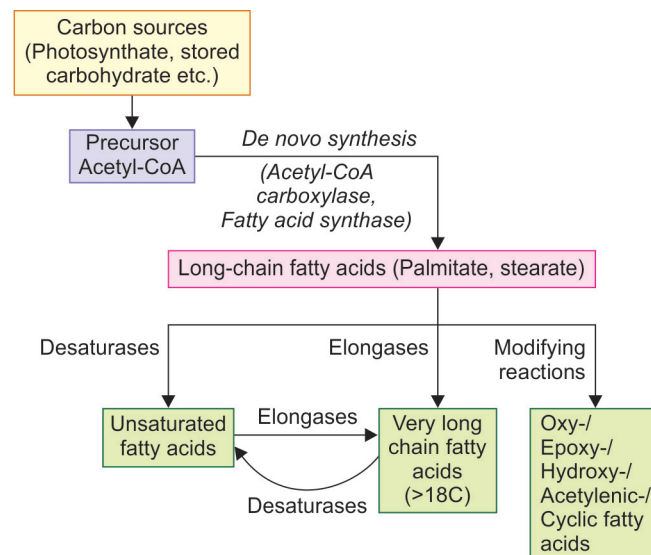

Ref: Harper's Biochemistry, 30th ed. pg. 234-35

NADPH is Used for

- Lipid synthesis
- Cholesterol synthesis
- Fatty acid chain elongation
- Regeneration of reduced glutathione (which protects against Reactive oxygen species)

LIPIDS43. Ans. (a) **Acetyl CoA**

- **Principle building block in fatty acid synthesis: Acetyl CoA**
- **Cofactors required:** NADPH, ATP, Mn^{2+} and HCO_3^-
- **Source of Acetyl CoA:** From mitochondria (after aerobic glycolysis and Fatty acid oxidation)
- **Site of FA synthesis:** Liver, Kidney, Brain, Lungs, Adipose tissue, Lactating breast
 - **Organelle:** Extra-mitochondrial system in cytosol
- **Enzyme:**
 - Acetyl CoA carboxylase-rate limiting enzyme
 - Fatty acid synthase

44. Ans. (c) **3.5**

Ref: Harrison's, 18th ed. pg. ch 356

- The total cholesterol to HDL cholesterol ratio is a number that is helpful in predicting an individual's risk of developing atherosclerosis.
- High ratios indicate higher risks of heart attacks, low ratios indicate lower risk.
- **Ideally ratio should be kept below 4.**

45. Ans. (a) **Sphingomyelinase**

Ref: Harper's Biochemistry, 30th ed. pg. 250

FMGE Solutions Screening Examination

192

- Niemann's Pick diseases are genetic diseases which are classified in a subgroup of lipid storage disorders in which harmful quantities of fatty substances, or lipids, accumulate in the spleen, liver, lungs, bone marrow, and brain.
- In the classic infantile type-A variant, a mis-sense mutation causes complete deficiency of sphingomyelinase which leads to niemann pick disease.

Extra Mile

Other lysosomal storage disease and deficient enzymes

- **Hurler's syndrome:** Alpha-L-iduronidase deficiency
- **Hunter's syndrome:** Iduronate-2-sulfatase deficiency
- **Gaucher's:** β -Glucosidase deficiency
- **Farber's disease:** Ceramidase deficiency
- **Fabry disease:** Alpha Galactosidase-A
- **Tay-sach's:** Hexosaminidase A deficiency
- **Sandhoff's disease:** β -Hexosaminidase A and B
- **Metachromatic leukodystrophy:** arylsulfatase A enzyme deficiency
- **Krabbe disease:** β -Galactosidase

46. Ans. (a) Lysosome

Ref: Harper's Biochemistry, 30th ed. pg. 251

- Sphingomyelin is a major neural tissue component, the core structure of which is formed by ceramide.
- **It is the only sphingolipid without sugar.**
- The common sphingomyelin deficiency is Neiman-Pick disease. The organelle which is involved is the lysosomes which allow accumulation of sphingomyelin.
- **Signs & symptoms of Niemen pick's:** Hepatosplenomegaly, decreased appetite, unsteady gait, ataxia, slurring of speech (due to accumulation of sphingolipids in neural tissue).

47. Ans. (a) Gaucher's disease

Ref: Harper's Biochemistry, 30th ed. pg. 251

LYSOSOMAL STORAGE DISEASE

- Lysosomal storage disorders are a group of approximately 50 rare inherited metabolic disorders that result from defects in lysosomal function.
- Lysosomal storage disorders are caused by lysosomal dysfunction usually as a consequence of deficiency of a single enzyme required for the metabolism of lipids, glycoproteins (sugar containing proteins) or so-called mucopolysaccharides.
- **Gaucher's disease is the most common of the lysosomal storage diseases.** It is a form of sphingolipidosis (a subgroup of lysosomal storage diseases), as it involves dysfunctional metabolism of sphingolipids.
- *The disorder is characterized by bruising, fatigue, anemia, low blood platelets, and enlargement of the liver and spleen.*

48. Ans. (c) Gaucher's disease

Ref: Harper's Biochemistry, 30th ed. pg. 251

Management of Gaucher's Disease

- *Regular, intravenous enzyme therapy is currently the treatment of choice in affected patients and is highly efficacious and safe in diminishing the hepatosis and improving bone marrow involvement and hematologic findings.*
- Symptomatic management of the blood cytopenias and joint replacement continue to have important roles in management
- The bone disease is decreased but not eliminated by enzyme therapy. Adults benefit from adjunctive treatment with bisphosphonates to improve bone mass.

49. Ans. (b) Hexosaminidase A

Ref: Harper's Biochemistry, 30th ed. pg. 251

- **Tay-Sach's disease** (also known as **GM2 gangliosidosis** or **hexosaminidase A deficiency**) is a rare autosomal recessive genetic disorder.
- In its most common variant (known as infantile Tay-Sachs disease), it causes a progressive deterioration of nerve cells and of mental and physical abilities that commences around six months of age and usually results in death by the age of four.

50. Ans. (b) HMG CoA reductase

Ref: Harper's Biochemistry, 30th ed. pg. 267

- **HMG CoA reductase is the rate limiting enzyme in cholesterol synthesis.**
- HMG CoA Synthetase is involved in the formation of ketone bodies while HMG CoA lyase is involved also in the ketogenesis and also in the processing of leucine.
- Catalase on the other hand is an oxidoreductase which is involved in the conversion of hydrogen peroxide to water and oxygen.

51. Ans. (b) APO B-100

Ref: Harper's Biochemistry, 30th ed. pg. 254

- The low-density-lipoprotein (LDL) receptor is a cell-surface protein that plays an important part in the metabolism of cholesterol by mediating the uptake of LDL from plasma into cells.
- Although LDL particles bind to the LDL receptor through their apolipoprotein B (apo B) and apolipoprotein E (apo E) moieties, other apo E-containing particles, like chylomicron remnants, are not dependent on the LDL receptor for uptake into cells.
- ApoB100 levels are associated with coronary heart disease, and are even a better predictor of it than is LDL level. A simple way of explaining this observation is to use the idea that ApoB-100 reflects lipoprotein particle

number (independent of their cholesterol content). In this way, one can infer that the number of ApoB100-containing lipoprotein particles is a determinant of atherosclerosis and heart disease.

Extra Mile

Ref: Harper's Biochemistry, 30th ed. pg. 253-254

53. Ans. (a) **LDL-receptors**

Ref: Harper's Biochemistry, 30th ed. pg. 275

- **Familial hypercholesterolemia** is a genetic disorder characterized by high cholesterol levels, specifically very

54. Ans. (b) **LDL**

Ref: Harper's Biochemistry, 30th edn. pg. 254; Harper 26th ed. pg. 206

- **Max cholesterol-** LDL
- **Max TG-** chylomicrons (in form of triacylglycerol)
- **Max exogenous TG-** Chylomicron
- **Max endogenous TG-** VLDL

TABLE: Lipoprotein, its source, composition, main lipid component and its apolipoprotein

Lipoprotein	Source	Composition		Main lipid component	Apo-lipoprotein
		Protein (%)	Lipid (%)		
Chylomicrons	Intestine	1-2	98-99	Triacylglycerol	A-I, A-II, A-IV, B-48, C-I, C-II, C-III, E
VLDL	Liver (intestine)	7-10	90-93	Triacylglycerol	B-100, C-I, C-II, C-III
IDL	VLDL	11	89	Triacylglycerol, cholesterol	B-100, E
LDL	VLDL	21	79	Cholesterol	B-100
HDL	Liver, intestine, VLDL, chylomicrons	32	68	Phospholipids, Cholesterol	A-I, A-II, A-IV, C-I, C-II, C-III, D, E
Albumin	Adipose tissue	99	1	Free fatty acid	

55. Ans. (b) **VLDL**

Ref: Harper's Biochemistry, 30th edn. pg. 271-272

Lipoprotein	Transport
• HDL	Tissue → liver (good cholesterol)
• VLDL	Liver → plasma
• LDL	Liver → tissue (bad cholesterol)
• CHYLOMICRON	Intestine → plasma

high levels of low-density lipoprotein in the blood and early cardiovascular disease.

- These patients have mutations in the *LDLR* gene that encodes the LDL receptor protein, which normally removes LDL from the circulation.
- The high cholesterol levels in FH are less responsive to the kinds of cholesterol control methods that are usually more effective in people without FH (such as dietary modification and statin tablets), because the body's underlying biochemistry is slightly different. However, treatment (including higher statin doses) can often be successful.
- Heterozygous FH is normally treated with statins, bile acid sequestrants or other hypo-lipidemic agents that lower cholesterol levels.
- Homozygous FH often does not respond to medical therapy and may require other treatments, including LDL apheresis (removal of LDL in a method similar to dialysis) and occasionally liver transplantation.

56. Ans. (d) **All of the above**

Ref: Harper's Biochemistry, 30th edn. pg. 213-214

Medium chain fatty acid contain 8-14 carbon atoms

- Examples: caproic acid (10 C), lauric acid (12C), Myristic acid (14C), Palmitic acid (16C), Stearic Acid (18C).
- They do not require prolonged digestion
- Do not require Pancreatic lipase and bile salts
- Diffuse directly into portal circulation
- Preferentially oxidized by peripheral cells and therefore do not get deposited into adipose.

57. Ans. (b) **Arachidonic acid**

Ref: Harper's Biochemistry, 30th edn. pg. 238-40

- Auto oxidation is any oxidation that occurs in open air or in presence of oxygen and/or radiation and forms peroxides and hydro-peroxides.
- Unsaturated fatty acids undergo auto-oxidation in presence of oxygen due to presence of highly reactive double bonds. Unsaturated fatty acids have one or more double bonds between carbon atoms.
- The carbon atoms in the chain that are bound next to either side of the double bond can occur as *cis* or *trans* configuration.
 - A *cis* configuration means that adjacent hydrogen atoms are on the same side of 1 double bond.
 - A *trans* configuration, by contrast, means that the next two hydrogen atoms are on opposite sides of the double bond. As a result, they do not cause the chain to bend much, and their shape is similar to straight saturated fatty acids.

58. Ans. (b) **α -Linolenic acid**

Ref: Harper's Biochemistry, 30th edn. pg. 214

- PUFA are carboxylic acid with hydrocarbon tails of varying length containing two or more C=C double bonds.
- There are two families of PUFA: Omega-3 and Omega-6.
- In Omega-3 PUFA, the first C=C double bond is located at carbon 3 counting from terminal or omega methyl group tail.
- In Omega-6 PUFA, the first C=C double bond is located at carbon 3 counting from terminal or omega methyl group tail.

Remember

TABLE: Different omega families and their respective members

ω 3 family	ω 6 family	ω 7 family	ω 9 family
<ul style="list-style-type: none"> • Alpha linolenic • Docosahexaenoic acid (DHA) • Timnodonic • Cervonic 	<ul style="list-style-type: none"> • Gamma linolenic • Arachidonic • Linoleic 	Palmitoleic	Oleic Elaidic

59. Ans. (c) **Docosahexaenoic Acid**

Ref: Harper's Biochemistry, 30th edn. pg. 214

Please refer to above table.

60. Ans. (a) **Alpha linolenic acid**

Ref: Harper's Biochemistry, 30th edn. pg. 214

Please refer to above explanation

61. Ans. (b) **Mitochondria**

- Enzymes responsible for ketone body formation are associated mainly with the mitochondria.
- Under conditions like starvation, Oxidation of fatty acids occurring in mitochondria, liver produces ketone bodies. Enzyme used is: **Pyruvate carboxylase**
- Acetoacetate, 3-hydroxybutyrate (Acetoacetate continually undergoes spontaneous decarboxylation to yield acetone) and Acetone are collectively known as the ketone bodies.

62. Ans. (c) **Pyruvate carboxylase**

Pyruvate carboxylase plays a crucial role in:

- Gluconeogenesis
- Lipogenesis
- In the biosynthesis of neurotransmitters
- Glucose-induced insulin secretion by pancreatic islets.

63. Ans. (b) **Ketone bodies**

Ref: Harper's Biochemistry, 30th edn. pg. 141, 149, 227-29

- **Initially up to 24 hours glycogen stores are utilized.**
- Later it is fatty acid oxidation leading to ketone production which becomes the source of fuel.
- After 2 weeks proteins in muscles are catabolized to produce amino acids which act as substrate to produce energy.

TABLE: Source of Energy During Starvation

STAGE	I	II	III
DURATION	1 st 2-3 days	Upto 2 weeks (longest)	< 1 week
Energy source	Carbohydrate	Fats	Proteins
Metabolism	Initially Glycogenolysis then gluconeogenesis	Lipolysis and KETONE BODY formation	Breakdown of protein

64. Ans. (b) **Oleic acid**

Ref: Harper's Biochemistry, 30th edn. pg. 213

- Oleic acid is a monounsaturated fatty acid.
- Polyunsaturated fatty acid are: Palmitate, stearate etc.

Extra Mile

- Essential fatty acid are:
 - **Linoleic Acid: most essential fatty acid**
 - Linolenic Acid
 - Arachidonic acid
- Richest source of essential fatty acid: Safflower oil
- Richest source of saturated fatty acid: coconut oil
- Richest source of MUFA: groundnut oil.

65. Ans. (c) **Propionyl CoA**

Ref: Harper's Biochemistry, 30th edn. pg. 224-26

Propionyl-CoA is a coenzyme A derivative of propionic acid. There are several different ways in which it is formed:

- It is formed as a product of beta-oxidation of odd-chain fatty acids.
- It is also a product of metabolism of isoleucine and valine.
- It is a product of alpha-ketobutyric acid, which in turn is a product of digestion of threonine and methionine.

66. Ans. (c) **Propionyl CoA**

Ref: Harper's Biochemistry, 30th edn. pg. 224-26

- Fatty acids with an odd number of carbon atoms are oxidized by the pathway of **beta-oxidation**, producing **acetyl-CoA**, until a **three-carbon (propionyl-CoA)** residue remains.
- **Odd-chain fatty acid is the only part of a fatty acid that is glucogenic.**

NUCLEIC ACID

67. Ans. (b) **Lesch nyhan syndrome**

Ref: Harrison's 20th ed. P 3001

Lesch Nyhan Syndrome

- XLR condition
- Occurs due to complete deficiency of HGPRTase enzyme → accumulation of purine
- Degradation of purine → Increased uric acid
- The syndrome is characterized by hyperuricemia, nephrolithiasis, obstructive uropathy, self-mutilative behaviour, choreoathetosis, spasticity, and mental retardation.

Extra Mile

- Partial deficiency of HGPRTase enzyme → Kelley-Seegmiller syndrome.
 - Associated with hyperuricemia, nephrolithiasis, obstructive uropathy but no central nervous system manifestations.

68. Ans. (c) **AUG**

Ref: Lippincott's Biochemistry, 6th ed. P 457 - 458

- Initiator codon in eukaryotes: **AUG** (codes for methionine)
- Initiator codon In prokaryotes: **AUG** (codes for N-Formyl methi-onine)
- **Stop codons:**
 - **UAG:** Amber
 - **UGA:** Opal
 - **UAA:** Ochre

69. Ans. (c) **Denature of DNA → Annealing of primers → Extension of primer**

Ref: Lippincott's Biochemistry 6th ed. P 480 - 81

Steps in PCR cycle:

- **DNA denaturation:** DNA to be amplified is heated → to separate dsDNA into single strands
- **Annealing of primers:** separated ssDNA cooled → allowed to anneal to 2 primers
- **Extension of primer:** new chain synthesis which is complimentary to original DNA chains.

Steps	Temperature	Time (sec)
Denaturation	90-96°C	20 - 60 sec
Annealing	50-70°C	20 - 90 sec
Extension	68-75°C	10 - 60 sec

70. Ans. (d) **Uracil**

- Uracil is present in RNA.
- Nitrogen base pairs present in RNA: Adenine, Guanine, Uracil, Cytosine

Structure of DNA

- Double helix, right handed, anti-parallel to each other
- Two strands of DNA are held together with help of hydrogen bonds
 - 2 hydrogen bonds between A = T
 - 3 hydrogen bonds between G ≡ C
- 6 types of DNA have been described: A, B, C, D, E, Z
 - Z is left handed

Extra Mile

Important differences between DNA types:

Types of DNA	No. of base pairs per turns	Physical character	Orientation
A - DNA	11	Short and broad	Right handed
B - DNA (MC form)	10.5	Long and thin	Right handed
Z - DNA	12	Elongated and thin	Left handed

71. Ans. (b) **Inducer**

Ref: Instant Notes in Biochemistry, P 174

- Lac operon induces the production of structural genes in the absence of repressor.
- Repressor is inactivated by allolactose or simply lactose.
- In the *lac* operon, the structural genes are the *lacZ*, *lacY* and *lacA* genes encoding β-galactosidase, the permease and the transacetylase, respectively. They are transcribed

FMGE Solutions Screening Examination

to yield a single **polycistronic mRNA** that is then translated to produce all three enzymes. The existence of a polycistronic mRNA ensures that the amounts of all the gene products are regulated. Transcription occurs from a single promoter (P_{lac}) that lies upstream of these structural genes and binds RNA polymerase. Also present are an operator site (O_{lac}) between the promoter and the structural genes and a *lacI* gene that codes for the **lac repressor** protein.

72. Ans. (d) All of the above

Ref: Vasudevan Biochemistry, 7th ed. P 580

- Multiple DNA polymerase molecules engage in DNA replication. These share three important properties:
 - Chain elongation:** Rate (in nucleotides per second) at which polymerization occurs.
 - Processivity:** Number of nucleotides added to the nascent chain before the polymerase disengages from the template.
 - Proofreading:** Identifies copying errors and corrects them.
- In *E. coli*, polymerase III (pol III) functions at the replication fork. Of all polymerases, it catalyzes the highest rate of chain elongation and is the **most processive**. It has 3' to 5' activity.
- Polymerase II (pol II) is mostly involved in proofreading and DNA repair. It has 3' to 5' activity.
- Polymerase I (pol I) completes chain synthesis between Okazaki fragments on the lagging strand. Eukaryotic cells have counterparts for each of these enzymes plus some additional ones.
 - 5' to 3' activity:** For repair and proofreading.
 - 3' to 5' activity:** For polymerization

Extra Mile

Classes of proteins involved in replication

Protein	Function
DNA polymerases	Deoxynucleotide polymerization
Helicases	Processive unwinding of DNA
Topoisomerases	Relieve torsional strain that results from helicase-induced unwinding
DNA primase	Initiates synthesis of RNA primers
Single-strand binding proteins	Prevent premature reannealing of dsDNA
DNA ligase	Seals the single strand nick between the nascent chain and Okazaki fragments on lagging strand

A COMPARISON OF PROKARYOTIC AND EUKARYOTIC DNA POLYMERASES

E. coli	Mammalian	Function
I	α	Gap filling and synthesis of lagging strand
II	ϵ	DNA proofreading and repair
	β	DNA repair
	γ	Mitochondrial DNA synthesis
III	δ	Processive, leading strand synthesis

73. Ans. (b) RNA

- This technique is the PCR amplification of a reverse transcriptase product.
- It amplifies very small amount of any kind of RNA like mRNA, tRNA, rRNA and analyses the expressed mRNA sequence.
- Reverse transcriptase enzyme generates cDNA of mRNA.
- This method is used to obtain relative expression of gene in a cell.

Extra Mile

- A **real-time polymerase chain reaction**, also known as quantitative polymerase chain reaction (qPCR), monitors the amplification of a targeted DNA molecule during the PCR, i.e. in real-time, and not at its end, as in conventional PCR.

74. Ans. (a) Free radical damage

- Ionizing radiation can be divided into X-rays, gamma rays, alpha and beta particles and neutrons.
- It is a type of high-energy radiation that is able to release electrons from atoms and molecules generating ions which can break covalent bonds.
- Ionizing radiation directly affects DNA structure by inducing **DNA breaks, particularly, double stranded breaks**. Secondary effects are the generation of **reactive oxygen species** that oxidize proteins and lipids, and also induce several damages to DNA, like generation of abasic sites and single strand breaks (SSB).
- Collectively, all these changes induce cell death and mitotic failure.

Damaging agent	Defect	Repair mechanism	Associated disorder
Ionizing radiation	<ul style="list-style-type: none"> Double strand break Single strand break Intrastrand crosslinking Interstrand crosslinking 	<ul style="list-style-type: none"> Non homologous End joining repair Homologous repair 	<ul style="list-style-type: none"> SCID Ataxia Telangiectasia Werner Syndrome Breast CA susceptibility Bloom Syndrome

Extra Mile

- UV light creates bulky adducts and pyrimidine dimers, which is repaired by nucleotide excision repair. A defect in nucleotide excision repair can cause disorders like **Xeroderma pigmentosa**, **Cockayne syndrome**, **Trichothiodystrophy**.

75. Ans. (c) C

X chromosome belongs to group C.

Different groups of chromosomes

Groups	Chromosome
A	1–3
B	4–5
C	6–12, X
D	13–15
E	16–18
F	19–20
G	21, 22, Y

Note

- X chromosome belongs to group C. They are submetacentric
- Y chromosome belongs to group G. They are small acrocentric
- The largest chromosome is chromosome 1

76. Ans. (b) DNA mismatch repair

Ref: Harrison's, 19th ed. pg. 94e.4

- Cockayne syndrome:** Includes a number of **autosomal recessive disorders** with features such as impaired neurologic growth, photosensitivity (xeroderma pigmentosa), and death during childhood years. These disorders are caused by mutations in the genes for **DNA excision repair proteins**, **ERCC-6** and **ERCC-8**.
- Disorder associated with mismatch repair:** Hereditary non- polyposis colon cancer

77. Ans. (c) 3

- Stop codons are a normal part of protein synthesis—they are the reason that all proteins do not go on 'forever'. During translation, it is stop codon on mRNA sequence, that *terminates the process*. Therefore they are known to act as terminator codon.
- There are three stop codons namely:
 - UAG: Amber
 - UGA: Opal
 - UAA: Ochre

Extra Mile

Initiator codon:

- In eukaryotes: **AUG** (codes for methionine)
- In prokaryotes: **AUG** (codes for N-Formyl methionine)
- UGA codes for tryptophan in mitochondrial DNA.

78. Ans. (d) 3 codon act as terminator codon

Please refer to above explanation

79. Ans. (c) t-RNA

- There are three main types of RNA: tRNA, mRNA, and rRNA.
- The most abundant form of RNA is rRNA or ribosomal RNA because it is responsible for coding and producing all the proteins in cells.
- tRNA (transfer RNA): RNA which transfers amino acid from cytoplasm to ribosomal protein synthesizing machinery.
- Secondary structure: Clover leaf shape**
- Tertiary structure: L shaped

tRNA Arms

- Acceptor arm:**
 - It is 3' end of tRNA, and has 3 unpaired nucleotide, CCA
 - It is the site of amino acid attachment
- Anticodon arm:**
 - It has trinucleotide sequence complimentary to the codon of the amino acid, which mRNA carries.
 - Codon of mRNA and anti-codon of tRNA are anti-parallel in their complimentary.
- DHU arm/D-arm:**
 - Recognizes the specific amino acyl tRNA synthetase enzyme

- **Pseudouridine arm:**
 - Binds the charged tRNA to the ribosome
- **Variable arm/Extra arm:**
 - Most variable feature of tRNA. It differentiates the different class of tRNA.

80. Ans. (b) Secondary

Structural organization of amino acid can be of following types:

- **Primary structure:**
 - Linear sequence of amino acid, held together by peptide bond (a type of covalent bond).
- **Secondary structure:**
 - Folding of short ~ 3–30 residue, contiguous segment of polypeptide.
 - Joined together by **non-covalent bond** primarily.
 - ◆ **Hydrogen bond:** Most important bond
 - ◆ Vander walls force
 - ◆ Hydrophobic bond
 - ◆ Electrostatic bond
- **Tertiary structure:** 3D conformation of polypeptide. Bonds are non-covalent (*similar to secondary structure*)
- **Quaternary structure:**
 - When more than one polypeptide aggregate to form one functional protein. The spatial relationship between these polypeptide subunit is called quaternary structure.
 - Bonds are non-covalent (*similar to secondary structure*)

Alpha Helix

- It is an example of **secondary structure**.
- It is the **most common** and **stable secondary structure**. Right handed spiral
- Each turn of alpha helix is formed by 3.6 amino acyl residues.
- Size of 1 turn of alpha helix: 0.54 nm
- Proteins whose major secondary structure is alpha-helix:
 - Haemoglobin and Myoglobin

81. Ans. (a) Glycine

- Most abundant amino acid in bend/turn is proline > Glycine.
- Since proline is NOT given in option, glycine is our next best choice.

82. Ans. (b) 7 methyl transferase

Ref: PubMed

Post-transcriptional modification of mRNA:

- **7 methyl guanosine capping** at 5' end is one of the post-transcriptional modification of mRNA.
- It takes place in two steps:

	Step I	Step II
Step	Guanosine triphosphate is attached to 5' end of hnRNA	Methylation of guanosine triphosphate
Enzyme	Guanylyl transferase	7 methyl transferase
Site	Nucleus	Cytoplasm

83. Ans. (b) Thymine

Ref: Harper's Biochemistry, 30th pg. 341, 29th ed. pg. 344

Nitrogen Bases present in RNA are-	Nitrogen Bases present in DNA are-
<ul style="list-style-type: none"> • Adenine • Guanine • Uracil • Cytosine 	<ul style="list-style-type: none"> • Adenine • Guanine • Thymine • Cytosine

84. Ans. (b) Glutamine

Ref: Harper's Biochemistry, 29th ed. pg. 332

- AA for purine synthesis- glycine, aspartate, glutamine
- AA for pyrimidine synthesis- glutamine, aspartate (aspartate)
- Hence 2 AA are common i.e. glutamine and aspartate

85. Ans. (b) Carbamoyl phosphate synthetase II > (A) Aspartate transcarbamylase

Ref: Harper's Biochemistry, 30th ed. pg. 340, 353

- **Harper 27th ed p. 305 says** Aspartate transcarbamylase is the rate limiting enzyme of the pyrimidine synthesis in which case it does not make any differentiating remark between prokaryotic and eukaryotic pyrimidine synthesis.
- **"Pyrimidine synthesis is regulated by ACTase in bacteria (prokaryotes) and CPS-II in animals (eukaryotes) as there rate limiting enzymes respectively"**
- Sources of a pyrimidine:
 - Aspartic acid (N1, C4, C5, C6)
 - Amine N2 of glutamine (N3)
 - CO₂ (C2)

Note: UMP is the first pyrimidine to be synthesized.

86. Ans. (a) Right handed anti parallel

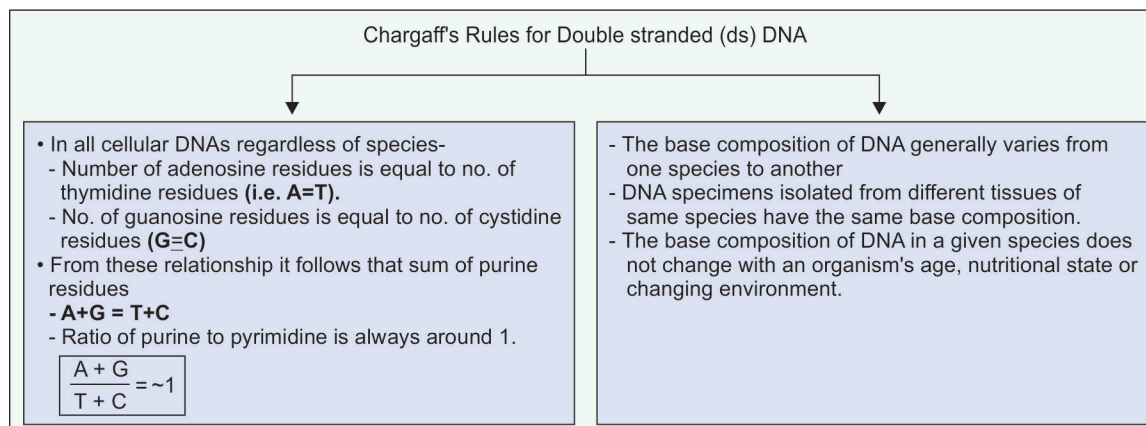

Ref: Harper's Biochemistry, 30th edn. pg. 360-361

- Helical structure assumed by two strands of deoxyribonucleic acid, held together throughout their length by hydrogen bonds between bases on opposite strands, referred to as Watson-Crick base pairing. The structure is right handed anti-parallel structure.

87. Ans. (c) $G \equiv C$

Ref: Harper's Biochemistry, 30th ed. pg. 360-361

88. Ans. (d) **Deletion of 2 bases**

Ref: Harper's Biochemistry, 30th ed. pg. 417-18

Somatic Mutation Include

- **Point mutation-** (mutation of single nucleotide)
 - **Silent mutation:** If the changed base in the mRNA molecule at the third nucleotide of a codon, leads to no detectable effect.
 - **Mis-sense mutation:** Substitution of amino acid
 - **Non sense mutation:** Appearance of stop codon due to mutation
- **Frame shift mutation-** due to deletion/insertion, of one or two bases, which causes shift in reading frame. Whole reading frame is changed leading to entirely different protein molecule synthesis, called garbled protein.
- **Trinucleotide repeat mutation-** repeat more than 55 times.

89. Ans. (a) **Translation**

Ref: Harper's Biochemistry, 30th edn. pg. 417-418

- Frameshift mutations take place when there is an insertion or removal of 1 or 2 base pairs into the codon sequence. *When the translation of the codon takes place, as it is read in triplets, the amino acid sequence of the protein synthesized is changed which leads to a "shift" in the frame that is being translated.* But during the replicative or transcription processes there will be no problems as in the structure or stability of the DNA molecule.
- *Frameshift mutations also do not occur in multiples of 3 because in that case, only an amino acid is skipped in the translation process and the sequence is maintained.*

90. Ans: (b) 3

Ref: Harper's Biochemistry, 30th ed. pg. 417-18

- Frame-shift mutations
- *The genetic code is read in form of triplets of nucleotides which are known as codons.*
- If one or two base pairs from the code are removed or inserted, the genetic code will be misread from that change onwards, because the genetic code is not punctuated. Therefore the amino acid sequence translated from the change onwards will be completely changed. This is known as frame shift mutation.
- *However if the removal /insertion happens in multiples of three, rest of the reading frame doesn't change and hence the amino acid sequence will not change.*

91. Ans. (d) **Base pair substitution**

Ref: Harper's Biochemistry, 30th ed. pg. 416-17

A partial missense mutation (type of base pair substitution) glutamic acid, the normal amino acid in position 6 of the β chain, has been replaced by valine.

92. Ans. (a) **Nucleoside correction**

DNA correction has been divided into two types:

- **Pre replication repair:**
 - Most efficient form of repair
 - Done by: excision repair, photoreactivation, base replacement

- **Post replication repair:**
 - Done by: daughter strand Gap repair, error prone induced repair.

TABLE: Mechanism of Dna Repair

Mechanism	Problem	Solution
Mismatch repair	Copying errors (single base or Two -to five-base unpaired loops)	Methyl-directed strand cutting, exonuclease digestion, and replacement
Double-strand break repair	Ionizing radiation, chemotherapy, oxidative free radicals	Synapsis, unwinding, alignment, ligation
Base excision-repair	Spontaneous, chemical, or radiation damage to a single base	Base removal by N-glycosylase, abasic sugar removal, replacement
Nucleotide excision-repair	Spontaneous, chemical, or radiation damage to a DNA segment	Removal of an approximately 30-nucleotide oligomer and replacement

93. Ans. (b) Repair of damaged DNA

Ref: Harper's Biochemistry, 30th ed. pg. 389-90

Two types of exonuclease activity has been described:

- **5' to 3' exonuclease activity:** responsible for cleavage of phosphodiester bond starting from 5' end of the strand. It is considered as the error correcting activity in damaged DNA.
- **3' to 5' exonuclease activity:** responsible for cleavage of phosphodiester bond starting from 3' end of the strand. This activity provides a means for proofreading if in case any wrong base is mistakenly incorporated by DNA polymerase III during DNA synthesis.

94. Ans. (b) DNA

Ref: Harper's Biochemistry, 30th ed. pg. 724

- Radiation exposure leads to increased destruction of DNA.
- Radiation causes pyrimidine dimerisation- leading to DNA damage.

95. Ans. (b) HSP 70 family of chaperones bind with hydrophobic amino acid

Ref: Harper's Biochemistry, 30th ed. pg. 618-20, 26th ed. pg. 36-37

- **Over half of mammalian protein folding is done by Chaperone proteins.**
- Chaperones prevent aggregation, thus providing an opportunity for the formation of appropriate secondary structural elements.
- **There are 2 families of hsp:** hsp 60 and hsp 70.
- The hsp60 family of chaperones, sometimes called chaperonins, **differ in sequence and structure from hsp70 and its homologs.**
- The HSP 70 (70-kDa heat shock protein) **family of chaperones binds short sequences of hydrophobic amino acids in newly synthesized polypeptides, shielding them from solvent.**
- Hsp60 acts later in the folding process, **often together with an hsp70 chaperone.**
- Hsp 60 chaperone is donut shaped, which provides a sheltered environment in which a polypeptide can fold until all hydrophobic regions are buried in its interior, eliminating aggregation.
- **Chaperone proteins can also "rescue" proteins** that have become thermodynamically trapped in a misfolded dead end. They rescue it **by unfolding hydrophobic regions and providing a second chance to fold productively.**

96. Ans. (a) Xeroderma pigmentosum

Ref: Harper's Biochemistry, 30th ed. pg. 389-90, 28th ed. pg. 330-32

- **Xeroderma pigmentosum** is an **autosomal recessive** genetic disease which arises due to defect in DNA repair particularly of thymidine dimers.

Examples of Conditions Arising due to DNA Repair Defects:

- Xeroderma pigmentosa
- Ataxia telangiectasia
- Fanconi's syndrome
- Bloom syndrome
- HNPCC

97. Ans. (c) Telomerase

Ref: Harper's Biochemistry, 30th ed. pg. 374, 732, 26th ed. pg. 318

- The ends of each chromosome contain structures called telomeres.
- Telomeres consist of short, repeat TG-rich sequences. Human telomeres have a variable number of repeats of the sequence 5'-TTAGGG-3', which can extend for several kilobases.
- **Telomerase**, is related to viral RNA-dependent DNA polymerases (reverse transcriptases) and *is the enzyme*

responsible for telomere synthesis and thus for maintaining the length of the telomere.

- Telomere shortening has been associated with both aging and malignant transformation. Because of this reason, telomerase has become an attractive target for cancer chemotherapy and drug development.

98. Ans. (b) **Rough endoplasmic reticulum**

Ref: Harper's Biochemistry, 30th ed. pg. 576-77

- The surface of the rough endoplasmic reticulum is studded with protein-manufacturing ribosomes giving it a "rough" appearance.
- The ribosomes bound to ER are not a stable part of this organelle's structure as they are constantly being bound and released from the membrane.
- A ribosome only binds to the RER once a specific protein-nucleic acid complex forms in the cytosol. This special complex forms when a free ribosome begins translating the mRNA of a protein destined for the secretory pathway.
- **Protein once produced from RER will go to golgi apparatus → secretory vesicles → which is further released.**

99. Ans. (b) **Endoplasmic reticulum**

Ref: Harper's Biochemistry 30th ed. pg. 576-77

Please refer to above explanation

100. Ans. (c) **Golgi Body**

Ref: Ganong's Physiology, 25th ed. pg. 43-44

101. Ans. (a) **Primary structure**

Ref: Harper's Biochemistry, 30th ed. pg. 26-29, 618-19

PROTEIN DENATURATION

- In **quaternary structure** denaturation, protein sub-units are dissociated and/or the spatial arrangement of protein subunits is disrupted.
- **Primary structure**, such as the sequence of amino acids held together by covalent peptide bonds, is **not disrupted by denaturation**.
- In **secondary structure** denaturation proteins adopt a random coil as they lose all regular repeating patterns such as alpha-helices and beta-pleated sheets, and configuration.
- **Tertiary structure** denaturation involves the disruption of:
 1. **Covalent interactions** between amino acid side-chains (such as disulfide bridges between cysteine groups)
 2. **Non-covalent dipole-dipole interactions** between polar amino acid side-chains (and the surrounding solvent)
 3. **Van der Waals (induced dipole) interactions** between nonpolar amino acid side-chains.

102. Ans. (c) **Uric acid stones are frequently formed**

Ref: Harper's Biochemistry, 30th ed. pg. 354-55, 26th ed. pg. 300

LESCH-NYHAN SYNDROME

- It is a X-linked recessive disorder which is characterized by:
 - An overproduction hyperuricemia
 - Frequent episodes of **uric acid lithiasis**
 - Self-mutilative behavior,
 - **Mental retardation**.
- It reflects a defect in **hypoxanthine-guanine phosphoribosyl transferase, an enzyme of purine salvage**. The accompanying rise in intracellular PRPP results in purine overproduction. Mutations that decrease or abolish hypoxanthine-guanine phosphoribosyl transferase activity include deletions, frameshift mutations, base substitutions, and aberrant mRNA splicing.

103. Ans. (d) **Immunodeficiency**

Ref: Harper's Biochemistry, 30th edn. pg. 354-355

- **Lesch-Nyhan syndrome** is a rare inherited disorder caused by a deficiency of the enzyme hypoxanthine-guanine phosphoribosyl transferase (HGPRT), produced by mutations in the HPRT gene located on X chromosome.

**Clinical Features**

- **One of the first symptoms of the disease is the presence of sand-like crystals** of uric acid in the diapers of the affected infant. *Overproduction of uric acid may lead to the development of uric acid crystals or stones in the kidneys, ureters, or bladder.* Such crystals deposited in joints later in the disease may produce gout-like arthritis, with swelling and tenderness
- **Irritability** is most often noticed along with the first signs of nervous system impairment. Within the first few years of life, extrapyramidal involvement causes abnormal involuntary muscle contractions such as dystonia, atheosis and opisthotonus.
- **Cognitive impairment:** Affected persons have behavioral disturbances that emerge between 2 – 3 years of age. The self-injury begins with biting of the lips and tongue at the age of 3 years.

Remember

- A less severe related disease is **partial HGPRT deficiency** is known as Kelley-Seegmiller Syndrome (*Lesch-Nyhan Syndrome involves total HGPRT deficiency*). Symptoms generally involve less neurological involvement but the disease still causes gout and kidney stones.
- The prognosis for individuals with severe LNS is poor. *Death is usually due to renal failure or complications from hypotonia (PNEUMONIA), in the first or second decade of life.*

104. Ans. (c) Uric Acid

Ref: Harper's Biochemistry, 30th edn. pg. 347-357

Purines are metabolized by several enzymes:

■ GUANINE

- A nuclease frees the nucleotide
- A nucleotidase creates guanosine
- Purine nucleoside phosphorylase converts guanosine to guanine
- Guanase converts guanine to xanthine
- *Xanthine oxidase (a form of xanthine oxidoreductase) catalyzes the oxidation of xanthine to uric acid*

■ ADENINE

- A nuclease frees the nucleotide
 - A nucleotidase creates adenosine, then adenosine deaminase creates inosine
 - Alternatively, AMP deaminase creates inosinic acid, then a nucleotidase creates inosine

- Purine nucleoside phosphorylase acts upon inosine to create hypoxanthine
- *Xanthine oxidoreductase catalyzes the biotransformation of hypoxanthine to xanthine*
- *Xanthine oxido-reductase acts upon xanthine to create uric acid*

105. Ans. (a) Xanthine oxidase

Ref: Harper's Biochemistry, 30th ed. pg. 355, 120, 26th ed. pg. 300

- **Xanthine oxidase** deficiency leads to hypouricemia.
- **Hypouricemia** and increased excretion of hypoxanthine and xanthine are associated with **xanthine oxidase deficiency due to a genetic defect or to severe liver damage.**
- **Patients with a severe enzyme deficiency may exhibit xanthinuria and xanthine lithiasis**

There are at least three different inherited defects that lead to early development of severe hyperuricemia and gout:

- Glucose-6-phosphatase (G6PT) deficiency (**as seen in Von gierke's disease**)
- Severe and partial hypoxanthine-guanine phosphoribosyl-transferase (HGPRT) deficiency: (**As seen in Lesch Nyhan syndrome**)
- **Elevated 5'-phosphoribosyl-1'-pyrophosphate synthetase (PRPP synthetase) activity.**

Extra Mile**DRUGS CAUSING HYPERURICEMIA:**

(Mn: LEAD Poisoning Causes Stone and Nephropathy)

- Levodopa
- Ethcrynac acid
- Alcohol
- Diuretics
- Pyrazinamide
- Cyclosporine
- Salicylates
- Nicotinic acid

106. Ans. (a) Xanthine oxidase

Ref: Harper's Biochemistry, 30th ed. pg. 120, 355, 26th pg. 300

107. Ans. (a) Northern Blot

Ref: Harper's Biochemistry, 30th ed. pg. 362-63

Northern blot	The northern blot is a technique used in molecular biology research to study gene expression by detection of RNA (or isolated mRNA) in a sample.
Southern blot	A Southern blot is a method routinely used in molecular biology for detection of a specific DNA sequence in DNA samples

Contd...

Eastern blot	The eastern blot is a biochemical technique used to analyze protein post translational modifications (PTM) such as lipids, phosphomoieties and glycoconjugates . <i>It is most often used to detect carbohydrate epitopes. Thus, Eastern blotting can be considered an extension of the biochemical technique of Western blotting.</i>
Western blot	The western blot (sometimes called the protein immunoblot) is a widely accepted analytical technique used to detect specific proteins in a sample of tissue homogenate or extract

108. Ans. (a) DNA cistrons

Ref: Harper's Biochemistry, 30th ed. pg. 359-62

- DNA cistrons are a section of DNA that contain the genetic code for a single polypeptide and functions as a hereditary unit.

109. Ans. (b) N formyl methionine t-RNA will be the first t-RNA to come into action

Ref: Harper's Biochemistry, 30th ed. pg. 433-37

- *Methionine t-RNA is the first t-RNA involved in eukaryotic protein synthesis.*

110. Ans. (c) r-RNA

Ref: Harper's Biochemistry, 30th ed. pg. 366-67

- **There are three main types of RNA:** tRNA, mRNA, and rRNA.
- The most abundant form of RNA is rRNA or ribosomal RNA because it is responsible for coding and producing all of the proteins in cells.
- rRNA is found in the cytoplasm of cells and is associated with ribosomes. It takes the coded information delivered from the nucleus by mRNA and translates it so that proteins can be produced and modified.

111. Ans. (d) mi-RNA

Ref: Harper's Biochemistry, 30th ed. pg. 368, 28th ed. pg. 307-320, Lippincott 5th ed. pg. 402

TYPES OF RNA

CODING vs NON-CODING

- **Coding RNA** – mRNA
- **Non-coding RNA** – RNA that do not encode protein. Rest all type of RNA are non coding i.e. t-RNA, r-RNA, sn RNA, sno RNA, sca RNA, mi RNA, siRNA, piRNA, etc.

miRNA

- Non-coding RNA, 21-25 nucleotide long
- Transcribed from RNA polymerase II
- All known mi RNA cause inhibition of gene expression by decreasing specific protein production via translational arrest or mRNA degradation. And thus the gene that it produces is silenced.
- Noble prize was awarded for the discovery of mi RNA in 2006.

112. Ans. (b) Small Nuclear Ribo-nucleoproteins

Ref: Harper's Biochemistry, 30th edn. pg. 365-67, 94-95, 26th edn. pg. 354

- "SNURPS" are **small nuclear ribonucleic proteins**
- They are RNA-protein complexes that combine with unmodified pre-mRNA and various other proteins to form a **spliceosome**, a large RNA-protein molecular complex with which splicing of pre-mRNA occurs.

113. Ans. (c) Decreased glucose concentration, increased cAMP

Ref: Harper's Biochemistry, 30th edn. pg. 430-31

- The **lac operon** aka lactose operon is an operon required for the transport and metabolism of lactose in *Escherichia coli* and some other enteric bacteria.
- It has **three adjacent structural genes**, which encodes: (*Mn: ZiYA ki GaLaThi*)
 - **lacZ** : Encodes β -galactosidase
 - **lacY** : Encodes lactose permease
 - **lacA** : Encodes thiogalactoside transacetylase (or galactoside O-acetyltransferase)
- The **lac operon** uses a two-part control mechanism to ensure that the cell spends energy only when necessary. In the absence of lactose, the **lac repressor** stops production of the enzymes encoded by the **lac operon**.
- In the presence of glucose, the catabolite activator protein (CAP), required for production of the enzymes, remains inactive, and EI_{IIA} shuts down lactose permease to prevent transport of lactose into the cell.
- In the absence of glucose, there is an **increase in the concentration of cAMP** and this leads to the activation of the lac operon which leads to the enzyme production in order to consume the lactose present in the cells.

AMINO ACID

114. Ans. (a) Pellagra like symptoms

Ref: Harrison's 20th ed. P 3021

FMGE Solutions Screening Examination

204

Hartnup Disease

- It is an AR condition, mainly seen due to defect in the transport of tryptophan and other neutral amino acids from the renal tubules and intestine
- **Molecular defect:** SLC6A19 gene (encode transporter protein of these amino acid)

Clinical Features:

- **MC:** Cutaneous photosensitivity
- Constant neutral aminoaciduria

- Intermittent pellagra like symptoms
 - Intermittent ataxia (unsteady wide based gait)
- Diagnosis:** Obermeyer test (urinary test for indole compound)

Treatment: High protein diet and Nicotinic acid

- **Drummond syndrome/Blue diaper syndrome:** Tryptophan transport defect lies only in intestine, NOT in kidney

Class of substance and disorder	Individual substrates	Tissues manifesting transport defect	Molecular defect	Major clinical manifestations	Inheritance
Amino acids					
Cystinuria	Cystine, lysine, arginine, ornithine	Proximal renal tubule, jejunal mucosa	Shared dibasic-cystine transporter SLC3A1, SLC7A9	Cystine nephrolithiasis	AR
Lysinuric protein intolerance	Lysine arginine, ornithine	Proximal renal tubule, jejunal mucosa	Dibasic transporter SLC7A7	Protein intolerance, hyperammonemia, intellectual disability	AR
Hartnup disease	Neutral amino acids	Proximal renal tubule, jejunal mucosa	Neutral amino acid transporter SLC6A19	Constant neutral aminoaciduria, intermittent symptoms of pellagra	AR
Brain branched-chain amino acid deficiency	Leucine, isoleucine, valine	Plasma membrane of blood brain barrier	Branched-chain amino acid transporter SLC7A5	Microcephaly, intellectual disability, seizures	AR
Citrullinemia type 2	Aspartate, glutamate, malate	Inner mitochondrial membrane	Mitochondrial aspartate/ glutamate carrier 2 SLC25A13	Sudden behavioral changes with stupor, coma, hyperammonemia	AR

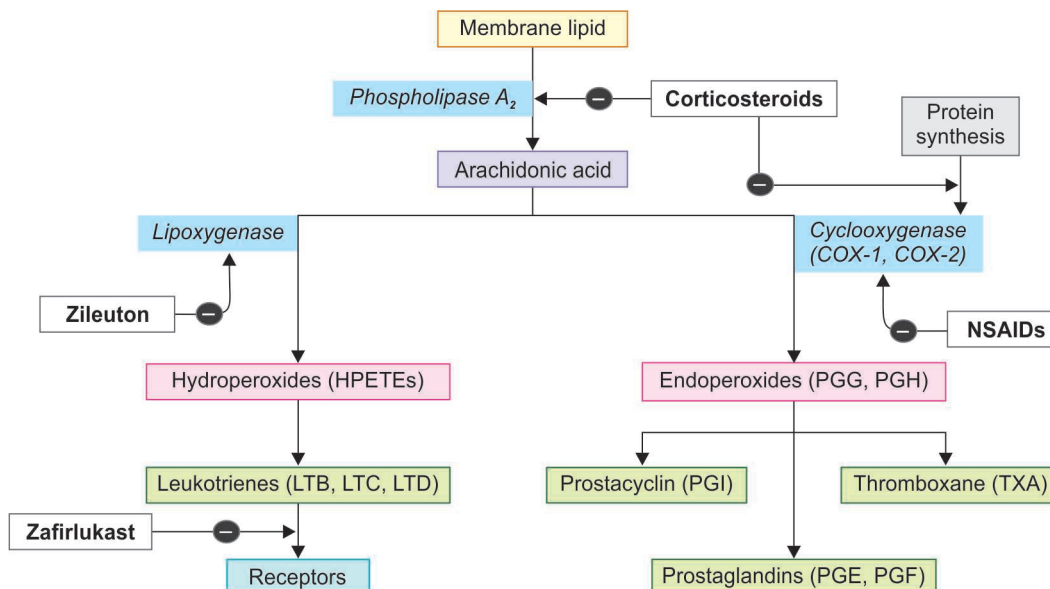

115. Ans. (d) Creatinine

- Tryptophan is one of the essential aromatic amino acid
- Metabolic fate of tryptophan: Metabolized by enzyme Tryptophan oxygenase (pyrrolase)
- **Derivatives of tryptophan:**
 - Niacin (Nicotinic acid)
 - Serotonin
 - Melatonin
- **Note:** Creatinine is synthesized from 3 amino acids namely: Glycine, Arginine, Methionine

116. Ans. (b) Arachidonic acid

Ref: Lippincott's Biochemistry, 6th ed. P 213

- Prostaglandin is derived from the metabolism of arachidonic acid with the help of cyclooxygenase (COX) enzyme.

117. Ans. (d) Phenylketonuria

Ref: Harrison's 20th ed. P 3015 – 16**Phenylketonuria**

- MC metabolic disorder of amino acid
- Seen due to deficiency of enzyme: Phenylalanine Hydroxylase
- Increased phenylalanine in blood → metabolized to phenylketones → excreted in urine → hence the name Phenylketonuria (PKU).
- MC organ damaged due to phenylalaninemia: Brain

Clinical Feature

- Gradual development of mental retardation (intellectual disability)
 - Infants normal at birth
- Excessive vomiting
- Autistic, choreiform movement
- Unpleasant, musty odor

Diagnosis

- Guthrie test-screening test in blood sample
- Ferric chloride test: Screening test in urine sample
- Tandem mass spectrometry: **IOC**

TABLE: Inherited disorders of Amino Acid Metabolism

Amino Acid(s)	Condition	Enzyme Defect	Clinical Findings	Inheritance
Phenylalanine	DNAJC12 Deficiency	Hydroxylase Co-chaperone	Dystonia, parkinsonism, intellectual disability	AR
	Phenylketonuria	Phenylalanine hydroxylase	Intellectual disability, microcephaly, hypopigmented skin and hairs, eczema, "mousy" odor	AR
	DHPR deficiency	Dihydropyridine reductase	Intellectual disability, hypotonia, spasticity, myoclonus	AR
	PTPS deficiency	6-Pyruvoyl-tetrahydropterin synthase	Dystonia, neurologic deterioration, seizures, intellectual disability	AR

Contd...

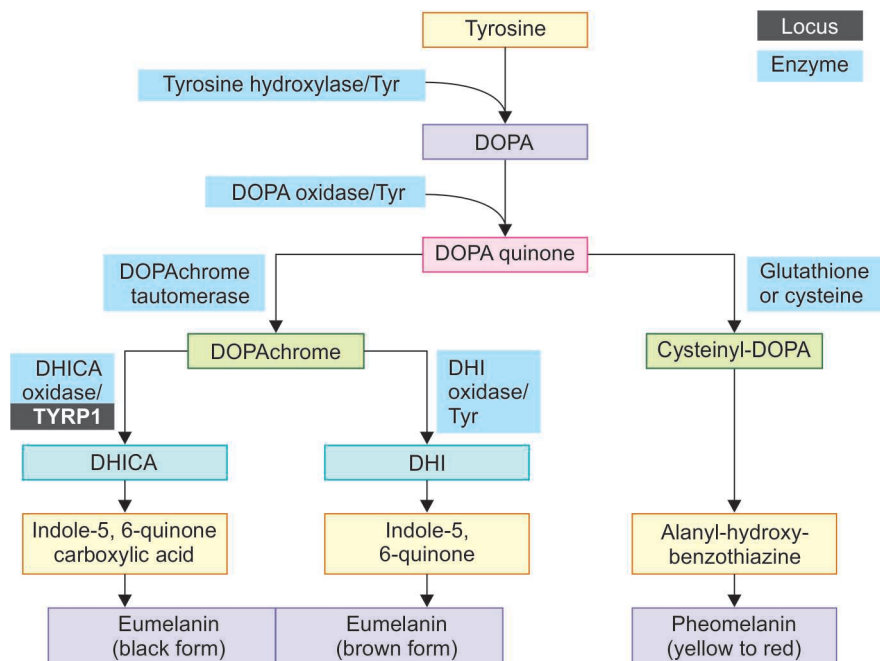

Amino Acid(s)	Condition	Enzyme Defect	Clinical Findings	Inheritance
	GTP cyclohydrolase I deficiency	GTP cyclohydrolase I	Intellectual disability, seizures, dystonia, temperature instability	AR
	Carbinolamine dehydratase deficiency	Pterin-4 α -carbinolamine dehydratase	Transient hyperphenylalaninemia (benign)	AR
Tyrosine	Tyrosinemia type I (hepatorenal)	Fumarylacetoacetate hydrolase	Liver failure, cirrhosis, rickets, failure to thrive, peripheral neuropathy, "boiled cabbage" odor	AR
	Tyrosinemia type II (oculocutaneous)	Tyrosine transaminase	Palmoplantar keratosis, painful corneal erosions with photophobia, learning disability	AR
	Tyrosinemia type III	4-Hydroxyphenyl pyruvate dioxygenase	Hypertyrosinemia with normal liver function, occasional mental delay	AR
	Hawkinsinuria type III	4-Hydroxyphenyl pyruvate dioxygenase	Transient failure to thrive, metabolic acidosis in infancy	AD
	Alkaptonuria	Homogentisic acid oxidase	Ochronosis, arthritis, cardiac valve involvement, coronary artery calcification	AR
	Albinism (oculocutaneous)	Tyrosinase	Hypopigmentation of hair, skin, and optic fundus; visual loss; photophobia	AR
	Albinism (ocular)	Different enzymes or transporters	Hypopigmentation of optic fundus, visual loss	AR, XL
	DOPA-responsive dystonia	Tyrosine hydroxylase	Rigidity, truncal hypotonia, tremor, intellectual disability	AR

118. Ans. (a) **Tyrosine**

Ref: Harper's Biochemistry, 30th ed. pg. 618-20, 26th ed. P 288

- **Melanin** is pigment of skin, hair and eyes, synthesized from tyrosine in the epidermis by the melanocytes.
- **Function:** Protect underlying cells from UV rays of sun.
- **Defect in melanin production:** Albinism
- **Generalized Albinism** aka Oculocutaneous albinism (OCA) is mainly classified into 3 types:
 - **OCA 1:** Tyrosinase deficient
 - **OCA 2:** Tyrosinase positive- MC type of albinism
 - **OCA 3:** Red OCA
- **Localized albinism:** Piebaldism, Waardenburg syndrome

Extra Mile

- Specialized products from glycine: Creatinine, Heme, Purine nucleotide, Glutathione

119. Ans. (a) **Glycine**

Glycine

- In collagen every third amino acid is glycine
- Glycine is considered as the simplest amino acid
- Properties of glycine: Non-essential, Glucogenic and optically inactive amino acid
- Acts as a conjugating agent:**
 - Conjugation of benzoic acid
 - Conjugation of bile acid
- As neurotransmitter, it has both properties excitatory and inhibitory.

Other amino acids present in collagen are: Proline, Hydroxyproline, Hydroxylysine

Lysine (K)

- An essential amino acid which is predominantly ketogenic
- It is an amino acid which is deficient in cereals
- Functions:**
 - Important for covalent cross linking in collagen
 - Precursor of carnitine = Lysine + Methionine

120. Ans. (b) **Cysteine**

- SH group of 2 cysteine in proteins can be oxidized to form a covalent disulfide bond.
- It significantly stabilizes tertiary structures of protein
- This bond plays crucial role in structures of many proteins by forming covalent links.

Extra Mile

- Amino acid that decreases ageing process: **Cysteine and Taurine**
- Amino acid that accelerate ageing: **Homocysteine**

121. Ans. (b) **Melatonin**

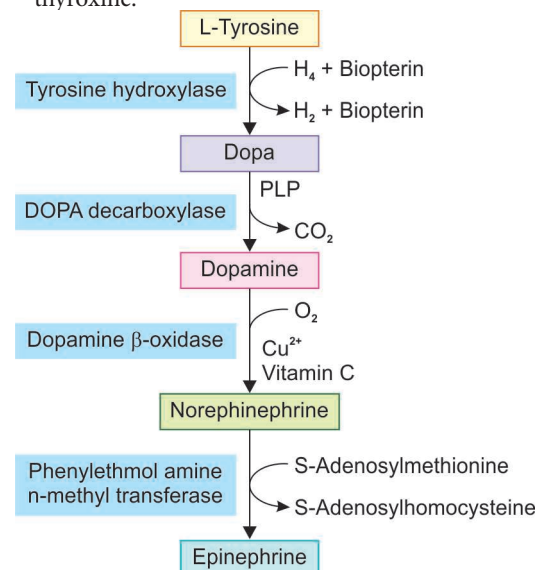

Ref: Vasudevan Biochemistry, 8th ed. P 273

- Melatonin is released from pineal gland.

TYROSINE

- Neural cells convert tyrosine to epinephrine and norepinephrine. While dopa is also an intermediate in the formation of melanin, different enzymes hydroxylate tyrosine in melanocytes. Dopa decarboxylase, a pyridoxal phosphate-dependent enzyme, forms dopamine.
- β -oxidase then forms norepinephrine. In the adrenal medulla, phenylethanolamine-N-methyltransferase utilizes S-adenosylmethionine to methylate the primary amine of norepinephrine, forming epinephrine.

- Tyrosine is also a precursor of triiodothyronine and thyroxine.

122. Ans. (a) **Glycine, arginine, methionine**

Ref: Vasudevan Biochemistry, 8th ed. P 269

- Creatinine is formed in muscle from creatine phosphate by irreversible, nonenzymatic dehydration and loss of phosphate.
- Glycine, arginine, and methionine all participate in creatine biosynthesis.
- Synthesis of creatine is completed by methylation of guanidinoacetate by S-adenosylmethionine.

123. Ans. (b) **Lysine**

Ref: Vasudevan Biochemistry, 8th ed, P 281-82

Based on variable side chain, amino acid can be classified into: Aliphatic amino acid and aromatic amino acid.

Aliphatic amino acid	Aromatic amino acid
<p>It is further classified into several subtypes:</p> <ul style="list-style-type: none"> Simple AA: Glycine, alanine Branched chain AA: Leucine, isoleucine, Valine Sulfur containing: Cysteine, methionine With –OH group: Serine, threonine With amide group: Asparagine, glutamine Acidic AA: Aspartic acid, glutamic acid Basic AA: Arginine, lysine 	<ul style="list-style-type: none"> Histidine Tyrosine Tryptophan Phenylalanine

Extra Mile

- **Basic amino acid:** Histidine, arginine, lysine (Histidine is also basic in nature, but it is aromatic)
- **-OH containing AA:** Threonine, serine, tyrosine
- **Most basic amino acid:** Arginine

124. (a) **Chaperone**

Ref: *Harper's Biochemistry*, 26th ed. pg. 36-37

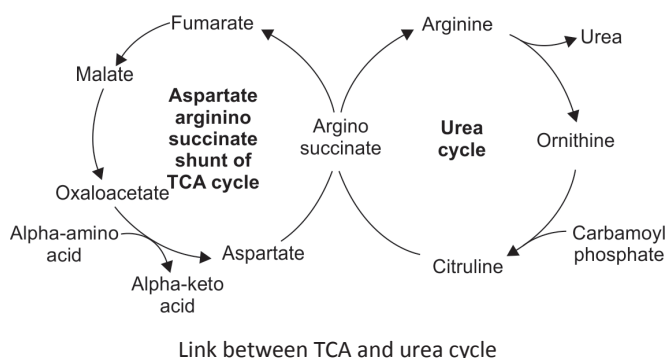

- Chaperone proteins participate in the *folding of over half of mammalian proteins*. The hsp70 (70-kDa heat shock protein) *family of chaperones binds short sequences of hydrophobic amino acids in newly synthesized polypeptides, shielding them from solvent*.

125. Ans. (a) **Aspartate**

Ref: *Satyanarayan Biochemistry*, pg. 339

Role of Aspartate in urea cycle:

- Aspartate participates in urea cycle for condensation with citrulline to form Argino succinic acid. The reaction is catalyzed by Argino succinic acid synthetase (Aspartate provides one out of the two nitrogens of urea, the other nitrogen is contributed by Glutamate).
- In the subsequent reaction, Argino succinic acid undergoes a lytic reaction to form Arginine and fumarate. Fumarate forms a link between TCA cycle and urea. Fumarate can be recycled to form oxaloacetate, through intermediate formation of malate that can be transaminated to form aspartate, to get reutilized in the urea cycle

Role of Aspartate in TCA cycle

- Oxaloacetate, the keto acid obtained from Aspartate by transamination is an intermediate of TCA cycle.
- Oxaloacetate can either be utilized in TCA cycle or be channeled to the pathway of gluconeogenesis.
- Hence aspartate is a common intermediate of TCA cycle (through oxaloacetate) and urea cycle (directly)

126. Ans. (a) **Aspartic acid**

Based in variable side chain, amino acid can be classified into: Aliphatic amino acid and Aromatic amino acid.

Aliphatic amino acid

Aromatic amino acid

It is further classified into several subtypes:

- **Simple AA:** Glycine, Alanine
- **Branched chain AA:** Leucine, Isoleucine, Valine
- **Sulphur containing:** Cysteine, Methionine
- **With -OH group:** Serine, Threonine
- **With amide group:** Asparagine, Glutamine
- **Acidic AA:** Aspartic acid, Glutamic acid
- **Basic AA:** Arginine, Lysine

- Histidine
- Tyrosine
- Tryptophan
- Phenylalanine

Extra Mile

- **Basic amino acid:** Histidine, Arginine, Lysine (Histidine is also basic in nature, but it is aromatic)
- **-OH containing AA:** Threonine, Serine, Tyrosine
- **Most basic amino acid:** Arginine

127. Ans. (b) **Arginine**

TABLE: Special groups present in amino acid

Special group	Amino acid
Guanidinium	Arginine
Phenol	Tyrosine
Thioether linkage	Methionine
Pyrrolidine	Proline
Benzene	Phenylalanine
Indole	Tryptophan
Thioalcohol	Cysteine
Imidazole	Histidine

128. Ans. (c) **Phenylalanine**

Ref: *Lippincott's Biochemistry*, pg. 268

Phenylketonuria (PKU), caused by a deficiency of *phenylalanine hydroxylase* and is the most common clinically encountered inborn error of amino acid metabolism (prevalence 1:11,000). **Hyperphenylalaninemia** may also be caused by deficiencies in the enzymes that synthesize or reduce the coenzyme **tetrahydrobiopterin (BH₄)**. It is important to distinguish among the various forms of hyperphenylalaninemia, because their clinical management is different. For example, a small fraction of PKU is a result of a deficiency in either *dihydropteridine (BH₂) reductase* or *BH₂ synthetase*. These mutations prevent synthesis of BH₄, and indirectly raise phenylalanine concentrations, because *phenylalanine hydroxylase* requires BH₄ as a coenzyme. BH₄ is also required for *tyrosine hydroxylase* and *tryptophan hydroxylase*, which catalyze reactions leading to the synthesis of neurotransmitters, such as serotonin and catecholamines.

129. Ans. (c) **Valine**

Glycated hemoglobins arise from the non-enzymatic attachment of glucose to hemoglobin. They are formed and accumulate in the red cell in proportion to the blood glucose level. Their concentration reflects the long-term average glucose level and is thus *useful as an indicator of diabetic control*.

Types of glycated hemoglobin

- **HbA1a1:** Fructokinase 1,6 diphosphate N terminal valine
- **HbA1a2:** Glucose 6 phosphate N terminal valine
- **HbA1b:** Unknown carbohydrate N terminal valine
- **HbA1c:** Attachment of glucose to N terminal of amino acid valine

130. Ans. (b) **SDS-PAGE**

Ref: Harper's Biochemistry, pg. 24

- The most widely used method for determining the purity of a protein is SDS-PAGE—polyacrylamide gel electrophoresis (PAGE) in the presence of the anionic detergent sodium dodecyl sulfate (SDS)
- Electrophoresis separates charged biomolecules based on the rates at which they migrate in an applied electrical field. For SDS-PAGE, acrylamide is polymerized and crosslinked to form a porous matrix. SDS denatures and binds to proteins at a ratio of one molecule of SDS per two peptide bonds.

▶ Extra Mile

- **Mass spectrometry** is considered as the method of choice for protein identification.
- **Sanger's technique** was the first technique to determine the sequence of protein.
- **Western blot detects** Protein by antigen-antibody interaction.
- **Southern blot** detects DNA by DNA-DNA hybridization.
- **Northern blot** detect RNA by RNA-cDNA hybridization.

131. Ans. (c) **Heart**

TABLE: Isoenzyme of LDH, its subunit, origin tissue and their respective electrophoretic activity

LDH isoenzyme	Subunit	Origin tissue	Electrophoretic activity
LDH 1	H4	Heart, RBC	Fastest
LDH 2	H3M1	Reticuloendothelial system	↓
LDH 3	H2M2	Lungs	
LDH 4	H1M3	Kidney, placenta pancreas	
LDH 5	M4	Liver and skeletal muscle	Slowest

132. Ans. (b) **Tyrosine**

- **TYROSINE:** nonessential AA, which is converted to Melanin, T3, T4 hormone by enzyme Tyrosinase.
 - Deficiency of Tyrosinase → Albinism
 - Deficiency of melanocyte → Vitiligo

AMINO ACIDS AT A GLANCE: Total AA = 20 in number

ESSENTIAL AA: <i>can't be synthesized.</i> (Mn: TV TILL 8 PM)	Semi-essential AA: <i>can be synthesized under normal condition as per demand.</i>	Non-Essential AA: <i>synthesized in body readily</i>
Threonine, Valine, Tryptophan, Isoleucine, Lysine, Leucine, Phenylalanine, Methionine	Histidine Arginine	The remaining 10 AA are Non-essential (including tyrosine).

133. Ans. (b) Deficient in cereals

- Lysine is an essential amino acid.
- It is **deficient in cereals and maize**.
- It is a basic amino acid. **Basic amino acids are:**
 - Arginine
 - Lysine
 - Histidine (Aromatic)
- **Acidic amino acids are:**
 - Aspartic acid
 - Glutamic acid

Food item	Limiting Amino acids
• Pulses	Methionine & cysteine
• Cereals	Threonine & Lysine
• Maize	Tryptophan & Lysine

**134. Ans. (c) Non-protein alpha amino acid**Ref: *Harrisons, 19th ed. pg. 434e2*

- Homocysteine is a non-protein alpha amino acid.
- It is a derived amino acid (from methionine) not seen in protein.
- Two fates of methionine
 - Derived as homocysteine
 - Derived as cysteine

TABLE: Diseases associated with homocysteine and its clinical features

Amino acid	Disease	Enzyme deficient	Clinical manifestation/ inheritance
Homo-cysteine	Homocyst-inuria— Classical	Cystathionine β -synthase	Lens dislocation, thrombotic vascular disease, intellectual disability, osteoporosis/AR
	Homocyst-inuria— Nonclassical	5, -1-10-Methylene tetrahydrofolate reductase	Intellectual disability, gait and psychiatric abnormalities, recurrent strokes/AR
	Homocyst-inuria	Methionine synthase	Intellectual disability, hypotonia, seizures, megaloblastic anemia/AR
	Homocyst-inuria and methyl-malonic acidemia	Vitamin B ₁₂ lysosomal efflux and metabolism	Intellectual disability, lethargy, failure to thrive, hypotonia, seizures megaloblastic anemia/AR

135. Ans. (b) Glutaminase

- In amino acid metabolism, there is detachment of NH_2 . Since this amino group is toxic to body in free form, it is neutralized in form of glutamate by the process of transamination.
- This glutamate is converted to glutamine \rightarrow which carries the ammonia to liver.
- In liver:

- It releases ammonia by hydrolytic cleavage and again gets converted to glutamate.
- Enzyme required here is: **Glutaminase**.

136. Ans. (c) Fatty acidRef: *PubMed*

- **Carnitine** is a quaternary ammonium compound biosynthesized from the amino acids lysine and methionine.
- It is required for the **transport of fatty acids** from the inter-membranous space in the mitochondria, into the mitochondrial matrix during the breakdown of lipids for the generation of metabolic energy.

Extra Mile

- Abnormalities in *carnitine* metabolism can cause dilated or restrictive cardiomyopathies, usually in children

137. Ans. (b) Phenylalanine hydroxylaseRef: *Harrisons, 19th ed. pg. 434e1*

- PKU is an autosomal recessive disorder characterized by an increased concentration of phenylalanine and its by-products in body fluids and by severe mental retardation if untreated in infancy.
- It results from reduced activity of **phenylalanine hydroxylase**.
- The accumulation of phenylalanine:
 - Inhibits the transport of other amino acids required for protein or neurotransmitter synthesis
 - Reduces synthesis and increases degradation of myelin, and leads to inadequate formation of norepinephrine and serotonin.
- To prevent intellectual disability, diagnosis and initiation of dietary therapy must be started **before 2 weeks of age**

138. Ans. (a) CollagenRef: *Harrisons, 19th ed. pg. 2504*

- Collagen is the most abundant protein in the body.
- *Harrisons* states: "The first genes cloned for connective tissues were the two genes coding for **type I collagen**, the most abundant protein in bones, skin, tendons, and several other tissues.

139. Ans. (a) TryptophanRef: *Harper's Biochemistry 30th ed. pg. 316, 547, 5517; Food-facts and principles by N. Shakuntala, pg. 71*

- Niacin can be synthesized by the bacteria of the intestinal flora and is formed in the tissues from amino acid tryptophan, which has *niacin sparing activity*. This explains why some food rich in tryptophan e.g. milk and egg, have a far greater niacin potency than would be expected from their actual content of niacin.
- In humans, deficiency of niacin results in weakness and indigestion followed by ulcerated mouth and tongue.

TRYPTOPHAN

- It is an essential amino acid, which is a precursor of melatonin, 5-HIAA and serotonin

60 mg of tryptophan $\xrightarrow{\text{Vit B}_6}$ 1 mg of Niacin.

- In deficiency of vitamin B₆, the pathway altered and leads to formation of xanthuric acid. **Thus XANTHURIC ACID IS THE INDEX OF VITAMIN B₆ DEFICIENCY.**
- **Sulphur containing amino acid: CYSTEINE AND METHIONINE**
- **BASIC AMINO ACID:**
 - HISTIDINE
 - LYSINE
 - ARGININE (*most basic amino acid*)
- Most stable amino acid at physiologic pH: **HISTIDINE**
- **TYROSINE:** non-essential AA, which is converted to Melanin, T₃, T₄ hormone by enzyme Tyrosinase.
 - Deficiency of Tyrosinase → Albinism
 - Deficiency of melanocyte → Vitiligo

140. Ans. (a) Niacin

Ref: Harper's Biochemistry, 30th ed. pg. 557

- Niacin is synthesized from tryptophan via kynurenine and quinolinic acids as key biosynthetic intermediates.
- Refer to above explanation for more details.

141. Ans. (b) Maple syrup disease

Ref: Harper's Biochemistry, 30th ed. 309, 27th ed. pg. 257

- Branched chain amino acids are remembered as VIL (Valine, Isoleucine, **Leucine**).
- These amino acids are converted to alpha-keto acid and then undergo oxidative decarboxylation by **enzyme alpha keto-decarboxylase**. Deficiency of this enzyme leads to MSUD, which is characterized by burnt sugar or maple syrup smell in urine or sometimes in ear wax also.
- In patients with deficiency of alpha keto-decarboxylase enzyme, there is **increased concentration of valine, Isoleucine and Leucine**.
- **Management** is done by restricted dietary intake of branched chain amino acid.

Extra Mile

Diseases and Deficiency

- **HARTNUP DISEASE:** TRYPTOPHAN
- **ALKAPTONURIA:** Homogentisate oxidase
- **ALPORT SYNDROME:** due to antibody against type IV collagen.

142. Ans. (c) Tryptophan

Ref: Harper's Biochemistry, 30th ed. pg. 281, 544

Food item	Limiting Amino acids
• Pulses	Methionine & cysteine
• Cereals	Threonine & Lysine
• Maize	Tryptophan & lysine

143. Ans. (c) Homogentisate oxidase

Ref: Harper's Biochemistry, 30th ed. pg. 304

The defect in Alkaptonuria is lack of homogentisate oxidase. Most imp features are:

- The urine darkens on exposure to air due to oxidation of excreted homogentisate.
- Deposits called ochronosis occur in sclera, ear, nose, cheeks, intervertebral disc space. There may be calcification of inter vertebral discs.
- **Ochronosis arthritis-** affects shoulder, hip and knee.
- **Benedicts reaction is strongly positive and gives green brown precipitate.**
- **Fehling test** reagent gives blue green colour.

144. Ans. (a) Kynurenine

Ref: Harper's Biochemistry, 30th ed. pg. 306-307

- Tryptophan is degraded to amphibolic intermediates via the kynurenine-anthranilate pathway. Tryptophan oxygenase (tryptophan pyrrolase) opens the indole ring, incorporates molecular oxygen, and forms N-formyl kynurenine.
- **Hydrolytic removal of the formyl group of N-formylkynurenine, catalyzed by kynurenine formylase, produces kynurenine.**
- Since kynureninase requires pyridoxal phosphate, excretion of xanthurenate in response to a tryptophan load is diagnostic of vitamin B₆ deficiency.
- Hartnup disease reflects impaired intestinal and renal transport of tryptophan and other neutral amino acids.

145. Ans. (d) Aspartate

Ref: Harper's Biochemistry, 30th ed. pg. 294-95

UREA CYCLE

- Urea Is the Major End Product of Nitrogen Catabolism in Humans
- Some reactions of urea synthesis occur in the matrix of the mitochondrion, other reactions in the cytosol
- *Synthesis of 1 mol of urea requires 3 mol of ATP plus 1 mol each of ammonium ion and of the amino nitrogen of aspartate.*

STEPS OF UREA METABOLISM

Step -1: Site: Mitochondria

- Carbamoyl Phosphate Synthase I Initiates Urea Biosynthesis
- Condensation of CO₂, ammonia, and ATP to form carbamoyl phosphate is catalyzed by mitochondrial carbamoyl phosphate synthase I.

FMGE Solutions Screening Examination

- Carbamoyl phosphate synthase I, the rate-limiting enzyme of the urea cycle, is active only in the presence of its allosteric activator N-acetylglutamate
- *The step requires 2 ATPs*

Step - 2: Site: Mitochondria

- Carbamoyl Phosphate Plus Ornithine Forms Citrulline
 - L-Ornithine transcarbamoylase catalyzes the reaction
- Next 3 steps take place in cytosol

Step -3 : Site : Cytosol

- Citrulline plus Aspartate forms Argininosuccinate
- Argininosuccinate synthase links aspartate and Citrulline via the amino group of aspartate and provides the second nitrogen of urea. The reaction requires ATP.

Step: 4 : Site : Cytosol

- Cleavage of Argininosuccinate Forms Arginine & Fumarate catalyzed by argininosuccinase.

Step: 5 : Site : Cytosol

- Cleavage of Arginine Releases Urea & Re-Forms Ornithine
- Hydrolytic cleavage of the guanidino group of arginine, catalyzed by liver arginase, releases urea
- The other product, ornithine, reenters liver mitochondria for additional rounds of urea synthesis.

146. Ans. (a) Cleavage of Arginine

Ref: Harper's Biochemistry, 30th ed. pg. 299-300

Please refer to above explanation.

147. Ans. (b) Ornithine

- Polyamines like spermine, spermidine and putrescine metabolite are produced from L-ornithine by action of ODC (ornithine decarboxylase).
- S-Adenosylmethionine, the methyl group donor for many biosynthetic processes, also participates directly in spermine and spermidine biosynthesis.

148. Ans. (d) Made of cystine and methionine

Ref: Harper's Biochemistry, 30th ed. pg. 299-300, 295

SELENOCYSTEINE

- Considered to be the 21st proteinogenic amino acid. It exists naturally in all kingdoms of life as a building block of selenoproteins.
- It is utilized only when required for protein functions.
- **Selenocysteine is present in several enzymes** for example:
 - **Gutathione peroxidases**
 - Tetraiodothyronine 5' deiodinases
 - Thioredoxin reductases and
 - Some hydrogenases

- Selenocysteine is not coded directly in the genetic code. Instead, **it is encoded in a special way by a UGA codon**, which is normally a stop codon. Such a mechanism is called translational receding and its efficiency depends on the seleno-protein being synthesized and on translation initiation factors.

- The UGA codon is made to encode Selenocysteine by the presence of a SECIS Element (Seleno-Cysteine Insertion Sequence) in the mRNA.

Extra Mile

- **Pyrrolysine is 22nd amino acid.**

149. Ans. (d) Cysteine

Ref: Harper's Biochemistry, 30th ed. pg. 301

- *The clinical disease is due to the accumulation of cysteine which forms stones.*
- **MC inborn error of AA transport**

Causes of Cysteinuria:

- Due to the defective transport in the proximal and jejunal transport of dibasic amino acids such as cysteine, lysine, arginine and ornithine.
- **Cystinuria** (cystin-lysin-uria)- kidney is not able to reabsorb mainly 4 AA- cystine, ornithine, lysine, arginine (COLA)- excess amount excreted in urine.

Extra Mile

- **Cystinosis-** (cystine storage disorder)- cystine accumulates in the lysosome in many tissue and there is generalized **aminoaciduria**.

150. Ans. (a) Cysteine

Ref: Harper's Biochemistry, 30th ed. pg. 301

151. Ans. (a) L-arginine

Ref: Harper's Biochemistry, 30th ed. pg. 314, 660-61, 26th pg. 269

- Nitric oxide, known as the *endothelium-derived relaxing factor* is biosynthesized endogenously from L-arginine, oxygen and NADPH by various nitric oxide synthase (NOS) enzymes. Reduction of inorganic nitrate may also serve to make nitric oxide.
- The endothelium of blood vessels uses nitric oxide to signal the surrounding smooth muscle to relax, thus resulting in vasodilation and increasing blood flow.

152. Ans. (c) Arginine

Ref: Harper's Biochemistry, 30th edn. pg. 314, 660-61

153. Ans. (c) **Lysine & methionine**

Ref: Harper's Biochemistry, 30th edn. pg. 223-24

- **Carnitine** is a quaternary ammonium compound biosynthesized from the amino acid lysine and methionine.
- It is required for the transport of fatty acids from the intermembrane space in the mitochondria, into the mitochondrial matrix during the breakdown of lipids for the generation of metabolic energy.

154. Ans. (a) **Dihydrouracil**

Ref: Harper's Biochemistry, 30th edn. pg. 318

- β -alanine is formed in vivo by the **degradation of dihydrouracil and carnosine**.
- β -Alanine is not used in the biosynthesis of any major proteins or enzymes. However, It is a component of the naturally occurring peptides carnosine and anserine and also of pantothenic acid (vitamin B₅), which itself is a component of coenzyme A. Under normal conditions, β -alanine is metabolized into acetic acid.
- β -Alanine is the rate-limiting precursor of carnosine, i.e. carnosine levels are limited by the amount of available β -alanine.

155. Ans. (d) **N-Acetyl Glucosamine**

Ref: Harper's Biochemistry, 30th edn. pg. 157-58

- Chitin is a long-chain polymer of N-acetyl-glucosamine, a derivative of glucose. Chitin's properties as a flexible and strong material make it favorable as a surgical thread. Its bio-degradability means it wears away with time as the wound heals. Moreover, chitin has been reported to have some unusual properties that accelerate healing of wounds in humans.

156. Ans. (b) **Glycine**

Ref: Harper's Biochemistry, 30th ed. pg. 326-28

- Heme is synthesized in a complex series of steps involving enzymes in the mitochondrion and in the cytosol of the cell
- The first step in heme synthesis takes place in the mitochondrion. Steps in heme synthesis are:
 - **Condensation of succinyl CoA and glycine by ALA synthase to form 5-aminolevulinic acid (ALA).**
 - 5 ALA is transported to the cytosol where a series of reactions produce a ring structure called coproporphyrinogen III. This molecule returns to the mitochondrion where an addition reaction produces protoporphyrin IX.
 - The enzyme ferrochelatase inserts iron into the ring structure of protoporphyrin IX to produce heme.

157. Ans. (c) **Tryptophan**

Ref: Harper's Biochemistry, 30th ed. pg. 308, 557; Harrison's, 19th ed. pg. 435e-2

- Hartnup disease is an **autosomal recessive** disorder caused by impaired neutral amino acid transport in the apical brush border membrane of the small intestine and the proximal tubule of the kidney.
- Patients of hartnup disease present with pellagra like skin eruptions, cerebellar ataxia, and gross aminoaciduria.
- Amino acids which are retained within the intestinal lumen due to impaired transport, are converted by bacteria to indolic compounds that can be toxic to the CNS. Amino acid like **Tryptophan is converted to indole in the intestine**.
- Following absorption, indole is converted to 3-hydroxyindole (i.e. indoxyl, indican) in the liver, where it is conjugated with potassium sulfate or glucuronic acid. Subsequently, it is transported to the kidneys for excretion (i.e. indicanuria).
- Other tryptophan degradation products which are excreted in urine are: kynurenine and serotonin.
- In these patients Tubular renal transport is also defective, contributing to gross aminoaciduria.

158. Ans. (b) **Lignin**

- Gut flora's primary benefit to the host is the gleaning of energy from the fermentation of undigested carbohydrates and the subsequent absorption of short chain fatty acids. *They can even digest even products like cellulose, pectin and starch.*
- **The most important of these are:** Butyrates, metabolised by the colonic epithelium; propionates by the liver; and acetates by the muscle tissue.
- Intestinal bacteria also play a role in synthesizing vitamin B and vitamin K as well as metabolising bile acids, sterols and xenobiotics.
- *The human body carries about 100 trillion microorganisms in its intestines, a number ten times greater than the total number of human cells in the body*
- Lignin or lignen is a complex polymer of aromatic alcohols known as monolignols. It is most commonly derived from wood, and is an integral part of the secondary cell walls of plants.

159. Ans. (b) **Histidine**

Ref: Harper's Biochemistry, 30th ed. pg. 340-42

- N1 of purine is derived from amino group of aspartate
- N3 & N9 are obtained from amide group of glutamine
- C4, C5, & N7 of the purine ring of nucleotides are contributed by glycine.

160. Ans. (b) **Glycine**

Ref: Harper's Biochemistry 30th ed. pg. 325-27; 26th / 264

- **Glycine** is required for the biosynthesis of **heme**, **purines** and **creatine** and is conjugated to **bile acids**.
- **Serine** is required for the **phospholipid** and **sphingosine** synthesis apart from **purines** and **thymine**.
- **S-Adenosyl methionine** (the methyl group donor) for many biosynthetic processes, also participates directly in **spermine** and **spermidine** synthesis.

161. Ans. (d) **All of the above**

Ref: Harper's Biochemistry 30th ed. pg. 22-23, 748

- **Glutathione (GSH)** is a tripeptide with a gamma peptide linkage between the amine group of cysteine (which is attached by normal peptide linkage to a glycine) and the carboxyl group of the glutamateside-chain.
- It is an antioxidant, preventing damage to important cellular components caused by reactive oxygen species such as free radicals and peroxides.

162. Ans. (a) **Proline to hydroxyproline**

Ref: Harper's Biochemistry, 30th ed. pg. 47, 562

- **Ascorbic acid** is needed for a variety of biosynthetic pathways, by accelerating hydroxylation and amidation reactions.
- In the synthesis of collagen, ascorbic acid is required as a cofactor for following enzymes:
 - Prolyl hydroxylase
 - Lysyl hydroxylase
- **These two enzymes are responsible for the hydroxylation of the proline and lysine amino acids in collagen.**
- **Remember**, Hydroxyproline and hydroxylysine are important for stabilizing collagen by cross-linking the propeptides in collagen.
- Clinical effects if there is defective collagen fibrillogenesis:
 - Impaired wound healing.
 - Impaired bone formation
 - Abnormal bleeding due to fragile capillaries.

163. Ans. (b) **Proline**

Ref: Harper's Biochemistry, 30th ed. pg. 141, 298-99

- **Proline** is the amino acid which changes the conformation of the alpha helix in collagen due to the nature of proline having a cyclical structure. It also forms the ends of the beta sheets in the secondary structures.

164. Ans. (a) **Pyridoxal phosphate**

- Transamination involves reversible transfer of alpha amino group of alpha amino acid to an alpha-keto-acid to form a new amino acid and a new keto-acid.
- Enzyme catalyze this reaction is called transaminase (aminotransferase)
- All transaminase require **pyridoxal phosphate (Vit B6)** as a coenzyme
- **Example of transaminase are:**
 - Alanine transferase (ALT)
 - Aspartate transaminase (AST)
- Transamination reactions are **reversible**
- Transamination reactions occur **via ping pong mechanism** in which the 1st substrate bound and its product is released prior to binding of second substrate.
- Most amino acid undergo transamination **except lysine, theonine, proline, and hydroxyproline**

VITAMINS, MINERALS AND ENZYMES165. Ans. (b) **Copper**

Ref: Harrison's 20th ed. P 2318

Menkes Kinky Hair Syndrome

- X-Linked metabolic disturbance of copper metabolism
- Characterized by:
 - Mental retardation
 - Hypocupremia
 - Decreased circulating ceruloplasmin
- Due to mutation in **ATP7-A gene** (copper transporting gene)
- **Cause of death:** Dissecting aneurysm or cardiac rupture (usually <5 years of age)

Extra Mile

- **Wilson's disease:** Copper accumulation in liver, brain; due to mutation in ATP7-B gene.
- **Acrodermatitis enteropathica:** AR condition. Due to zinc deficiency
- **Chromium** potentiates the action of insulin and improves lipid profile
- **Keshan disease:** Endemic cardiomyopathy, due to dietary deficiency of selenium
- **Kashin-Beck disease/Selenosis:** Chronic ingestion of large amount of selenium. Characterized by hair loss and nail brittleness, garlic breath odor, rash, myopathy etc.

166. Ans. (b) **Cell membrane**

Ref: Lippincott's Biochemistry 6th ed. P 151-152

- **G6PD** enzyme is located at the cell membrane. RBC membrane is one such example, and is associated with severe pathology

- Location: X chromosome at q28 locus. (G6PD enzyme is X-linked gene)
- It protects the RBC from the deleterious effects of oxidizing agents by reducing themselves to NADPH.
- In deficiency of G6PD enzyme → impaired ability of RBC to form NADPH → Hemolysis

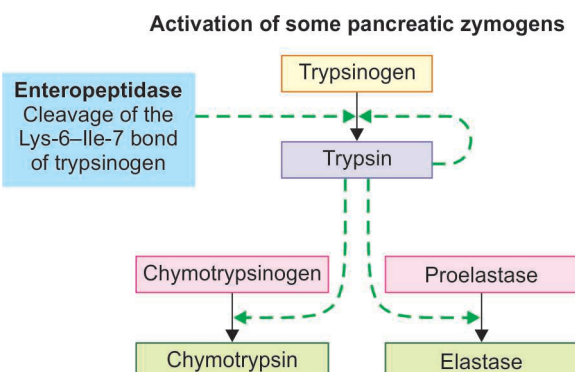

167. Ans. (c) **X-Linked**

Ref: Lippincott's Biochemistry 6th ed. P 151-152

- G6PD deficiency is most common disease producing enzyme abnormality in humans
- It is a X-linked disorder

168. Ans. (b) **Enteropeptidase**

- The pancreatic enzyme trypsinogen is activated to form trypsin with the help of enzyme enteropeptidase/enterokinase.

169. Ans. (c) **It rescues proteins that have folded improperly and...**

Ref: Harper's Biochemistry, 30th ed. pg. 618-20, 26th ed. P 36-37

- **Over half of mammalian protein folding is done by Chaperone proteins.**
- Chaperones prevent aggregation, thus providing an opportunity for the formation of appropriate secondary structural elements.
- **There are 2 families of hsp:** hsp 60 and hsp 70.
- The hsp 60 family of chaperones, sometimes called chaperonins, differ in sequence and structure from hsp 70 and its homologs.
- The HSP 70 (70-kDa heat shock protein) **family of chaperones binds short sequences of hydrophobic amino acids in newly synthesized polypeptides, shielding them from solvent.**
- **Chaperone proteins can also “rescue” proteins** that have become thermodynamically trapped in a misfolded dead end. They rescue it **by unfolding hydrophobic**

regions and providing a second chance to fold productively.

Extra Mile

- Chaperones for eukaryotes: Hsp 70
- Force favourable for protein folding: Hydrophobic interaction

170. Ans. (b) **Chemical antagonism**

Ref: Vasudevan Biochemistry, 8th ed. P 321

- **Chemical:** A type of antagonism where a drug counters the effect of another by simple chemical reaction/neutralization (not binding to the receptor).
- **Physiological:** Two drugs act on two different types of receptor and antagonize action of each other.
- **Competitive:** Both drugs bind to same receptor.

171. Ans. (b) **Vitamin C**

Ref: Vasudevan Biochemistry, 8th ed. P 481

TABLE: The vitamins

Vitamin		Functions
A	Retinol, β -carotene	Visual pigments in the retina; regulation of gene expression and cell differentiation; β -carotene is an antioxidant
D	Calciferol	Maintenance of calcium balance; enhances intestinal absorption of Ca^{2+} and mobilizes bone mineral
E	Tocopherols, tocotrienols	Antioxidant, especially in cell membranes
K	Phylloquinone, menaquinones	Coenzyme in formation of γ -carboxyglutamate in enzymes of blood clotting and bone matrix
B ₁	Thiamine	Coenzyme in pyruvate and α -ketoglutarate, dehydrogenases, and transketolase; poorly defined function in nerve conduction
B ₂	Riboflavin	Coenzyme in oxidation and reduction reactions; prosthetic group of flavoproteins
Niacin	Nicotinic acid, nicotinamide	Coenzyme in oxidation and reduction reactions, functional part of NAD and NADP
B ₆	Pyridoxine, pyridoxal, pyridoxamine	Coenzyme in transamination and decarboxylation of amino acids and glycogen phosphorylase; role in steroid hormone action
	Folic acid	Coenzyme in transfer of one-carbon fragments
B ₁₂	Cobalamin	Coenzyme in transfer of one-carbon fragments and metabolism of folic acid
	Pantothenic acid	Functional part of CoA and acyl carrier protein; fatty acid synthesis and metabolism

Contd...

Vitamin		Functions
H	Biotin	Coenzyme in carboxylation reactions in gluconeogenesis and fatty acid synthesis
C	Ascorbic acid	Coenzyme in hydroxylation of proline and lysine in collagen synthesis; antioxidant; enhances absorption of iron

172. Ans. (c) **ATP**

Ref: Vasudevan Biochemistry, 8/e. P 531

- Cyclic AMP (cAMP) is formed from cytosolic ATP by **adenylyl cyclase**, an enzyme that is anchored in the plasma membrane
- The enzyme is inactive until bound to activated G_s ; (by receptor-ligand stimulated acquisition of GTP and release (from $G_{s_{\beta\gamma}}$)
- G_i inhibits adenylyl cyclase

173. Ans. (c) **Vitamin E**

Ref: Harper's Biochemistry, 30th ed. pg. 553, 564

- Vitamin E has many biological functions, the antioxidant function being the most important and/or best known.
- Other functions include:
 - Enzymatic activities
 - Gene expression
 - Neurological function and
 - Cell signalling

- As an antioxidant, **vitamin E acts as a peroxyl radical scavenger**, preventing the propagation of free radicals in tissues.
- It does so by reacting with ROS to form a tocopheryl radical, which will then be reduced by a hydrogen donor (such as vitamin C) to its reduced state. As it is fat-soluble, it is incorporated into cell membranes, which protects them from oxidative damage.

174. Ans. (c) **Keshan disease**

- **Keshan disease** is an endemic cardiomyopathy found in children and young women of Chinese regions due to dietary deficiency of selenium.
- **Kashin beek disease:** Occurs due to selenium toxicity/selenosis. It is characterized by hair loss, brittle nail, garlic breath odor, rashes, myopathy and nervous system abnormality.

175. Ans. (b) **Exist in three forms**

TABLE: Forms of VITAMIN K

	Vitamin K1	Vitamin K2	Vitamin K3
Also known as	Phylloquinone	Menaquinone	Menadione
Source	Several green vegetables and prepared synthetically	Synthesized by GI bacteria, supplies 50% human requirement	Synthetic, Analog of 1,4-naphthoquinone
Solubility	Fat soluble	Fat soluble	Diphosphate salt is Water soluble

176. Ans. (a) **Oxidase-Reductase**

Oxidoreductase enzyme groups can be remembered by mnemonic **DOOP**

- Dehydrogenases
- Oxidases
- Oxygenases
- Peroxidases

177. Ans. (a) **Chromium**

Ref: Harrison's, 19th ed. pg. 96e-9

- A deficiency of chromium can cause impaired glucose tolerance.
- Physiologically, chromium potentiates the action of insulin in patients with impaired glucose tolerance, presumably by increasing insulin receptor-mediated signalling.
- Rich food sources of chromium include yeast, meat, and grain products.

- **Note:**
 - **Deficiency of Selenium:** Can cause cardiomyopathy (Keshan disease)
 - **Selenium toxicity:** Can cause selenosis (Kashinbeck disease)

178. Ans. (d) **Zinc**

TABLE: Important minerals and their respective action as cofactor

Minerals	Function
Selenium	<ul style="list-style-type: none"> • Cofactor for <ul style="list-style-type: none"> ▪ Glutathione peroxidase ▪ Deiodinase ▪ Thioredoxin reductase
Manganese	<ul style="list-style-type: none"> • Cofactor for: <ul style="list-style-type: none"> ▪ Arginase ▪ Kinase ▪ Carboxylase ▪ Glucosyl transferase ▪ Enolase
Zinc	<ul style="list-style-type: none"> • Cofactor for: <ul style="list-style-type: none"> ▪ Carbonic anhydrase ▪ Alcohol dehydrogenase ▪ Lactate dehydrogenase ▪ Carboxypeptidase

179. Ans. (a) K_m increased, V_{max} same

Type of Inhibition	K_m	V_{max}
Competitive inhibition	INCREASED	SAME
Non-competitive inhibition	Same	DECREASED

Competitive Inhibition: Substrate and inhibitor, both compete for same site on enzyme.

Non-competitive Inhibition: Substrate and inhibitor both bind at different sites in the enzyme.

180. Ans. (c) **Methionine synthase**

Ref: Harper's Biochemistry, 30th ed. pg. 558

CONVERSION OF HOMOCYSTEINE TO METHIONINE

- Active form in this reaction is methylcobalamin. This reaction requires both methylcobalamin and folic acid. The reaction is catalyzed by methionine synthase which is a methylcobalamin dependent reaction.

181. Ans. (b) **Consist of flavin group which is required in oxidation-reduction reaction**

Ref: Harper's Biochemistry, 30th ed. pg. 556

RIBOFLAVIN is vitamin B₂ which contains isoalloxazine ring. It gives yellow color, therefore used to fortify some foods.

- **It consists of flavin group which is required in oxidation-reduction reactions.**
- **Source:** Meat products, liver, egg, whole grain, vegetables
 - Green leafy vegetables are major sources of folic acid (B9)
- **Deficiency causes:** Angular stomatitis, cheilosis, dermatitis, Glossitis, geographic tongue Lesion on mouth and genitalia.

Lets summarize the other names of Vitamin B complexes:

TABLE: Vitamin B, their other names and disease entities due to deficiency

Vitamin	Other name	Deficiency causes
Vit B1	Thiamine	Beri Beri, Wernicke's encephalopathy
Vit B2	Riboflavin	Angular stomatitis, cheilosis, dermatitis, Glossitis
Vit B3	Niacin	Pellagra (4D's- Dementia, Diarrhea, Dermatitis, Death)
Vit B5	Pantothenic acid	Burning foot syndrome, Liener disease
Vit B6	Pyridoxine	Peripheral neuropathy, Sideroblastic anemia, Pellagra, Homocystinuria, Hartnup disease
Vit B7	Biotin	Multiple carboxylase deficiency
Vit B9	Folic acid	Megaloblastic anemia, Neural tube defect
Vit B12	Cyano-cobalamin	Megaloblastic anemia, subacute combined degeneration (SACD)

182. Ans. (c) **Biotin**

Ref: Harper's Biochemistry, 30th ed. pg. 560-61

- Acetyl-CoA carboxylase is a biotin-dependent enzyme that catalyzes the irreversible carboxylation of acetyl-CoA to produce malonyl-CoA through its two catalytic activities, biotin carboxylase and carboxyl transferase

183. Ans. (b) **Folic Acid**

Ref: Harper's Biochemistry, 30th ed. pg. 299, 559-560, 26th ed. pg. 494

184. Ans. (b) **Deficiency of tryptophan**

Ref: Harper's Biochemistry 30th ed. pg. 546, 557, 29th ed. pg. 540

- Pellagra is seen due to deficiency of niacin (vitamin B3) aka nicotinic acid.
- **Nicotinic acid can be formed in the body from tryptophan.** 60 mg of tryptophan forms 1 mg of niacin. Henceforth, deficiency of tryptophan causes deficiency of niacin leading to pellagra.

Extra Mile

- **Deficiency of thiamine causes:** Beri-Beri, Wernicke's encephalopathy, Lactic acidosis
- **Deficiency of Vitamin B12 causes:** Pernicious anemia, Megaloblastic anemia, SCID, methymalonic aciduria.
- **Deficiency of vitamin B9/Folic acid:** Megaloblastic anemia, NTD.

185. Ans. (a) **Vitamin K**

Ref: Harper's Biochemistry, 30th ed. pg. 554

- Menadione is the water soluble form of vitamin K.

TABLE: Forms of VITAMIN K

	Vitamin K1	Vitamin K2	Vitamin K3
Aka	Phylloquinone	Menaquinone	Menadione
Source	Several green vegetables and prepared synthetically	Synthesized by GI bacteria, supplies 50% human requirement	Synthetic, Analog of 1,4-naphthoquinone
Solubility	Fat soluble	Fat soluble	Diphosphate salt is Water soluble

- Vitamin K Is the Coenzyme for Carboxylation of Glutamate in Postsynthetic Modification of Calcium Binding Proteins. Vitamin K Is Also Important in Synthesis of Bone Calcium Binding Proteins.
- **Dicumarol is an anticoagulant that functions as a vitamin K antagonist.**

186. Ans. (c) **Menadione**

Ref: Harper's Biochemistry, 30th ed. pg. 554

Please refer to above table

187. Ans. (c) **Menadione**

Ref: Harper's Biochemistry, 30th ed. pg. 554

188. Ans. (d) **Vitamin K**

Ref: Harper's Biochemistry, 30th ed. pg. 554-555

- Anti-oxidants are vitamin A, C and vitamin E (ACE). *Most important of all is vitamin E.*
- Free-radicals are formed from exposure to sunlight and pollution and also as a byproduct of cell metabolism.
- Alcohol, cigarette smoke, stress and even diet also affect the level of free-radical development in the body. Excellent antioxidants include Vitamin A, Vitamin E, Vitamin C, zinc, selenium, ginkgo biloba, grape seed extract, and green tea extract.

189. Ans. (a) **Vitamin K**

Ref: Harper's Biochemistry, 30th ed. pg. 5341-42, 554, 26th ed. pg. 481

Apart from **dietary inadequacy**, conditions affecting the digestion and absorption of the lipid-soluble vitamins (vitamins A, D, E and K) such as **steatorrhea and disorders of the biliary system**, all can lead to deficiency syndromes, including: night blindness and xerophthalmia (vitamin A); rickets in young children and osteomalacia in adults (vitamin D); neurologic disorders and anemia of the newborn (vitamin E); and hemorrhage of the newborn (vitamin K).

Vitamin K is also important in the synthesis of bone calcium-binding proteins like osteocalcin and bone matrix Gla protein. In fact, the release into the circulation of **osteocalcin provides an index of vitamin D status.**

190. Ans. (b) **Vitamin C**

Ref: K. Park, 23rd ed. pg. 630

- **Eggs has all the nutrients except vitamin C and carbohydrate.**
- Eggs are also a source of folate, biotin, pantothenic acid, choline, phosphorus, iodine and selenium in terms of minerals and vitamins.
- **Egg contains Avidin, which interferes with biotin absorption.**

191. Ans. (b) **Zinc deficiency**

Ref: Harrison's, 19th ed. pg. 96e-9

- Zinc is an essential trace nutrient required for the proper function of more than 100 enzymes and plays a crucial role in nucleic acid metabolism.
- Acrodermatitis enteropathica is an **autosomal recessive** disorder postulated to occur as a result of mutations in the **SLC39A4 gene** located on band 8q24.3.

- This protein is highly expressed in the **enterocytes in the duodenum and jejunum**. Therefore, affected individuals have a decreased ability to absorb zinc from dietary sources. Absence of a binding ligand needed to transport zinc may further contribute to zinc malabsorption.
- **Clinical manifestations include** diarrhea, alopecia, muscle wasting, depression, irritability, and a rash involving the extremities, face, and perineum. The rash is characterized by vesicular and pustular crusting with scaling and erythema.
- Features of acrodermatitis enteropathica **start appearing in the first few months of life**, if mother discontinues breast milk.

TABLE: Deficiency and toxicity of several metals

Element	Deficiency	Toxicity
Boron	No biologic function determined	Developmental defects, male sterility, testicular atrophy
Calcium	Reduced bone mass, osteoporosis	Renal insufficiency (milk-alkali syndrome) ^a nephrolithiasis, impaired iron absorption, thiazide diuretics.
Copper	Anemia, growth retardation, defective keratinization and pigmentation of hair, hypothermia, degenerative changes in aortic elastin ^a , osteopenia, mental deterioration.	Nausea, vomiting, diarrhea, hepatic failure, tremor, mental deterioration, hemolytic anemia, renal dysfunction
Chromium	Impaired glucose tolerance ^a	<i>Occupational</i> ; Renal failure, dermatitis, pulmonary cancer
Fluoride	↑Dental caries ^a	Dental and skeletal fluorosis ^a , osteosclerosis
Iodine	Thyroid enlargement, ↓T ₄ cretinism	Thyroid dysfunction, acne-like eruptions ^a .
Iron	Muscle abnormalities, koilonychia, pica anemia, ↓work performance, impaired cognitive development, premature labor, ↑perinatal maternal death	Gastrointestinal effects, (nausea, vomiting, diarrhea, constipation), iron overload with organ damage, acute and chronic systemic toxicity, increased susceptibility to malaria, increased risk association with certain chronic diseases (e.g. diabetes)
Manganese	Impaired growth and skeletal development reproduction, lipid and carbohydrate metabolism, upper body rash	<i>General</i> : Neurotoxicity, Parkinson-like symptoms ^a <i>Occupational</i> : Encephalitis like syndrome, Parkinson like syndrome, psychosis, pneumoconiosis.
Molybdenum	Severe neurologic abnormalities	Reproductive and fetal abnormalities
Selenium	Cardiomyopathy, heart failure, striated muscle degeneration	<i>General</i> : Alopecia, nausea, vomiting, abnormal nails, emotional
Phosphorus	Rickets (osteomalacia) proximal muscle weakness, rhabdomyolysis, paresthesia, ataxia, seizure confusion, heart failure, hemolysis acidosis.	Hyperphosphatemia
Zinc	Growth retardation, ↓taste and smell alopecia, dermatitis, diarrhea, immune dysfunction, failure to thrive, gonadal atrophy, congenital malformations.	<i>General</i> : Reduced copper, absorption, gastritis, sweating fever, nausea, vomiting <i>Occupational</i> ; Respiratory distress, pulmonary fibrosis

192. Ans. (c) ADP-ribosylation of Gs alpha sub-unit

Ref: Harper's Biochemistry, 30th ed. pg. 250

Cholera Toxin Acts by the Following Mechanism

- The B subunit ring of the cholera toxin binds to GM1 gangliosides on the surface of target cells. Once bound, the entire toxin complex is endocytosed by the cell and the cholera toxin **A1 (CTA1) chain is released** and leads to ADP ribosylation of G_s subunit massive fluid efflux in GI lumen.
- *Cholera toxin ADP-ribosylates G proteins, causing ↑cAMP and massive fluid secretion from the lining of the small intestine, resulting in life-threatening diarrhea.*
- ADP-ribosylation is also responsible for the actions of some bacterial toxins, such as cholera toxin, diphtheria toxin, pertussis toxin, and heat-labile enterotoxin.

Extra Mile

- Active subunit of cholera toxin: A
- Binding subunit of cholera toxin: B

193. Ans. (c) 7.36-7.44

Ref: Harper's Biochemistry, 30th edn. pg. 10-13

Well I think this one is too simple for an explanation.
Also remember pH of urine=4.6-8.0

Extra Mile

- Values of pH going above 7.4 is alkalosis and value of pH going below 7.4 is acidosis
- pH of Aqueous Humor - 7.2

TABLE: Conditions arising due to low and high pH

Low pH	High pH
<ul style="list-style-type: none"> • Metabolic acidosis • Respiratory acidosis 	<ul style="list-style-type: none"> • Metabolic alkalosis • Respiratory alkalosis

194. Ans. (b) Net protein utilization

Ref: K.Park 23th ed.

- The **net protein utilization**, or NPU, is the ratio of amino acid converted to proteins to the ratio of amino acids supplied. This figure is somewhat affected by the salvage of essential amino acids within the body, but is profoundly affected by the level of limiting amino acids within a foodstuff.
- NPU can range from 1 to 0, with a value of 1 indicating 100% utilization of dietary nitrogen as protein and a value of 0 an indication that none of the nitrogen supplied was converted to protein. Certain foodstuffs, such as eggs or milk, rate as 1 on an NPU chart.

195. Ans. (a) Vitamin B₁₂

Ref: Harper's Biochemistry 30th ed. pg. 559

- Increased methyl malonic acid levels may indicate a vitamin B₁₂ deficiency. However, it is sensitive but not specific. MMA is elevated in 90-98% of patients with B₁₂ deficiency.
- The coenzyme A is linked form of methylmalonic acid. Methylmalonyl-CoA, is converted into succinyl-CoA by methylmalonyl-CoA mutase, in a reaction that requires vitamin B₁₂ as a cofactor.

- In this way, it enters the Krebs cycle, and is thus part of one of the anaplerotic reactions.

196. Ans. (d) Copper deposit

Ref: Harper's Biochemistry, 30th ed. pg. 496

- Wilson's disease is also associated with sunflower cataracts exhibited by brown or green pigmentation of the anterior and posterior lens capsule.
- For more details about the different types of cataract, please refer to ophthalmology section.

197. Ans. (b) Fibrillin

Ref: Harrison's, 19th ed.

- Fibrillin-1 is a major component of the microfibrils that form a sheath surrounding the amorphous elastin. It is believed that the microfibrils are composed of end-to-end polymers of fibrillin. To date, 3 forms of fibrillin have been described and mutations in the FBN1 gene cause Marfan's syndrome. This protein and its genes are found on chromosome 15.
- **Mutation in Fibrillin 1 gene (FBN 1) primarily affects: Skeletal system, Cardiovascular system and Eye.**

198. Ans. (b) Demethylation

Ref: Harper's Biochemistry, 30th ed. pg. 509-510

- Conversion of norepinephrine to epinephrine is **demethylation reaction**. It utilizes **phenylethanolamine-N-methyltransferase**.
- Epinephrine to norepinephrine conversion is called methylation.
- **Immediate precursor of tyrosine: Phenylalanine**

199. Ans. (c) PENMT

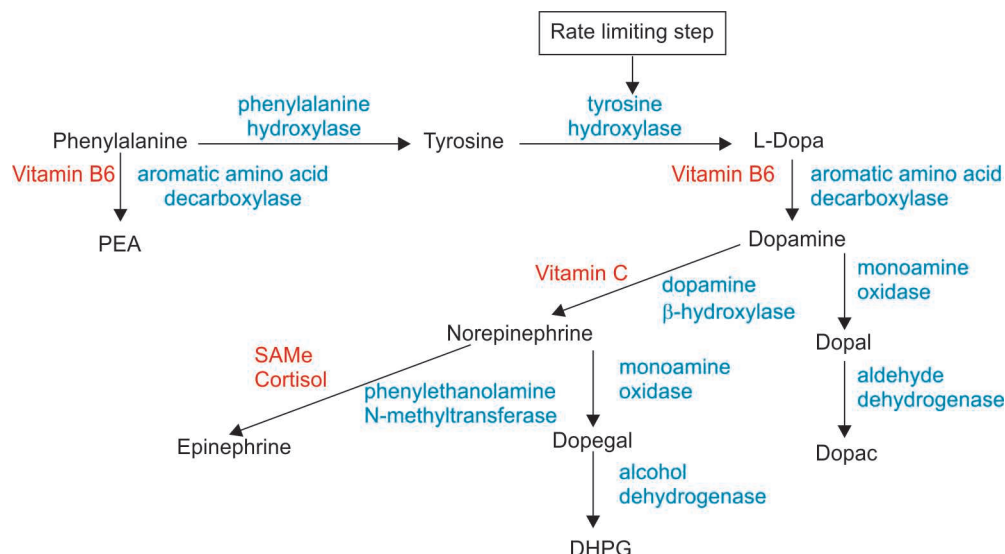

Ref: Harper's Biochemistry, 30th ed. pg. 509-510

- Phenylethanolamine N-methyltransferase (PENMT) is an enzyme found in the adrenal medulla that converts Norepinephrine (Noradrenaline) to Epinephrine (Adrenaline) cortex.
- S. Adenosyl -L- Methionine (SAM) is a required cofactor.

200. Ans. (c) **Phenylalanine hydroxylase**Ref: Harper's Biochemistry, 30th ed. pg. 509-510

221

Please refer to explanation fig.

- **Phenylalanine hydroxylase:** for conversion of Phenylalanine to tyrosine conversion
- **Tyrosine hydroxylase:** for conversion of tyrosine to L-Dopa
- **Phenylethanolamine-N-methyltransferase:** for conversion of norepinephrine to epinephrine

201. Ans. (b) **Phenylalanine**Ref: Harper's Biochemistry, 30th edn. pg. 509-10, 26th pg. 255, 446202. Ans. (a) **Dopamine hydroxylase**Ref: Harper's Biochemistry, 30th edn. pg. 561

- Those enzymes that require inorganic metal ions as their cofactor are termed as metalloenzymes aka cofactors.
- **Dopamine hydroxylase is a copper-containing enzyme involved in the synthesis of the catecholamines: Norepinephrine and Epinephrine from tyrosine in the adrenal medulla and central nervous system.**
- Ascorbic acid is also linked with copper containing hydroxylases such as peptidoglycine hydroxylase and dopamine hydroxylase. Dopamine decarboxylase requires pyridoxal phosphate for the conversion of L-dopa to 3,4-dihydroxyphenylethylamine.

TABLE: Metals and their Metalloenzymes

Metal	Metalloenzymes
Copper	Cytochrome oxidase, Lysyl oxidase, Dopamine Hydroxylase, ascorbic acid oxidase, Tyrosinase, Ferroxidase (Ceruloplasmin), Superoxide Dismutase
Magnesium	Hexokinase, PFK, Glucose-6-phosphatase, Kinases, Thermostable DNA polymerases , Enolase , Creatinine kinase

Contd...

Metal	Metalloenzymes
Selenium	Glutathione peroxidase
Molybdenum	Xanthine oxidase
Calcium	Lipase, Lecithinase
Iron	Cytochrome oxidase, Xanthine oxidase, Catalase, Peroxidase
Nickel	Urease

203. Ans. (a) **Lysyl oxidase**Ref: Harper's Biochemistry, 30th edn. pg. 628

- Lysyl oxidase is an extracellular copper enzyme that catalyzes formation of aldehydes from lysine residues in collagen and elastin precursors.

Please refer to above table

204. Ans. (b) **Xanthine Oxidase**Ref: Harper's Biochemistry, 30th edn. pg. 120205. Ans. (d) **Copper**Ref: Harper's Biochemistry, 30th edn. pg. 629-30

- Copper plays a role in collagen cross linking and is catalyzed by lysyl oxidase.

FMGE Solutions Screening Examination

222

- This enzyme utilizes copper as cupric ion.
- The genetic deficiency of lysyl oxidase is seen in Ehler danlos syndrome.

206. Ans. (b) Mg^{2+}

Ref: Harper's Biochemistry, 30th edn. pg. 458-59

- Magnesium is required as a co-factor for thermostable DNA polymerase, which is required for PCR.
- Taq polymerase is a magnesium-dependent enzyme and determining the optimum concentration to use is critical to the success of the PCR reaction.
- Some of the components of the reaction mixture such as template concentration, dNTPs and the presence of chelating agents (EDTA) or proteins can reduce the amount of free magnesium present thus reducing the activity of the enzyme.
- Primers which bind to incorrect template sites are stabilized in the presence of excessive magnesium

concentrations and so result in decreased specificity of the reaction.

- Excessive magnesium concentrations also stabilize double stranded DNA and prevent complete denaturation of the DNA during PCR reducing the product yield.

207. Ans. (c) Normal K_m , decrease V_{max}

Ref: Harper's Biochemistry, 30th edn. pg. 81-82

Type of Inhibition	K_m	V_{max}
Competitive inhibition	INCREASED	SAME
Non-Competitive inhibition	Same	DECREASED

Competitive Inhibition: Substrate and inhibitor Both compete for same site on enzyme.

Non-Competitive Inhibition: Substrate and Inhibitor both bind at different site in the enzyme.

208. Ans. (a) Glucokinase

- Glucokinase is an enzyme which phosphorylates the glucose to glucose 6 phosphate in the cells. It is a phosphorylase enzyme and not an oxidoreductase. Please see below Table.

TABLE: Enzymes according to their family

I	II	III	IV	V	VI
Oxidoreductases	Transferases	Hydrolases	Lyases	Isomerases	Ligases
<ul style="list-style-type: none"> • Dehydrogenases • Oxidases • Oxygenases • Peroxidases • Catalase 	<ul style="list-style-type: none"> • Amino transferase • Methyl-transferase • Phosphorylases • Kinases 	<ul style="list-style-type: none"> • Phosphatases • Phosphodiesterases • Proteases • Peptidase • Lipases • Nuclease, Nucleotidase, Nucleosidase 	<ul style="list-style-type: none"> • Carbonic anhydrase • Aldolase • Decarboxylases 	<ul style="list-style-type: none"> • RECEMASES • Epimerase • Mutases 	<ul style="list-style-type: none"> • Carboxylases • Synthetases • Synthase
Mn: DOOP-Cat	Mn: Amir Me & P-K	Mn: P4-LN	Mn: CAD	Mn: REM	

ANSWERS TO BOARD REVIEW QUESTIONS

209. Ans. (b) Zinc

Ref: Text of Biochemistry By G.P Talwar and LM Srivastava p 585, Shinde and Chatterjee 6th ed/-555

210. Ans. (a) 2 calories

Ref: Nutrition Now By Judith E. Brown p 4

211. Ans. (a) Glycogen

Ref: Guyton's 10th ed/1058

212. Ans. (c) Fructose

Ref: Harper's Biochemistry 27th ed Ch-22

213. Ans. (b) Glucokinase

Ref: Harper's 27th ed ch-18

214. Ans. (b) Increased K_m

Ref: Harper's Biochemistry 27th ed ch-8, Harper's Biochemistry 29th ed/76, 88, 85

215. Ans. (b) **Cytoplasm**

Ref: Harper's Biochemistry 27th ed ch-37

216. Ans. (b) **Glucose 6 Phosphatase**

Ref: Harper's Biochemistry 27th ed ch-19

217. Ans. (d) **Tryptophan**

Ref: Harper's Biochemistry 27th ed ch-29

218. Ans. (b) **Mitochondria**

Ref: Harper's Biochemistry 27th ed ch:22

219. Ans. (b) **Phase II reaction**

Ref: Harper's Biochemistry 27th ed ch:52

220. Ans. (a) **Sphingomyelinase**

Ref: Lehninger principles of Biochemistry 4th ed / 356

221. Ans. (a) **Kynurenine**

Ref: Harper's Biochemistry 27th ed ch:29

222. Ans. (d) **Aspartate**

Ref: Harper illustrated biochemistry 27th ed p 246-49

223. Ans. (a) **Cleavage of Arginine**

Ref: Previous question

224. Ans. (c) **Oligonucleotides**

Ref: Aptamers in Bioanalysis by M. Mascini / 230

225. Ans. (b) **Arachidonic acid**

Ref: Vasudevan's Biochemistry 6th ed / 77

226. Ans. (b) **5% iodine and 10% potassium iodide**

Ref: Pharmaceutical chemistry-I by Dr. A.V. Kastur p 9

227. Ans. (a) **L-arginine**

Ref: Guyton's physiology 22nd ed / 199

228. Ans. (b) **HMG CoA reductase**

Ref: Harper Biochemistry 29/e, / 251, 254

229. Ans. (d) **All of the above**

Ref: Harper's Biochemistry 28/e, chapter 26

230. Ans. (b) **OH-**

Ref: Textbook of medical biochemistry by Dinesh puri 3/e, /570, 717

231. Ans. (a) **Apo A1**

Ref: Harper's Biochemistry 28/e, chapter 25

232. Ans. (c) **Glutamate**

Ref: Harper's Biochemistry 28/e, chapter 30

233. Ans. (b) **Proline**

Ref: Harper's Biochemistry 28/e, chapter 28

234. Ans. (a) **Chaperones**

Ref: Harper's Biochemistry 28/e, ch. 45, Table 45-5, & Table 45-6

235. Ans. (d) **Protein folding**

Ref: Harper's 28/e, chapter 45, Table 45-5, Table 45-6

236. Ans. (b) **Golgi apparatus**

Ref: Grey's anatomy 39/e, chapter 2

237. Ans. (a) **Oxaloacetate**

Ref: Harper's Biochemistry 28/e, chapter 20

238. Ans. (b) **Triglycerides**

Ref: Harrison's 18/e, chapter 361

239. Ans. (d) **Complex IV**

Ref: Harper's Biochemistry 29/e, p 126, 127, 128

240. Ans. (d) **All of the above**

Ref: Lippincott 4/e, / 261

241. Ans. (b) **Zn**

Ref: Guyton 18/e, chapter 78, Cellular and molecular biology of metals by Rudolfs K. Zalups, D. James koropatnick / 196

242. Ans. (c) **Tryptophan**

Ref: Lippincott's 4/e, / 261

243. Ans. (d) **Niacin**

Ref: Harper's Biochemistry 28/e, chapter 44

244. Ans. (b) **Mitochondria**

Ref: Lippincott's 4/e, / 194, Harper's Biochemistry 28, chapter 22

245. Ans. (b) **Na⁺**

Ref: Ganong's 23/e, chapter 28

246. Ans. (d) **Liver and muscles**

Ref: Biochemistry M N Chatterjee 2/e, p 205, A manual of laboratory and diagnostic tests, p 429

247. Ans. (a) **High amount of leucine**

Ref: Harrison's 18/e, chapter 24, Textbook

248. Ans. (c) **Right handed anti parallel**

Ref: Lippincott's 4/e, chapter 29

249. Ans. (d) **mol/second**

Ref: Textbook of biochemistry for medical students by D.M. Vasudevan, Sreekumari S, Kannan Vaidyanantha 7/e, p 65, Biochemistry update by Reginald H. Gerrett, Charles M. Grishan 3/e, p 417

250. Ans. (b) **Halibut liver oil**

Ref: Harper's Biochemistry 27/e, chapter 44, Textbook of medical biochemistry S. Ramakrishnan 3/e, p 393

251. Ans. (b) **Alpha ketoglutarate dehydrogenase**

Ref: Harper's Biochemistry 28/e, ch-9, p 306

252. Ans. (d) **Malonate**

Ref: Harper's Biochemistry 28/e, p chapter 9, P 306

253. Ans. (c) **NADPH**

Ref: Harper's Biochemistry 27/e, Chapter 21

254. Ans. (b) **Nicotinic acid**

Ref: Harper's Biochemistry 27/e, Chapter 44

255. Ans. (b) **Muscle phosphorylase deficiency**

Ref: Harper's Biochemistry 29/e, p 181

256. Ans. (c) **Anaerobic glycolysis**

Ref: Harper's Biochemistry 27/e, Chapter 51

257. Ans. (a) **Arginine**

Ref: Protein reviews volume 4, Protein misfolding, aggregation and conformational diseases by Vladimir N. p 103

258. Ans. (a) **Hexosaminidase A**

259. Ans. (a) **Mitochondria to cytoplasm**

Ref: Harrison 17/e, Table 358-1

260. Ans. (c) **Aspartate**

261. Ans. (c) **Histidine**

Ref: Wintrobe's Haematology 12/e, Volume 1, p 141, Harper's 27/e, chapter 6

262. Ans. (b) **Uroporphyrinogen I synthase**

Ref: Harper's Biochemistry 26/e, p 271-275

263. Ans. (c) **Helicase**

Ref: Lippincott's biochemistry 3/e, p 400

264. Ans. (a) **Enolase**

Ref: Harper 27/e, chapter 18, Textbook of practical physiology-2/e, G.K. and Pal, Pal, Pravati p-9, Manual of basic techniques for a health laboratory by WHO p 69

265. Ans. (b) **Decarboxylation**

Ref: Goodman and Gillman 13th ed. P 712

- Histidine to histamine conversion is done by decarboxylation with the help of enzyme L-Histidine decarboxylase.

266. Ans. (a) **Vitamin E**

Ref: Harrison's 19th ed. P

- **Harrison's states:** "Vitamin E acts as a chain-breaking antioxidant and is an efficient peroxyl radical scavenger that protects low-density lipoproteins and polyunsaturated fats in membranes from oxidation"
- Vitamin E also inhibits prostaglandin synthesis and the activities of protein kinase C and phospholipase A2.
- **RDA of Vitamin E:** 15mg/day (22.5 IU)

267. Ans. (c) **Vitamin B₁₂**

Ref: Harrison's 19th ed. P 640

- Vitamin B₁₂ (Cobalamin) is synthesized solely by microorganisms.
- In humans, the only source for humans is food of animal origin, e.g., meat, fish, and dairy products.
- Vegetables, fruits, and other foods of nonanimal origin doesn't contain Vitamin B₁₂.
- Daily requirements of vitamin B₁₂ is about 1–3 µg. Body stores are of the order of 2–3 mg, sufficient for 3–4 years if supplies are completely cut off.

Pharmacology

MOST RECENT QUESTIONS 2019

1. Maximum parasympathetic outflow is by which cranial nerve?
 - a. V
 - b. VII
 - c. IX
 - d. X
2. 100% Bioavailability is seen with this route:
 - a. Oral
 - b. Intravenous
 - c. Intramuscular
 - d. Subcutaneous
3. Which among the following is shortest acting steroid?
 - a. Triamcinolone
 - b. Deflazacort
 - c. Dexamethasone
 - d. Hydrocortisone
4. Which of the following anti-epileptic drug has the highest teratogenic potential?
 - a. Valproate
 - b. Carbamazepine
 - c. Phenytoin
 - d. Lamotrigine
5. Healthy volunteers are recruited in which phase of clinical trials?
 - a. Phase 1
 - b. Phase 2
 - c. Phase 3
 - d. Phase 4
6. Long term use of which of the following drug is most likely associated with development of tremors?
 - a. Propofol
 - b. Salbutamol
 - c. Betaxolol
 - d. Timolol
7. Which of the following is a long acting bronchodilator?
 - a. Salbutamol
 - b. Terbutaline
 - c. Adrenaline
 - d. Formoterol
8. Drug of choice for neurogenic diabetes insipidus is:
 - a. Terlipressin
 - b. Desmopressin
 - c. Chlorthalidone
 - d. Conivaptan
9. Preferred drug for the treatment of ventricular tachycardia is
 - a. Digoxin
 - b. Diltiazem
 - c. Lignocaine
 - d. Propranolol
10. Drug of choice for chronic gout is
 - a. Allopurinol
 - b. Febuxostat
 - c. Probenecid
 - d. Sulfinpyrazone
11. A female with 20 weeks pregnancy presents with fever and dysuria. A preliminary diagnosis of cystitis was made. Which of the following drugs will be safe to use for this patient?
 - a. Ciprofloxacin
 - b. Gentamicin
 - c. Cotrimoxazole
 - d. Amoxicillin
12. Insulin of choice for the treatment of diabetes mellitus is:
 - a. Regular Insulin
 - b. NPH insulin
 - c. Insulin glargine
 - d. Insulin lispro
13. Which of the following is a long acting insulin that never attains a peak concentration in plasma?
 - a. Insulin lispro
 - b. Insulin aspart
 - c. Insulin glulisine
 - d. Insulin glargine
14. Praziquantel is used for the treatment of
 - a. Strongyloidiasis
 - b. Trichomoniasis
 - c. Schistosomiasis
 - d. Rhinosporidiosis
15. A young male presents with reduced sleep, hyperactivity and elevated mood. He has a family history of mania. Which of the following drug should be used for long term treatment of this patient?
 - a. Sodium valproate
 - b. Lithium carbonate
 - c. Carbamazepine
 - d. Barbiturates
16. Drug of choice for nasal carriers of MRSA is:
 - a. Vancomycin
 - b. Teicoplanin
 - c. Mupirocin
 - d. Linezolid
17. Anti-depressant drug which is used for smoking cessation is?
 - a. Venlafaxine
 - b. Topiramate
 - c. Bupropion
 - d. Amitriptyline
18. Drug of choice for treatment of Alzheimer's disease is:
 - a. Atropine
 - b. Donepezil
 - c. Physostigmine
 - d. Fluoxetine
19. Secretion of prolactin is inhibited by:
 - a. Dopamine
 - b. Nor-adrenaline
 - c. Adrenaline
 - d. Serotonin
20. Which of the following drug is a selective COX-2 inhibitor?
 - a. Ketorolac
 - b. Etoricoxib
 - c. Piroxicam
 - d. Nimesulide

**GENERAL PHARMACOLOGY**

21. Good practice is NOT needed in which phase of clinical trial: *(Recent Pattern Question 2018-19)*

- a. Preclinical stage b. Phase 2
- c. Phase 3 d. Phase 4

22. Drug not given with ketoconazole:

(Recent Pattern Question 2018)

- a. Aminoglycoside b. Macrolide
- c. Indinavir d. All of the above

23. Physiological antagonist of histamine is:

(Recent Pattern Question 2018)

- a. Adenosine b. Adrenaline
- c. Atropine d. Acetylcholine

24. In a first order kinetics Area under curve denotes:

(Recent Pattern Question 2018)

- a. Clearance b. Bioavailability
- c. Volume of distribution d. A and B both

25. Adverse drug reaction class B is?

(Recent Pattern Question 2017)

- a. Predictable side effect b. Bizarre effect of a drug
- c. Failure of a drug d. Chronic side effect

26. Which of the following is not an example of chronic adverse drug reactions?

- a. Nitrate induced headache
- b. Glucocorticoid induced osteoporosis
- c. Chloroquine induced retinopathy
- d. Amiodarone deposition in cornea

27. After oral administration the fraction of drug reaching the systemic circulation in unchanged form is:

(Recent Pattern Question 2017)

- a. Elimination b. Distribution
- c. Bioavailability d. Metabolism

28. Pharmacovigilance is:

- a. Monitoring generic drugs
- b. Monitoring drug efficacy
- c. Monitoring ethical drug
- d. Monitoring adverse effects of drugs

29. Pharmacovigilance is done for:

- a. Pharmacy companies
- b. To monitor potency and efficacy
- c. To monitor adverse effects of drugs
- d. Monitoring ethical drug

30. 100% bioavailability is seen with which route

- a. Oral b. Intravenous
- c. Rectal d. Subcutaneous

31. True about zero order kinetics:

- a. Rate of elimination is independent of plasma concentration
- b. Rate of elimination is dependent on plasma concentration
- c. Clearance of drug is always constant
- d. Half life of drug is constant

32. All drugs are metabolized by acetylation EXCEPT:

- a. Phenytoin b. Isoniazid
- c. Procainamide d. Hydralazine

33. Which of the following drug is metabolized by acetylation:

- a. Phenytoin b. Isoniazid
- c. Salbutamol d. Haloperidol

34. Which of the following G-proteins is a receptor for Photons:

- a. G_s b. G_i
- c. G_{t1} d. G_q

35. Glucagon acts via

- a. cAMP b. cGMP
- c. Cytoplasmic Ca^{+} d. Intracellular K^{+}

36. True about highly ionized drug:

- a. Can cross the placental barrier
- b. Well absorbed from intestine
- c. Accumulates in cellular lipids
- d. Excreted mainly by kidneys

37. Which of the following drug is an enzyme inducer:

- a. Rifampicin b. Isoniazid
- c. Ketokonazole d. Erythromycin

38. All are enzyme inhibitors EXCEPT:

- a. Carbamazepine b. Cimetidine
- c. Valproate d. Ketoconazole

39. Which is the best way to manage a patient present with aspirin poisoning:

- a. Make urine acidic with NH_4Cl
- b. Make urine alkaline with $NaHCO_3$
- c. Treat with N-acetyl cysteine
- d. Do gastric lavage

40. All of the following work on nuclear receptor EXCEPT:

- a. Glucocorticoids b. Vitamin A
- c. Vitamin D d. Thyroxine

41. All of the following work on nuclear receptors EXCEPT:

- a. Vitamin D b. Androgen
- c. Estrogen d. Vitamin A

42. Which of the following doesn't act via intracellular receptor:

- a. Leutenizing hormone b. Androgen
- c. Estrogen d. Vitamin A

43. Which of the following drug require therapeutic dose monitoring?

- a. Phenytoin b. Warfarin
- c. Metformin d. Propanolol

44. Duration of sub-acute toxicity study with animals:

- a. 3 months b. 6 months
- c. 1 year d. 1 ½ years

45. For knowing the acute toxicity of a drug, the drug micro doses should be tested on:

- a. Two different species b. On rabbit, one rodent
- c. Two rabbits d. Two rodents

46. Category X drugs are all EXCEPT:

- a. Warfarin b. Methotrexate
- c. Alprazolam d. Simvastatin

**47. Number of patients in Phase II clinical trial:**

- a. 10–100 b. 200–400
- c. 1000–2000 d. 2000–4000

48. Patients are first enrolled in this phase of clinical trial:

- a. Phase 0 b. Phase I
- c. Phase II d. Phase III

49. Pharmacoepidemiology is this phase of clinical trial:

- a. Phase 0 b. Phase II
- c. Phase IV d. Phase V

50. Which of the following is *not* a prodrug:

- a. Levodopa b. Lisinopril
- c. Carbimazole d. Prednisolone

51. All are prodrug EXCEPT:

- a. Aspirin b. Levodopa
- c. Dipivefrin d. Captopril

52. True statement about orphan drugs:

- a. Drugs used for orphans
- b. Drugs used for rare disease
- c. Easily available drugs
- d. Drugs with excessive financial benefits

53. What happens to drug after expiry date:

- a. Company is not responsible after expiry date
- b. Maximum expiry to 3 years from manufacture date
- c. Product changes to toxic products
- d. Decrease in efficacy

AUTONOMIC NERVOUS SYSTEM

54. Drug of choice for motion sickness:

(Recent Pattern Question 2018-19)

- a. Promethazine b. Ondansetron
- c. Cyclizine d. Domperidone

55. Mechanism of action of alpha Methyl-dopa:

(Recent Pattern Question 2018-19)

- a. Alpha 1 agonist b. Alpha 2 agonist
- c. Alpha 1 antagonist d. Alpha 2 antagonist

56. Which of the following is the action of Pilocarpine?

(Recent Pattern Question 2018-19)

- a. Active mydriatic b. Passive mydriatic
- c. Active miotic d. Passive miotic

57. Which of the following agents can cause recurrent fall in elderly patient with postural hypotension:

(Recent Pattern Question 2018-19)

- a. Methoxamine b. Prazosin
- c. Metformin d. Acarbose

58. Most sensitive test for organophosphate poisoning:

(Recent Pattern Question 2018-19)

- a. Plasma acetylcholinesterase
- b. OP level in blood
- c. OP level in urine
- d. OP level in lavage

59. In a 2-year-old child refractive error test is done with:

(Recent Pattern Question 2018-19)

- a. 1% atropine ointment b. 1% atropine eye drop
- c. Tropicamide 0.5% d. Eucatropine 5%

60. Ritodrine is a:

(Recent Pattern Question 2018)

- a. β_2 agonist b. β_2 antagonist
- c. α_1 agonist d. α_1 antagonist

61. Esmolol is a short acting beta blocker because:

(Recent Pattern Question 2018)

- a. It has more plasma protein binding
- b. Its plasma hydrolysis by esterases is rapid
- c. It has high lipid solubility
- d. It has high oral bioavailability

62. Correct about pralidoxime are all EXCEPT:

(Recent Pattern Question 2018)

- a. It is given slow IV
- b. Given effectively in carbamate poisoning
- c. It does not cross blood brain barrier
- d. Reactivates the AChE enzyme

63. Drug of choice for diabetic diarrhea:

(Recent Pattern Question 2018)

- a. Duloxetine b. Clonidine
- c. Domperidone d. Alosetron

64. Botulinum toxin acts on: (Recent Pattern Question 2017)

- a. Inhibition of release of neurotransmitter
- b. Post synaptic block
- c. At synapse
- d. Reuptake inhibitor

65. Botulinum toxin acts by:

- a. Postsynaptic acetylcholine receptor blocker
- b. Presynaptic inhibition of release of acetylcholine
- c. GABA mimetic
- d. GABA antagonist

66. Botulinum toxin decreases transmission across nerve terminals. It is an example of:

- a. Depolarizing blockade b. Competitive blockade
- c. Presynaptic blockade d. Postsynaptic blockade

67. A farmer presented in OPD clinic with sweating, lacrimation, pin-point pupils with a heart rate of 40/min. Possible diagnosis:

- a. Dhatura poisoning
- b. Organophosphate poisoning
- c. Atropine poisoning
- d. Cocaine poisoning

68. A 45 year male presents with delirium, increased body temperature, dryness, dilated pupils and HR 130/min. Possible diagnosis:

- a. Carbamate poisoning
- b. Organophosphate poisoning
- c. Atropine poisoning
- d. Cocaine poisoning

69. Anticholinergic side effect is:

- a. Salivation b. Dryness
- c. Increased GIT motility d. Sweating

**70. Neostigmine used in all EXCEPT:**

- a. Myasthenia Gravis b. Curare poisoning
- c. Snake bite d. OP poisoning

71. Action of M2 receptor is seen at?

- a. Sphincter dilatation *(Recent Pattern Question 2017)*
- b. Sympathetic nerve
- c. Parasympathetic nerve
- d. Tachycardia

72. Methacholine acts mainly as:

- a. M1 agonist b. M2 agonist
- c. 1 antagonist d. M2 antagonist

73. Tripitramine acts as:

- a. M1 agonist b. M2 agonist
- c. M1 antagonist d. M2 antagonist

74. Alpha bungarotoxin acts at:

- a. Muscarinic receptor agonist
- b. Muscarinic receptor antagonist
- c. Nicotinic ganglion agonist
- d. Neuromuscular junction

75. All of the following side effects are seen with ipratropium bromide, EXCEPT: *(Recent Pattern Question 2017)*

- a. Urinary incontinence b. Dryness of mouth
- c. Irritation in trachea d. Bad taste

76. Mechanism of action of aminophylline in bronchial asthma: *(Recent Pattern Question 2017)*

- a. Decreasing phosphodiesterase activity
- b. Direct action on smooth muscles
- c. Releasing catecholamines
- d. Stabilizing membrane of mast cells

77. Increased urinary frequency is best managed by

(Recent Pattern Question 2016)

- a. Oxybutynin b. Imipramine
- c. Alfuzosin d. Bethanechol

78. Which of the following drug is used in urinary retention: *(Recent Pattern Question 2016)*

- a. Bethanechol b. Finasteride
- c. Oxybutynin d. Letrozole

79. Which of the following sympathetic receptors acts as vasoconstriction and vasodilatation:

- a. Alpha 1 and Alpha 2 b. Alpha 1 and Beta 1
- c. Alpha 1 and Beta 2 d. Beta 1 and Beta 2

80. Bronchial calibre is reduced by:

(Recent Pattern Question 2016)

- a. Beta 2 receptor stimulation
- b. Stimulation of sympathetic fibre
- c. Stimulation of parasympathetic fiber
- d. Alpha 2 receptor stimulation

81. In contrast to epinephrine, norepinephrine does the following:

- a. Increase BP, bradycardia b. Increase BP, tachycardia
- c. Decrease BP, bradycardia d. Decrease BP, tachycardia

82. Dobutamine mainly act at this receptor:

- a. Beta 1 b. Beta 2
- c. Alpha 1 d. Alpha 2

83. Midodrine is used in:

- a. Hypertension b. Orthostatic hypotension
- c. Increasing cardiac output d. Decongestant

84. Tachyphylaxis is seen with:

- a. Dopamine b. Salbutamol
- c. Propranolol d. Haloperidol

85. Longest acting beta adrenergic blocker?

- a. Atenolol b. Sotalol
- c. Nadolol d. Esmolol

86. Which of the following drug does *not* produce hypotension during/followed by surgery?

- a. Esmolol b. Nadolol
- c. Propranolol d. Metoprolol

87. A hypertensive patient who is on beta blockers develops bradycardia and start to sweat whenever he takes the medication. Which beta blocker is *not* the probable cause of his condition:

- a. Atenolol b. Acebutalol
- c. Metoprolol d. Nadolol

88. All of the following beta blockers have intrinsic sympathomimetic activity EXCEPT:

- a. Celiprolol b. Propranolol
- c. Pindolol d. Acebutalol

89. β blocker with intrinsic sympathomimetic activity:

- a. Nadolol b. Atenolol
- c. Alprenolol d. Propranolol

90. Beta-adrenoceptor blocking agent that should be avoided in patients with renal failure is:

- a. Atenolol b. Metoprolol
- c. Propranolol d. Esmolol

91. Which of the following beta blocker is vasodilator:

- a. Metoprolol b. Atenolol
- c. Propranolol d. Carvedilol

92. Which of following is a non selective alpha blocker?

- a. Prazosin b. Tolazoline
- c. Terazosin d. Doxazosin

93. Drug with a first dose effect:

- a. Yohimbine b. Verapamil
- c. Dopamine d. Prazosin

94. Irreversible alpha-1 adrenoreceptor antagonist:

- a. Prazosin b. Clonidine
- c. Isoprenaline d. Phenoxybenzamine

95. All of the following drugs cause mydriasis EXCEPT:

- a. Pilocarpine b. Epinephrine
- c. Atropine d. Phenylephrine

96. All of the following drugs can cause mydriasis EXCEPT:

- a. Atropine b. Phenylephrine
- c. Phentolamine d. Cocaine

97. Shortest acting mydriatics:
 a. Atropine b. Homatropine
 c. Tropicamide d. Cyclopentolate
98. Treatment of choice for scorpion bite:
 a. Anti-venin b. Insulin
 c. Steroids d. Atropine
99. Which of the following drug is used for treating overactive bladder:
 a. Pirezepine b. Tolterodine
 c. Bethanechol d. Alfuzosin
100. Mechanism of action of Oxybutynin?
 a. Cholinergic
 b. Anticholinergic
 c. Adrenergic
 d. Selectively inhibits M2 receptor
101. Miotic agent used in glaucoma:
 a. Methacholine b. Pilocarpine
 c. Cevimeline d. Bethanechol

CNS AND PNS

102. Which of the following is an opioid receptor?
(Recent Pattern Question 2018-19)
 a. Epsilon b. Sigma
 c. Gamma d. Delta
103. A violent manic patient should not be treated with:
(Recent Pattern Question 2018-19)
 a. Benzodiazepines b. Cognitive therapy
 c. Atypical antipsychotics d. Quetiapine
104. All are morphine effects EXCEPT:
(Recent Pattern Question 2018)
 a. Miosis b. Delayed gastric emptying
 c. Respiratory depression d. Hyperalgesia
105. Drug of choice for akathisia:
(Recent Pattern Question 2018)
 a. Lithium b. Fluoxetine
 c. Propranolol d. Haloperidol
106. Which is the drug preferred for sleep onset insomnia?
(Recent Pattern Question 2017)
 a. Larazepam b. Lorazepam
 c. Ramelteon d. Ritanserin
107. Which of the following is an atypical antipsychotic?
(Recent Pattern Question 2017)
 a. Clozapine b. Chlorpromazine
 c. Thioridazine d. Haloperidol
108. Lipodystrophy is caused by which of the following?
(Recent Pattern Question 2017)
 a. Thioridazine b. Fluphenazine
 c. Prochlorphenazine d. Clozapine
109. In which drug extra pyramidal side effect is not seen?
 a. Haloperidol b. Carbamazepine
 c. Chlorpromazine d. Fluphenazine

110. Drug of choice of neuroleptic malignant syndrome:
 a. Lorazepam b. Propranolol
 c. Dantrolene d. Benzhexol
111. Akathisia is best treated by:
 a. Lithium b. Fluoxetine
 c. Propranolol d. Haloperidol
112. Which drug has least extrapyramidal symptoms?
 a. Haloperidol b. Clozapine
 c. Fluphenazine d. Chlorpromazine
113. Which drug has least extrapyramidal symptoms?
 a. Aripiprazole b. Loxapine
 c. Fluphenazine d. Chlorpromazine
114. Anti-emetic with Extrapyramidal side effect:
 a. Cyclizine b. Mozapride
 c. Prochlorperazine d. Ondansetron
115. Antipsychotic which can cause cataract:
 a. Clozapine b. Thioridazine
 c. Chlorpromazine d. Quetiapine
116. Atypical antipsychotic with maximum risk of hyperprolactinemia:
 a. Risperidone b. Aripiprazole
 c. Olanzapine d. Sertindole
117. Which of the following ICU sedation drug causes neuroleptic malignant syndrome:
 a. Midazolam b. Lorazepam
 c. Diazepam d. Haloperidol
118. Treatment for anxiety attack:
(Recent Pattern Question 2016)
 a. α -blockers b. Diazepam
 c. Barbiturates d. Bupropion
119. Which of the following anaesthetic agent leads to increase in ICT
(Recent Pattern Question 2016)
 a. Thiopentone b. Ketamine
 c. Propofol d. Sevoflurane
120. True about Benzodiazepine:
 a. It is GABA mimetic b. It is GABA facilitator
 c. Not a safe drug d. Powerful enzyme inducer
121. Diazepam acts by:
 a. GABA mimetic action
 b. Exciting CNS
 c. GABA facilitator
 d. By increasing duration of channel
122. Antidote of benzodiazepine overdose:
 a. Flupenthixol b. Fluoxetine
 c. Fluvoxamine d. Flumazenil
123. Drug of choice for ADHD:
 a. Amphetamine
 b. Methylphenidate
 c. Pemoline
 d. Modafinil

- 124. Methylphenidate is used for:**
a. Attention deficit disorder
b. Alzheimer's disease
c. Seizure disorder
d. Obsessive compulsive disorder
- 125. Rivastigmine is given in:**
a. Depression
b. Alzheimer's disease
c. Schizophrenia
d. OCD
- 126. Which of following is not used for the prophylaxis of migraine**
a. Propanolol
b. Topiramate
c. Verapamil
d. Ethosuximide
- 127. In treatment of Parkinsonism carbidopa is used along with levodopa because:**
a. It increases the half life of levodopa by inhibiting its metabolism
b. It inhibits levodopa excretion
c. It inhibits peripheral dopa decarboxylase
d. It inhibits central dopa deaminase
- 128. On-Off phenomenon seen during levodopa therapy is due to:**
a. Toxicity of drug
b. As a mild and known side effect of drug
c. Short half life of drug
d. Long half life of drug
- 129. Antiviral drug amantadine is approved for:**
a. Schizophrenia
b. Depression
c. Alzheimer's disease
d. Parkinsonism
- 130. Ergot derivative used for Parkinson's disease:**
a. Emmenagogue
b. Benhexol
c. Bromocriptine
d. Ropinirole
- 131. Anti-Parkinson drug that has the potential to cause retro-peritoneal fibrosis is:**
a. Pramipexole
b. Bromocriptine
c. Ropinirole
d. Levodopa and carbidopa
- 132. Selegiline acts by:**
a. MAO-A inhibition
b. MAO-B inhibition
c. COMT inhibition
d. Dopamine receptor stimulator
- 133. Which of the following anti epileptic drug act by inhibiting voltage gated sodium channel?**
a. Levetiracetam
b. Lamotrigine
c. Ethosuximide
d. Perampanel
- 134. True statement about lamotrigine:**
a. It acts by blocking NMDA type of glutamate receptors
b. It is a DA agonist used in Parkinson's disease
c. It has Broad spectrum of anti-seizure activity
d. It doesn't have any adverse side effects
- 135. Drug of choice for absence seizure:**
a. Lamotrigine
b. Sodium valproate
c. Trimethadione
d. Ganoxolone
- 136. Drug preferred in generalized tonic clonic seizure:**
a. Phenytoin
b. Na⁺ Valproate
c. Carbamazepine
d. Diazepam
- 137. A 30-year-old female with partial seizure. Drug of choice:**
a. Clonazepam
b. Carbamazepine
c. Phenobarbitone
d. Lamotrigine
- 138. Reversible alopecia, weight gain, tremor, Hepatotoxicity is the major side effect of which of the following anti epileptic drug:**
a. Valproate
b. Lamotrigine
c. Zonisamide
d. Phenytoin
- 139. Which of the following anti epileptic drug causes gum hypertrophy:**
a. Phenytoin
b. Valproate
c. Topiramate
d. Vigabatrin
- 140. Phenytoin therapy may lead to which of the following:**
a. Microcytic anemia
b. Thrombosis
c. Hypercalcemia
d. Folic acid deficiency
- 141. Vigabatrin acts by:**
a. GABA receptor inhibitor
b. Glutamate receptor inhibitor
c. GABA transaminase inhibitor
d. GABA transport inhibitor
- 142. The recently approved antiepileptic drug lacosamide acts by:**
a. Inhibiting synaptic vesicular protein
b. Inhibiting CRMP protein
c. Inhibiting GABA metabolism
d. Inhibiting glutamate release
- 143. A patient with recent onset primary generalized epilepsy, develops drug reaction and skin rash and neutropenia due to phenytoin sodium. The most appropriate course of action is:**
a. Shift to sodium valproate
b. Shift to clonazepam
c. Shift to ethosuximide
d. Restart phenytoin after 2 weeks
- 144. The antiepileptic drug which causes weight loss:**
a. Valproate
b. Vigabatrin
c. Topiramate
d. Felbamate
- 145. Drug of choice in acute poisoning of morphine:**
a. Naloxone
b. Naltrexone
c. Nalmefene
d. Methadone
- 146. Giving intrathecal opioid leads to which side effect?**
(Recent Pattern Question 2017)
a. Anaphylaxis
b. Pruritus
c. Hypotension
d. Cardiac arrest
- 147. All of the following are anti smoking drugs EXCEPT:**
a. Bupropion
b. Buspirone
c. Clonidine
d. Varenicline
- 148. First line therapy in smoking dependence:**
a. Nicotine replacement gum
b. Rimobant
c. Naloxone
d. Acute cessation

149. Ebstein anomaly is known teratogenic effect due to this drug:

- | | |
|--------------|----------------|
| a. Clozapine | b. Phenytoin |
| c. Lithium | d. Lamotrogine |

150. Which of the following is SSRI:

- | | |
|----------------|-----------------|
| a. Desipramine | b. Clomipramine |
| c. Fluvoxamine | d. Imipramine |

151. Venlafaxine comes under which class of drugs:

(Recent Pattern Question 2018)

- Selective serotonin reuptake inhibitor
- Serotonergic noradrenergic reuptake inhibitor
- Tricyclic antidepressant
- Serotonin receptor antagonist

152. Most common side effect of SSRI:

- | | |
|------------------------|-------------|
| a. Delayed ejaculation | b. Nausea |
| c. Weight gain | d. Insomnia |

153. Scopolamine is used mostly in:

- | | |
|---------------------------|--------------------|
| a. Hyperemesis gravidarum | b. Vomiting |
| c. Constipation | d. Motion sickness |

154. Disulphiram acts by competitive inhibition of which enzyme?

- | | |
|--------------------------|---------------------------|
| a. Alcohol dehydrogenase | b. Aldehyde dehydrogenase |
| c. Alcohol carboxylase | d. Aldehyde carboxylase |

155. Mechanism of action of ethanol in methyl alcohol poisoning:

- Competitively inhibits alcohol Dehydrogenase
- Selectively inhibits catalase
- Competitively inhibits lactate dehydrogenase
- Competitive inhibition of acetaldehyde dehydrogenase

156. All of the following drugs are used in detoxification therapy of chronic alcoholism EXCEPT:

- | | |
|----------------|---------------|
| a. Acamprosate | b. Naltrexone |
| c. Disulfiram | d. Flumazenil |

ANTIMICROBIAL AGENTS

157. Drug of choice for Enterococcus faecalis:

(Recent Pattern Question 2018-19)

- | | |
|-----------------|-----------------|
| a. Cephalixin | b. Tetracycline |
| c. Azithromycin | d. Ampicillin |

158. Dose of oseltamivir for prophylaxis of swine flu in a child aged 3-5 months? (Recent Pattern Question 2018-19)

- 3 mg/kg/day twice daily
- 5 mg/kg/day twice daily
- 10 mg/kg/day twice daily
- 15 mg/kg/day twice daily

159. Which of the following agent is used for prophylaxis of meningococcal meningitis in pregnancy?

(Recent Pattern Question 2018-19)

- | | |
|------------------|-----------------|
| a. Ceftriaxone | b. Rifampicin |
| c. Ciprofloxacin | d. Penicillin G |

160. Which of the following is a bacterial protein synthesis inhibitor? (Recent Pattern Question 2018-19)

- | | |
|----------------|-----------------|
| a. Ceftriaxone | b. Streptomycin |
| c. Nevirapine | d. Indinavir |

161. In a pregnant female which drug is strictly contraindicated? (Recent Pattern Question 2018-19)

- | | |
|-------------------|---------------|
| a. Streptomycin | b. Isoniazid |
| c. Cephalosporins | d. Penicillin |

162. A female patient was treated with antibiotics for chlamydia induced UTI, suddenly presents again with itching/pruritus, vaginal discharge, burning micturition. Which drug should be given?

(Recent Pattern Question 2018-19)

- | | |
|-----------------|-------------------|
| a. Ceftriaxone | b. Azithromycin |
| c. Moxifloxacin | d. Amphotericin B |

163. CYD-TDV Vaccine is used for which of the following infections? (Recent Pattern Question 2018-19)

- | | |
|-----------------|--------------------------|
| a. Dengue | b. Malaria |
| c. Yellow fever | d. Japanese encephalitis |

164. DOC for management of visceral Leishmaniasis:

(Recent Pattern Question 2018-19)

- Parenteral Sodium stibogluconate
- Liposomal Amphotericin B
- Miltefosine
- Pentamidine

165. Drug of choice for UTI:

(Recent Pattern Question 2018-19)

- | | |
|---------------|---------------------|
| a. Fosfomycin | b. Trimethoprim |
| c. Ampicillin | d. β -lactams |

166. The drug pyronaridine is: (Recent Pattern Question 2018)

- | | |
|---------------|-----------------|
| a. Antifungal | b. Antimalarial |
| c. Anti-HIV | d. PPI drugs |

167. Empirical drug of choice for treatment of meningococcal meningitis is: (Recent Pattern Question 2018)

- | | |
|--------------|----------------|
| a. Cefoxitin | b. Ceftriaxone |
| c. Cefotetan | d. Gentamicin |

168. Drug not used in CMV retinitis:

(Recent Pattern Question 2018)

- | | |
|----------------|--------------|
| a. Acyclovir | b. Foscarnet |
| c. Ganciclovir | d. Cidofovir |

169. Resistance to ciprofloxacin is due to:

(Recent Pattern Question 2018)

- | | |
|-----------------|-------------------|
| a. Transduction | b. Transformation |
| c. Conjugation | d. Mutation |

170. Which of the following aminoglycoside is cochleotoxic:

(Recent Pattern Question 2018)

- | | |
|---------------|-----------------|
| a. Kanamycin | b. Streptomycin |
| c. Gentamycin | d. Minocycline |

171. Following antibiotics inhibit cell wall formation EXCEPT:

- | | |
|------------------|----------------|
| a. Cephalosporin | b. Clindamycin |
| c. Cycloserine | d. Vancomycin |

- 172. Which of the following drug acts at 50s ribosome:**
a. Streptomycin b. Tetracycline
c. Quinpristin d. Demeclocycline
- 173. All of the following penicillins are acid resistant EXCEPT:**
a. Carbenicillin b. Cloxacillin
c. Ampicillin d. Amoxicillin
- 174. Drug of choice for listeria**
a. Trimethoprim-sulfamethoxazole
b. Ampicillin
c. Chloramphenicol d. Azithromycin
- 175. Which of the following drug can cause grey baby syndrome**
a. Tetracycline b. Chloramphenicol
c. Vancomycin d. Clindamycin
- 176. Which of the following antimicrobial agent can result in ototoxicity, nephrotoxicity and redneck syndrome?**
a. Methicillin b. Vancomycin
c. Tetracycline d. Chloramphenicol
- 177. DOC for antibiotic induced colitis:**
a. Clindamycin b. Metronidazole
c. Vancomycin d. Ceftriaxone
- 178. Vancomycin is used orally for treatment of**
a. Hepatic encephalopathy
b. Pseudomembranous colitis
c. Staphylococcal food poisoning
d. None of the above
- 179. All of the following drugs are used in MRSA infection EXCEPT:**
a. Vancomycin b. Rifampicin
c. Linezolid d. Nafcillin
- 180. MRSA is resistant to:**
a. Vancomycin b. β lactams
c. Linezolid d. Meropenems
- 181. Drug which is absolutely contraindicated in pregnancy is:**
a. Ceftriaxone b. Chloramphenicol
c. Penicillin d. Erythromycin
- 182. All antibiotics are safe in pregnancy EXCEPT:**
a. Ciprofloxacin b. Azithromycin
c. Ampicillin d. Cefotaxime
- 183. Drug of choice for gonorrhea:**
a. Azithromycin b. Erythromycin
c. Cefuroxime d. Ceftriaxone
- 184. Which of the following is a second generation cephalosporin?**
a. Cefaclor b. Cephalexin
c. Ceftriaxone d. Cefepime
- 185. Which of the following β lactams doesn't show cross allergy:**
a. Ampicillin b. Cefotaxim
c. Doripenem d. Aztreonam
- 186. aa-tRNA synthetase inhibitor:**
a. Mitomycin-C b. Mupirocin
c. Metronidazole d. Methenamine Mandelate
- 187. The preferred treatment option for primary syphilis is:**
a. Injection Benzathine penicillin 2.4 million units IM single dose
b. Injection Benzathine penicillin 2.4 million units IM once a week for 3 weeks
c. Cap. Doxycycline 100 mg orally twice a day for 2 weeks
d. Tab. Azithromycin 2 gm single dose
- 188. Drug of choice for trachoma:**
a. Ceftriaxone b. Azithromycin
c. Erythromycin d. Clarithromycin
- 189. Side effect of sulfonamide:**
a. Thrombocytosis b. Sensorineural hearing loss
c. Crystalluria d. Phototoxicity
- 190. Ratio of Trimethoprim and Sulfamethoxazole in a Cotrimoxazole tablet: (Recent Pattern Question 2016)**
a. 2:1 b. 3:1
c. 5:1 d. 1:5
- 191. Drug of choice for brucellosis:**
a. Chloramphenicol b. Erythromycin
c. Doxycycline d. Cefuroxime
- 192. Drug of choice for dermatitis herpetiformis:**
a. Dapsone b. Rifampicin
c. Ketokonazole d. Azithromycin
- 193. Drug used in dermatitis herpetiformis are all EXCEPT:**
a. Acyclovir b. Colchicine
c. Dapsone d. Tetracycline
- 194. Which of the following is not a protease inhibitor?**
a. Atazanavir b. Ritonavir
c. Abacavir d. Indinavir
- 195. Reverse transcriptase inhibitor zidovudine is given for:**
a. HIV b. HBV
c. HCV d. All of the above
- 196. All drugs are used in AIDS EXCEPT:**
a. Abacavir b. Ritonavir
c. Acyclovir d. Tenofovir
- 197. Mechanism of action of maraviroc:**
a. Cyt P 450 inhibitor b. GP 41 inhibitor
c. CCR5 inhibitor d. GP 120 inhibitor
- 198. NRTI which has maximum tendency to cause peripheral neuropathy**
a. Zidovudine b. Stavudine
c. Lamivudine d. Didanosine
- 199. NOT a fast acting anti-malarial drug:**
a. Mefloquine b. Chloroquine
c. Artemisinin d. Pyrimethamine
- 200. Drug of choice for schistosomiasis:**
a. Praziquantel b. Metronidazole
c. Albendazole d. Ivermectin
- 201. Drug of choice for fasciola hepatica:**
a. Praziquantel b. Triclabendazole
c. Ivermectin d. Albendazole

**202. Drug of choice for neurocysticercosis:**

- a. Praziquantel b. Triclabendazole
- c. Ivermectin d. Albendazole

203. Drug of choice for Taenia Solium:

- a. Praziquantel b. Triclabendazole
- c. Ivermectin d. Albendazole

204. Scabies oral drug of choice:

- a. Permethrin b. Benzyl Benzoate
- c. Ivermectin d. Lindane

205. Drug of choice for scabies

- a. Ivermectin b. Permethrin
- c. Sulfur d. Benzyl benzoate

206. Drug of choice for tetanus:

- a. Metronidazole b. Penicillin
- c. Erythromycin d. Clindamycin

207. Drug of choice for filariasis:

- a. Metronidazole b. Praziquantel
- c. Ciprofloxacin d. Ivermectin

208. What is the recommended dose of DEC in filariasis?*(Recent Pattern Question 2017)*

- a. 2 mg/kg b. 6 mg/kg
- c. 10 mg/kg d. 20 mg/kg

209. Which drug is given in combination with DEC for massive reduction of filariasis?*(Recent Pattern Question 2017)*

- a. Albendazole b. Streptomycin
- c. Pyrimethamine d. Tinidazole

210. Mechanism of action of amphotericin B:

- a. Cell wall synthesis inhibitor
- b. Alters permeability of fungal cell wall
- c. Protein synthesis inhibitor
- d. Act as antibody for fungus

211. To reduce Amphotericin B toxicity, it is given?*(Recent Pattern Question 2017)*

- a. With aminoglycoside
- b. Give intravenous with saline
- c. With 5% dextrose
- d. Liposomal preparation

212. NOT an adverse effects of amphotericin-B?*(Recent Pattern Question 2017)*

- a. Thrombocytopenia b. Renal damage
- c. Cholelithiasis d. Hepatic damage

213. Most serious side effects of amphotericin B:

- a. Hepatic damage b. Renal damage
- c. Cardiotoxicity d. Hypochromic anemia

214. Which of the following drugs causes acute kidney injury with hypomagnesemia:

- a. Cyclophosphamide
- b. Ceftriaxone
- c. Amphotericin-B
- d. Vancomycin

ANTITUBERCULAR AGENTS**215. Isoniazid is NOT given in:***(Recent Pattern Question 2017)*

- a. Renal disease b. Liver disease
- c. Diabetes mellitus d. Hypertension

216. If somebody develops resistance to INH, patient will develop simultaneously resistance to which drug?*(Recent Pattern Question 2017)*

- a. Streptomycin b. Rifampicin
- c. Ethambutol d. Pyrazinamide

217. ATT Drug that kills slowly or intermittently dividing bacteria:

- a. Isoniazid
- b. Rifampicin
- c. Pyrazinamide
- d. Streptomycin

218. True statement about action of ethambutol:

- a. Exclusive agent against extracellular bacilli
- b. Selectively tuberculocidal agent
- c. Increase the permeability of cell wall
- d. More active on slowly multiplying bacilli

219. Anti TB drug causing optic neuritis:

- a. Isoniazid b. Rifampicin
- c. Pyrazinamide d. Ethambutol

220. Which of the following anti TB drug is not bactericidal

- a. Rifampicin b. Isoniazid
- c. Pyrazinamide d. Ethambutol

221. Which of the following anti tubercular drug requires dose adjustment in renal failure:

- a. Isoniazid b. Rifampicin
- c. Pyrazinamide d. Ethambutol

222. Isoniazid dosage in infants

- a. 5 mg/kg PO qday b. 10-15 mg/kg PO qday
- c. 300 mg BID d. 300 mg once a week

223. RNA transcription is blocked by this ATT:

- a. Rifampicin b. Streptomycin
- c. Chloroamphenicol d. INH

224. In patients on isoniazid, which vitamin deficiency is more likely to be seen?

- a. Vitamin B9 b. Vitamin B12
- c. Vitamin B6 d. Vitamin B3

225. Anti TB drug causing depression & suicidal tendency:

- a. Kanamycin b. Cycloserine
- c. Streptomycin d. Capreomycin

226. ATT contraindicated in pregnant women

- a. Isoniazid b. Rifampicin
- c. Streptomycin d. Ethambutol

227. Which anti TB drug is contraindicated throughout the pregnancy:

- a. Rifampicin b. Streptomycin
- c. Isoniazid d. Ethambutol

**228. Ototoxicity caused by:**

- a. Vancomycin
- b. Streptomycin
- c. Ampicillin
- d. Rifampicin

229. Dose for tuberculin test:

- a. 1 TU
- b. 2 TU
- c. 2.5 TU
- d. 5 TU

230. ATT drug causing hypothyroidism:

- a. Isoniazid
- b. Ethambutol
- c. PAS
- d. Rifampicin

231. ATT drug causing hyperuricemia:

- a. Isoniazid
- b. Pyrazinamide
- c. Streptomycin
- d. Rifampicin

ANTICANCER DRUGS

232. DOC of anal cancer: (Recent Pattern Question 2018-19)

- a. Gefitinib
- b. Eflornithin
- c. 5FU
- d. Cisplatin

233. Pemetrexed MOA is: (Recent Pattern Question 2018)

- a. RNA synthesis inhibitor
- b. Dihydrofolate reductase inhibitor
- c. Dopamine agonist
- d. Folate antagonist

234. Folinic acid used in: (Recent Pattern Question 2018)

- a. Methotrexate toxicity
- b. Cisplatin toxicity
- c. Vincristine toxicity
- d. 5FU toxicity

235. Which Radiosensitizer drug is used in head and neck surgery? (Recent Pattern Question 2017)

- a. Paclitaxel
- b. Cisplatin
- c. Amikacin
- d. Mitomycin-C

236. Which anticancer drug inhibits dihydrofolate reductase? (Recent Pattern Question 2017)

- a. Vincristine
- b. Methotrexate
- c. Paclitaxel
- d. Cisplatin

237. Which drug will be preferred in imatinib resistant CML? (Recent Pattern Question 2017)

- a. Nilotinib
- b. Infliximab
- c. Hydroxyurea
- d. Gefitinib

238. Breast cancer chemotherapeutic agent that causes osteoporosis:

- a. Letrozole
- b. Nafarelin
- c. Tamoxifen
- d. Leuprolide

239. A 40-year-old lady with breast cancer has undergone MRM and is on Tamoxifen for 1 year. She now presents with bleeding per vaginum 4-5 times. What is the probable cause:

- a. Bleeding disorder
- b. Endometrial cancer
- c. Ovarian cancer
- d. Cervical cancer

240. All are alkylating agents used in chemotherapy EXCEPT:

- a. Melphalan
- b. Busulfan
- c. Cladribine
- d. Cyclophosphamide

241. All are example of alkylating agents EXCEPT:

- a. Bleomycin
- b. Busulfan
- c. Procarbazine
- d. Melphalan

242. Alkylating agent used in chemotherapy:

- a. Mechlorethamine
- b. Procarbazine
- c. Cyclophosphamide
- d. All of the above

243. True about Cyclophosphamide

- a. Antimetabolites
- b. Alkylating agent
- c. Platinum compound
- d. Topoisomerase inhibitors

244. Which of the following drug is a not a purine analogue:

- a. 6 Mercaptopurine
- b. Cladribine
- c. Cytarabine
- d. Fludarabine

245. Mercaptopurine is –

- a. Purine analogue
- b. Nucleoside analogue
- c. Pyrimidine analogue
- d. Anti tumor antibiotics

246. First line chemotherapy for cancer cervix:

- a. Cyclophosphamide
- b. Lomustine
- c. Vincristine
- d. Cisplatin

247. Drug of choice for CML

- a. Imatinib mesylate
- b. Fludarabine
- c. All trans retinoic acid (for AML 3)
- d. Methotrexate

248. Mechanism of action of Aspirin

- a. Inhibit PGI₂ formation
- b. Inhibit TXA₂ formation
- c. Stimulate TXA₂ formation
- d. Stimulate platelet aggregation

249. Methotrexate mechanism of action:

- a. Inhibit dihydrofolate reductase
- b. Stimulate dihydrofolate reductase
- c. Inhibit tetrahydrofolate reductase
- d. Stimulate tetrahydrofolate reductase

250. Antidote for methotrexate toxicity:

- a. Folic acid
- b. Folinic acid
- c. Vitamin B
- d. Thymine

251. Which of the following is not used in treatment for Multiple myeloma:

- a. Melphalan
- b. Thalidomide
- c. Zolendronic acid
- d. Methotrexate

252. Most emetogenic anti CA drug:

- a. 5 FU
- b. Methotrexate
- c. Cisplatin
- d. All

253. Most widely used anti CA drug:

- a. 5 FU
- b. Methotrexate
- c. Cisplatin
- d. All

254. Which of the following anti neoplastic drug commonly causes hepatotoxicity:

- a. 6-mercaptopurine
- b. 5-fluorouracil
- c. Doxorubicin
- d. Etoposide

255. Hemorrhagic cystitis is caused by:
- Procarbazine
 - Cisplatin
 - Doxorubicin
 - Cyclophosphamide

256. Not used in treatment protocol of Hodgkin's lymphoma

- Vincristine
- Vinblastine
- Bleomycin
- Adriamycin

257. Cardiomyopathy is caused by

- Actinomycin D
- Doxorubicin
- Mitomycin C
- Mitoxantrone

258. Which of the following anticancer drug causes hemolytic uremic syndrome:

- Vincristine
- Vinblastine
- Cisplatin
- Mitomycin C

259. Chemoradiation was given to a patient. Which drug given will reduce toxicity caused by radiotherapy?

- Vitamin A
- Gemcitabine
- Amifostine
- Actinomycin D

CARDIOVASCULAR SYSTEM

260. Gemfibrozil is: *(Recent Pattern Question 2018)*

- HMG CoA inhibitor
- PPAR- α activator
- Inhibit cholesterol synthesis
- Inhibit cholesterol absorption

261. Mechanism of action of statins is by:

(Recent Pattern Question 2018)

- Competitive inhibition
- Noncompetitive inhibition
- Uncompetitive
- Irreversible inhibition

262. Drug of choice for cardiogenic shock:

(Recent Pattern Question 2018)

- Dopamine
- Dobutamine
- Digoxin
- Digitoxin

263. Which of the following condition precipitate Digoxin toxicity? *(Recent Pattern Question 2017)*

- Hypokalemia
- Hyperkalemia
- Hypernatremia
- Hyperphosphatemia

264. All are true statement about digitalis action EXCEPT:

- Increases cardiac contraction
- Pumps sodium inside cell in exchange of Ca^{2+}
- Increases intracellular calcium
- Causes bradycardia

265. In a patient with PIH, with BP 150/90, what will be the management *(Recent Pattern Question 2016)*

- Rest
- Labetalol
- Diuretics
- CCB

266. Which of the following is not a mechanism of action of Antihypertensive agents?

- Blockade of alpha adrenergic receptors
- Blockade of ATP sensitive K^{+} channels
- Blockade of Noradrenaline release
- Blockade of beta adrenergic receptors

267. Drug not useful in emergency condition in pregnancy:

- Nifedipine
- Labetalol
- Ritodrine
- Phenobarbitone

268. Which of the following antihypertensive is contraindicated in pregnancy:

- Beta blockers
- ACE inhibitors
- Methyldopa
- Ca channel blockers

269. All of the following antihypertensive drugs are given in pregnancy EXCEPT:

- Methyldopa
- Labetalol
- Captopril
- Nifedipine

270. The drug of choice in scleroderma induced hypertensive crisis is:

- ACE inhibitors
- Angiotensin receptor blockers
- Beta blockers
- Sodium nitroprusside

271. Drug of choice in supra ventricular tachycardia

- Adenosine
- Verapamil
- Metoprolol
- Lignocaine

272. Drug of choice for Paroxysmal Supraventricular Tachycardia

- Digitalis
- Adenosine
- Adrenaline
- Verapamil

273. A Patient who is on anti hypertensive drug develops dry cough. Which of the following drug might be responsible for the condition:

- Diuretics
- ACE inhibitors
- Calcium channel blockers
- Beta blockers

274. All of the following are true about MOA of anti hypertensive drugs EXCEPT:

- Act by Na^{+} K^{+} ATPase inhibition
- Thiazide Diuretics
- Alpha adrenergic blockade
- Beta adrenergic blockade

275. Mechanism of action of statins:

- Inhibit HMG CoA synthase
- Stimulate HMG CoA reductase
- Inhibit HMG CoA reductase
- Stimulate HMG CoA synthase

276. Not a hypolipidemic drug:

- Simvastatin
- Fenofibrate
- Somatostatin
- Fluvastatin

277. All of the following anti-arrhythmic drugs are from class Ic EXCEPT:

- Encainide
- Hecainide
- Tocainide
- Propafenone

278. Which of the following is an L-type calcium channel blocker:

- Nifedipines
- Amlodipines
- Diltiazem
- All of the above

**279. Drug that leads to glucose intolerance:**

- a. Hydrochlorthiazide b. ACE inhibitors
- c. Verapamil d. Sulfonylureas

280. Which of the following drug has uricosuric action:

- a. Losartan b. Allopurinol
- c. Enalapril d. Ramipril

281. Angiotensin receptor blockers which attenuate platelet aggregation:

- a. Telmisartan b. Losartan
- c. Valsartan d. Irbesartan

282. Which of the following anti-hypertensives are contraindicated together:

- a. CCB & Nitrates b. Nitrates and β blockers
- c. CCB and β blockers d. CCB and ARB

283. A diabetic patient with hypertension, which drug is preferred:

- a. ACE inhibitor b. Beta blockers
- c. CCB d. Diuretics

HORMONES AND AUTOCOIDS

284. Mechanism of action of Exenatide:

(Recent Pattern Question 2018-19)

- a. SGLT inhibitor b. GLP-1 Analogue
- c. DPP4 inhibitor d. AMP kinase inhibitor

285. Most potent analgesic:

(Recent Pattern Question 2018-19)

- a. COX-2 inhibitor b. Remifentanyl
- c. Morphine d. Sufentanyl

286. Paracetamol causes: (Recent Pattern Question 2018-19)

- a. Renal failure b. Pancreatic toxicity
- c. Neurotoxicity d. Hepatotoxicity

287. What is the impact on foetus in case of Indomethacin used in third trimester?

(Recent Pattern Question 2018-19)

- a. PDA b. Early closure of PDA
- c. VSD d. ASD

288. Purpose of adding zinc with insulin:

(Recent Pattern Question 2018-19)

- a. Make the insulin more rapid acting
- b. Provide stability in insulin molecule
- c. Increase the risk of insulin resistance
- d. Prevent insulin from causing hypoglycemia

289. Half-life of parathormone:

(Recent Pattern Question 2018-19)

- a. 4 minutes b. 10 minutes
- c. 30 minutes d. 1 hour

290. Zileuton is:

(Recent Pattern Question 2018)

- a. 5-lipoxygenase inhibitor
- b. Cyclooxygenase inhibitor
- c. Phospholipase inhibitor
- d. Leukotriene receptor antagonist

291. Which of the following leads to obesity:

(Recent Pattern Question 2018)

- a. Acarbose b. Insulin
- c. Sitagliptin d. Pioglitazone

292. Alcaftadine trial used this concentration of drug:

(Recent Pattern Question 2018)

- a. 5% b. 1%
- c. 0.25% d. 2.5%

293. Phosphodiesterase inhibitor used for erectile dysfunction? (Recent Pattern Question 2017)

- a. Sildenafil b. Amrinone
- c. Milrinone d. Tamoxifen

294. Which of the following is a selective estrogen receptor down-regulator: (Recent Pattern Question 2017)

- a. Flutamide b. Fulvestrant
- c. Tamoxifen d. Clomiphene citrate

295. FDA approved drug Bevacizumab is?

(Recent Pattern Question 2017)

- a. VEGF 2 inhibitor
- b. EGF receptor inhibitor
- c. Antibody to VEGF receptor
- d. TNF alpha agonist

296. Which of the following drug acts by inhibiting IL-2 activation? (Recent Pattern Question 2017)

- a. Cycloserine b. Cyclosporine
- c. OKT-3 d. None

297. Frequency of urine in pregnancy is increased due to

(Recent Pattern Question 2016)

- a. Prostaglandins
- b. Increased progesterone
- c. Enlarged uterus pressing on bladder
- d. Oxytocin

298. Receptor for vasopressin in collecting duct:

(Recent Pattern Question 2016)

- a. V1 b. V2
- c. V3 d. Endothelium

299. Intermediate acting insulin

- a. Regular insulin b. Glargine
- c. Lispro d. NPH

300. Which of the following insulin is rapidly acting

- a. Insulin lispro b. Regular insulin
- c. Insulin glargine d. NPH

301. Fastest acting insulin:

- a. Insulin aspart b. Insulin Glargine
- c. Insulin Lente d. Insulin detemir

302. All are true about Prolactin agonist EXCEPT:

- a. Associated with lactation
- b. Stimulate milk production after child birth
- c. Dopamine stimulate prolactin production
- d. Dopamine inhibit prolactin production

303. Prolactin production is controlled by:

- a. Metoclopramide b. Chlorpromazine
- c. Dopamine d. None

304. Which of the following drugs can cause galactorrhea:

- a. Bromocriptine b. Pantoprazole
- c. Metoclopramide d. Omeprazole

305. MOA of oral hypoglycemic agent

- a. Inhibit glucose uptake by skeletal muscle
- b. Enhance glucose uptake by skeletal muscle
- c. Stimulate glycogenolysis
- d. Stimulate gluconeogenesis

306. Antidiabetic drug of choice for obese patients

- a. Metformin b. Sulfonylureas
- c. Repaglinide d. Acarbose

307. True statement about long term use of tamoxifen:

- a. Has no effect on uterine carcinoma
- b. Increased risk of heart disease
- c. Monitoring of liver enzymes is recommended
- d. Safer in DVT patients

308. Which of the drug is not used to treat hirsutism:

- a. Flutamide b. Finasteride
- c. Cyproterone acetone d. Spironolactone

309. The drug preferred to stop the growth of prostate in a 70 year old male with Benign hyperplasia of prostate is

- a. Spironolactone b. Ketoconazole
- c. Finasteride d. Flutamide

310. Sildenafil acts by blocking which enzyme?

- a. Phosphodiesterase 3 inhibition
- b. Phosphodiesterase 5 inhibition
- c. 5 alpha Reductase inhibition
- d. Stimulate androgen production

311. Sildenafil is a drug used for erectile dysfunction. It acts by

- a. Blocking beta-adrenoceptors
- b. Inhibiting phosphodiesterase type 5
- c. Inhibiting reuptake of serotonin and nor-adrenaline
- d. Selective serotonin reuptake inhibition

312. Side effect of latanoprost:

- a. Lacrimation
- b. Increased pigmentation of cornea
- c. Increased eye lashes hair growth
- d. All of the above

313. Drug contraindicated in glaucoma patient suffering from bronchial asthma:

- a. Timolol b. Betaxolol
- c. Acetazolamide d. Latanoprost

314. Which of following prostaglandin analogue is beneficial in glaucoma?

- a. PG D2 b. PG E2α
- c. PG I2 d. PG F2α

315. Olopatadine is:

- a. Mast cell stabilizer
- b. Anti- histamine
- c. Both mast cell stabilizer and anti histamine
- d. None of the above

316. Which of the following is a soft steroid:

- a. Betamethasone b. Dexamethasone
- c. Prednisolone d. Ciclesonide

317. True about febuxostat:

- a. Anti-gout and Xanthine Oxidase inhibitor
- b. Purine inhibitor
- c. Dose adjustment required in renal impairment
- d. Has uricosuric action

318. Drug given for acute gout:

- a. Aspirin b. Indomethacin
- c. Febuxostat d. Allopurinol

RENAL, GIT AND RESPIRATORY SYSTEM

319. Laxative used in hepatic encephalopathy

(Recent Pattern Question 2018-19)

- a. Lactulose b. Sodium picosulfate
- c. Lubiprostone d. Bisacodyl

320. DOC for tropical pulmonary eosinophilia:

(Recent Pattern Question 2018)

- a. Albendazole b. Itraconazole
- c. Corticosteroid d. DEC

321. DOC for nephrogenic diabetes insipidus:

(Recent Pattern Question 2018)

- a. Mannitol b. Spironolactone
- c. Thiazides d. Demeclocycline

322. True about acetazolamide

(Recent Pattern Question 2016)

- a. Increase sodium reabsorption and potassium secretion
- b. Carbonic anhydrase inhibitor
- c. Acts at ascending limb of loop of Henle
- d. Increase aqueous outflow mainly

323. True reason for avoiding diuretics in pregnancy

(Recent Pattern Question 2017)

- a. Increase vascular resistance
- b. Decrease placental circulation
- c. Causes maternal distress
- d. High risk of birth defects

324. Calcium carbonate is used for

(Recent Pattern Question 2016)

- a. Antacid b. Renal stone
- c. Metabolic alkalosis d. Renal failure

325. Drug used in renal osteodystrophy:

- a. Vitamin D
- b. Calcitriol
- c. Calcidiol
- d. All of the above

326. All of the following are potassium sparing diuretic EXCEPT:

- a. Spironolactone b. Triamterene
- c. Indapamide d. Amiloride

**327. Drug of choice for initial management of CKD:**

- a. Thiazide diuretics b. Loop diuretics
- c. K⁺ sparing diuretics d. Osmotic diuretics

328. ACE inhibitor is contraindicated in which of the following condition:

- a. Bilateral renal artery stenosis
- b. Chronic kidney disease
- c. Post myocardial infarction
- d. Diabetes mellitus

329. Drug of choice for treatment of NSAID-induced peptic ulcer is

- a. Prostaglandin analogues like Misoprostol
- b. H₂-receptor antagonists like Ranitidine
- c. Proton pump inhibitors like Omeprazole
- d. Antacids like Mg(OH)₂

330. All of the following are indicated in drug induced vomiting EXCEPT:

- a. Ondansetron b. Metoclopramide
- c. Hyoscine d. Chlorpromazine

331. Which of the following drug is *not* effective against chemotherapy induced vomiting?

- a. Aprepitant b. Hyoscine
- c. Metoclopramide d. Ondansetron

332. All of the following statements about treatment of diarrhea are correct EXCEPT:

- a. Anti-motility drugs are drug of choice for infective diarrhea
- b. Loperamide and diphenoxylate are opioids used as anti-motility drugs
- c. Diphenoxylate overdose can cause respiratory depression
- d. Opioids decrease peristalsis and can be used in diarrhea

333. All of the following are anti tussives EXCEPT:

- a. Codeine b. Dextromethorphan
- c. Ambroxol d. Noscipine

334. Which drug should *not* be given in acute persistent asthma

- a. Theophylline b. Salbutamol
- c. Salmeterol d. Formoterol

335. Which is *not* useful in persistent severe asthma:

- a. Slow acting β_2 agonist b. Long acting β_2 agonist
- c. Inhaled corticosteroids d. High flow oxygen

336. Which is most common side effect of inhaled beclomethasone dipropionate:

- a. Pneumonia
- b. Oropharyngeal candidiasis
- c. Atrophic rhinitis
- d. Pituitary adrenal suppression

337. Non-sympathomimetic Bronchodilator preferred in COPD:

- a. Ipratropium bromide b. Salmeterol
- c. Terbutaline d. Salbutamol

338. Noscipine is an:

- a. Anti-tussive
- b. Anti emetic
- c. Anti diarrheal
- d. Mucolytics

339. Cough syrup acts by inhibiting

- a. Cough center
- b. Respiratory center
- c. Breathing center
- d. Pulmonary secretion center

340. A 34-year-old man with a long history of asthma is referred to pulmonologist. The physician decides to prescribe zileuton. The mechanism of action of this drug is to:

- a. Antagonize Leukotriene D₄ receptor
- b. Inhibits 5-lipoxygenase
- c. Inhibit phosphodiesterases
- d. Stimulate P₂ receptors

HEMATOLOGY AND VITAMINS

341. Coumarin necrosis occurs due to:

(Recent Pattern Question 2018-19)

- a. Heparin
- b. Low molecular weight heparin
- c. Warfarin
- d. Clopidogrel

342. Which of the following is a Factor Xa inhibitor?

(Recent Pattern Question 2018-19)

- a. Apixaban b. Argatroban
- c. Fondaparinux d. Bivalirudin

343. Neutropenia after chemotherapy is treated by?

(Recent Pattern Question 2018-19)

- a. Leucovorin b. Filgrastim
- c. Ondansetron d. Darbepoetin

344. Which among the following is iron chelator:

(Recent Pattern Question 2018)

- a. EDTA b. Deferoxamine
- c. BAL d. Dimercaprol

345. What is the mode of action of warfarin?

(Recent Pattern Question 2017)

- a. Factor Xa inhibitor
- b. Vitamin K antagonist
- c. Activates antithrombin III
- d. Activates factor IX

346. aPTT is done for assessing?

(Recent Pattern Question 2017)

- a. Warfarin toxicity
- b. LMW heparin
- c. Heparin toxicity
- d. Extrinsic coagulation pathway defect

347. Argatroban acts by inhibiting:

(Recent Pattern Question 2017)

- a. Factor Xa b. Factor IXa
- c. Factor II d. Factor IV

- 348. Anticoagulant of choice in pregnancy**
(Recent Pattern Question 2016)
- Warfarin
 - Vitamin K
 - Tranexamic acid
 - Heparin
- 349. Which of the following drugs is used in heparin-induced thrombocytopenia**
(Recent Pattern Question 2016)
- Warfarin
 - Coumarin
 - Lepirudin
 - Enoxaparin
- 350. All of the following are true about Vitamin K EXCEPT:**
- Required for synthesis of clotting factors
 - Hematuria is the first manifestation of deficiency
 - Used as first line treatment in bleeding conditions
 - It has a water soluble form also
- 351. All of following are anti platelet EXCEPT:**
- Aspirin
 - Clopidogrel
 - Abciximab
 - Tranexamic acid
- 352. Aspirin acts by inhibiting the production of:**
- Prostaglandin
 - Cytokines
 - Leukotriene
 - Thromboxane
- 353. Mechanism of action of Aspirin**
- Inhibit PGI₂ formation
 - Inhibit TXA₂ formation
 - Stimulate TXA₂ formation
 - Stimulate platelet aggregation
- 354. Which of the following is *not* true about Heparin function:**
- Inhibit antithrombin 3
 - Activate antithrombin 3
 - Inhibit factor IIa
 - Inhibit factor Xa
- 355. True about oral anticoagulant warfarin are all EXCEPT:**
- Acts in vivo
 - Acts both in vivo and in vitro
 - Interferes with synthesis of Vit K
 - Causes Hematuria
- 356. All of the following drugs are contraindicated in G6PD EXCEPT:**
- Ciprofloxacin
 - Primaquine
 - Dapsone
 - Sulfonamide
- 357. Which of the following drug will cause hemolysis in G6PD patients:**
- Cephalosporins
 - Ampicillin
 - Chloroquine
 - Erythromycin
- 358. Which of the following is a low molecular weight heparin:**
- Hirudin
 - Enoxaparin
 - Tranexamic acid
 - Lepirudin
- 359. Low molecular weight heparin affects which factor:**
- Factor X
 - Anti-thrombin
 - Factor Xa
 - Factor IX
- 360. All of the following are true regarding enoxaparin EXCEPT:**
- It has higher and predictable bioavailability
 - It act by inhibiting both factor IIa and factor Xa
 - Monitoring is not required
 - It has more favorable pharmacokinetics
- 361. Treatment of choice in severe cystic acne:**
- Isotretinoin
 - Tretinoin
 - Benzoyl peroxide
 - Azelaic acid
- 362. Vitamin B12 is given in severe anemia via which route:**
- I/M
 - IV
 - Oral
 - All of the above
- 363. Antivitamin of biotin-**
- Vitamin B6
 - Vitamin K
 - Avidin
 - None
- 364. The vitamin which can be used for treatment of hypercholesterolemia is:**
- Thiamine
 - Niacin
 - Pyridoxine
 - VitaminB₁₂
- 365. Ketamine causes:**
- Hallucination
 - Hypotension
 - Myocardial depression
 - Decrease in intracranial pressure
-
- MISCELLANEOUS**
-
- 366. IUGR is caused by which drug:**
(Recent Pattern Question 2017)
- Methyldopa
 - Hydralazine
 - Propranolol
 - Nifedipine
- 367. Drugs contraindicated in pregnancy are all EXCEPT?**
(Recent Pattern Question 2017)
- Chloroquine
 - Primaquine
 - Tobramycin
 - ACE inhibitor
- 368. *Not* true about use of silver sulfadiazine:**
- 1% concentration
 - Burns
 - Safer for pregnant lady and infants
 - Acts against staph aureus
- 369. Medical adrenalectomy is seen with:**
- Vincristine
 - Vinblastine
 - Mitotane
 - Methotrexate
- 370. Which of the following is needed for conversion of norepinephrine to epinephrine:**
- COMT
 - MAO
 - PENMT
 - SAM

BOARD REVIEW QUESTIONS

371. Which of the following is a long acting beta 2 agonist?
a. Salbutamol b. Salmeterol
c. Terbutaline d. Levalbuterol
372. Galantamine is used in?
a. Alzheimer's disease b. Parkinson's disease
c. Emesis d. Chorea
373. Half life of Digoxin is?
a. 12 hours b. 24 hours
c. 36 hours d. 48 hours
374. Spironolactone is the first drug to be given for?
a. Cirrhotic edema b. Cardiac edema
c. Idiopathic edema d. Nutritional edema
375. Side effect of Amphotericin B is?
a. Hypocalcemia b. Hypokalemia
c. Hyponatremia d. Hypermagnesemia
376. Mechanism of action of dantrolene is?
a. Inhibits Ca^{++} secretion from sarcoplasm
b. Binds to ryanodine receptors to block release of Ca^{++}
c. Inhibits GABA
d. Inhibits Gamma motor neuron
377. Inhibitors of GpIIb/ IIIa receptors is all EXCEPT
a. Eptifibatide b. Tirofiban
c. Abciximab d. Filgrastim
378. Omalizumab is used for
a. Ulcerative colitis b. Crohn disease
c. Asthma d. Psoriatic arthritis
379. Most potent loop diuretic
a. Bumetanide b. Torsemide
c. Furosemide d. Ethacrynic acid
380. All are advantages of LMWH over heparin EXCEPT:
a. Longer half life
b. Lower risk of HIT syndrome
c. Lower risk of osteoporosis
d. Antidote is protamine sulfate
381. Which of the following is soft steroid?
a. Fluticasone b. Budenoside
c. Ciclesonide d. Mometasone
382. Lubiprostone is used for
a. Osmotic diarrhoea b. Secretory diarrhoea
c. Chronic constipation d. Irritable bowel syndrome
383. Drug of choice for extended spectrum bacterial lactamase is
a. Carbenicillin b. Carbapenem
c. Aztreonam d. Clavulanic acid
384. Most common side effect of sulphonamides?
a. Aplastic anemia b. Rash
c. SLE d. Haemolysis
385. All drugs act on pseudomonas EXCEPT?
a. Vancomycin b. Meropenem
c. Cefipime d. Ciprofloxacin
386. Bulls eye maculopathy is seen with
a. Chloroquine b. Quinine
c. Pyrimethamine d. Halofentrine
387. Drug of choice for falciparum malaria in pregnancy?
a. Quinine b. Artesunate
c. Choloroquine d. Pyrimethamine
388. c-ART therapy leading to pancreatitis
a. Didanosine b. Stavudine
c. Lamivudine d. Emtricitabine
389. Drug of choice for larva migrans
a. Mebendazole b. DEC
c. Albendazole d. Praziquantal
390. Best anti- thyroid drug in pregnancy is
a. Propyl-thiouracil b. Levothyroxine
c. Carbimazole d. Liothyronine
391. Drug of choice in Lithium induced diabetes mellitus?
a. Conivaptan b. Amiloride
c. Indapamide d. Vasopressin
392. Not recommended in acute CHF
a. Diuretic b. ACE inhibitor
c. NTG d. Beta blocker
393. Mechanism of action of sulphonamides is
a. Inhibiting dihydrofolate synthase
b. Inhibiting folate synthase
c. Inhibiting tetrahydrofolate synthase
d. Inhibiting amino acyl transferase
394. Haemorrhagic pancreatitis is seen with?
a. Linagliptin b. Valdagliptin
c. Exenatide d. Liraglutide
395. Drug used in Medical adrenalectomy is?
a. Ketoconazole b. Terbinafine
c. Febuxostat d. Tamoxifen
396. Drug used in migraine is all EXCEPT?
a. Onabotulinum b. Flunarizine
c. Telcagepant d. Vigabatrin
397. Shortest acting mydriatic
a. Atropine b. Tropicamide
c. Homatropine d. Cyclopentolate
398. Drug of choice for POAG
a. Lanatoprost b. Brimonidine
c. Dipivefrin d. Brinzolamide
399. Drug of choice for steroid induced osteoporosis
a. Zoledronate b. Teriparatide
c. Gallium nitrate d. Strontium
400. Best Drug to reduce cell counts in Hyperleucocytosis?
a. Hydroxyurea
b. Anagrelide
c. Doxorubicin
d. Radioactive phosphorus

401. Drug of choice for acyclovir resistant herpes is?
a. Cidofovir b. Gancyclovir
c. Valacyclovir d. Foscarnet
402. Drug of choice for Heparin induced thrombocytopenia?
a. Protamine sulfate b. Vitamin K
c. Fresh Frozen plasma d. Argatroban
403. Most commonly used drug for prophylaxis of migraine is?
a. Sumatriptan b. Propranolol
c. Valproate d. Flunarizine
404. Amount of chloride in ORS
a. 65 mmol/L b. 75 mmol/L
c. 10 mmol/L d. 20 mmol/L
405. Red man syndrome is seen with
a. Lincomycin b. Vancomycin
c. Linezolid d. Carbanicillase
406. Macrolides are drug of choice for all EXCEPT?
a. Chancroid b. Legionella
c. Acinetobacter d. Bordetella
407. DOC for hepatitis B
a. Sofosbuvir b. Entecavir
c. Lamivudine d. Pegylated interferon
408. Vitamin deficiency leading to photosensitivity?
a. Niacin b. Riboflavin
c. Pyridoxine d. B12
409. All are PDE 3 inhibitors EXCEPT:
a. Amrinone b. Milrinone
c. Cilostazol d. Cilastin
410. Which of the following inhibits degradation of dopamine
a. Rasagiline b. Ropirinoles
c. Rotigotine d. Carbi-dopa
411. Drug of choice for ethylene glycol poisoning
a. Ethyl alcohol b. Disulfiram
c. Fomepizole d. Methylene blue
412. Longest acting opioid antagonist is
a. Naloxone b. Nalmefene
c. Naltrexone d. Nitrazepam
413. Short-term treatment of insomnia is
a. Chloral hydrate b. Zolpidem
c. Diazepam d. Nitrazepam
414. Anti-parkinsonism drug leading to Raynaud phenomenon?
a. Bromocriptine b. Tolcapone
c. Ropirinoles d. Levodopa
415. DOC for huntington chorea
a. Tetrabenzamine b. Riluzole
c. Alpha interferon d. Beta interferon
416. DOC for febrile seizures
a. Oral diazepam b. Intranasal midazolam
c. Intravenous lorazepam d. Oral PCM
417. Longest acting anti-arrhythmia drug
a. Amiodarone b. Dronedrone
c. Ibutilide d. Lidocaine
418. All are side effects of beta blockers EXCEPT
a. Bradycardia b. Hyperglycemia
c. Rebound hypertension d. Ankle edema
419. Longest acting statin is
a. Simvastatin b. Lovastatin
c. Atorvastatin d. Rosuvastatin
420. Drug useful in Pulmonary artery hypertension
a. Thiazide b. NTG
c. Ivabradine d. Milrinone
421. Adenosine is class _____ anti arrhythmia drug?
a. Class I b. Class II
c. Class V d. Class IV
422. Drug contraindicated in pregnancy are all EXCEPT:
a. Diuretics b. ACE inhibitors
c. CCB d. Sodium nitroprusside
423. Maximum decrease in HDL is by
a. Vitamin A b. Vitamin B
c. Vitamin C d. Vitamin E
424. Mechanism of action of statin is?
a. Stimulation of HMG COA reductase
b. Indirect increase of LDL receptors synthesis
c. Inhibition of HMG COA synthase
d. Inhibition of intestinal cholesterol absorption
425. Tocolytic preferred in heart disease in mother
a. Nifedipine b. Atosiban
c. Magnesium sulfate d. Oxytocin
426. Which of the following anti-epileptic drug is a microsomal enzyme inhibitor:
a. Ethosuximide b. Sodium valproate
c. Phenobarbitone d. Phenytoin
427. Number of patients in phase II clinical trial:
a. Few healthy patients b. Around 200 patients
c. Around 2000 patients d. Around 5000 patients
428. Alkaline diuresis is done for treatment of poisoning due to:
a. Amphetamine b. Morphine
c. Paracetamol d. Phenobarbitone
429. Drugs following zero order kinetics EXCEPT:
a. Phenytoin b. Phenobarbitone
c. Theophylline d. Aspirin
430. True about orphan drugs:
a. Drug used for orphans b. They are rare drugs
c. They are emergency drugs
d. Drugs for rare diseases
431. All are true about rifampicin EXCEPT:
a. Bacteriostatic agent
b. Acts by inhibiting DNA dependent RNA synthesis
c. Resistance is due to rpo-B gene
d. Can cause staining of soft lenses
432. ATT which can interfere with function of thyroid:
a. Streptomycin b. Para amino salicylic acid
c. Rifampicin d. Isoniazid

- 433. Which of the following ATT can arouse suicidal tendency:**
a. Kanamycin b. Capreomycin
c. Cycloserine d. Streptomycin
- 434. Drug used to perform stress echo:**
a. Adrenaline b. Adenosine
c. Dobutamine d. Thallium
- 435. Pralidoxime acts by:**
a. Stimulate Ach receptor
b. Inhibit breakdown of Ach
c. Block Ach receptor
d. Reactivate Ach esterase enzyme
- 436. Atropine can cause all EXCEPT:**
a. Mydriasis b. Vomiting
c. Bradycardia d. Sweating
- 437. Agonist of M2 receptor:**
a. Carbachol b. Methacholine
c. Bethanechol d. Pilocarpine
- 438. Rate limiting enzyme for noradrenaline synthesis:**
a. Dopa D carboxylase b. Acetylcholine esterase
c. Tyrosine hydroxylase d. Tyrosine reductase
- 439. Tachyphylaxis is shown by all EXCEPT:**
a. Amphetamine b. Tyramine
c. Imipramine d. Ephedrine
- 440. Most effective in increasing heart rate:**
a. Dopamine b. Adrenaline
c. Noradrenaline d. Isoprenaline
- 441. Beta blocker with a blocker capacity is?**
(DNB 2012-section-1)
a. Atenolol b. Labetelol
c. Propranolol d. Metoprolol
- 442. Drug used in the treatment for hyperprolactinemia is?**
(DNB 2012-section-1)
a. Bromocriptine b. Methyl Dopamine
c. Haloperidol d. Chlorpromazine
- 443. Which drug inhibits absorption of cholesterol from intestine?**
(DNB 2012-section-1)
a. Resins b. Ezetimibe
c. Niacin d. Orlistat
- 444. Modafinil is used as an adjunct in the treatment of?**
(DNB 2012-section-1)
a. Sleep apnea syndrome b. Narcolepsy
c. ADHD d. Shift work disorder
- 445. Rizatriptan is a drug used for?** *(DNB 2012-section-1)*
a. Prophylaxis of migraine b. Acute migraine
c. Cluster headache d. Chronic migraine
- 446. Febuxostat is used for?** *(DNB 2012-section-1)*
a. Hyperkalemia b. Hyperuricemia
c. Hypernatremia d. Hypercalcemia
- 447. Drug withdrawn in India is?** *(DNB 2012-section-1)*
a. Levofloxacin b. Gatifloxacin
c. Moxifloxacin d. Ofloxacin
- 448. Which of the following is a parasympatholytic agent?**
(DNB 2012-section-1)
a. Atropine b. Neostigmine
c. Pyridostigmine d. Acetylcholine
- 449. Drug of choice for prophylaxis of TB is?**
(DNB 2012-section-1)
a. Rifampicin b. Isoniazid
c. Pyrizinamide d. Streptomycin
- 450. Anti-tubercular drug not given in liver disease is?**
(DNB 2012-section-1)
a. Isoniazid b. Ethambutol
c. Pyrizinamide d. Rifampicin
- 451. ACE inhibitors should not be used with?**
(DNB 2012-section-1)
a. Amilorides b. Calcium channel blockers
c. Chlorthalidone d. Spironolactone
- 452. Drug not used in the treatment of acute asthma attack is?**
(DNB 2012-section-1)
a. Oral prednisolone b. Inhalational salbutamol
c. Inhalational salmeterol d. IV corticosteroid
- 453. True about clavulanic acid is?** *(DNB 2012-section-1)*
a. β lactamase inhibitors
b. Extended spectrum penicillin
c. Gram negative bacteria
d. Plasmid inhibitors
- 454. Drug of choice for diarrhea in HIV is?**
(DNB 2012-section-1)
a. Loperamide b. Somatostatsins
c. Octreotide d. Codeine
- 455. Drugs that should be given with prescription of registered medical practitioner only are included in which schedule?**
a. Schedule C b. Schedule E
c. Schedule H d. Schedule I
- 456. Mechanism of action of clofibrates is?**
a. Inhibit HMGC_oA reductase
b. Inhibit HMG CoA synthase
c. Inhibit absorption of cholesterol
d. Inhibit release of TG and LDL
- 457. Which of the following anticancer drug is M phase specific?**
a. Methotrexate b. Vincristine
c. Etoposide d. Irinotecan
- 458. Renal papillary necrosis is caused by?**
a. NSAID b. Cocaine
c. Heroin d. Morphine
- 459. Anti-smoking drug is?**
a. Theophylline b. Biclutamide
c. Salmeterol d. Varenicline
- 460. Antagonist of benzodiazepine is?**
a. Naltrexone b. Flumazenil
c. Naloxone d. N-Acetyl cysteine

- 461. Inverse agonist of benzodiazepine:**
 a. β carboline b. Flumazenil
 c. Naloxone d. N-Acetyl cysteine
- 462. Sumatriptan is antagonist of?**
 a. 5HT 1A b. 5HT 1D
 c. 5HT 2A d. 5HT 4
- 463. Gynaecomastia is caused by?**
 a. Flutamide b. Cimetidine
 c. Pyrazinamide d. Methotrexate
- 464. Drug which can cause photosensitivity reaction is?**
 a. Streptomycin b. Demeclocycline
 c. Clindamycin d. Clofibrate
- 465. Daily dose of albendazole in neurocysticercosis in children is?**
 a. 1–3 mg/kg b. 4 to 8 mg/kg
 c. 15 mg/kg d. 25 mg/kg
- 466. Which of the following is an oxytocin antagonist?**
 a. Ritodrine b. Atosiban
 c. Isoxsuprine d. Methergine
- 467. Drug used for treatment of malignant hyperthermia is?**
 a. Succinylcholine b. Dantrolene
 c. Diazepam d. Valproate
- 468. Most common side effect of calcium channel blocker is?**
 a. Headache b. Constipation
 c. Diarrhoea d. Muscle cramps
- 469. Which of the following is a cerebro selective calcium channel blocker?**
 a. Nimodipine b. Ziconotide
 c. Verapamil d. Diltiazem
- 470. Drug approved for anorgasmia and premature ejaculation:**
 a. SSRI b. Beta blocker
 c. Alfa 2 antagonist d. Alfa 1 antagonist
- 471. Prokinetic drug with extrapyramidal side effect is?**
 a. Cisapride b. Domperidone
 c. Ondansetron d. Metoclopramide
- 472. Mechanism of action of sulfonamide is:**
 a. Inhibit bacterial cell wall synthesis
 b. Inhibit translocation of mRNA
 c. Inhibit folate synthesis
 d. Inhibit bacterial respiration
- 473. Mechanism of action of tranexamic acid in controlling bleeding is?**
 a. Inhibits plasminogen
 b. Promote platelet aggregation
 c. Cause vasoconstriction
 d. Promote fibrin synthesis
- 474. Most common side effect of thiazide diuretics is?**
 a. Hyperuricemia b. Hypermagnesemia
 c. Hypocalcemia d. Hypokalemia
- 475. H2 blockers are given for duodenal ulcer for a period of?**
 a. 4 weeks b. 6 weeks
 c. 8 weeks d. 12 weeks
- 476. Therapeutic index signifies?**
 a. Potency b. Toxic dose
 c. Safety d. Efficacy
- 477. Parathormone is useful in which of the following?**
 a. Hyperparathyroidism b. Paget's disease
 c. Osteoporosis d. Osteomalacia
- 478. Which insulin is never mixed with other insulins?**
 a. Lente b. Aspart
 c. Lispro d. Glargine
- 479. Drug of choice for neurogenic diabetes insipidus is?**
 a. Vasopressin b. Terlipressin
 c. Desmopressin d. Pralipressin
- 480. Drug which does not cause hemolysis in G6PD deficiency is?**
 a. Primaquine b. Dapsone
 c. Aspirin d. Methylene blue
- 481. Which of the following is a selective alpha 2 antagonist?**
 a. Prazosin b. Labetalol
 c. Yohimbine d. Butoxamine
- 482. Drug of choice for acute adrenal insufficiency is?**
 a. Oral prednisone b. IV Hydrocortisone
 c. IV Betamethasone d. IV Dexamethasone
- 483. Drug of choice for absence seizure is?**
 a. Clonazepam b. Diazepam
 c. Phenytoin d. Valproate
- 484. Drug of choice for Lennox gastaut syndrome:**
 a. Clonazepam b. Diazepam
 c. Phenytoin d. Valproate
- 485. Mechanism of action of aspirin is?**
 a. Inhibits COX-2 preferentially
 b. Inhibits COX-1 preferentially
 c. Inhibits COX1 and COX 2 reversibly
 d. Inhibits COX1 and COX 2 irreversibly
- 486. Anti tubercular drug which is exclusive for intracellular mycobacterium?**
 a. Isoniazid b. Rifampicin
 c. Pyrazinamide d. Ethambutol
- 487. Antiparkinson drug known to cause pleuropulmonary is?**
 a. Bromocriptine b. Ropinrole
 c. Pramiprexole d. Amantadine

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTIONS 2019

1. Ans. (d) X

- Parasympathetic outflow is from cranial nerve 3, 7, 9, 10 and sacral nerve 2, 3, 4.
- Majority of parasympathetic outflow (~75%) is from vagus nerve (CN-X)

2. Ans. (b) Intravenous

- Bioavailability is fraction of unchanged drug reaching the systemic circulation following administration by any route.
- IV route has 100% bioavailability.

TABLE: Routes of administration, bioavailability, and general characteristics

Route	Bioavailability (%)	Characteristics
Intravenous (IV)	100 (by definition)	Most rapid onset
Intramuscular (IM)	75 to ≤ 100	Large volumes often feasible; may be painful
Subcutaneous (SC)	75 to ≤ 100	Smaller volumes than IM; may be painful
Oral (PO)	5 to < 100	Most convenient; first-pass effect may be important
Rectal (PR)	30 to < 100	Less first-pass effect than oral
Inhalation	5 to < 100	Often very rapid onset
Transdermal	80 to ≤ 100	Usually very slow absorption; used for lack of first-pass effect; prolonged duration of action

3. Ans. (d) Hydrocortisone

Classification of steroids

Short acting: (8 – 12 hours)	<ul style="list-style-type: none"> Cortisone Hydrocortisone
Intermediate acting (12 – 36 hours)	<ul style="list-style-type: none"> Fludrocortisone Prednisone Prednisolone Methylprednisolone
Long acting (36 – 72 hours)	<ul style="list-style-type: none"> Triamcinolone Dexamethasone Betamethasone

4. Ans. (a) Valproate

Ref: Katzung 14th ed P. 427, 434

- Though all the anti-epileptics have teratogenic potential, Valproate is the most teratogenic among all.
- Treatment with valproate during first trimester is associated with increased risk of neural tube defect including spina bifida, cardiovascular, orofacial and digital abnormalities.
- First trimester exposure with valproate causes 3 fold increased risk of major congenital malformations, most commonly spina bifida (absolute risk: 6–9%).

Extra Mile

- MC congenital defect associated with phenobarbitone exposure: Cardiac defect
- MC congenital defect associated with topiramate exposure: cleft lip and palate (10 fold increased risk)
- Antiseizure drugs with lowest congenital defect risk: Lamotrigine and Levetiracetam
- Antiseizure drug having maximal breast milk secretion: Lamotrigine

5. Ans. (a) Phase I

6. Ans. (b) Salbutamol

- Salbutamol is beta-2 agonist, preferred in acute bronchial asthma attack
- Most common side effect associated with the agent is Tremor

7. Ans. (d) Formoterol

- Beta-2 agonists are well known bronchodilators. This includes:
 - Salbutamol, Terbutaline, Formoterol, Salmeterol, Indacaterol, Albuterol etc.
- Among these agents formoterol, salmeterol, Indacaterol are longer acting analogue and are preferred in prophylactic therapy of bronchial asthma and COPD.

8. Ans. (b) Desmopressin

Ref: Katzung 14th ed. P 682

- Desmopressin is a long acting synthetic analogue of vasopressin
- DOC for neurogenic/pituitary diabetes insipidus: Desmopressin
- Note: Desmopressin is also used for treatment of Hemophilia A and von Willebrand disease, nocturnal enuresis.

Extra Mile

- DOC for nephrogenic diabetes insipidus: Thiazide diuretics
- Conivaptan and Tolvaptan: Vasopressin receptor antagonist. DOC for SIADH (Syndrome of Inappropriate Anti Diuretic Hormone). Also approved to be used in heart failure for free water clearance and in hyponatremia.

9. Ans. (c) **Lignocaine**Ref: Katzung 14th ed. P 241

- **Lidocaine** is one of the local anaesthetics having anti-arrhythmic properties (Class 1B)
- It has low incidence of toxicity and high degree of effectiveness in arrhythmias associated with acute MI.
- Used only by IV route (t_{1/2}: 1 – 2 hours)
- **MOA**: Blocks inactivated sodium channels
- **Use**:
 - DOC for termination of ventricular tachycardia and prevention of ventricular fibrillation
 - DOC for digoxin induced arrhythmia.
- It has least cardiotoxicity among sodium channel blockers.
- **Side effect**:
 - Depress myocardial contractility (can cause hypotension in heart failure patients)
 - **MC side effect**: Neurologic- Paresthesias, tremor, nausea, light headedness, hearing disturbances, slurring of speech and seizure episodes.

10. Ans. (a) **Allopurinol**Ref: Katzung 14th ed. P 661

- DOC for chronic gout/period between acute gout attacks: Allopurinol
- **MOA**: Xanthine oxidase inhibitor
- When initiating allopurinol therapy, colchicine or NSAID should be used until steady-state serum uric acid is normalized or decreased to less than 6 mg/dL and they should be continued for 6 months or longer.
- **Initial dose**: 50–100 mg/day
- **Side effect**:
 - Precipitation of gout (that's why initially given with NSAIDs or colchicine)
 - GI intolerance (N/V/D)
 - Peripheral neuritis and necrotizing vasculitis
 - Bone marrow suppression → Aplastic anemia
 - Hepatotoxicity and interstitial nephritis
 - Maculopapular rash and exfoliative dermatitis
 - Cataract

Extra Mile

- DOC for acute gout attack: Probenecid (NSAID except Aspirin)
- **Febuxostat**: Also a xanthine oxidase inhibitor. Used in patients with intolerance to allopurinol or not responding to it.
- **Uricosuric agents like Probenecid, Sulfinpyrazone, Lesinurad** can also be used in treatment of gout especially when allopurinol or febuxostat is contraindicated.

11. Ans. (d) **Amoxicillin**Ref: KDT 8th ed P 1018

Class of Drugs contraindicated in pregnancy and its safer alternative

Class of drug	Contraindicated	Safer alternative
Antibacterials (systemic bacterial infections)	Cotrimoxazole, Fluoroquinolones (X), Tetracycline (X), Doxycycline (X), Chloramphenicol (X), Gentamicin, Streptomycin (X), Kanamycin (X), Tobramycin (X), Clarithromycin, Azithromycin, Clindamycin, Vancomycin, Nitrofurantoin,	Penicillin G, Ampicillin, Amoxicillin-clavulanate, Cloxacillin, Piperacillin, Cephalosporins, Erythromycin

Extra Mile

- Sulfonamides (Co-Trimoxazole) if used during pregnancy can lead to kernicterus.
- Aminoglycosides (Gentamicin): Can produce ototoxicity and nephrotoxicity
- Fluoroquinolones (Ciprofloxacin): Affects growing cartilage and tendon

12. Ans. (a) **Regular Insulin**Ref: Katzung 14th ed. P 753

- **Regular insulin** is a short-acting, soluble crystalline zinc insulin
- Hypoglycemic effect appears within 30 minutes after subcutaneous injection, peaks at about 2 hours, and lasts for 5–7 hours.
- For very insulin-resistant subjects who would otherwise require large volumes of insulin solution, a U500 preparation of human regular insulin is available both in a vial form and a disposable pen
- **IV infusion**: used in treatment of diabetic ketoacidosis

13. Ans. (d) **Insulin glargine**Ref: Katzung 14th ed. P 755

- **Insulin glargine** is a soluble, “peakless” (i.e. having broad concentration plateau), long acting insulin analogue.
- Onset: 1–1.5 hours. Duration of action: 11–24 hours.

TABLE: Summary of bioavailability characteristics of the insulins

Insulin preparations	Onset of action	Peak action	Effective duration
Insulins lispro, aspart, glulisine	5–15 minutes	1–1.5 hours	3–4 hours
Human regular	30–60 minutes	2 hours	6–8 hours
Technosphere inhaled insulin	5–15 minutes	1 hour	3 hours
Human NPH	2–4 hours	Flat	~24 hours
Insulin detemir	0.5–1 hours	Flat	17 hours
Insulin degludec	0.5–1.5 hours	Flat	>42 hours

14. Ans. (c) Schistosomiasis

Ref: Katzung 14th ed. P 939

- Drug of choice for all the **flukes (trematodes)** is **Praziquantel** except liver fluke, where drug of choice is Triclabendazole or Bithionol.
- Drug of choice for all the **tapeworms (cestodes)** is **Praziquantel** except Cysticercosis and Echinococcus where drug of choice is Albendazole.
- Drug of choice for all the **Roundworms (Nematode)** is Albendazole/Mebendazole except Strongyloides, Onchocerca (DOC: Ivermectin) and Filariasis, loa-loa disease (DOC is Diethylcarbamazine).

TABLE: Drugs for the treatment of helminthic infections¹

Infection organism	Drug of choice	Alternative drugs
Roundworms (nematodes)		
<i>Ascaris lumbricoides</i> (roundworm)	Albendazole or pyrantel pamoate or mebendazole	Ivermectin, piperazine
<i>Trichuris trichiura</i> (whipworm)	Mebendazole or albendazole	Ivermectin, oxantel pamoate drug combinations
<i>Necator americanus</i> (hookworm); <i>Ancylostoma duodenale</i> (hookworm)	Albendazole or mebendazole or pyrantel pamoate	
<i>Strongyloides stercoralis</i> (threadworm)	Ivermectin	Albendazole or thiabendazole
<i>Enterobius vermicularis</i> (pinworm)	Mebendazole or pyrantel pamoate	Albendazole
<i>Trichinella spiralis</i> (trichinosis)	Mebendazole or albendazole; add corticosteroids for severe infection	
<i>Trichostrongylus</i> species	Pyrantel pamoate or mebendazole	Albendazole
Cutaneous larva migrans (creeping eruption)	Albendazole or ivermectin	Thiabendazole (topical)
Visceral larva migrans	Albendazole	Mebendazole
<i>Angiostrongylus cantonensis</i>	Albendazole or mebendazole	
<i>Wuchereria bancrofti</i> (filariasis); <i>Brugia malayi</i> (filariasis); tropical eosinophilia; <i>Loa loa</i> (loiasis)	Diethylcarbamazine	Ivermectin
<i>Onchocerca volvulus</i> (onchocerciasis)	Ivermectin	
<i>Dracunculus medinensis</i> (guinea worm)	Metronidazole	Thiabendazole or mebendazole
<i>Capillaria philippinensis</i> (intestinal capillariasis)	Albendazole	Mebendazole
Flukes (trematodes)		
<i>Schistosoma haematobium</i> (bilharziasis)	Praziquantel	Metrifonate
<i>Schistosoma mansoni</i>	Praziquantel	Oxamniquine

Contd...

Infection organism	Drug of choice	Alternative drugs
<i>Schistosoma japonicum</i>	Praziquantel	
<i>Clonorchis sinensis</i> (liver fluke); <i>Opisthorchis</i> species	Praziquantel	Albendazole
<i>Paragonimus westermani</i> (lung fluke)	Praziquantel	Bithionol
<i>Fasciola hepatica</i> (sheep liver fluke)	Bithionol or triclabendazole	
<i>Fasciolopsis buski</i> (large intestinal fluke)	Praziquantel or niclosamide	
<i>Heterophyes heterophyes</i> ; <i>Metagonimus yokogawai</i> (small intestinal flukes)	Praziquantel or niclosamide	
Tapeworms (cestodes)		
<i>Taenia saginata</i> (beef tapeworm)	Praziquantel or niclosamide	Mebendazole
<i>Diphyllobothrium latum</i> (fish tapeworm)	Praziquantel or niclosamide	
<i>Taenia solium</i> (pork tapeworm)	Praziquantel or niclosamide	
Cysticercosis (pork tapeworm larval stage)	Albendazole	Praziquantel
<i>Hymenolepis nana</i> (dwarf tapeworm)	Praziquantel	Niclosamide nitazoxanide
<i>Echinococcus granulosus</i> (hydatid disease); <i>Echinococcus multilocularis</i>	Albendazole	

15. Ans. (b) Lithium carbonate

Ref: Katzung 14th ed. P 524

- Drug of choice for mania is Lithium
- DOC for acute attack of manic episode: Atypical antipsychotics/Benzodiazepines
- Agents that can be used in treatment of Mania: (Mn: Li ACT Val)
 - Lithium (DOC)
 - Atypical antipsychotics
 - Carbamazepine
 - Topiramate
 - Valproate

16. Ans. (c) Mupirocin

Ref: Katzung 14th ed. P 1070

- Mupirocin is used for topical treatment of minor skin infection such as impetigo. It is also effective against gram positive cocci including-susceptible and methicillin-resistant strains of staph aureus.
- Intranasal mupirocin ointment is preferred for eliminating nasal carrier of S. aureus
- MOA: inhibits staphylococcal isoleucyl tRNA synthetase.

17. Ans. (c) Bupropion

Ref: Katzung 14th ed. 584

- **Book states:** “the antidepressant Bupropion is approved for nicotine cessation therapy. It is most effective when combined with behavioral therapies”

- **Note:** Topiramate is approved for decreasing alcohol craving, obesity.

18. Ans. (b) Donepezil

Ref: Katzung 14th ed. P 1063

- DOC for Alzheimer's disease: Donepezil (reversible AchEsterase inhibitor)
- Other Ach Esterase inhibitor used in treatment of Alzheimer's disease is Gallantamine, Rivastigmine.

19. Ans. (a) Dopamine

- Dopamine keeps inhibitory control over prolactin.
- This explains the reason behind hyperprolactinemia in psychotic patients who are treated with dopamine antagonists.
- Dopamine agonists (bromocriptine, cabergoline) therefore are used in treatment of hyperprolactinemia, acromegaly.

20. Ans. (b) Etoricoxib

Ref: Katzung 14th ed. P 323, 647

TABLE: Non-steroidal anti-inflammatory drugs classification

Selective COX-2 Inhibitor (Coxibs)	Non-selective COX-1 and 2 inhibitor
<ul style="list-style-type: none"> • Celecoxib • Etoricoxib • Valdecoxib • Rofecoxib • Parecoxib 	<ul style="list-style-type: none"> • Indomethacin • Ibuprofen • Naproxen • Piroxicam • Aspirin • Ketoprofen

**GENERAL PHARMACOLOGY****21. Ans. (a) Preclinical stage***Ref: Sharma & Sharma 3rd ed. P 101*

- **Clinical Trial:** Systemic study of a new drug in human subject to generate data for pharmacological and adverse effects with an aim to determine safety and efficacy.
- The procedures followed during the trial should comply with an elaborate code known as “**Good clinical practice (GCP)**” prescribed by international conference on Harmonization.
- GCP provide details about:
 - Designing the trial
 - Collection of the data
 - Recording of information
 - Statistical analysis
 - Documentation and reporting the results of clinical trials

PRECLINICAL EVALUATION PHASE (ANIMAL STUDIES)

- Animals studies are done initially in order to define the pharmacological profile of lead compound
- Aim: Satisfy all requirements that are needed before a compound is considered fit to be tested for first in humans
- It is done according to formal operating code known as “**Good Laboratory Practices**”
- Good laboratory practices ensures reliability and reproducibility of laboratory data and minimises human errors
- Duration of preclinical study: ~2 years
- **Out of 10,000** compounds screened during preclinical phase, only 10 qualify, which are then subjected to clinical trial in humans.

22. (d) All of the above*Ref: Goodman & Gillman's 13th ed. P 90*

- The common antifungal agent ketoconazole is a potent inhibitor of CYP3A4
- Therefore coadministration of ketoconazole with other CYP3A4 inhibitors like anti-HIV drug viral protease inhibitors (ritonavir, indinavir), clarithromycin, itraconazole, nefazodone, and grapefruit juice reduces the clearance of these drugs and increases its plasma concentration and the risk of toxicity. Hence these drugs are not given together.

23. Ans. (b) Adrenaline*Ref: Goodman and Gillman 13th ed. P 58*

- **Physiological (Functional) antagonism** occurs when two different agents produce opposite effects by acting at the different receptors.
 - Example: action of histamine and Epinephrine at smooth muscle of bronchus. Histamine causes bronchoconstriction (by acting at H₁ receptor) but epinephrine causes bronchodilation (by acting at β₂ receptor).

Extra Mile

- **Pharmacological antagonist:** Drug binds at the receptor of agonist and produce no effect, shows no intrinsic activity.
- **Chemical antagonist:** Agent that binds chemically with the agonist. Example: Binding of chelating agent with the metal.

24. Ans. (d) A and B both*Ref: Goodman and Gillman 13th ed. P 22*

- **AUC** is the total area under the curve that describes the measured concentration of drug in the systemic circulation as a function of time (from zero to infinity) after its administration.
- AUC represents extent of absorption evaluating the bioavailability of drug from its dosage form and its clearance.

**25. Ans. (b) Bizarre effect of a drug***Ref: KD Tripathi, 7th ed. pg. 82*

Adverse drug reactions are classified as follows:

Type A (Predictable)	Augmented pharmacological effects: Dose dependent Side effects → at therapeutic dose Toxicity → at high dose Intolerance → toxicity at therapeutic dose
Type B (Unpredictable)	Bizarre effects: Dose independent Drug allergy: 4 types Anaphylaxis (type I) Blood cytotoxicity (type II) Complex (Ag-Ab) mediated reaction (type III) Delayed hypersensitivity (type IV) Idiosyncrasy: Abnormal effect, e.g. CNS depressants causing stimulation
Type C	Chronic effects: Duration dependent Adverse effects of prolonged treatment e.g. Corticosteroids causing immunosuppression
Type D	Delayed effects: Adverse effects long time after stopping the drug e.g. Carcinogenicity and Mutagenicity by anticancer drugs and radioisotopes
Type E	End of treatment effects Adverse effects due to abruptly stopping the drug e.g. withdrawal syndrome of clonidine i.e. rebound hypertension
Type F	Failure of therapy Ex: OCP failure Antimicrobial resistance

26. Ans. (a) **Nitrate induced headache**

Ref: KDT, 7th ed. pg. 82

Note: Nitrate induced vasodilation and headache occur immediately, these are not chronic adverse drug reactions whereas others are example of type C or chronic ADRs.

27. Ans. (c) **Bioavailability**

Ref: KD Tripathi, 7th ed. pg. 16

BIOAVAILABILITY

- Bioavailability is a measure of the fraction of administered dose of a drug that reaches the systemic circulation in the unchanged form.
- Bioavailability of drug injected IV is 100%**, but is frequently lower after oral ingestion because—
 - The drug may be incompletely absorbed.
 - The absorbed drug may undergo first pass metabolism in the intestinal wall/liver or be excreted in bile.

28. Ans. (d) **Monitoring adverse effects of drugs**

Ref: KDT, 6th ed. pg. 79

- Pharmacovigilance is the science and activities relating to the **detection, assessment, understanding and prevention of adverse effects** or any other possible drug-related problems.
- Recently, its concerns have been widened to include herbals, traditional and complementary medicines, blood products, biologicals, medical devices and vaccines.

29. Ans. (c) **To monitoring adverse effects of drugs**

Please refer to above explanation

30. Ans. (b) **Intravenous**

Ref: Katzung Pharmacology, 10th ed. Ch 3

- Bioavailability is defined as the fraction of unchanged drug reaching the systemic circulation following administration by any route.
- In case a drug is given orally, the bioavailability shall be less than 100%. This is due to
 - Incomplete extent of absorption
 - First pass metabolism

TABLE: Routes of administration, bioavailability, and general characteristics

Route of Administration	General characteristics	Bioavailability
Intravenous	Onset of action is fastest	100%
Intramuscular	Painful	75–100%
Subcutaneous	Lesser volumes can be given compared to intramuscular route	75–100%
Per oral	Most convenient from patients perspective MC used route	5% to <100% First pass metabolism limits blood levels
Per rectal	Less first pass metabolism than per oral	30 to <100%
Transdermal	Very slow absorption Lack of first pass effect Prolonged duration of action	80–100%

31. Ans. (a) **Rate of elimination is independent of plasma concentration**

Ref: Goodman & Gillman 13th ed. P 20

- In pharmacokinetics, drug's clearance, rate of elimination and half life is given by the order of kinetics i.e. by zero order kinetics or first order kinetics.

Zero order kinetics Non-Linear kinetics	First order kinetics (Linear kinetics)
Constant amount of drug is eliminated per unit of time	Constant fraction of drug eliminated per unit of time
Rate of elimination is independent of plasma concentration	Rate of elimination is directly proportional to plasma concentration
Clearance is more at low concentration and less at high concentration	Clearance remains constant
Half life less at low concentration, more at high concentration	Half life is constant
Only few drugs follow zero order kinetics	Most drugs follow first order kinetics

NOTE: Drugs which follow zero order kinetics: **(WATT-Power)**
Warfarin
Alcohol/Aspirin
Theophylline
Tolbutamide
Phenytoin,
Propaphenone

Kinetics in a Nutshell:

Zero order	First order
ROE = constant CL \propto 1/P.C. t _{1/2} \propto PC	ROE \propto P.C. CL = constant t _{1/2} = constant

32. Ans. (a) **Phenytoin**

Ref: Katzung, 11th ed. pg. 80

ACETYLATION

- Compounds having amino or hydralazine residues are conjugated with the help of N-Acetyl transferase enzyme.
 - If acetylation is slow- increased side effect
 - Fast acetylation- not effective or effectiveness decreases
 - Normal acetylation- effective
- These drugs are remembered as CHIPS-ABC drugs:
 - Clonazepam** (sedative)
 - Hydralazine** (anti HTN)
 - Isoniazid** (anti TB)
 - Procainamide** (anti-arrhythmic)
 - Sulfonamides** (dapsone)
 - Acebutalol, Amrinone, ASA**
 - Benzocaine**
 - Caffeine**
- Phenytoin hydroxylation in liver is carried out by cytochrome P 450.
- The drugs metabolized by acetylation causes SLE.

33. Ans. (b) **Isoniazid**

Ref: KDT, 6th ed. pg. 25

Please refer to above explanation

34. Ans. (c) **G_{t1}**

Ref: Katzung's Pharma, 14th ed. pg. 31

TABLE: G-Proteins and their receptors and effectors

G-protein	Assicated receptor	Effector Pathway
G _{t1} , G _{t2}	Photons (rhodopsin and color opsins in retinal rod and cone cells)	↑cGMP phosphodiesterase → ↓ ⁻ cGMP (phototransduction)
G _s (stimulates membrane-bound adenylate cyclase)	β-adrenoceptors, histamine, serotonin, dopamine (D ₁) receptor, Glucagon	Increased adenylyl cyclase activity → increased cAMP
G _i (inhibits membrane-bound adenylate cyclase)	α ₂ -adrenoceptors, muscarine (M ₂) receptors, opioid receptors, some SHT receptors; dopamine (D ₂) receptor	<ul style="list-style-type: none"> Decreased adenylyl cyclase activity → decreased cAMP Open cardiac k⁺ channel → ↓ HR
Gq/G _{12/13} (activates phospholipase-C)	α ₁ -adrenoceptors, muscarinic (M ₁) receptor, angiotensin receptor (AT ₁)	Activates phospholipase-C → ↑ IP ₃ , ↑ DAG, ↑ Ca ²⁺ entry

35. Ans. (a) **cAMP**

Ref: Katzung, 14th ed. pg. 31

- G-protein receptor for glucagon is G_s which acts via ↑ Adenylyl cyclase causing ↑ cAMP.
- Refer to above table for detailed explanation.

36. Ans. (d) **Excreted mainly by kidneys**

Ref: Katzung, 14th ed. pg. 56; KDT, 6th ed. pg. 16-17

Ionized drugs/hydrophilic drugs	Nonionized drugs/lipophilic drugs
They are water soluble	Lipid soluble
Can not cross epithelial lining	Can cross epithelial lining easily
Poor absorption from intestine	Well absorbed from intestine
Can not cross placental barrier	Can cross placental barrier
Excreted mainly by kidneys	Excreted through faeces, urine, sweat etc.

Extra Mile

When medium is same: drugs will cross

Example 1: Acidic drug will cross acid medium

Acidic drugs like salicylates, barbiturates etc. are predominantly *unionized* in the acid gastric juice and are absorbed from stomach.

Example 2: Basic drug will cross basic medium.

Basic drugs like morphine, quinine etc. are highly ionized and are absorbed only after reaching small intestine when it gets basic medium.

37. Ans. (a) Rifampicin

Ref: Katzung, 14th ed. pg. 59; KDT, 6th ed. pg. 27

- **Enzyme induction** involves microsomal enzyme in liver as well as in other organ.
- It increases the rate of metabolism 2-4 fold. Therefore effect of drug decreases.
- **Enzyme inhibitors** also involves microsomal enzyme.
- It inhibits the microsomal enzyme, which decreases drug metabolism rate and increases duration of drug action.
- Let us take an example of warfarin, which is used as an anti thrombotic agent.
 - **Warfarin + enzyme inducer** = Thrombosis (warfarin metabolism increases and action of warfarin diminishes rapidly and thrombotic condition arises).
 - **Warfarin + enzyme inhibitor** = Bleeding (warfarin metabolism decreases and duration of warfarin action increases and patient develops bleeding tendency)

Drugs which are enzyme inducers and enzyme inhibitors

Enzyme inducers	Enzyme inhibitors
Griseofulvin	Phenylbutazone
Phenytoin	Erythromycin
Rifampicin	Allopurinol, Amiodarone
Smoking	Ciprofloxacin
Carbamazepine	Omeprazole
Phenobarbitone	Cimetidine
Barbiturate	Ketoconazole
DDT	Valproate
Remembered as: GPRS Cell Phone Battery Dead	Mn: PEACOCK Vala

Extra Mile

- Most of the anti epileptic are enzyme inducers except **VALPROATE (an inhibitor)**
- Most of the antimicrobial are enzyme inhibitors except **GRISEOFULVIN (an Inducer)**

38. Ans. (a) Carbamazepine

Ref: Katzung, 14th ed. pg. 59

- Carbamazepine is an enzyme inducer.

Please refer to above explanation.

39. Ans. (b) Make urine alkaline with NaHCO₃

Ref: Katzung, 14th ed. pg. 9; KDT, 6th ed. pg. 16

- Aspirin is an acidic drug, it readily crosses any acidic medium. To treat this toxicity, make the urine alkaline with NaHCO₃.
- Now, this acidic drug can't be reabsorbed from the basic medium, and it readily gets excreted from the body.

Extra Mile

- In basic drug poisoning like amphetamine, we acidify the urine with NH₄Cl to change the medium, which opposes reabsorption and hence excretion.
- N-acetyl cysteine is the DOC for paracetamol poisoning

40. Ans. (a) Glucocorticoids

Ref: Goodman & Gillman 13th ed. P 851, 809

- Ligands that act by intracellular receptors are classified into nuclear and cytoplasmic. All these ligands acts by nuclear transcription but their receptors are either present in nucleus (nuclear receptor) or in cytoplasm (cytoplasmic receptor).
- Glucocorticoids act by binding to a specific glucocorticoid receptor (GRs) that is a member of the nuclear receptor family of transcription factors.
- GRs reside predominantly in the cytoplasm in an inactive form complexed with other proteins. Steroid binding results in receptor activation and translocation to the nucleus
- The GR translocates to the nucleus and induces complex gene expression changes that lead to antiproliferative and apoptotic responses in sensitive cells.

Receptors	Ligands
Nuclear receptors present in nucleus (Mn: ROAD TRAP Fixed)	RAR (Retinoic acid Receptor) Oestrogen Vitamin A Vitamin D Thyroxine Retinoid X receptor (RXR) AHR (Aryl Hydrocarbon Receptor) PPAR (peroxisome proliferator-activated receptor) PXR (Pregnane X Receptor) FXR (Farnesoid X receptor)
Nuclear receptors present in Cytoplasm	All Steroids EXCEPT Oestrogen (Ex: Glucocorticoids, Androgen)
Cell membrane via G protein stimulation	All others like ACTH, LH, GH, FSH

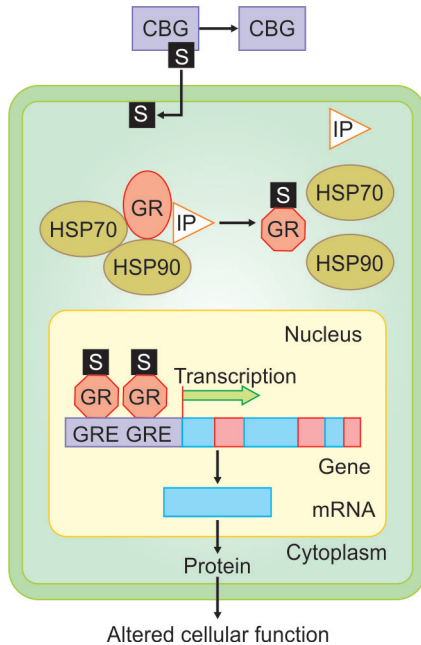

FIGURE: Intracellular mechanism of action of the GR. The figure shows the molecular pathway by which cortisol (labeled S) enters cells and interacts with the GR to change GR conformation (indicated by the change in shape of the GR), induce GR nuclear translocation, and activate transcription of target

Extra Mile

(Goodman & Gillman 13th ed.) (Important)

TABLE: Nuclear receptors that induce drug metabolism

Receptor	Ligands
Aryl hydrocarbon receptor (AHR)	Omeprazole
Constitutive androstane receptor (CAR)	Phenobarbital
Pregnane X receptor (PXR)	Rifampin
Farnesoid X receptor (FXR)	Bile acids
Vitamin D receptor (VDR)	Vitamin D
Peroxisome proliferator-activated receptor (PPARs)	Fibrates
Retinoic acid receptor (RAR)	<i>all-trans</i> -Retinoic acid
Retinoid X receptor (RXR)	<i>9-cis</i> -Retinoic acid

41. Ans. (b) **Androgen**

Ref: Goodman & Gillman 13th ed. P 851, 809

- Androgens act by binding to a specific androgen receptor (ARs) that is a member of the nuclear receptor family of transcription factors.

- ARs reside predominantly in the cytoplasm in an inactive form complexed with other proteins. Androgen binding results in receptor activation and translocation to the nucleus

Please refer to above question for detailed explanation

42. Ans. (a) **Leutenizing Hormone**

Ref: Goodman & Gillman 13th ed. P 851, 809

- Leutenizing hormone acts via cell membrane receptor.

43. Ans. (a) **Phenytoin**

Ref: Katzung, 14th ed. pg. 432; KDT, 6th ed. pg. 34-35

- Therapeutic dose monitoring (TDM) is used to monitor the effect of drug through plasma concentration.

Criteria to do TDM

- When response of drug can't be measured.

Note:

- Response of warfarin measured by INR.
- Response of metformin measured by blood glucose level.
- Response of propranolol measured by BP measurement.
- If any drug having narrow therapeutic index (unsafe drugs).
- If a drug is showing wide variation in pharmacokinetics.

Drugs in which TDM done (Remembered as: DAAALI)

- Digitalis
- Aminoglycosides (Gentamicin)
- Anti epileptics
- Anti Cancer
- Lithium
- Immuno suppressant (Cyclosporine, Tacrolimus, Sirolimus)

TABLE: Therapeutic drug range for some anti-seizure drug

Drug	Reference range
Carbamazepine	4–12
Clobazam	0.03–0.30
Ethosuximide	40–100
Phenytoin	10–20
Phenobarbital	15–40
Valproate	40–100
Lamotrigine	3–15
Levetiracetam	12–46
Oxcarbazepine	5–35
Topiramate	5–20

44. Ans. (a) **3 months**

Ref: Katzung's Pharmacology, 14th ed. pg. 13

Type of test	Approach
Acute toxicity	Defined as dose that is lethal in approximately 50% of animals and is maximum tolerated dose. It requires usually two species, two routes, single dose.
Subacute toxicity	It requires three doses and two species. 4 weeks to 3 months may be necessary prior to clinical trial.
Chronic toxicity	It is done in Rodent and non-rodent species for 6 months or longer. Required when drug is intended to be used in humans for prolonged periods. Usually run concurrently with clinical trial.
Carcinogenic potential	Two years, two species. It is required when drug is intended to be used in humans for prolonged periods.
Mutagenic potential	Effects on genetic stability and mutations in bacteria (Ames test) or mammalian cells in culture
Investigative toxicology	Determine sequence and mechanisms of toxic action. Discover the genes, proteins, pathways involved. Develop new methods for assessing toxicity.

45. Ans. (a) **Two different species**

Ref: Katzung, 14th ed. pg. 13

Please refer to above table for explanation.

46. Ans. (c) **Alprazolam**

Ref: Goodman & Gillman 13th ed. 1320-21; Katzung's Pharmacology, 10th ed. Ch 60

- Alprazolam comes under "Category D" drugs
- The FDA has established five categories to indicate the potential of a drug to cause birth defects **if used during pregnancy**.
- These categories range from A to X, in increasing order of concern:

Category A	No risk in controlled human studies	Adequate and well-controlled studies have failed to demonstrate a risk to the fetus in the first trimester of pregnancy (and there is no evidence of risk in later trimesters). <i>Example drugs: Levothyroxine, Folic Acid, Magnesium Sulfate, Liothyronine</i>
Category B	No risk in other studies	Animal reproduction studies have failed to demonstrate a risk to the fetus and there are <i>no adequate and well-controlled studies in pregnant women</i> . <i>Example drugs: Metformin, Hydrochlorothiazide, Cyclobenzaprine, Amoxicillin, PPI</i> Should be prescribed only as needed for maternal health.
Category C	Risk not ruled out	Animal reproduction studies have shown an adverse effect on the fetus and there are no adequate and well-controlled studies in humans, but potential benefits may warrant use of the drug in pregnant women despite potential risks. <i>Example drugs: Tramadol, Gabapentin, Amlodipine, Trazodone, Prednisone</i> Prescribed in pregnancy only when benefit clearly outweighs risk.
Category D	Positive evidence of risk	There is positive evidence of human fetal risk based on adverse reaction data from investigational or marketing experience or studies in humans, but potential benefits may warrant use of the drug in pregnant women despite potential risks. <i>Example drugs: Lisinopril, Alprazolam, Losartan, Clonazepam, Lorazepam</i> Not used during pregnancy. Should be prescribed only if absolutely necessary.
Category X	Contraindicated in pregnancy	Studies in animals or humans have demonstrated fetal abnormalities and/or there is positive evidence of human fetal risk based on adverse reaction data from investigational or marketing experience, and the risks involved in use of the drug in pregnant women clearly outweigh potential benefits. <i>Example drugs: Atorvastatin, Simvastatin, Warfarin, Methotrexate, Finasteride</i> Must not be used during pregnancy or in women likely to become pregnant.

TABLE: Clinical Trials and its characteristics

Phase I first in human	Phase II first in patient	Phase III multisite trial	Phase IV postmarketing surveillance
10–100 participants	50–500 participants	A few hundred to a few thousand participants	Many thousands of participants
Usually healthy volunteers; occasionally patients with advanced or rare disease	Patient-subjects receiving experimental drug	Patient-subjects receiving experimental drug	Patients in treatment with approved drug
Open label	Randomized and controlled (can be placebo controlled); may be blinded	Randomized and controlled (can be placebo controlled) or uncontrolled; may be blinded	Open label
Safety and tolerability	Efficacy and dose ranging	Confirm efficacy in larger population	Adverse events, compliance, drug-drug interactions
1–2 years	2–3 years	3–5 years	No fixed duration
US \$10 million	US \$20 million	US \$50–100 million	—
Success rate: 50%	Success rate: 30%	Success rate: 25%–50%	—

- Maximum drug failure occur in this phase: Phase II
- Most important phase of clinical trial: Phase III
- A new drug is launched in market after phase III

Extra Mile

- **Phase 0 trial** is microdosing study, done on normal healthy volunteers. To study the PK/PD of drug by radiolabelling and administering.
- **Phase 5** clinical trial is Pharmacoeconomics.
- Phase 0 and 1 done on normal healthy volunteers.

48. Ans. (c) Phase II

Ref: Goodman & Gillman 13th ed. P 6

Refer to above explanation

49. Ans. (d) Phase V

Ref: Goodman & Gillman 13th ed. P 6

Refer to above explanation

50. Ans. (b) Lisinopril

Ref: KDT 6th ed. pg. 24

- Drugs that are administered and then converted to the active drug by biologic processes—inside the body are called a **prodrug**.
- If an active drug converted to another active metabolite, they are considered as prodrugs.
- All ACE inhibitors are prodrug EXCEPT **Captopril** and **Lisinopril** (Mn = ACL)

- **Other List of prodrugs are (MAMC-LEADS)**
 - Minoxidil, ace inhibitors, mercaptopurine, cyclophosphamide, clopidogrel
 - Levodopa, enalapril, alpha methyl dopa, dipivefrine, sulfasalazine, sulindac

51. Ans. (d) Captopril

Please refer to above explanation

52. Ans. (b) Drugs used for rare disease

Ref: Katzung, 14th ed. pg. 18

- Drugs which are developed specifically for rare diseases are called **orphan drugs**.
- These drugs are difficult to research, develop, and market due to lack of financial benefits.
- Because of this a separate law known as 'The Orphan Drug Act' was passed in 1983.
- **Examples** include deferiprone to treat iron overload in thalasemia patients, N-acetylcysteine to treat paracetamol poisoning etc.

53. Ans. (d) Decrease in efficacy

Ref: KDT pg. 73

- The food, drug and cosmetics act requires expiry date on all the drugs. Drugs used past the expiry date may lead to suboptimal therapeutic effect due to loss of efficacy.
- Drug and cosmetics act (1940) specifies the life period of drugs (mostly 1-5 years) and the conditions of storage.

The expiry of other medicines has to be specified by the manufacturer but cannot exceed 5 years.

- The expiry date doesn't mean that the medicines has actually been found to loss potency or become toxic after it, but simply the quality of the medicine is not assured after the expiry date and the manufacturer is not liable if any harm arises from the use of product.

AUTONOMIC NERVOUS SYSTEM

54. Ans. (a) Promethazine

Ref: Goodman & Gillman 13th ed. P 935

- Drugs that are used as agent of choice for motion sickness are:
 - **Antimuscarinic** agents like Hyoscine and Scopolamine
 - **H₁ antagonist drugs** like Promethazine, Diphenhydramine > Buclizine, Cyclizine, etc.
- The anti-motion sickness activity of both these classes becomes more pronounced when combined with ephedrine.
- Both the class of drugs can also be used in Meniere's syndrome.

TABLE: General classification of antiemetic agents

Antiemetic class	Examples	Most effective against
5HT ₃ receptor antagonists ^a	Ondansetron	Cytotoxic drug-induced emesis
Centrally acting Dopamine receptor antagonists	Metoclopramide Promethazine	
Cannabinoid receptor agonists	Dronabinol nabilone	
Neurokinin receptor antagonists	Aprepitant	Cytotoxic drug induced emesis (delayed vomiting)
Histamine H ₁ antagonists	Cyclizine	Vestibular emesis (Motion sickness)
Muscarinic receptor antagonists	Hyoscine (scopolamine)	

^a The most effective agents for chemotherapy induced nausea and vomiting are the 5HT₃ antagonists and metoclopramide.

55. Ans. (b) Alpha 2 agonist

Ref: Goodman & Gillman 13th ed. P 203

- Alpha methyl dopa is an alpha-2 agonist acts as centrally acting sympatholytic agent

α2 agonist	Uses
Alpha methyl dopa	Antihypertensive
Clonidine	Antihypertensive
Tizanidine	Sedative
Moxonidine	Analgesics
Apraclonidine	Glaucoma (Decrease aqueous production)
Brimonidine	
Guanfacine	Antihypertensive ADHD

56. Ans. (c) Active miotic

Ref: Goodman & Gillman 13th ed. P 1017

- Pilocarpine is one of the M₃ receptor agonist causing active miosis.
- To understand this concept of active and passive miosis/mydriasis, we need to know the receptors present in eye and its function:

Receptor	M3	α1	Example of drugs
Location	Sphincter pupillae Ciliary muscle	Dilator pupillae/ Radial muscle	
Agonist	Active miosis	Active mydriasis	M ₃ agonist: Pilocarpine α1 agonist: Dipivefrin
Antagonist	Passive mydriasis	Passive miosis	M ₃ antagonist: Atropine α1 antagonist: Prazosin

57. Ans. (b) Prazosin

Ref: Goodman & Gillman 13th ed. P 208-209

- Prazosin is one of the non-selective alpha 1 antagonists used for treatment of hypertension and BPH.
- DOC for HTN + BPH: Prazosin
- DOC for BPH: Silodosin (selective α_{1a} agonist)
- **Side effect:**
 - Marked Postural hypotension (orthostatic/first dose hypotension), syncope → can cause recurrent falls. Therefore it is given at bedtime
 - Retrograde ejaculation

58. Ans. (a) Plasma acetylcholinesterase

Ref: Goodman & Gillman 13th ed. P 170

- The diagnosis of organophosphate poisoning can be made with the help of history of exposure and characteristic cholinergic signs and symptoms.
- In suspected cases of milder or chronic poisoning determination of plasma cholinesterase activities in erythrocytes and plasma establishes the diagnosis. It the most sensitive test.

Extra Mile

- **Symptoms of organophosphate poisoning:**
 - Salivation, Lacrimation, Urination, Diarrhea, GI distress, Emesis, Fasciculation, Bradycardia, Pin point pupil (*Mn: SLUDGE-FBP*).
- **Antidote of OP poisoning:** Atropine (2-4 mg IV or 2 mg IM → repeated every 10–15 minutes till atropinization).
- **AChE reactivators:**
 - **Pralidoxime (2-PAM), Obidoxime:** Action seen peripherally only (1-2 mg IV slow infusion. If symptom persists → repeat the dose)
 - **Diacetylmonoxime (DAM):** Action seen both peripheral and central.

59. Ans. (a) 1% atropine ointment

Ref: K.D. Tripathi 8th ed. P 131

- Atropine 1% ointment is preferred for refractive error test in children below 5 years. It is applied 24 hours and 2 hours before the procedure.
- The shorter acting agents like homatropine, tropicamide and cyclopentolate doesn't produce effective cycloplegia in children (ciliary muscle tone of child is high)
- Ointment is preferred over eye drop as there is increased risk of systemic absorption of eye drop which can cause anticholinergic side effect in child. Example: Hyperthermia, decreased secretion, tachycardia etc.

Extra Mile

- Cycloplegic agent of choice is adult/elderly: Tropicamide. The protein binding of esmolol is 55%.
- For only fundoscopy/mydriasis, preferred agent is: Phenylephrine (Sympathomimetic)

60. Ans. (a) β_2 agonist

Ref: Goodman & Gillman's 13th ed. P 201

- Ritodrine is a β_2 -selective agonist that was developed specifically as a uterine relaxant and is used in preterm labor as tocolytic agent.

Other β_2 agonists are:

Short acting	Long acting	Very long acting
<ul style="list-style-type: none"> • Metaproterenol • Albuterol • Levalbuterol • Pirbuterol • Terbutaline • Isoetharine • Fenoterol • Procaterol 	<ul style="list-style-type: none"> • Salmeterol • Formoterol • Arformoterol 	<ul style="list-style-type: none"> • Indacaterol • Olodaterol • Vilanterol

61. Ans. (b) Its plasma hydrolysis by esterase's is rapid

Ref: Goodman & Gillman's 13th ed. P 216-17

- Esmolol is a β_1 -selective antagonist with a rapid onset and a very short duration of action ($t_{1/2} = 8$ minutes).
- The drug is hydrolyzed rapidly by esterases in erythrocytes leading to its short half-life.
- Esmolol is used in urgent settings where immediate onset of β -blockade is warranted so it is given by slow intravenous injection.
- A partial loading dose (500 $\mu\text{g/kg}$ over 1 minute) typically is administered, followed by a continuous infusion of the drug (maintenance dose of 50 $\mu\text{g/kg/min}$ for 4 minutes).

Extra Mile

- The lipid solubility of esmolol is low and has no oral bioavailability so it is given via IV.
- The protein binding of esmolol is 55%.

62. Ans. (b) Given effectively in carbamate poisoning

Ref: Sharma & Sharma 3rd ed. P 146-47

- Organophosphate poisoning causes irreversible blockade of AChE enzyme, which causes cholinergic effects on the patients.
- Symptoms are: salivation, lacrimation, urination, diarrhea, GI upset, emesis, fasciculation, bradycardia, miosis, hypotension, restlessness, tremor, ataxia.
- Immediate management is done by atropine.
- Treatment is done by using AChE enzyme reactivating drugs along with atropine.
- AChE reactivating drugs are: Pralidoxime (PAM), obidoxime and Diacetylmonoxime (DAM).
- Initially, atropine is injected in a dose of 2 mg IV q 10–15 minutes until muscarinic symptoms disappear.
- Thereafter pralidoxime 1–2 g is given by slow IV infusion over 15–30 minutes to reactivate AChE.
- Pralidoxime and obidoxime does not cross BBB, hence cannot activate AChE inhibited in the brain. Therefore DAM which can cross BBB is used in such cases.

63. Ans. (b) Clonidine

Ref: Sleisenger and Fordtran's Gastrointestinal and Liver Disease, Volume 1; P 575

- Diabetic diarrhea is seen in middle aged type 1 poorly controlled diabetic patients and is characterized by intermittent, brown, watery and voluminous stools which is occasionally accompanied by tenesmus.
- In these patients GI adrenergic function is impaired in autonomic neuropathy. Therefore any adrenergic agonist may further stimulate the intestinal absorption of fluid and electrolytes.

Drugs used are

- **Alpha 2 adrenergic agonist: Clonidine.** Acts as adrenergic antagonist which acts by reversing the peripheral adrenergic resorptive abnormalities.
 - Because of autonomic neuropathies, these patients will not experience postural hypotension.
 - Moreover, clonidine doesn't alter diabetic control or renal function.
- **Somatostatin analogue: Octreotide.** Useful in refractory diabetic diarrhea
- **Codeine, Diphenoxylate with atropine, Loperamide:** Used for symptomatic treatment.

Extra Mile

Anti diarrheal agents

Drugs	Main uses
Tryptophan hydroxylase inhibitor: Telotristat ethyl	Severe diarrhea due to carcinoid tumors
Enkephalinase inhibitor- Racecadotril	Acute diahhrea Safe in children
Octreotide	<ul style="list-style-type: none"> • Severe secretory diarrhea due to GI tumors • Postgastrectomy dumping syndrome
Crofelemer (plant derived)	HIV/AIDS diarrhea
Alosetron	<ul style="list-style-type: none"> • Diarrhea-predominant IBS in women
Bile acid sequestrants: Cholestyramine, Colesevelam, Colestipiol	Bile salt induced diarrehia
Clonidine	Diabetic diarrhea
MOR agonists <ul style="list-style-type: none"> • Diphenoxylate, difenoxin, Loperamide 	Acute diarrhea Chronic diarrhea Traveler's diarrhea
Antibiotics—empiric therapy <ul style="list-style-type: none"> • Fluoroquinolone • Ciprofloxacin • Levofloxacin • Norfloxacin • Ofloxacin 	<ul style="list-style-type: none"> • Acute diarrhea • Traveler's diarrhea
Alternative antibiotics <ul style="list-style-type: none"> • Azithromycin • Rifaximin 	<ul style="list-style-type: none"> • Azithromycin: Preferred treatment for children with traveler's diarrhea • Rifaxamin: Preferred for diarrhea predominant IBS

64. Ans. (a) Inhibition of release of neurotransmitter

Ref: KD Tripathi, 7th ed. pg. 99

- Release of Ach from nerve terminals occurs in small quanta—amount contained in individual vesicles is extruded by exocytosis.

- Two toxins interfere with cholinergic transmission by affecting release:
 - **Botulinum toxin** inhibits release
 - **Black widow spider toxin** induces massive release and depletion
- **Botulinum toxin**
 - Botulinum toxin A and B are highly potent exotoxins produced by *Clostridium botulinum* that are responsible for 'botulism' (a type of food poisoning). These neurotoxic proteins cause long-lasting loss of cholinergic transmission by interacting with axonal proteins involved in exocytotic release of Ach.

65. Ans. (b) Presynaptic inhibition of release of acetylcholine

Ref: Katzung, 10th ed. Ch 27

- Botulinum toxin is a neuromuscular blocking agent which acts at neuromuscular junction by **blocking the presynaptic release of Ach vesicles.**
- Doing so, it reduces spasticity in a variety of neurologic conditions (ie, **spasmolytics**).
- **Note:** Neuromuscular blocking drugs interfere with transmission at the neuromuscular end plate and lack central nervous system activity.

Extra Mile

TABLE: MOA of drugs and their site

Drug	Site of action	MOA
Local anesthetics	Nerve axons	Block Na channels
Hemicholinium	At cholinergic nerve terminal	Blocks uptake of cholin and slows synthesis
Vesamicol	Cholinergic terminal vesicle	Prevents storage, depletes
Reserpine	Adrenergic terminal vesicle	Prevents storage, depletes
Tyramine, Amphetamine	Adrenergic nerve terminals	Promote transmitter release
Bethanechol	Receptors, parasympathetic effector cells (smooth muscle, glands)	Binds and activates muscarinic receptors
Atropine	Receptors, parasympathetic effector cells	Binds muscarinic receptors; prevents activation

66. Ans. (c) Presynaptic blockade

Please refer to above explanation

67. Ans. (b) Organophosphate poisoning

Ref: Katzung Pharmacology, 14th ed. pg. 115

- Organophosphates are irreversible Acetylcholinesterase inhibitor which is well absorbed from the skin, lung, gut, and conjunctiva—thereby making them dangerous to humans and highly effective as insecticides.
- Due to inhibition of acetylcholinesterase enzyme, acetylcholine levels are increased and the patient therefore presents with cholinergic symptoms: (Mn: SLUDGE-FB)
- Salivation, Lacrimation, increased urination, Diarrhea, GI distress, Emesis, Fasciculation, Bradycardia
- DOC for this poisoning: ATROPINE

Extra Mile

OXIMES (Pralidoximes, Di-Acetyl monoxime) are known as AchE enzyme reactivators. These are used only in organophosphate poisoning.

Pin-point pupil is seen in poisoning with: (Mn: POMP)
Pontine hemorrhage, Organophosphate, Morphine and Phenol poisoning

68. Ans. (c) Atropine poisoning

Ref: Katzung Pharmacology, 14th ed. pg. 127–28

Refer to above explanation

69. Ans. (b) Dryness

Ref: Katzung's Pharmacology, 14th ed. pg. 126

- Anti-cholinergic agent/Muscarinic antagonists** are the class of drugs which competitively inhibit the effect of acetylcholine at muscarinic receptors. Therefore decreasing secretion from glands leading to DRYNESS.
- Anti-cholinergic side-effect can be remembered by this mnemonic:**
 - Hot as hare- increased temperature
 - Blind as bat- mydriasis
 - Dry as bone- Dry mouth, dry eye, dry skin
 - Red as beet- Flushed face
 - Mad as hatter: Delirium

Extra Mile

- Indirect acting Cholinergic agents increases the acetylcholine level by blocking acetylcholine esterase enzyme (Ex: Organophosphate, Carbamate).
- The patient therefore will present with cholinergic symptoms: (Mn: SLUDGE-FB)
Salivation, Lacrimation, increased urination, Diarrhea, GI distress, Emesis, Fasciculation, Bradycardia
- DOC for this OP poisoning: ATROPINE

70. Ans. (d) OP poisoning

Ref: Katzung, 14th ed. pg. 115; KDT, 7th ed. pg. 111

- Neostigmine is a cholinergic agent which act by inhibiting cholinergic esterase enzyme, thereby increasing acetylcholine level at the synapse.
- Ach in eyes causes miosis
- Uses of Physostigmine:** Atropine/Belladonna poisoning
- Uses of Neostigmine:** Myasthenia Gravis, Snake bite, Curare poisoning, post operative paralytic ileus, reversal of neuromuscular blockade.
- Uses of Rivastigmine:** Alzheimer's disease and parkinsonism
- DOC for organo-phosphate poisoning:** Atropine

71. Ans. (c) Parasympathetic nerve

Ref: Katzung, 14th ed. pg. 127; KD Tripathi, 7th ed. P 101

Cholinergic receptors are:

- M₁:** The M₁ is primarily a neuronal receptor located in ganglion cells and central neurons, especially in cortex, hippocampus and corpus striatum. It plays a major role in mediating gastric secretion, relaxation of lower esophageal sphincter (LES) caused by vagal stimulation, and in learning, memory, motor functions, etc.
- M₂:** Cardiac muscarinic receptors are predominantly M₂ and mediate vagal bradycardia. Autoreceptors on cholinergic nerve endings are also M₂ subtype.

- **M₃**: Visceral smooth muscle contraction and glandular secretions are elicited through M₃ receptors, which also mediate vasodilatation through EDRF release. Together the M₂ and M₃ preceptors mediate most of the well-recognized muscarinic actions including contraction of LES.

72. Ans. (b) M2 agonist

Ref: Katzung, 14th ed. pg. 127; KD Tripathi, 7th ed. P 101

TABLE: Muscarinic receptors

	M1	M2	M3
Site	CNS Stomach	Heart	All remaining
Func:	Gastric secretion CNS excitation	Dec HR	Increase everything
Agonist:	Oxotremorine	Methaholine	Bethanechol
Antagonist	Pirenzepine Telenzepine	Tripitramine	Tolterodine Darifenacin

73. Ans. (d) M2 antagonist

Ref: Sharma & Sharma 3rd ed. pg. 119

Refer to above explanation

74. Ans. (d) Neuromuscular junction

Ref: Sharma & Sharma 3rd ed. pg. 117

- Alpha bungaratoxin is extracted from venom of elapid snake.
- It acts by neuromuscular junction blocking, therefore producing muscular weakness, respiratory failure like symptoms.

TABLE: Nicotinic receptors

	Nn	Nm
Site	At all autonm ganglia, Adrenal medulla	NMJ
Func:	Impulse transmission NE/E secretion	Skeletal ms contraction
Agonist:	Epibatidine, Nicotine, DMPP	Ach, Sch, PTMA
Antagonist	Hexamethonium Trimethaphan	D- Tubocurarine, α- Bungarotoxin

75. Ans. (a) Urinary incontinence

- Ipratropium and Tiotropium is long acting muscarinic antagonist.
- Ipratropium bromide, given as inhalation, shows transient local side effects like dry mouth, irritation in trachea and bad taste.

- But systemic effects like urinary retention are rare because of poor absorption from GIT and lungs.

76. Ans. (a) Decreasing phosphodiesterase activity

Aminophylline and other methylxanthines act by

- Inhibiting phosphodiesterase enzyme causing – cAMP
- Blocking adenosine receptors
- Releasing Ca²⁺ from sarcoplasmic reticulum in cardiac and skeletal muscles.
- Use–Asthma, COPD, chronic bronchitis

77. Ans. (a) Oxybutynin

Ref: KD Tripathi, 6th ed. pg. 111

- Oxybutynin is a relatively M₃ selective muscarinic antagonist which has preferential action on urinary bladder
- It is **indicated in overactive bladder with urinary frequency and urgency.**
- **Drugs which are used in overactive bladder: (remembered as: My SOFTT/Bladder)**
 - Mirabegron (β₃ agonist)
 - Solifenacin
 - Oxybutynin
 - Flavoxate, Fesoterodine
 - Tolterodine, Trospium
 - Darifenacin
- **Note: Mirabegron is beta 3 agonist.** Recently approved for overactive bladder. All other drugs are parasympatholytics acting as M₃ antagonist

Extra Mile

- Alfuzosin is a selective α₁ blocker which is used to treat BPH.
- Bethanechol selectively stimulates M₃ receptor present on bladder. It is used in case of atonic bladder (urinary retention).

78. Ans. (a) Bethanechol

Ref: Katzung, 14th ed. pg. 109; KD Tripathi, 6th ed. pg. 111-12

- Bethanechol has mainly muscarinic action without effect on nicotinic receptors and is used to treat urinary retention secondary to general anaesthesia or diabetic neuropathy.
- Bethanechol is totally resistant to hydrolysis by AchE as well as by pseudocholinesterase and hence its t_{1/2} is very long.
- **Other uses of bethanechol:**
 - To reverse post op or neurogenic bladder atony.
 - To treat GI atony/post op paralytic ileus
 - To treat salivary gland malfunction (xerostomia).
- **Side effects:**
 - Hyperthyroidism, MI (due to risk of developing conduction block), peptic ulcer, asthma exacerbation.

79. Ans. (c) Alpha 1 and Beta 2

Ref: Katzung, 14th ed. pg. 145–47

- Alpha 1 and Beta 2 receptors present at blood vessels causing vasoconstriction and vasodilatation respectively.

TABLE: Sympathetic receptors, their location, function and G protein.

Receptor	Location	Function	G-Protein
$\alpha 1$	BV, smooth muscle, Salivary glands	Vasoconstriction Increase secretion	Gq
$\alpha 2$	Presynapse Beta pancreatic cell	Brake/Inhibit NA release Decrease insulin release	Gi
$\beta 1$	Heart JG cell	Inc Heart rate Renin release	Gs
$\beta 2$	Lungs Smooth muscle Liver	Bronchodilatation Relaxation of smooth muscles Glycogenolysis	Gs
$\beta 3$	Adipocyte Detrusor muscle	Lipolysis, thermogenesis Bladder relax	Gs

80. Ans. (c) Stimulation of parasympathetic fiber

Ref: Katzung, 14th ed. pg. 130

- Sympathetic and parasympathetic fibers present widely on the viscera, control their function.
- Sympathetic fibers** stimulate/constrict heart (increase in HR) and inhibit/Relax all other organs (e.g. Bronchodilation, decreased GI motility, mydriasis, etc.)
 - Receptor** of sympathetic fibres are: $\beta 1$ (present on heart mainly) and $\beta 2$ (present on lungs, muscle, liver, etc.)
 - Stimulation of $\beta 2$ receptor will cause bronchodilation/Increased bronchial calibre
- Parasympathetic fibers** inhibit/Relax heart (decreased HR) and stimulate/constrict all other organs (bronchoconstriction/reduced bronchial caliber (bronchoconstriction), increased GI motility, miosis, etc.)
 - Receptors** of parasympathetic fibres are M1, M2 and M3
 - M1 is located mainly in gastric glands and CNS, M2 is located on heart and M3 is located on all other areas like eyes, glands, bladder, intestine, etc.

81. Ans. (a) Increase BP, bradycardia

Ref: Katzung, 14th ed. pg. 141–41; KDT, 6th ed. pg. 122

- Epinephrine (adrenaline) and Norepinephrine (NA) are endogenous catecholamine. These are the hormones

responsible for actions like bradycardia and tachycardia by acting on their specific receptors.

- Systolic blood pressure (SBP)** is determined by cardiac output ($\beta 1$ action). $\beta 1$ receptors are present on heart which upon stimulation causes tachycardia.
- Diastolic BP (DBP)** depends on the state of blood vessels. $\beta 2$ receptors are present on blood vessels which upon stimulation causes vasodilation \rightarrow DBP \downarrow
- Alpha receptors are present on vessel wall, which upon stimulation constricts vessel wall and increase total peripheral resistance \rightarrow DBP \uparrow
- Increased DBP stimulates baroreceptor mediated release of ACh (reflex action) that decreases heart rate via activation of M2 receptors.
- Reduction in DBP increases central sympathetic outflow and thereby increases heart rate.
- Note:** NA normally decreases heart rate but if given after a dose of atropine, increase in heart rate will be seen (reflex action is abolished because of blockage of M2 receptor).
- Adrenaline acts on $\alpha 1$, $\alpha 2$, $\beta 1$, $\beta 2$ receptors whereas Noradrenaline acts on $\alpha 1$, $\alpha 2$, $\beta 1$. Which means.
 - Activation of adrenaline causes tachycardia ($\beta 1$ action) and NO effect on DBP because action of $\alpha 1$ and $\beta 2$ are neutralized by each other.
 - Activation of NA causes \uparrow DBP (due to unopposed $\alpha 1$ action) and reflex bradycardia.

	SBP ($\beta 1$)	DBP ($\beta 2$ and $\alpha 1$)	Heart rate		
			Direct	Indirect	Net Effect
Adrenaline/epinephrine	$\uparrow\uparrow$	–	\uparrow	–	\uparrow
Noradrenaline/NE	$\uparrow\uparrow$	$\uparrow\uparrow$	\uparrow	$\downarrow\downarrow$	\downarrow

82. Ans. (a) Beta 1

Ref: Katzung, 14th ed. pg. 149; KDT, 6th ed. pg. 126

- Dobutamine is a relatively selective $\beta 1$ agonist. Though it acts on both alpha and beta receptors, **the only prominent action of clinically employed doses is its $\beta 1$ action, i.e. an increase in force of cardiac contraction and output, without significant change in HR, BP or peripheral resistance.**
- Use:** Heart failure (as an inotrope)

83. Ans. (b) Orthostatic hypotension

Ref: Katzung's Pharmacology, 14th ed. pg. 149

- Midodrine is a directly acting sympathomimetics (selective $\alpha 1$ receptor agonist non catecholamines).

- Primary indication of midodrine is the **treatment of orthostatic hypotension**, typically due to impaired autonomic nervous system function.
- It may also cause hypertension when patient is supine.

Mechanism of Action

- Alpha-1 selective adrenergic agonist; increases peripheral vascular resistance; arteriolar and venous tone increases and results in a rise in sitting, standing, and supine systolic and diastolic blood pressure in patients with orthostatic hypotension.
- **Side effects:** Paresthesia, Piloerection, Pruritus, Supine hypertension, Urinary retention or urgency.
- **Orthostatic hypotension;** defined as a reduction in systolic blood pressure of at least 20 mmHg or diastolic blood pressure of at least 10 mmHg within 3 minutes of standing or head-up tilt on a tilt table. It is a manifestation of sympathetic vasoconstrictor (autonomic) failure.
- **Delayed orthostatic hypotension;** occurs beyond 3 minutes of standing; this may reflect a mild or early form of sympathetic adrenergic dysfunction.

84. Ans. (b) Salbutamol

Ref: Katzung 11th ed. Ch 2

- Tachyphylaxis is an acute rapid decrease in response to a drug after its administration. It can occur after an initial dose or after a series of small doses.
- Inhalation of an agonist for the beta-2 adrenergic receptor, such as **Salbutamol**, Albuterol (US), is the most common treatment for asthma. **Polymorphisms of the beta-2 receptor play a role in tachyphylaxis.**
- Increasing the dose of the drug may be able to restore the original response.
- **Drug causing tachyphylaxis: (SAD NET/Cigarette)**
 - Salbutamol
 - Amphetamine
 - Dobutamine
 - Nicotine
 - Ephedrine
 - Tyramine

85. Ans. (c) Nadolol

Ref: Katzung Pharma, 14th ed. pg. 162–166

- The β antagonists are rapidly distributed and have large volumes of distribution.
- Most β antagonists have half-lives in the range of 3–10 hours. A major exception is esmolol, which is rapidly hydrolyzed and has a half-life of approximately 10 minutes. *Therefore esmolol is the shortest acting β blocker.*
- **Nadolol** is excreted unchanged in the urine and **has the longest half-life** of any available β antagonist (up to 24 hours).

- The half-life of nadolol is prolonged in renal failure. Therefore it is contraindicated in renal failure.
- β blockers which are contraindicated in renal failure are: (*remember as ANS*)
 - Atenolol
 - Nadolol
 - Sotalol

Extra Mile

“ALSO KNOW” ABOUT β BLOCKERS:

- $\beta 1$ **receptors** are present mainly on heart. Therefore selective $\beta 1$ **BLOCKERS** are for cardiac condition mainly.
- $\beta 2$ **receptors** are present mainly on respiratory pathway and some on liver, uterus, bladder etc. therefore $\beta 2$ stimulants are used in conditions like asthma, preterm labor, urinary incontinence etc.
- Most cardioselective β blocker- **NEBIVOLOL**
- Longest acting- **NADOLOL**
- Shortest acting- **ESMOLOL**
- β blockers which is DOC in open angle glaucoma in India-**TIMOLOL**

86. Ans. (a) Esmolol

Ref: KDT, 6th ed. pg. 147

- Esmolol is an ultra short acting, cardio-selective β blocker devoid of partial agonistic or membrane stabilizing effect.
- It is metabolized by pseudocholinesterase, which is abundant in our body. thereby making it least likely to cause hypotension followed by or during surgery.
- **It is used in:**
 - Terminating supraventricular tachycardia
 - Episodic atrial fibrillation or flutter
 - Arrhythmia during anaesthesia
 - To reduce BP and HR during cardiac surgery and early treatment of MI.

87. Ans. (b) Acebutalol

Ref: Katzung, 14th ed. pg. 166; KDT, pg. 140

- Some patients are sensitive to beta blockers. They usually develop bradycardia upon intake. Such patients are known as β -blocker sensitive patient.
- However, some beta blockers possess **Intrinsic Sympathomimetic Activity (ISA)** aka partial agonistic activity. For such sensitive patients, beta blockers with partial agonistic activity are preferred.
- These drugs themselves activate $\beta 1$ or $\beta 2$ receptors sub-maximally.
- **Benefits:**
 - Bradycardia and depression of contractility at rest are not prominent.
 - Withdrawal doesn't exacerbate hypertension or angina.

- **Beta Blockers With Partial Agonistic Activity**
(Remembered as **Mn. COP Pins CAB**)
 - Celiprolol, Oxprenolol, Penbutolol
 - Pindolol
 - Carteolol
 - Acebutolol
 - Bopindolol

88. Ans. (b) **Propanolol**

Ref: Katzung, 14th ed. pg. 166; KDT, 6th ed. pg. 140

Please refer to above explanation.

89. Ans. (c) **Alprenolol**

Ref: Katzung, 14th ed. pg. 166

Please refer to above explanation.

90. Ans. (a) **Atenolol**

Ref: Katzung, 14th ed. pg. 179; KDT 6th ed. pg. 140 table 10.2

Lipid insoluble β blockers: These agents are mainly excreted by kidney and are therefore contraindicated in renal failure. These have long duration of action. The drugs are:

- Nadolol (longest acting β blockers)
- Sotalol
- **Atenolol**
- Acebutolol
- Betaxolol
- Bisoprolol
- Celioprolol

91. Ans. (d) **Carvedilol**

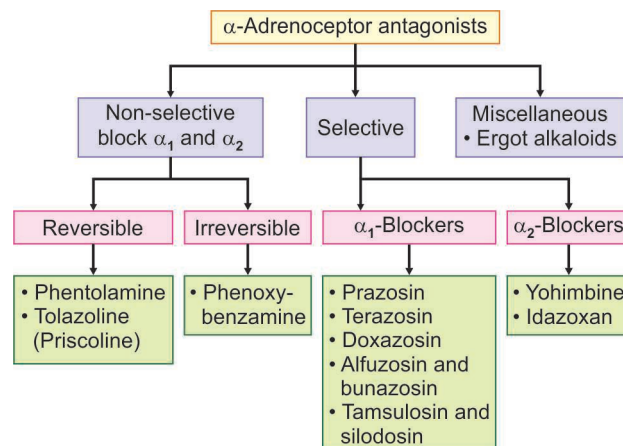

Ref: Katzung, 14th ed. pg. 160–164; KDT, 7th ed. pg. 151

- Carvedilol is a third generation beta blocker having blocking property of $\beta_1 + \beta_2 + \alpha_1$.
- It produces peripheral vasodilation due to blocking property of α_1 as well as L type calcium channel blocker.
- Carvedilol also inhibits free radical induced lipid peroxidation.
- Other third generation beta blocker having similar property is Labetalol Bucindolol.

92. Ans. (b) **Tolazoline**

Ref: KDT, 6th ed. pg. 132

- α_1 receptor is further divided in α_{1A} receptor (present on bladder neck and urethra) and α_{1B} (on blood vessel)
- **Selective α_{1A} blocker:** TAMSULOSIN, SILODOSIN (causes relaxation of urethra and bladder neck)

Question Forms

- Hypertensive patient with benign prostatic hyperplasia. What is the DOC: α_1 **selective blocker** (PRAZOSIN/TERAZOSIN/DOXAZOSIN/ALFUZOSIN)
- **Non hypertensive patient with BPH. What is DOC:** TAMSULOSIN (selective α_{1A} blocker)
- Side effect of selective α_1 blocker: Postural Hypotension
- DOC for pheochromocytoma- PHENOXYBENZAMINE
- DOC for cheese reaction and clonidine induced rebound hypertension- PHENTOLAMINE, TOLAZOLINE

93. Ans. (d) **Prazosin**

Ref: Katzung, 14th ed. pg. 159

- **First dose effect** is sudden severe hypotension while changing position from lying to a standing position after first dose intake of alpha blocker, ACE inhibitor.
- Most common class of drug for causing first dose effect: **selective alpha-1 blocker**
- **Selective alpha-1 blocker Drugs:**
 - **Prazosin: Most common among all**
 - Terazosin
 - Doxazosin
 - Alfuzosin
- Other drugs that can cause first dose effect is: Phentolamine, Tolazoline, Phenoxybenzamine.

94. Ans. (d) **Phenoxybenzamine**

Ref: Katzung, 14th ed. pg. 170

- **Phenoxybenzamine** binds covalently to α receptors, causing **irreversible blockade** of long duration.
- **It is DOC for pheochromocytoma**
- **Examples of reversible α blocker is: Phentolamine, Tolazoline**
- **Clonidine** is α_2 agonist
- **Isoprenaline** is beta agonist (acts at β_1 and β_2)

95. Ans. (a) **Pilocarpine**Ref: *Katzung, 14th ed. pg. 112*

- Agents which dilate the pupillary diameter in order to facilitate fundoscopy are known as mydriatics.
- Eyes are mainly innervated by cholinergic (parasympathetic) nerves which predominantly secrete acetylcholine, which acts at circular iris muscle causing miosis.
- Stimulation of parasympathetic system constricts pupillary diameter (miosis) while stimulation of sympathetic system dilates pupillary diameter (mydriasis).
- Anticholinergic (e.g. atropine) and sympathomimetic (e.g. phenylephrine) drugs result in mydriasis.
- Pilocarpine is a parasympathomimetic drug, which upon stimulation constricts the pupillary diameter (miosis). Used in treatment of Glaucoma.
- Atropine is a parasympatholytic drug which act as mydriatic and cycloplegic agent as well.
 - **Mydriasis:** used for fundoscopy, for full visualization of retina. Contraindicated in Glaucoma.
 - **Cycloplegic:** paralysis of ciliary muscle. Used predominantly in treatment of iridocyclitis (anterior uveitis).
- Agents like epinephrine and phenylephrine are sympathomimetic drugs, which acts at radial muscles and causes pupillary dilatation.

96. Ans. (c) **Phentolamine**Ref: *Katzung, 14th ed. pg. 170*

- Phentolamine is an alpha blocker and can cause miosis not mydriasis (*because alpha 1 agonist in the eye causes mydriasis*).

97. Ans. (c) **Tropicamide**Ref: *KDT, 8th ed. pg. 130*

- Agents which dilate the pupillary diameter in order to facilitate fundoscopy are known as mydriatics. These are anti-muscarinic class of drugs.

TABLE: Anti-muscarinic drugs used in ophthalmology

Drug	Duration of Effect (days)
Atropine	7–10
Scopolamine	3–7
Homatropine	1–3
Cyclopentolate	1
Tropicamide	0.25 days (6 hrs)

- These agents have mydriatic as well as cycloplegic action both.

Extra Mile

- Strongest cycloplegic is: **Atropine**
- Cycloplegic agent of choice in child: **Atropine** (child age group has strong ciliary muscles)
- Cycloplegic agent of choice in adults: **Tropicamide**

98. Ans. (a) **Anti-venin**Ref: *KDT, 6th ed. pg. 2748*

- General time guidelines for the disappearance of symptoms after anti-venom administration are as follows:
 - **Centruroides anti-venom:** Severe neurologic symptoms reverse in 15-30 min. Mild-to-moderate neurologic symptoms reverse in 45-90 min.
 - **Non-Centruroides anti-venom:** In the first hour, local pain abates. In 6-12 hours, agitation, sweating, and hyperglycemia abate. In 6-24 hours, cardio-respiratory symptoms abate.
- Insulin administration in scorpion envenomation animal experiments has helped the vital organs to use metabolic substrates more efficiently, thus preventing venom-induced multiorgan failure, especially cardiopulmonary failure. *Unfortunately, no human studies have been conducted.*
- The use of steroids to decrease shock and edema is of unproven benefit.
- Atropine for symptomatic bradycardia.

Remember

- Scorpion venom is composed of neurotoxin cardiotoxin, nephrotoxin, hemolytic toxin, phosphodiesterases, phospholipases, hyaluronidases, glycosaminoglycans, histamine, serotonin, tryptophan, and cytokine releasers.
- Hence the clinical effects of envenomation are neuromuscular, neuro-autonomic, or local tissue effects.
- The main targets of scorpion venom are voltage-dependent ion channels, of which sodium channels are mainly affected.
- Alpha blocker like **Prazosin** can also be used for this purpose.

99. Ans. (b) **Tolterodine**Ref: *KD Tripathi, 8th ed. pg. 129***TOLTERODINE**

- This M3 selective muscarinic antagonist has preferential action on urinary bladder
- It is indicated in overactive bladder with urinary frequency and urgency.

Extra Mile

Pirenzepine is selective M1 blocker which is an antacid given for PUD.

Alfuzosin is a selective α_1 blocker which is used to treat BPH.

Bethanechol selectively stimulate M3 receptor present on bladder. It is used in case of atonic bladder (urinary retention).

100. Ans. (b) Anticholinergic

Ref: KDT 8th ed. pg. 129

MOA oxybutynin-cholinergic-muscarinic receptor antagonist

- Oxybutynin is a selective M_3 receptor blocker, used to relieve bladder spasm after urologic surgery, eg, prostatectomy.
- It is also used to relieve urinary and bladder difficulties, including frequent urination and inability to control urination, by decreasing muscle spasms of the bladder.
- It competitively antagonizes the M_3 subtypes of the muscarinic acetylcholine receptor.
- **M3 receptor blockers:** Mn: MY SOFT blaDar
 - Solifenacin, Oxybutynin, Flavoxate, Fesoterodine, Tolterodine, Trospium and Darifenacin.

101. Ans. (b) Pilocarpine

Ref: KDT, 8th ed. pg. 167

- **Pilocarpine** is a directly acting parasympathomimetic (cholinergic) drug which acts mainly on pupil (M_3) causes miosis.
- Reduces IOP within few minutes and lasts for upto 4–8 hrs
- Hence used in Glaucoma (OAG) patients.
- **Methacholine** is a directly acting parasympathomimetic (cholinergic) drug which acts mainly on myocardium (M_2) causing bradycardia. Hence used to treat tachycardia and can also be used to diagnose bronchial hyperactivity (*methacholine challenge test*).
 - **Half life:** > 2 hours
- **Bethanechol** is directly acting parasympathomimetic (cholinergic) drug which works on bladder (M_3) and is used in acute urinary retention/Atonic bladder.
 - **Half life:** ~ 2 hours
- **Cevimeline** is recently approved drug used for xerostomia in sjogren syndrome or for patients undergoing chemotherapy.

CNS AND PNS

102. Ans. (d) Delta

Ref: Goodman & Gillman 13th ed. P 358

Opioid receptors	
Opioid receptor class	Effects
MU ₁	Euphoria, supraspinal analgesia, confusion, dizziness, nausea, low addiction potential
MU ₂	Respiratory depression, cardiovascular and gastrointestinal effects, miosis, urinary retention
Delta	Spinal analgesia, cardiovascular depression, decreased brain and myocardial oxygen demand
Kappa	Spinal analgesia, dysphoria, psychomimetic effects, feedback inhibition of endorphin system

Extra Mile

- Sigma (σ) receptor was early identified and was thought to represent a site that accounted for the paradoxical excitatory effects of opiates.
- Agonist binding to the σ receptor is not antagonized by naloxone, and the receptor is not classified as an opiate receptor.

103. Ans. (b) Cognitive therapy

Ref: Goodman & Gillman 13th ed. P 281-282

- For acute manic attacks, preferred agents are atypical antipsychotics, benzodiazepines, anticonvulsants (Valproate, carbamazepine), Lithium
- All atypical antipsychotics medications with the exception of clozapine, iloperidone, brexpiprazole, and lurasidone, have indications for acute mania, and doses are titrated rapidly close to or at the maximum FDA-approved dose over the first 24–72 hours of treatment. Typical antipsychotic drugs are also effective in acute mania, but often are eschewed due to the risk for EPSs.

104. Ans. (d) Hyperalgesia

Ref: Goodman & Gillman's 14th ed. pg. 363-64

- Effect of morphine is seen mainly at μ -receptor. Effect on μ -receptor depends on either supraspinal or spinal μ -receptor.
 - **Supraspinal effects:** Physical dependence, euphoria, analgesia, sedation. (PEAS)
 - **Spinal effects:** Constipation, analgesia and respiratory depression. (CAR)
- **Effect of morphine at heart:** No effect at usual dose but at high dose it can cause bradycardia and hypotension.
- **Effect of morphine at eye:** No effect if applied locally. Miosis on systemic intake. Miosis can be worsened to pin point pupil upon systemic morphine toxicity.

Note: Morphine causes analgesia. Hyperalgesia is one of the withdrawal symptoms.

105. Ans. (c) Propanolol

Ref: KDT 8th ed. P 471

Explanation:

- **Akathisia** is an extra pyramidal symptom arise mainly due to intake of typical antipsychotics like haloperidol, fluphenazine, etc.
 - It is characterized by restlessness, feeling of discomfort and constant purposeless involuntary movement from one place to another.
 - **Akathisia is the most common extra pyramidal symptom.**
- DOC for akathisia: PROPRANOLOL**

106. Ans. (c) Ramelteon

Ref: KD Tripathi, 8th ed. pg. 436

- The most common prescription drugs for insomnia include: Benzodiazepines, nonbenzodiazepines, hypnotics, ramelteon as well as some anti-depressants.

Extra Mile

Types of insomnia, their causes and the drugs used

Insomnia	Causes	Drugs used
Transient insomnia	Lasts less than 7 days Jet lag, Shift work, new place, overnight journey	Rapid onset and short duration of action Triazolam: in patients with difficulty going to sleep Temazepam: for insomnia caused by inability to stay asleep. Zolpidem, Zoleplon
Short term insomnia	Lasts 1-3 weeks Due to expected but self limiting problems like bereavement, pain, occupational issue.	Flurazepam, Estrazolam, Temazepam Zopiclone, Eszopiclone
Long term insomnia	Lasts > 3weeks Indicates underlying disease or a personality disorder	Flurazepam, Nitrazepam Intermittent use with a break after every 3 rd day

- Benzodiazepines are first-line drugs of choice for short-term management of insomnia, especially for reducing the sleep latency (time to sleep onset).
- Among benzodiazepines, Triazolam is effective in treating individuals who have difficulty going to sleep, while temazepam is useful for insomnia caused by inability to stay asleep.
- Lorazepam, Diazepam and Midazolam is used as preanesthetic drug. It causes high degree of amnesia, has more rapid onset and shorter duration of action.
- Recently approved Melatonin receptor agonist, **Ramelteon** is used for sleep onset insomnia, especially in the treatment of circadian disruptions induced by shift work and jet lag.
- 5HT₂ serotonin receptor antagonist, **Ritanserin**, has improved sleep depth and sleep quality.

107. Ans. (a) Clozapine

Ref: KD Tripathi, 7th ed. pg. 440-41

TABLE: Classification of typical vs atypical antipsychotics

Typical/Classical antipsychotics MOA: D2 receptor blocking	<ul style="list-style-type: none"> • Phenothiazines: Chlorpromazine, Thioridazine, Trifluoperazine, Fluphenazine, Perphenazine • Thioxanthenes: Flupenthixol, Zuclopenthixol, Thiothixene • Butyrophenones: Haloperidol, Droperidol, Benperidol, Domperidone
Atypical Antipsychotics MOA: 5HT _{2A} , D4, D2, α blocking	<ul style="list-style-type: none"> • Risperidone, Quetiapine, Aripiprazole, Clozapine, Olanzapine, Ziprasidone, Zotepine, Asenapine, Sertidole, Lurasidone

108. Ans. (d) Clozapine

Ref: KD Tripathi, 8th ed. pg. 468

Side effects of Typical vs Atypical

Typical antipsychotics	Atypical antipsychotics
Major side effect: Extrapyramidal symptoms <ul style="list-style-type: none"> • Dystonia: Earliest • Akathisia: MC • Parkinsonism • Neuroleptic malignant syndrome: Most dangerous • Perioral tremors (Rabbit syndrome) • Tardive dyskinesia 	Lipodystrophy syndrome: metabolic side effect present with hyperglycemia, hyperlipidemia, weight gain and insulin resistance.

- Among antipsychotics, maximum risk of lipodystrophy syndrome is seen with atypical antipsychotics (MC with CLOZAPINE).
- First antisuicidal drug: Clozapine
- Other side effects of clozapine: **Sedation, Sialorhea, Agranulocytosis**
- DOC for resistant schizophrenia: Clozapine
- Atypical antipsychotics Least commonly associated with lipodystrophy syndrome are **Ziprasidone** and **risperidone**
- Typical antipsychotic with least extra pyramidal symptoms (EPS): **Thioridazine** (low potency drug)
- Atypical antipsychotic with least EPS is clozapina.

109. Ans. (b) Carbamazepine*Ref: KDT 8th ed. pg. 464*

- Extra pyramidal side effect or aka Extra pyramidal symptom (EPS) is due to excess blockade of dopamine receptors in basal ganglia, leading to Parkinson like symptoms such as slow movement (bradykinesia), akathisia, stiffness and tremor.
- EPS most commonly seen with the intake of typical antipsychotics, which blocks D2 receptors.

Typical antipsychotics		Important side effect
Strong D2 blocker	Haloperidol- <i>has maximum risk of EPS</i> Droperidol	EPS Hyperprolactinemia
Weak D2 blocker	Chlorpromazine Thioridazine – <i>has minimum risk of EPS among typicals</i>	EPS Corneal opacity, Retinal Pigmentation, Decreases seizure threshold
Intermediate D2 blocker	Fluphenazine Pechlorphenazine	

Extrapyramidal Symptoms

- **Dystonia**- earliest EPS which is seen.
 - R_x for dystonia: Diphenhydramine
- **Akathisia**- most common EPS seen. Constant purposeless movement from one place to other.
 - **DOC for Akathisia: PROPANOLOL**
- **Neuroleptic Malignant syndrome**: Severe muscle spasm and high grade fever after intake of anti psychotics.
 - **DOC for NMS: DANTROLENE**
- It is most dangerous type of EPS

110. Ans. (c) Dantrolene*Ref: KDT, 8th ed. pg. 382*

- DOC for NMS: Dantrolene

111. Ans. (c) Propanolol*Ref: KDT, 8th ed. pg. 471*

- **Akathisia** is an extra pyramidal symptom that arises mainly due to intake of typical anti psychotics like haloperidol, fluphenazine etc.
- It is characterized by restlessness, feeling of discomfort and constant purposeless involuntary movement from one place to another without any source of anxiety.
- **Akathisia is the most common extra pyramidal symptom.**
- DOC for akathisia: **PROPANOLOL**.

112. Ans. (b) Clozapine*Ref: KDT 8th ed. pg. 467*

- Among given option Clozapine is the only atypical antipsychotics. As discussed earlier, atypical antipsychotics has less risk of EPS development as compared to typical antipsychotics.
- Overall least risk of EPS among atypicals is: Clozapine

113. Ans. (a) Aripiprazole*Ref: KDT 8th ed. pg. 467*

- Among given choice, least risk of EPS among atypicals is: **ARIPIRAZOLE**.
- Typicals always has high EPS.

114. Ans. (c) Prochlorperazine*Ref: KDT 8th ed. pg. 711*

- EPS most commonly seen with the intake of typical antipsychotics, which blocks D2 receptors.
- **Prochlorperazine** is a dopamine (D2) receptor antagonist that belongs to the phenothiazine class of antipsychotic agents that are **used for the antiemetic treatment of nausea and vertigo**. It is also a highly potent typical antipsychotic, 10–20× more potent than chlorpromazine.

Now lets see other options:

- **Cyclizine**: Anti-histaminics, used for nausea and vomiting associated with motion sickness.
- **Mozapride**: is a gastroprokinetic agent that acts as a selective 5HT₄ agonist.
- **Domperidone**: Act as anti-emetic by blocking D2 and D3 peripherally. It has no CNS side effects.

115. Ans. (d) Quetiapine

- Antipsychotic which is associated with lenticular opacity/Cataract: **Quetiapine**
- Antipsychotic associated with corneal opacity: **Chlorpromazine and Thioridazine**

116. Ans. (a) **Risperidone**Ref: KDT, 8th ed. pg. 469

- Atypicals with maximum risk of hyperprolactinemia is: Risperidone
- Most potent atypical antipsychotic: Risperidone
- Atypicals with least risk of EPS: Clozapine
- Atypicals that can cause cardiac arrhythmias: Sertindole, Zotepine
- Atypicals with maximum risk of obesity: Clozapine

117. Ans. (d) **Haloperidol**Ref: KDT, 8th ed. pg. 471

Haloperidol is from typical antipsychotic class that is commonly associated with extrapyramidal symptoms like neuroleptic malignant syndrome.

118. Ans. (b) **Diazepam**Ref: Katzung's, 11th ed. pg. 462-63

- Anxiety occurs as a result of mild CNS stimulation which may occur secondary to reduction in GABAergic activity or increase in serotonin activity.
- Therefore, a drug which is used for anxiety is CNS depressant (e.g. Diazepam) or the other which is decreasing serotonin level (e.g. Buspirone, *NOT Bupropion*).
- **DOC for anxiety attacks: Benzodiazepines**
- **DOC for chronic anxiety disorder: SSRI (Fluoxetine)**
- Anti-serotonergic drugs take around 2 weeks for its therapeutic effect. Hence NOT preferred in acute attack of anxiety.

119. Ans. (b) **Ketamine**Ref: Katzung, 11th ed. pg. 437; KDT, 6th ed. pg. 376

- Ketamine is the only intravenous anesthetic that possesses analgesic properties and produces cardiovascular stimulation.
- It causes "**dissociative anesthesia**" which is characterized by profound analgesia, immobility, amnesia and feeling of dissociation from one's own body and the surrounding.
- It has bronchodilator effect therefore considered as Induction agent of choice in asthma patient.
- **In addition it also causes:**
 - Hallucination
 - Delusion and illusion
 - Profound analgesia
- **Ketamine increases all pressures like:**
 - BP (hypertension), Heart rate, Cardiac output
 - Intracranial tension (it increases cerebral blood flow)
 - Intraocular pressure (IOP)
- It is contraindicated in intracerebral mass/haemorrhage, MI, schizophrenia, Epilepsy

MOA of Ketamine:

- It acts by blocking NMDA receptor (of glutamate).

Extra Mile

Side effect of other given options:

- **Propofol:** Apnea, Decreases BP and HR
- **Thiopentone:** Laryngospasm, Shivering & Delirium
- **Etomidate:** Adrenocortical suppression

120. Ans. (b) **It is GABA facilitator**Ref: KDT, 7th ed. 402, Katzung, 11th ed. pg. 377

- GABA is an inhibitory neurotransmitter.
- Benzodiazepine helps GABA to open the chloride channel. Once Chloride enters, negativity in the neuron increases (hyperpolarized), which leads to depressed neuron.
- It is barbiturate which is GABA mimetic.

TABLE: Difference between Benzodiazepine and barbiturates

Benzodiazepine	Barbiturates
<ul style="list-style-type: none"> • Increase FREQUENCY of GABA mediated chloride channel opening • GABA facilitator • Dose response curve: flat • Safe drug • Non-enzyme inducer- no drug interaction • Less amnesia • Antidote: FLUMAZENIL 	<ul style="list-style-type: none"> • Increase DURATION of GABA mediated chloride channel opening • GABA mimetic • Dose-response curve: steep • Unsafe drug • Powerful enzyme inducer; (+)drug interaction • Causes strong amnesia • No antidote available

121. Ans. (c) **GABA facilitator**Ref: KDT, 7th ed. 402, Katzung, 11th ed. 377122. Ans. (d) **Flumazenil**

- Flumazenil is antidote of benzodiazepine overdose.

123. Ans. (b) **Methylphenidate**Ref: KD Tripathi, 6th ed. pg. 470-471 & 126

- **Methylphenidate** acts by releasing NA and DA in brain and is most widely used for attention deficit hyperkinetic disorder because it causes lesser tachycardia and growth retardation as compared to amphetamine.
- It is considered as DOC of ADHD
- **Modafinil**
 - Psychostimulant agent; used most commonly among night-shift (call centre) workers who need alertness and want to keep awake.
 - Increases attention span and improve accuracy compromised by fatigue and sleepiness.
- Considered as first line drug in narcolepsy.

• **Pemoline**

- It has CNS stimulant actions similar to those of methylphenidate.
- It can also be used in ADHD, narcolepsy and excessive day-time sleepiness
- S/E: Hepatotoxicity, thus it has limited use

• **Amphetamines**

- It can also be used in ADHD, but not a drug of choice due to highly abusive tendency.
- The central effects include alertness, increased concentration an attention spam, euphoria, talkativeness increased work capacity
- Stimulate respiratory centre and Hunger centre is suppressed.

124. Ans. (a) **Attention deficit disorder**

Ref: KDT, 6th ed. pg. 470

- Methylphenidate* is the preferred drug for the treatment of *attention deficit hyperkinetic disorder* (ADHD). Other drugs used for this indication are *amphetamines*, *atomoxetine* and *pemoline*. **Pemoline** has been withdrawn due to life threatening hepatotoxicity.
- Abuse of drugs like amphetamine, phencyclidine, methylphenidate, flumazenil etc. causes seizure and is NOT used for seizure disorder.
- DOC for alzheimer's disease**-Donepezil
- DOC for OCD**: Fluoxetine (SSRI)

125. Ans. (b) **Alzheimer's disease**

Ref: Katzung, 10th ed. Ch 7

- Rivastigmine is a parasympathomimetic drug used for the treatment of mild to moderate dementia of the *Alzheimer's type* and dementia due to Parkinson's disease
- DOC for alzheimer's disorder**-Donepezil
- DOC for OCD**: Fluoxetine
- DOC for parkinsonism**: Levodopa + Carbidopa
- DOC for drug induced parkinsonism**: Benzhexol (centrally acting anticholinergic)

126. Ans. (d) **Ethosuximide**

Ref: KD Tripathi, 6th ed. pg. 172 & 406

ETHOSUXIMIDE

- The most prominent action of ethosuximide is antagonism T type calcium channel → Thereby controlling the seizures like absence seizure. It also raises seizure threshold.
- Clinically it is effective only in absence seizures.

Extra Mile

Drugs used in Prophylaxis of Migraine

- β **Adrenergic blockers**: Propranolol is the **most commonly used** drug for prophylaxis of migraine. It reduces frequency as well as severity of attacks in upto 70% patients. DOC for prophylaxis
- Tricyclic antidepressants**: amitriptyline has been most extensively tried (25–50 mg at bed time) to reduce migraine attacks.
- Calcium channel blockers**: Verapamil was found to reduce migraine attacks, but was judged inferior to propranolol.
- Anticonvulsants Valproic acid and gabapentin.
- Topiramate has recently been approved for migraine prophylaxis
- Ethosuximide is the drug used in absent seizure. It has no role in migraine prophylaxis.

127. Ans. (c) **It inhibits peripheral dopa decarboxylase**

Ref: Katzung, 14th ed. pg. 495

COMT = Catechol othomethyl trasferase,
o MD = Ortho methyl dopa, BBB = Blood brain barrier

- In Parkinsons disease the balance between acetylcholine and dopamine (DA) is dearranged in brain.
- DA is comparatively decreased, making Ach on the higher side.
- Principle of treatment:**
 - Either increase DA (which is the prime treatment modality), or
 - Decrease the lecel of Ach
- Levodopa can be given for treatment but it is immediately converted to DA in periphery itself by the enzyme dopa decarboxylase and causes varied side effects.
- Note:** Dopamine cannot cross BBB but levodopa can cross it.
- Carbidopa is peripheral dopa decarboxylase inhibitor. It is always added with levodopa in treatment of Parkinsonism to avoid peripheral conversion of levodopa to carbidopa.

128. Ans. (c) **Short half life of drug**

Ref: Katzung, 14th ed. pg. 494

- ON-OFF phenomenon:** unpredictable fluctuation between mobility and immobility
 - Due to very short t1/2 of Levodopa: 1-2 hrs
 - To avoid this it is used along with COMT inhibitor → Entacapone, Tolcapone

129. Ans. (d) **Parkinsonism**Ref: Katzung, 14th ed. pg. 501

- Amantadine is an antiviral for Influenza A. It has been approved for treatment for Parkinson disease as well.
- Best for early stage PD or if patient not responding to L-Dopa
- **Mechanism of action**
- Facilitate DA release from presynaptic dopaminergic neuron and also Prevents DA uptake
- **Side effect:** Confusion, Hallucination, Ankle edema, Livido reticularis

130. Ans. (c) **Bromocriptine**Ref: Katzung, 14th ed. pg. 498; KDT, 6th ed. pg. 167

- Ergots are derived from a fungus *Claviceps purpurea*. Important compounds are:
 - Ergotamine
 - Ergometrine (ergonovine),
 - Ergotoxine
 - **Bromocriptine**
 - Methysergide and LSD.
- These drugs possess partial agonistic and antagonistic effect at 5HT, α and dopaminergic receptors.
- Ergot derivatives *can cause dry gangrene of hand and feet as well as coronary vasospasm*.
- Ergot derivatives are highly specific for migraine pain; they are not analgesic for any other condition.
- **Bromocriptine** is extremely effective in reducing the high levels of prolactin that result from pituitary tumors and has even been associated with regression of the tumor in some cases.
- **Benzhexol** is DOC for drug induced Parkinsonism.
- **Emmenagogues** are herbs which stimulate blood flow in the pelvic area and uterus; some stimulate menstruation.
- **Ropinirole** and pramipexole is a non-ergot derivative drug, and is used in Parkinsonism.

131. Ans. (b) **Bromocriptine**Ref: KDT, 6th ed. pg. 167

- **Bromocriptine** and **pergolide** are ergot derivatives and are used in Parkinsonism. All ergot derivatives can cause **retroperitoneal fibrosis**, cardiac and pleural fibrosis. They can also cause digital vasospasm leading to gangrene.
- Newer **nonergot dopamine agonists like pramipexole and ropinirole** do not have these limitations (these are **long acting** and **do not cause gangrene**). Adverse known side effect of these drugs is **excessive day time sleepiness**, Gambling habits, increased sexuality.

- Recently approved non ergot ROTIGOTINE is available as transdermal patch.

132. Ans. (b) **MAO-B inhibition**Ref: Katzung, 14th ed. pg. 499

- After release of DA in synaptic cleft, it is metabolized either by MAO-b or by COMT (catechol-ortho methyl transferase)
- In order to prevent this metabolism following drugs can be given, which will enhance DA availability:
 - MAO-b inhibitor: Selegiline, Rasagiline, safinamide
 - COMT inhibitor: Entacapone, Tolcapone

Extra Mile

Drugs stimulating DA receptor:

- Ergot Derivative: Bromocriptine, Cabergoline
- Non-Ergot: Pramipexole, Ropinirole, Rotigotine (*available as transdermal patch*)

133. Ans. (b) **Lamotrigine**Ref: Katzung, 14th ed. pg. 422

- Abnormal electrical activity in brain is propagated by voltage gated (VG) sodium channel, which is responsible for majority of seizure types.
- Drugs acting by inhibiting VG-Na⁺ sodium channel: (Mn: *Very Lame Priyanka Chopra Likes it Ruf & Top Zone*)
 - Valproate
 - Lamotrigine
 - Phenytoin
 - Carbamazepine
 - Lacosamide
 - Rufinamide
 - Topiramate
 - Zonisamide
- **Note:** In addition of VG-Na channel blocking action, these drugs also have additional action like N-type calcium channel blockage or by increasing GABAergic activity etc.

Extra Mile

- Ethosuximide acts by inhibiting T type VG-Ca⁺ channel blocking.
- Levetiracetam acts by inhibiting synaptic vesicular protein inhibition thereby increasing GABA → causing neuronal depression.
- Glutamate receptor inhibitors:
 - **NMDA receptor blocker:** FELBAMATE
 - **AMPA receptor blocker:** PERAMPANEL, TELAMPANEL

134. Ans. (c) It has Broad spectrum of anti-seizure activity

Ref: Lippincott's 5th ed. pg. 186; KDT 6th ed. pg. 409-410

- **Lamotrigine is effective in a wide variety of seizure types, including partial seizures, generalized seizures, and typical absence seizures and in the Lennox-Gastaut syndrome.**
- **MOA:** Lamotrigine acts by blocking Na⁺ channels, T-type Ca²⁺ channels and by increasing GABAergic activity.
- Lamotrigine dosages should be reduced when adding valproate to therapy unless the valproate is being added in a small dose to provide a boost to the lamotrigine serum concentration.
- **Major adverse effect:** Steven Johnson syndrome and toxic epidermal necrolysis, insomnia.
- **Other side effects:** Nausea, drowsiness, dizziness, headache, and Diplopia.

135. Ans. (b) Sodium valproate

Ref: KDT 6th ed. pg. 407-408

Uses of Sodium Valproate

- Valproic acid is the drug of choice for absence seizures.
- It is an alternative/adjuvant drug for GTCS, simple partial seizure and complex partial seizure
- Myoclonic and atonic seizures-control is often incomplete, but valproate is the drug of choice.
- Mania and bipolar illness: As alternative to lithium.
- Valproate has some prophylactic efficacy in migraine.

MOA: prolongation of Na⁺ channel inactivation

Augmentation of release of inhibitory transmitter GABA by inhibiting its degradation

Drugs which can be used for absence seizure:

- Sodium valproate
- Ethosuximide
- Lamotrigine
- Clonazepam.

TABLE: Drug of choice for different seizures

Seizure types	DOC
Absence seizures (petit mal) in children (<2 – 3 yr)	Ethosuximide
Absence seizures	Na ⁺ Valproate
GTCS (Grand mal)	LAMOTRIGINE > Na ⁺ Valproate
Focal onset/Partial seizure	Carbamazepine
Myoclonic seizures	Na ⁺ Valproate > Lamotrigine
Tonic/Clonic seizures	Na ⁺ Valproate
Infantile/salam seizure	ACTH
Infantile spasm associated with tuberous sclerosis	Vigabatrin
Febrile seizures	Diazepam (per rectal)
Status epilepticus	Lorazepam (I.V.)
Seizures in eclampsia	Magnesium sulphate
Seizure during pregnancy	Lamotrigine
Lennox Gastaut syndrome	Na ⁺ Valproate

136. Ans. (b) Na⁺ Valproate

Ref: Katzung, 14th ed. pg. 426; KDT, 6th ed. pg. 407-408

- Given the choices the answer will be Na⁺ Valproate
- According to Harrison's 19th ed. the current recommendable drug of choice for GTCS is **LAMOTRIGINE > Na⁺ Valproate.**

137. Ans. (b) Carbamazepine

Ref: Harrison's, 19th ed. pg. 2552

- **Carbamazepine is DOC** in partial/focal seizure.
- **Harrison states:** Carbamazepine (or a related drug, oxcarbazepine), lamotrigine, phenytoin, and levetiracetam are currently the drugs of choice approved for the initial treatment of focal seizures, including those that evolve into generalized seizures. Overall they have very similar efficacy, but differences in pharmacokinetics and toxicity are the main determinants for use in a given patient.

TABLE: Selection of antiepileptic drug

Generalized onset tonic clonic	Focal	Typical absence	Atypical absence, myoclonic, atonic
First-line			
Lamotrigine	Lamotrigine	Valproic acid	Valproic acid
Valproic acid	Carbamazepine	Ethosuximide	Lamotrigine
	Oxcarbazepine	Lamotrigine	Topiramate
	Phenytoin		
	Levetiracetam		
Alternatives			
Zonisamide	Topiramate	Lamotrigine	Clonazepam
Phenytoin	Zonisamide	Clonazepam	Felbamate
Carbamazepine	Valproic acid		Clobazam
Oxcarbazepine	Tiagabine ^a		Rufinamide
Topiramate	Gabapentin ^a		
Phenobarbital	Lacosamide ^a		
Primidone	Exogabine ^a		
Felbamate	Phenobarbital Primidone Felbamate		

^aAs adjunctive therapy

138. Ans. (a) **Valproate**Ref: Katzung, 14th ed. pg. 426**TABLE:** Important side effects of anti epileptic drugs

Drug	Side effect
Valproate	<ul style="list-style-type: none"> Fulminant Hepatitis: most grave side effect Reversible Alopecia, Hepatotoxicity, Weight Gain, Tremor, Pancreatitis, NTD, Thrombocytopenia PCOS- gender specific side effect
Phenytoin	Gum Hypertrophy: MC side effect Hirsutism, Fetal hydantoin syndrome, Megaloblastic anemia
Carbamazepine	Agaranolucytosis: Most serious side effect SJS, Bone marrow suppression, confusion, Ataxia, Blurring of vision
Zonisamide	Renal stone, Amnesia, Drowsiness, wt loss
Topiramate	Renal stone, Somnolence, wt loss
Vigabatrin	Visual acuity decreased, Weight gain
Felbamate	Aplastic anemia, Hepatotoxicity

139. Ans. (a) **Phenytoin**Ref: Katzung, 14th ed. pg. 418

- Gum hypertrophy is known side effect of phenytoin.

140. Ans. (d) **Folic acid deficiency**Ref: Katzung, 14th ed. pg. 418–19; KDT, 6th ed. 404–405

- Phenytoin is a major epileptic drug which is effective for treatment of partial seizures and generalized tonic-clonic seizures and in the treatment of status epilepticus.
- MOA:** Phenytoin blocks voltage-gated sodium channels by selectively binding to the channel in the inactive state and slowing its rate of recovery.
- It follows zero order kinetics.
- It can also be used as an anti-arrhythmic drug (class Ib) for the treatment of digitalis induced arrhythmia.
- Use of phenytoin during pregnancy can cause **Fetal hydantoin syndrome** characterized by: hypoplastic phalanges, cleft lip, cleft palate and microcephaly. It occurs due to metabolite of phenytoin, **arene oxide**.
- Phenytoin decreases folate absorption and increases its excretion → Megaloblastic anemia.**
- Prolonged use of phenytoin can result in gingival hyperplasia (**gum hypertrophy**).
- It can inhibit the insulin release and can cause **hyperglycemia**.
- Other adverse effects on long-term use include:** Hirsutism, coarsening of facial features, megaloblastic anemia (treated with folic acid), vitamin D deficiency

(rickets and **osteomalacia**), vitamin K deficiency, hyperglycemia (due to inhibition of insulin release), hypersensitivity.

141. Ans. (c) **GABA transaminase inhibitor**Ref: Katzung, 14th ed. pg. 431–32

- VIGABATRIN is GABAergic drug acts by inhibiting enzyme GABA transaminase.
- This enzyme inhibition causes increased level of GABA in the neuron.
- Use:**
 - DOC in infantile spasm + Tuberous sclerosis
 - Simple and complex partial seizure
- Contraindicated in absence seizure, Myoclonic seizure, Pre-existing visual field defect.
- Side effect:** Visual field defect due to peripheral retinal atrophy, weight gain, amnesia

Extra Mile

- GABA uptake transport inhibitor: TIAGABINE

142. Ans. (b) **Inhibiting CRMP protein**Ref: Katzung, 14th ed. pg. 417

- CRMP is Collapsing Response Mediator Protein, which causes neuronal excitotoxicity by releasing BDNF (Brain Derived Neurotrophic Factor).
- The drug Lacosamide acts by inhibiting CRMP protein, thereby causing protective action against neuronal excitotoxicity.

143. Ans. (a) **Shift to sodium valproate**Ref: Katzung, 14th ed. pg. 418–19; KDT 6th ed. pg. 405

Hypersensitivity reactions like rashes, DLE, lymphadenopathy and neutropenia require that phenytoin to be stopped.

144. Ans. (c) **Topiramate**Ref: Katzung, 14th ed. pg. 427–28

- The only antiepileptic drug which causes weight loss: Topiramate, Zonisamide
- MOA of topiramate:**
 - VG-Na⁺ channel blocker
 - Activate GABA receptor
 - Inhibit AMPA receptor (*receptor of Glutamate*)
- Use:**
 - GTCS, Partial seizure
 - Maintenance therapy of alcohol withdrawal
 - LGS
 - Decreases alcohol craving
- Side effects:** Urolithiasis, Somnolence

**145. Ans. (a) Naloxone**Ref: *Katzung, 14th ed. pg. 581*

- In acute morphine poisoning the DOC is Naloxone (Opioid antagonist).
- It is short acting and has rapid onset of action. It is given by IV route.
- **Naltrexone**
 - It is a longer acting oral opioid antagonist.
 - Given in long term addiction therapy to prevent relapse.
- **Nalmefene:**
 - Also a naltrexone derivative. Can be given IV.
 - It is recently approved for cholestatic pruritus.

146. Ans. (b) PruritusRef: <https://www.ncbi.nlm.nih.gov/pubmed/8706199>

- With the increasing utilization of intrathecal and epidural opioids in humans, a wide variety of clinically relevant side effects have been reported.
- The four classic side effects are *pruritus*, nausea and vomiting, urinary retention, and respiratory depression.
- Intrathecal injection has been shown to cause segmental analgesia without affecting other modalities. *It acts in the substantia gelatinosa of dorsal horn to inhibit release of excitatory transmitters from primary afferents carrying pain impulses.* The action appears to be exerted through inter neurons which are involved in the 'gating' of pain impulses. Release of glutamate from primary pain afferents in the spinal cord and its postsynaptic action on dorsal horn neurons is inhibited by morphine.

147. Ans. (b) BuspironeRef: *Katzung, 14th ed. pg. 584; KDT, 6th ed. pg. 451***BUSPIRONE**

- A new class of anti-anxiety drug.
- Relieves mild-to-moderate generalized anxiety
- The mechanism of anxiolytic action may be dependent on its selective partial agonistic action on 5-HT_{1A} receptors.

The Following Agents can be Used as Anti-Smoking Drugs

- **Varenicline:**
 - It is a direct acting nicotinic agonist
 - Can be used orally and has a half life of 14-20 hours.
- **Bupropion:** It acts by inhibition of neuronal reuptake of 5-HT, NE and DA.

• **Clonidine:**

- It is a very effective drug for reducing the withdrawal effects of nicotine.
- It decreases the craving as well as is useful in insomnia.
- Nicotine (Gums, Patch, Inhaler)

148. Ans. (a) Nicotine replacement gumRef: *Katzung, 14th ed. pg. 584***Treatment of smoking dependence:**

- **First line:** Nicotine replacement therapy (gum, patch, inhaler).
- **Bupropion and Varenicline** (Nicotine receptor agonist): Also first line. Considered more effective.
- **2nd line:** Clonidine and Nortryptiline
- **Rimonabant:** Cannabinoid receptor inverse agonist. Withdrawn due to increased depression and suicide risk.

149. Ans. (c) LithiumRef: *Katzung, 14th ed. pg. 527*

- Lithium is DOC in manic disorder.
- DOC for prophylaxis of mania: Lithium
- DOC for acute attack of mania: Sedative + Atypical antipsychotics
- DOC for mania in pregnancy: Atypical antipsychotics
- Side effect of lithium (*Mn: LITTH*)
 - **L:** LEUCOCYTOSIS
 - **I:** Insipidus diabetes
 - **T:** Tremors (MC side effect- Coarse tremor);
 - **T:** Teratogenic (Ebstein anomaly)
 - **H:** Hypothyroidism

Extra Mile**Therapeutic Plasma concentration of Lithium**

- Acute mania: 0.8 – 1.4 mEq/L
- Prophylaxis: 0.5 – 0.8 mEq/L
- Toxic plasma conc level: > 2mEq/L

150. Ans. (c) FluvoxamineRef: *Katzung, 14th ed. pg. 540*

- SSRI are selective serotonin reuptake inhibitor. Causing increased level of only serotonin in synaptic cleft.
- DOC in mild to moderate depression
- Drugs are:
 - CITALOPRAM
 - ESCITALOPRAM: **Most specific SSRI**
 - FLUOXETINE: Longest acting (50 hrs)
 - FLUOXAMINE: Shortest acting
 - PAROXETINE
 - SERTRALINE

Extra Mile

- **TCA: Tricyclic Antidepressant**
 - Inhibit reuptake of serotonin, Noradrenaline (NA) and Dopamine (DA)
 - **Drugs are:** Imipramine, Trimipramine, Desipramine, Clomipramine, Nortryptiline, Amitryptiline
- **SNRI: Serotonergic Noradrenergic reuptake inhibitor**
 - Inhibit reuptake of serotonin and NA
 - **Drugs are:** Venlafaxine, Desvenlafaxine, Duloxetine, Milnacipran, Levomilnacipran

151. Ans. (b) Serotonergic noradrenergic reuptake inhibitor

Ref: Goodman & Gillman's 13th ed. P 268

- Five medications with a nontricyclic structure that inhibit the reuptake of both 5HT and NE have been approved for use in the US for treatment of depression, anxiety disorders, pain, or other specific conditions. The drugs are:
 - Venlafaxine and its demethylated metabolite desvenlafaxine
 - Duloxetine
 - Milnacipran, and
 - Levomilnacipran

Mn: Vania Duals My Love

152. Ans. (b) Nausea

Ref: Katzung, 14th ed. pg. 546

TABLE: Side effect of antidepressants

Drug	Important side effects
SSRI	MC side effect: Nausea Other side effects: <ul style="list-style-type: none"> • Delayed ejaculation: Now approved for premature ejaculation • Serotonin syndrome • Anorgasmia • Agitation, anxiety, insomnia
TCA	Sedation, weight gain, T wave flattening, QT prolongation, Postural hypotension
SNRI	Serotonin syndrome Insomnia, Tachycardia, Anxiety

153. Ans. (d) Motion sickness

Ref: Katzung's Pharma, 14th ed. pg. 135

- Scopolamine (hyoscine) is a prototypic *muscarinic receptor antagonist*, and is one of the best agents for the prevention of motion sickness.
- Scopolamine has many effects in the body including decreasing the secretion of fluids, slowing the stomach and intestines, and dilation of the pupils.

- Scopolamine is also used to relieve nausea, vomiting, and dizziness associated with motion sickness and recovery from anesthesia and surgery.

154. Ans. (b) Aldehyde dehydrogenase

- Disulfiram is an anti-craving agent for alcoholics. It has been used as an aversion technique in alcoholics.
- Disulfiram acts by inhibiting aldehyde dehydrogenase. If a person still takes alcohol while on disulfiram treatment, alcohol is metabolized as usual, but acetaldehyde accumulates.
- This accumulation of acetaldehyde gives some distressing symptoms like **flushing, burning sensation, throbbing headache, perspiration, dizziness, vomiting, confusion and circulatory collapse**.
- Therefore, it is recommended only for those alcoholics who are motivated and sincerely desire to leave the habit.
- **Drugs causing disulfiram like reaction:**
 - Griseofulvin
 - Metronidazole
 - Chlorpropamide
 - Cefoperazone
 - Cefotetan
 - Trimethoprim
 - Procarbazine
- **Other drugs that decrease craving for alcohol and smoking: (remembered as NATO)**
 - NALTREXONE
 - ACAMPROSATE
 - TOPIRAMATE
 - ONDANSETRON

Extra Mile

- Drug which inhibits alcohol dehydrogenase- **FOMEPIZOLE**
- Antidote for methanol poisoning: **FOMEPIZOLE > ETHANOL**
- Antidote for ethylene glycol poisoning: **FOMEPIZOLE**

155. Ans. (a) Competitively inhibits alcohol Dehydrogenase

Ref: Katzung, 14th ed. pg. 404; KDT, 6th ed. pg. 387

- Ethanol acts by competitive inhibition of alcohol dehydrogenase which block further metabolism of methanol into formaldehyde and formic acid. These products also cause retinal damage leading to subsequent blindness.

ADH: alcohol dehydrogenase; FDH : formaldehyde dehydrogenase
F-THF-S: 10-formyl tetrahydrofolate synthetase

- **Catalase** is a common enzyme found in nearly all living organisms exposed to oxygen. It catalyzes the decomposition of hydrogen peroxide to water and oxygen.
- **Lactate dehydrogenase:** Dummy choice and is present in heart, RBC and is used as marker for malignancy.
- **Acetaldehyde dehydrogenase:** Converts acetaldehyde into acetic acid and is the target for disulfiram which is used to help patients quit alcohol.

Remember

- **Ethanol** is also metabolized by alcohol dehydrogenase and acts as its competitive inhibition. The enzyme's affinity for ethanol is 10-20 times higher than it is for methanol. Given via IV infusion in methanol or ethylene glycol poisoning.
- **Fomepizole** inhibits alcohol dehydrogenase. It is a stronger competitive inhibitor of ADH and, in addition, does not cause hypoglycemia or sedation.
- **Fomepizole** is relatively easier to administer than ethanol. It does not require monitoring of serum concentrations. Hence considered as **drug of choice**.

156. Ans. (d) Flumazenil

Ref: Katzung, 14th ed. pg. 404; KDT, 6th ed. pg. 385

- **Flumazenil** is benzodiazepine antagonist. It has no role in alcohol detoxification.

Alcohol Detoxification

Alcohol can produce physical and psychological dependence. In the treatment of alcohol dependence, major aim is to prevent withdrawal symptoms first and to avoid relapse of addiction thereafter.

- **Benzodiazepines** (chlordiazepoxide and diazepam) are long acting CNS depressant and are given to **prevent withdrawal**.
- **Acamprosate** is an NMDA antagonist that can be used for **maintenance therapy of alcohol abstinence**.
- **Naltrexone** is an opioid antagonist that can be used to reduce **alcohol craving**.
- **Disulfiram** can be used in psychologically dependent persons who are motivated to quit alcohol. It is

contraindicated in physically dependent individuals. It produces severe distressing symptoms (like flushing, headache, vomiting, visual disturbances and mental confusion) after intake of alcohol due to accumulation of acetaldehyde.

- **Topiramate and ondansetron** can also *decrease* alcohol craving.

ANTIMICROBIAL AGENTS

157. Ans. (d) Ampicillin

Ref: Goodman & Gillman 13th ed. P 1036, 1050

- Ampicillin is considered as agent of choice in several infections like:
 - Enterococcus faecalis infection
 - Listeria infection
 - URTI (sinusitis, pharyngitis, otitis media) due to beta haemolytic streptococci
- **Other agents effective against Enterococcus faecalis:** Daptomycin, Linezolid, Tigecycline, Telavancin, Vancomycin, Carbapenems.
- **Agents effective against Enterococcus faecium:** Daptomycin, Linezolid

Extra Mile

- Enterococcus Faecium and Faecalis are highly resistant to aminoglycosides

158. Ans. (a) 3 mg/kg/day twice daily

Ref: Goodman & Gillman 13th ed. P 114

- Oseltamivir is one of the Neuraminidase inhibitor effective against influenza A and B.
- It inhibits amantadine- and rimantadine-resistant influenza A viruses and some zanamivir-resistant variants.
 - **Note:** Seasonal influenza H1N1 is resistant to oseltamivir
- **Dose required:**
 - For treatment-Adult: 75 mg twice daily for 5 days. Initiated within 48 hours of onset of illness
 - For Prophylaxis-Adult: 75 mg once daily
 - For pediatric patients dose is according to weight band (given in the table)

TABLE: Recommended dosage and duration of influenza antiviral medications for treatment of chemoprophylaxis

Antiviral agent	Use	Children	Adults
Oral oseltamivir	Treatment (5 days)	<ul style="list-style-type: none"> • If younger than 1 year old: 3 mg/kg/dose twice daily • If 1 yr or older, dose varies by child's weight: <ul style="list-style-type: none"> • 15 kg or less, the dose is 30 mg twice a day • >15 to 23 kg, the dose is 45 mg twice a day • >23 to 40 kg, the dose is 60 mg twice a day • >40 kg, the dose is 75 mg twice a day 	75 mg twice daily
		If child is younger than 3 months old, use of oseltamivir for chemoprophylaxis is not indicated	

159. Ans. (a) Ceftriaxone

Ref: Harrison 20th edition, Page 1112

- DOC for meningococcal diseases: Penicillin G
- DOC for meningococcal meningitis: Ceftriaxone
- DOC for Prophylaxis of meningococcal meningitis: Rifampicin
- DOC for prophylaxis of H. Influenza meningitis: Rifampicin
- DOC for prophylaxis of meningococcal meningitis in pregnancy: Ceftriaxone
- DOC for listeria meningitides: Ampicillin
- **NOTE:** Rifampicin is known to cross placental barrier, hence avoided (but not contraindicated) in pregnancy.

160. Ans. (b) Streptomycin

Ref: Goodman & Gillman 13th ed. P 1039-40

- Streptomycin is one of the aminoglycosides.
- **MOA:**
 - Enters bacteria
 - Binds to 30s ribosomal unit and interferes with initiation of protein synthesis by causing the misreading and premature termination of mRNA translation.
 - This initial level interference causes accumulation of abnormal initiation complex and misreading causes insertion of incorrect amino acid in growing polypeptide chain → forming abnormal protein → Not compatible with bacterial life (Bactericidal).

- Other aminoglycosides are: Gentamicin, Tobramycin, Amikacin, Neomycin, Kanamycin, Netilmicin, Paromomycin.

USES OF AMINOGLYCOSIDES (AG)

- **Note:** AG is ineffective against anaerobes.
 - Most commonly used AG: Gentamicin
- Can be used as empirical therapy in majority of infections like UTI, hospital acquired Pneumonia, Meningitis, Peritonitis, Cystic fibrosis, sepsis.
- **Streptomycin:** DOC for tularemia, plague

SIDE EFFECT OF AG

- Ototoxicity
 - **Vestibulotoxicity:** MC due to Streptomycin and gentamicin
 - **Auditory/Cochlear dysfunction:** Irreversible, bilateral, high-frequency hearing loss. MC due to Amikacin, Neomycin, Kanamycin
 - ◆ **First symptom of cochlear toxicity:** High pitch tinnitus
- Nephrotoxicity
- Neuromuscular blockade (MC: Neomycin > Kanamycin)

Extra Mile

- Ceftriaxone is a third generation cephalosporin (from β Lactams class → a cell wall inhibitor).
- Nevirapine is one of the anti-retroviral drug from Non-nucleoside reverse transcriptase inhibitors class.
- Indinavir is one of the HIV protease inhibitor.

161. Ans. (a) Streptomycin

Ref: Goodman & Gillman 13th ed. P 1045; Harrison 20th edition, Page 1112

- Streptomycin is highly ototoxic (vestibulotoxic >> Cochleotoxic) and nephrotoxic drug.
- It is strictly contraindicated throughout the pregnancy.

TABLE: Drugs during pregnancy

	Drugs safe in pregnancy	Drugs contraindicated in pregnancy (Safety uncertain)
• Anti-tubercular	Isoniazid, Rifampicin, Pyrazinamide, Ethambutol	Streptomycin
• Antiamoebic	Diloxanide furoate, paromomycin	Metronidazole, Tinidazole, Quiniodochlor
• Antimalarial	Chloroquine, Mefloquine, Proguanil, Quinine (only in 1 st trimester)	Primaquine

Contd...

	Drugs safe in pregnancy	Drugs contraindicated in pregnancy (Safety uncertain)
• Antifungal	Topical: Clotrimazole, Nystatin, Tolnaftane	Amphotericin B, Fluconazole, Itraconazole, Ketoconazole, Griseofulvin
• Antiallergies	Chlorpheniramine, Promethazine	Cetirizine, Loratadine, Fexofenadine
• Anti-bacterials	Penicillin G, Ampicillin, Amoxicillin-clavulanate, cloxacillin, Piperacillin, Cephalosporins, Erythromycin	Cotrimoxazole, Fluoroquinolones, Tetracycline, Doxycycline, Chloramphenicol, Kanamycin, Tobramycin, Clarithromycin, Vancomycin
• Antiviral	–	Ganciclovir, Foscarnet, Amantadine, Vidarabine, α-interferon
• Anti-retroviral	Zidovudine, Lamivudine, tenofovir, Nelfinavir, Nevirapine, Saquinavir, Efavirenz	Didanosine, Abacavir, Indinavir, Ritonavir
• Anti-diabetic	Insulin (preferably human insulin)	Sulfonylureas, metformin, Acarbose, pioglitazone, Repaglinide
• Thyroid drugs	Propylthiouracil	Carbimazole, Radioactive iodine (X), Iodide

162. Ans. (b) Azithromycin

Ref: Goodman & Gillman 13th ed. P 1017

- The patient in the given case has chlamydia induced UTI. The agent that can be preferred for management of such condition is fluoroquinolones (FQ).
- **Books state:** "FQs are more efficacious than trimethoprim-sulfamethoxazole or oral B-Lactams". Moxifloxacin doesn't accumulate in urine and hence NOT approved for treatment of UTI.
- Fluoroquinolones lack activity for *Treponema pallidum* but have activity in vitro against *Chlamydia trachomatis* and *Haemophilus ducreyi*.
- This patient later presented with symptoms of sexually transmitted infection, for which the best option is Azithromycin, single dose is effective.

- **Book states:** "For chlamydial urethritis/cervicitis, a 7-day course of ofloxacin or levofloxacin is an alternative to a 7-day treatment with doxycycline or a single dose of azithromycin; other available quinolones are NOT effective in these condition"

163. Ans. (a) Dengue

Ref: Goodman & Gillman 13th ed. P 668-69

- CYD-TDV developed by Sanofi Pasteur is a recombinant tetravalent (four-serotype) live attenuated virus vaccine that was first licensed in Mexico in December 2015 for use in individuals 9–45 years of age living in endemic areas.
- However, it is given as a three-dose series on a 0–6–12-month schedule via subcutaneous route.
- It should only be given to individuals with previous history of dengue by any of the 4 serotypes.

Extra Mile

- **Malaria Vaccine:** The RTS, S vaccine is a recombinant protein-based malaria vaccine with AS01 adjuvant against *Plasmodium falciparum* only. It is the first malaria vaccine to be approved in April 2019.
 - The vaccine has been recommended by WHO for pilot introduction in selected areas of 3 African countries

164. Ans. (b) Liposomal Amphotericin B

Ref: Goodman & Gillman 13th ed. P 996

- Drug of choice for visceral leishmaniasis: Liposomal Amphotericin B.
 - **Note:** AmpB can be used even during pregnancy
 - **Side effect:** Renal toxicity, hypokalemia, hypomagnesemia
- **Other agents for management of leishmaniasis:**
 - **Sodium stibogluconate:** Given parenterally 20 mg/kg/day for 20 days in cutaneous disease and 28 days in visceral leishmaniasis. Due to increased resistance it has now become obsolete in India. At present oral preparation is available and shows better result.
 - ♦ **Side effect:** Pancreatitis, Hepatotoxicity, Bone marrow suppression, haemolytic anemia and renal failure
 - **Pentamidine** can be used in doses of 2–3 mg/kg IV or IM daily or every second day for 4–7 doses to treat cutaneous leishmaniasis.
 - ♦ **Side effect:** Nephrotoxic, Hypoglycemia
 - **Miltefosine:** Oral agent. Can be used in visceral and cutaneous leishmaniasis.
 - ♦ Only oral preparation available. Teratogenic → Not used in pregnancy

**165. Ans. (a) Fosfomycin**

- Among the given choices fosfomycin is preferred agent for UTI.
- Recommendations for treatment must be considered in the context of local resistance patterns and national differences in some agents' availability.
- For example, **fosfomycin** and pivmecillinam are not available in all countries but are considered **first-line** options where they are available because they retain activity against a majority of uropathogens that produce extended-spectrum β -lactamases.
 - Use of **fosfomycin** for UTIs (including complicated infections), particularly for infections caused by multidrug-resistant *E. coli*.
- TMP-SMX was earlier recommended as the first-line agent for treatment of uncomplicated UTI, but due to increasing evidence of resistance it is less preferred.
 - **TMP-SMX** has been recommended as first-line treatment for acute cystitis, and it remains appropriate to consider the use of this drug in regions with resistance rates not exceeding 20%

- **UTI drugs having minimal effect on fecal flora:** Pivmecillinam, Fosfomycin, and Nitrofurantoin.
- **UTI drugs having significant effect on fecal flora:** Trimethoprim, TMP-SMX, Quinolones, and ampicillin.
 - These drugs are notably the agents for which rising resistance levels have been documented.
- Fluoroquinolones should not be used for uncomplicated cystitis unless no alternatives are available.
 - Most **fluoroquinolones** are highly effective as short-course therapy for cystitis; the exception is moxifloxacin
 - Commonly used for UTI include ciprofloxacin and levofloxacin.
- **Nitrofurantoin** remains highly active against *E. coli* and most non-*E. coli* isolates. *Proteus*, *Pseudomonas*, *Serratia*, *Enterobacter*, and yeasts are all intrinsically resistant to this drug.
 - Resistance to nitrofurantoin remains low compared to TMP-SMX
- In acute cystitis, β -Lactam agents generally are not preferred as well as TMP-SMX or fluoroquinolones.

TABLE: Treatment strategies for acute uncomplicated cystitis

Drug and dose	Estimated clinical efficacy, %	Estimated bacterial efficacy, %	Common side effects
Nitrofurantoin, 100 mg bid \times 5–7 day	87–95	82–92	Nausea, headache
TMP-SMX, 1 DS tablet bid \times 3 day	86–100	85–100	Rash, urticaria, nausea, vomiting, hematologic abnormalities
Fosfomycin, 3-g single-dose sachet	83–95	78–98	Diarrhea, nausea, headache
Pivmecillinam, 400 mg bid \times 3–7 day	55–82	74–84	Nausea, vomiting, diarrhea
Fluoroquinolones, dose varies by agent; 3 day regimen	81–98	78–96	Nausea, vomiting, diarrhea, headache, drowsiness, insomnia
β -Lactams, dose varies by agent; 5–7 day regimen	79–98	74–98	Diarrhea, nausea, vomiting, rash, urticaria

166. Ans. (b) AntimalarialRef: Goodman & Gillman's 13th ed. P 974

- **Pyronaridine** is an antimalarial structurally related to amodiaquine.
- This drug is potent against both *P. falciparum* and *P. vivax* and is very well tolerated.
- It leads to fever resolution in 1–2 days and parasite clearance in 2–3 days.
- It is tested in clinical trials as an adjunct with artemisinin class drugs, has not yet been licensed.

167. Ans. (b) CeftriaxoneRef: Harrison 19th ed. P 767

- Ceftriaxone is the empirical drug of choice for treatment of meningitis. It is frequently combined with vancomycin.

168. Ans. (a) AcyclovirRef: Goodman & Gillman's 13th ed. P 1106–7

- Acyclovir's clinical use is limited to herpes viruses. Acyclovir is most active against HSV-1.
- Approximately half as active against HSV-2, and a tenth as potent against VZV and EBV.
- **Book states:** "Acyclovir is ineffective therapeutically in established CMV infections, but ganciclovir is effective for CMV prophylaxis in immunocompromised patients".
- EBV-related oral hairy leukoplakia may improve with acyclovir.
- Drugs which can be used in treatment of CMV retinitis are cidofovir, ganciclovir, foscarnet, valaciclovir.
- **DOC for CMV retinitis:** Ganciclovir

FMGE Solutions Screening Examination

278

- **Fomivirsen** is active against CMV strains **resistant** to ganciclovir, foscarnet, and cidofovir. Fomivirsen is given by intravitreal injection unresponsive to other therapies.

169. Ans. (d) Mutation

Ref: Goodman & Gillman's 13th ed. P 1016

- Ciprofloxacin is one of the fluoroquinolones along with norfloxacin, ofloxacin, levofloxacin, sparflaxacin, etc.
- **MOA of quinolones:** The quinolone antibiotics target bacterial DNA gyrase and topoisomerase IV.
- The quinolones inhibit gyrase-mediated DNA supercoiling at concentrations that correlate well with those required to inhibit bacterial growth.
- **Mutations of the gene that encodes the A subunit of the gyrase** can confer resistance to these drugs.

170. Ans. (a) Kanamycin

Ref: Goodman & Gillman 13th ed. P 1044-45

- All aminoglycosides have the potential to produce reversible and irreversible vestibular, cochlear, renal toxicity and neuromuscular blockade.
- Aminoglycoside-induced ototoxicity may result in irreversible, bilateral, high-frequency hearing loss or vestibular hypofunction.
- A high-pitched tinnitus often is **the first symptom** of cochlear toxicity.
- Drugs like amikacin, neomycin and kanamycin are specifically cochleotoxic > vestibulotoxic.
- Gentamicin, streptomycin is vestibular > cochleotoxic
- **Tobramycin:** Cochlear = Vestibular toxicity both.

171. Ans. (b) Clindamycin

Ref: KDT 6th ed. page 668

- **Lincosamide family** of antimicrobial drugs includes:
 - Clindamycin
 - Lincomycin (*It is obsolete now*)

Drugs which inhibit cell wall formation	Drugs which inhibit protein synthesis
Cycloserine Vancomycin Fosfomycin Beta Lactams Penicillin Cephalosporin Carbapenem Monolactams Bacitracin	<ul style="list-style-type: none"> • Tetracycline (<i>tRNA inhibitor</i>) • Chloramphenicol (<i>peptide bond formation inhibitor</i>) • Macrolides (erythro, clarithro, azithro) • Clindamycin • Aminoglycosides • Streptogramins (Quinpristin + Dalfopristin)
Remembered as: Cell Wall of Bacteria	The Child May Climb Amino Stairs

- **Clindamycin** is among the drugs which act by inhibiting protein synthesis.
- They bind to 50s subunit of ribosome resulting in bacteriostatic inhibition of bacterial protein synthesis.
- It is very effective drug against corynebacterium acne, pneumocystis carinii and toxoplasma gondii

172. Ans. (c) Quinpristin

Ref: Sharma & Sharma 3rd ed. P 702

TABLE: Protein synthesis inhibitor drugs acting at 30s and 50s ribosomal unit

Drugs acting by inhibiting 30s ribosome	Aminoglycoside (Streptomycin, Gentamicin, Tobramycin, Kanamycin, Amikacin) Tetracycline (Minocycline, Demeclocyclin, Doxycycline)
Drugs acting by inhibiting 50s ribosome	Streptogramins (Quinpristin & Dalfopristin) Erythromycin (macrolides) Lincosamides (Clindamycin) Linezolid Ketolides (Telithromycin, Cethromycin) Chloramphenicol
Mn: Buy AT 30, SELL Karo China in 50	

173. Ans. (a) Carbenicillin

Ref: Sharma & Sharma 3rd ed. P 731

- Some penicillins like PnG, Procaine PnG, Benzathine PnG, Carbenicillin, Ticarcillin, Mezlocillin, Azlocillin, Piperacillin are sensitive to gastric acid degradation.
- Such penicillins are not effective orally, and hence are given via parenteral route.

TABLE: Acid Resistant Vs acid Labile penicillins

Acid Resistant penicillin Mn: VODCA BoTal	Acid Labile penicillin Mn: GNM Car Till MAP
<ul style="list-style-type: none"> • PnV • Oxacillin • Dicloxacillin • Cloxacillin • Ampicillin/Amoxycillin • Bacampicillin • Talampicillin 	Natural penicillins <ul style="list-style-type: none"> • Penicillin G • Procaine PnG • Benzathine PnG Anti-staphylococcal penicillins <ul style="list-style-type: none"> • Nafcillin • Methicillin Antipseudomonal penicillins <ul style="list-style-type: none"> • Carbenicillin • Ticarcillin • Mezlocillin • Azlocillin • Piperacillin

174. Ans. (b) Ampicillin

Ref: Goodman & Gillman 13th ed. P 1028;
Katzung, 9th ed. pg. 1172

- First line drug of choice for listeria species is Ampicillin.
- Second line- TMP-SMZ
- The book states: "Ampicillin or penicillin G (with consideration for addition of gentamicin to both for immunosuppressed patients with meningitis) is the drugs of choice in the management of infections owing to *L. monocytogenes*. The recommended dose of penicillin G is 18–24 million units parenterally per day for at least 2 weeks."

Extra Mile

Listeria along with group B streptococci and E.coli is the most common cause of neonatal meningitis.

MOA of ampicillin: Inhibits cell wall synthesis during active multiplication.

First line drug of choice for neonatal meningitis- ampicillin + 3rd gen cephalosporin.

Chloramphenicol is a protein synthesis inhibitor, more specifically it inhibits formation of peptide bond between acceptor and peptide site.

- **Side effect:** Bone marrow suppression
- **Teratogenic S/E- Gray baby syndrome:** Chloramphenicol

175. Ans. (b) Chloramphenicol

Ref: KDT, 6th ed. pg. 717

Antimicrobial drugs	Side effects
Chloramphenicol	Grey baby syndrome Bone marrow suppression
Tetracycline	Teeth discoloration and bone growth suppression Phototoxicity Fanconi syndrome (in case of expired tetracycline) Vestibular dysfunction
Vancomycin	Red man/Red neck syndrome Nephrotoxic and ototoxic
Clindamycin	Pseudomembranous colitis

Extra Mile

VANCOMYCIN: drug of choice for MRSA

Vancomycin NEVER effective against Pseudomonas
β LACTAMS never effective against MRSA.

AMINOGLYCOSIDE never effective against Anaerobes.

Most common cause of pseudo membranous colitis: 3rd Gen. cephalosporin.

DOC for pseudo membranous colitis: **VANCOMYCIN (Oral).**

Preferred agent in mild case of pseudomembranous colitis
→ Metronidazole

176. Ans. (b) Vancomycin

Ref: Katzung, 14th ed. pg. 809; Sharma & Sharma 3rd ed. P 742-43; KDT, 6th ed. pg. 732

- Vancomycin is a bactericidal drug acts by cell wall synthesis inhibitor and by damaging cell membrane integrity.
- It is exclusively active against aerobic as well as anaerobic gram positive species such as streptococcus and staphylococci including MRSA.
- Parenterally it is DOC in MRSA, Staph epidermidis infection associated with use of IV catheters or with continuous peritoneal dialysis.
- Orally it is also effective in controlling pseudomembranous colitis not responding to metronidazole (act as local because it is poorly absorbed from GIT).
- **Side effects:**
 - Red neck syndrome (due to histamine release)
 - Ototoxicity, nephrotoxicity, skin rash, reversible neutropenia etc.

177. Ans. (b) Metronidazole

Ref: Katzung's Pharma, 10th ed. Ch 53

- Vancomycin (oral) is now considered as the drug of choice for pseudomembranous colitis.
- Metronidazole also used for pseudomembranous colitis in mild cases.
- Ampicillin has been associated with pseudomembranous colitis
- Ceftriaxone is DOC for typhoid/enteric fever. Should be given IV.

Extra Mile

- METRONIDAZOLE is also the drug of choice in the treatment of amebiasis, trichomoniasis, Giardiasis and extraluminal amebiasis.
- For serious pseudomembranous colitis not responding to metronidazole, DOC is Vancomycin.

178. Ans. (b) Pseudomembranous colitis

Ref: Sharma & Sharma 3rd ed. P 742-43;
Katzung, 14th ed. pg. 809

Please refer to above explanation for details

179. Ans. (d) Nafcillin

Ref: KD Tripathi, 6th ed. pg. 700 & 708

- Microbes which are resistant to methicillin, are said to be MRSA. Since methicillin is not clinically used

nowadays, then if the organism is resistant to Nafcillin and Cloxacillin, they are also said to be MRSA.

- Methicillin is highly penicillinase resistant but not acid resistant.
- MRSA have emerged in many areas. These are insensitive to all penicillinase-resistant penicillins and to other β -lactams as well as to erythromycin, aminoglycosides, tetracyclines, etc.
- The drug of choice for these organisms is vancomycin/linezolid, but ciprofloxacin and Rifampicin can also be used.
- Antibiotics effective against Beta lactamase producing bacteria:
 - **Beta lactamase resistant antibiotics:** Cloxacillin, Dclloxacillin, Methicillin and Nafcillin
 - **Beta lactamase inhibitors:** currently there are 3 drugs in this category (and they are added with)
 - ◆ Clavulanic acid (+ Amoxycillin)
 - ◆ Sulbactam (+ Ampicillin)
 - ◆ Tazobactam (+ Piperacillin)

180. Ans. (b) β Lactams

Ref: Sharma & Sharma 3rd ed. P 733

- No β Lactams are effective against MRSA, EXCEPT 5th generation cephalosporins like Ceftaroline and Ceftibiprole.
- DOC for MRSA: Vancomycin
- DOC for VRSA: Daptomycin
- Drugs used in VRSA: Quinpristin, Daptomycin, Linezolid

181. Ans. (b) Chloramphenicol

Ref: KD Tripathi, 6th ed. pg. 716 & 909

CHLORAMPHENICOL

- It is a broad-spectrum antibiotic, active against nearly the same range of organisms (gram-positive and negative bacteria, rickettsiae, mycoplasma) as tetracyclines.

Adverse Effects

- Bone marrow depression
- Hypersensitivity reactions
- Grey baby syndrome

TABLE: Choice of drugs for common problems during pregnancy

Drug class (condition)	Unsafe drugs	Safer alternative
Antibacterials	Fluoroquinolones Tetracycline Doxycycline Chloramphenicol Streptomycin Kanamycin Tobramycin	Penicillin G; Ampicillin Amoxicillin- Clavulanate Cloxacillin, Piperacillin cephalosporins erythromycin

Contd...

Drug class (condition)	Unsafe drugs	Safer alternative
Antitubercular	Pyrazinamide, Ethambutol Streptomycin	Isoniazid Rifampicin
Anti hypertensives	ACE inhibitors Angiotensin antagonists Diuretics Proanolol and nitroprusside	Methyldopa Hydralazine Atenolol, Metoprolol, pindolol Nifedipine
Anti thyroid drugs	Carbimazole Radio active iodine Iodide	Propylthiouracil (PTU)

182. Ans. (a) Ciprofloxacin

Ref: KDT, 6TH ed. pg. 909

- Antibiotics which are safe in pregnancy are remembered as "PCM":
 - Penicillin (PnG, ampicillin etc)
 - Cephalosporin (cefotaxime, cefixime etc.)
 - Macrolides (erythromycin, azithromycin etc.)
- Refer above explanation table.
- **Fluoroquinolones (Ciprofloxacin) are contraindicated in pregnancy and below 18 years patient because it effect growing bone and tendon.**

183. Ans. (d) Ceftriaxone

Ref: Katzung, 14th ed. pg. 909; KDT, 6th ed. pg. 706

- Ceftriaxone is a 3rd generation cephalosporin with long duration of action ($t^{1/2}$ - 8 hrs.) and with better CSF penetration.
- **Ceftriaxone** is highly effective in a wide range serious infections including bacterial meningitis, typhoid fever, complicated UTIs and STD's like gonorrhea.
- It is first choice drug for single dose therapy of gonorrhea if the penicillinase producing status of organism is not known.
- A single dose of 250 mg IM injection is curative in gonorrhea and in chancroid.
- Drugs which can also be given as first line in case of gonorrhea are:
 - Amoxicillin 3 g oral OR Ampicillin 3.5 g oral-for non penicillinase producing.
 - Ceftriaxone 250 mg IM or Cefuroxime 250 mg IM or Azithromycin 1 g oral single dose- for Penicillinase producing.
- TOC for Gonorrhea → VANCOMYCIN + CEFTRIAXONE

184. Ans. (a) **Cefaclor**Ref: Katzung, 14th ed. pg. 804 **281****TABLE:** Cephalosporin generations

Drug class	Useful antibacterial spectrum ^a
First generation Cefazolin Cephalixin monohydrate Cefadroxil Cephadrine	Streptococci; <i>Staphylococcus aureus</i> ; some <i>Proteus</i> , <i>E. coli</i> , <i>Klebsiella</i>
Second generation Cefaclor Cefuroxime Cefuroxime axetil Cefprozil Cefoxitin Cefotetan Cefmetazole	<i>Escherichia coli</i> , <i>Klebsiella</i> , <i>Proteus</i> , <i>Haemophilus influenzae</i> , <i>Moraxella catarrhalis</i> . Not as active against gram-positive organisms as first-generation agents
Third generation Cefotaxime Ceftriaxone Cefdinir Cefditoren pivoxil Ceftibuten Cefpodoxime proxetil Ceftizoxime	<i>Escherichia coli</i> , <i>Klebsiella</i> , <i>Proteus</i> , <i>Haemophilus influenzae</i> , <i>Moraxella catarrhalis</i> , <i>Citrobacter</i> , <i>Enterobacter</i> , <i>Serratia</i> ; <i>Neisseria gonorrhoeae</i> ; activity for <i>S. aureus</i> , <i>Streptococcus pneumoniae</i> , and <i>Streptococcus pyogenes</i> comparable to first-generation agents. Activity against <i>Bacteroides</i> spp. inferior to that of cefoxitin and cefotetan.
Antipseudomonal cephalosporins Ceftazidime Ceftazidime/avibactam Ceftolozame/tazobactam	Gram negative activity similar to third generation with addition of activity against <i>Pseudomonas</i> ; poor activity vs gram-positive organisms Expands ceftazidime's against <i>Pseudomonas</i> and multidrug-resistant Enterobacteriaceae, but not against gram-positives Similar to ceftazidime, with enhanced activity against <i>Pseudomonas</i> and extended-spectrum β -lactamase-producing Enterobacteriaceae Comparable to third generation but more resistant to some β -lactamases (especially those of <i>Pseudomonas</i> and <i>Enterobacter</i>); gram-positive activity similar to cefotaxime
Fourth generation Cefepime, cefpirome	
Fifth generation Ceftaroline Ceftobiprole	Similar activity to 3 rd generation but with activity against methicillin resistant <i>Staphylococcus aureus</i>

185. Ans. (d) **Aztreonam**Ref: KDT, 6th ed. pg. 708

- β lactams contain a β lactam ring and another one is 2nd ring.
- 4 types of β lactams based on 2nd ring:
 - Penicillins (*ampicillin*)
 - Cephalosporins (*cefotaxim*)
 - Carbapenems (*doripenem*)
 - Monobactams (*azteronam*)

- In **monolactams (azteronam)** the 2nd ring is absent, due to which it doesn't show cross allergy with other β lactams.
- Therefore it can be used in patients who are allergic to penicillins.
- It inhibits gram negative enteric bacilli, H. influenza and pseudomonas.
- It doesn't inhibit gram positive cocci or fecal anaerobes.

186. Ans. (b) **Mupirocin**

Ref: KDT, 6th ed. pg. 733-34

- **Aminoacyl-tRNA synthetases (aaRSs)** are enzymes that catalyze the transfer of amino acids to their cognate tRNA. They play a pivotal role in protein synthesis and are essential for cell growth and survival.
- Mupirocin, a natural product of *Pseudomonas fluorescens*, is the only aaRS inhibitor approved by the US Food and Drug Administration to this date.
- It is active against gram-positive cocci, including methicillin-susceptible and methicillin-resistant

strains of *Staphylococcus aureus*. Mupirocin inhibits staphylococcal isoleucyl tRNA synthetase.

- Mupirocin is indicated for topical treatment of minor skin infections, such as impetigo.

Extra Mile

Methenamine mandelate is the salt of mandelic acid and methenamine and possesses properties of urinary antiseptics. It doesn't treat UTI, but it suppresses.

Mitomycin C is antitumor antibiotics.

Metronidazole, an antibiotic for anaerobes.

187. Ans. (a) **Injection Benzathine penicillin 2.4 million units IM single dose**

Recommended treatment for syphilis

Stage of syphilis	Treatment	Comment
Early Primary, secondary, or early latent	Benzathine penicillin G 2.4 MU, IM more	
Late latent or uncertain duration	Benzathine penicillin G 2.4 million units 1M weekly for 3 wk	
Tertiary without neurophilis	Benzathine penicillin G 2.4 million units N weekly for 3 weeks	Cerebrospinal fluid evaluation recommended in all patients
Neurosyphilis	Aqueous penicillin G 18-24 million units IV daily, given every 3-4 hours or as continuous infusion for 10-14 days	Follow treatment with benzathine penicillin G 2.4 million units 1M weekly for up to 3 weeks

188. Ans. (b) **Azithromycin**

Ref: KDT, 6th ed. pg. 730-31; Katzung, pg. 1172

- Azithromycin is new congener of erythromycin with expanded spectrum and improved pharmacokinetics.
- Because of its higher efficacy, better gastric tolerance and convenient once a day dosing, it is preferred over erythromycin as first line drug of choice for infections such as (*Mn: CHAL MD*):
 - Chancroid
 - Chlamydia Trachomatis- 1 gm single dose is curative.
 - H. Influenzae
 - Atypical mycobacteria, Atypical pneumonia (by chlamydia)
 - Legionella
 - Moraxella catarrhalis
 - Donovanosis
- Erythromycin and clarithromycin are the macrolides with similar antimicrobial spectrum. But clarithromycin have action against mycobacterium avium complex (MAC), atypical mycobacteria and M. leprae, H.Influenzae, Toxoplasma gondii.

Extra Mile

- **Spiramycin:** Given in treatment of toxoplasma gondii to prevent transmission of infection from mother to fetus.

189. Ans. (c) **Crystalluria**

Ref: Sharma & Sharma 3rd ed. P 715

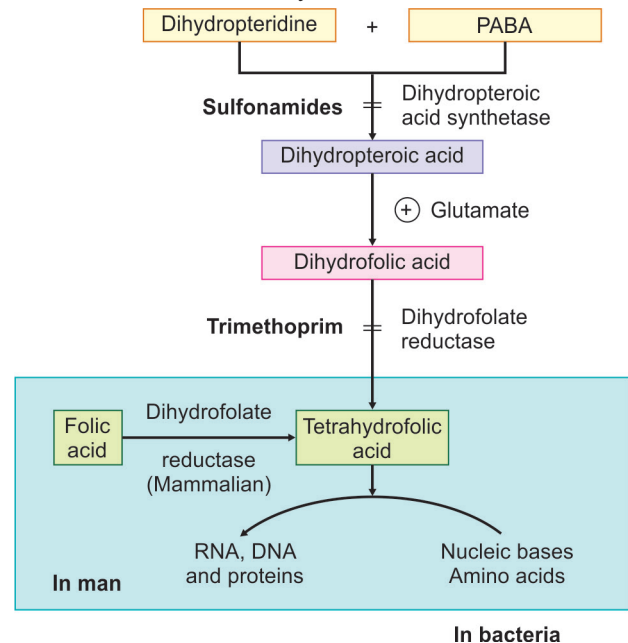

FIGURE: Bacterial Folate synthesis and sites of action of sulfonamides and trimethoprim. Pyrimethamine also inhibits dihydrofolate reductase but preferentially of protozoa

- Sulfonamides are structural analogue of PABA which enter the synthetic sequence of in place of PABA by competing with the enzyme dihydropteroic acid synthase and forms non-functional analogue of folic acid which is of no use to bacteria.
- Its growth ceases in absence of folic acid, hence these are bacteriostatic drugs.

Classification of sulfonamides:

- **Short acting** (t_{1/2}- 6-9 hrs): Sulfacytine, Sulfadiazine, Sulfasoxazole, Sulfamethizole
- **Intermediate** (t_{1/2}- 1 – 12 hrs): Sulfamethoxazole, Sulfamoxole
- **Long acting** (t_{1/2}- 7 to 8 days hrs): Sulfadoxine

Side effects (Mn: Karina Cry for ASH)

- Kernicterus in neonates
- Crystalluria and renal toxicity (acetylated metabolites of drug are less soluble in acidic urine)
- **Anemia: Hemolytic anemia in G6PD**
- **SJS: Chrt by EM, mucus ulceration of mouth and genitals**
- Hypersensitivity reaction: Rash at mucocutaneous junction, eosinophilia, Drug fever seen on 7–10th day of treatment.

190. Ans. (d) 1:5

*Ref: Sharma & Sharma 3rd ed. P 716;
Katzung's, 11th ed. pg. 818*

- Cotrimoxazole is a combination of Trimethoprim 80 mg and sulfamethoxazole 400 mg.
- Optimal ratio **in drug combination** 1:5 – 1 Trimethoprim: 5 sulfamethoxazole)
- Ratio of cotrimoxazole **in serum** is 1:20 (1 Trimethoprim: 20 sulfamethoxazole), due to rapid metabolism of trimethoprim and slower metabolism of sulfamethoxazole the ratio changes in plasma.
- A double strength (DS) tablet contains 160 mg Trimethoprim + 800 mg sulfamethoxazole.

Uses:

- UTI
- Prostatitis (since cotrimoxazole gets concentrated in prostatic fluid)
- Typhoid
- Nocardiosis (DOC)
- Pneumocystis carinii induced pneumonia (DOC)

Extra Mile

- Alone these both the drugs shows bacteriostatic action. When combined they become bactericidal.
- **Other combination:** Sulfadoxine (500 mg) + Pyrimethamine (25 mg): ratio is 20:1
 - Curative in chloroquine resistant P. Falciparum
 - First line in toxoplasmosis

191. Ans. (c) Doxycycline

Ref: Sharma & Sharma 3rd ed. P 760

- Doxycycline is from the tetracycline class of drug.
- Tetracyclins are first line DOC in following conditions like
 - Rocky mountain spotted fever
 - Typhus fever
 - Psittacosis
 - Granuloma inguinale
 - Non-specific urethritis (ureaplasma urealyticum)
 - Lyme disease
 - Brucellosis (Brucella abortus)
 - Plague
 - Pasturella abscess

Extra Mile

- First line combination therapy for brucellosis is: Doxycycline and Rifampicin

192. Ans. (a) Dapsone

Ref: Katzung, 14th ed. pg. 1086

- **Dermatitis herpetiformis (DH)** is a chronic blistering skin condition, characterised by blisters filled with a watery fluid.
- DH is neither related to nor caused by herpes virus: the name means that it is a skin inflammation having an appearance similar to herpes.
- It characterized by intensely itchy, chronic papulovesicular eruptions, usually distributed symmetrically on extensor surfaces (buttocks, back of neck, scalp, elbows, knees, back, hairline, groin, or face).
- **Diagnosis** is confirmed by a simple blood test for IgA antibodies, and by a skin biopsy in which the pattern of IgA deposits in the dermal papillae, revealed by direct immunofluorescence, distinguishes it from linear IgA bullous dermatosis and other forms of dermatitis.
- **Treatment:** Dapsone is considered as drug of choice for DH.
- In case of intolerance to dapsone, other drugs which can be used are: Colchicine, Tetracycline, Sulfapyridine.

193. Ans. (a) Acyclovir

Ref: Katzung, 11th ed. pg. 1468

Please refer to above explanation.

194. Ans. (c) Abacavir

Ref: KDT, 6th ed. pg. 773-74

- Abacavir is a NRTI

Protease inhibitors (ends with "navir")	Nucleoside reverse tanscriptase inhibitor (NRTI)
Indinavir Saquinavir Ritonavir Atazanavir Nelfinavir Amprenavir Lopinavir	Zidovudine Stavudine Lamivudine Didanosine Emtricitabine Zalcitabine Abacavir
Side effect: Lipodystrophy syndrome Minimum side effect seen with: ATAZANAVIR	Side effect: acute pancreatitis Peripheral neuropathy Bone marrow suppression and M.I.

Extra Mile

- NRTI which has the maximum risk of acute pancreatitis: DIDANOSINE
- NRTI which has the maximum risk of peripheral neuropathy: STAVUDINE
- **Safest NRTI:** LAMIVUDINE (minimal risk of pancreatitis and peripheral neuropathy)

195. Ans. (a) HIV

Ref: KDT, 6th ed. pg. 770

- ss Viral RNA $\xrightarrow{\text{Reverse transcriptase}}$ ds viral DNA.
- 2 class of reverse transcriptase inhibitors

Nucleoside Reverse Transcriptase Inhibitors (NRTI)	Non-Nucleoside Reverse Transcriptase Inhibitors (NNRTI)
<ul style="list-style-type: none"> • ZIDOVUDINE • STAVUDINE • DIDANOSINE • LAMIVUDINE • ABACAVIR • ZALCITABINE 	<ul style="list-style-type: none"> • EFAVIRENZ • NEVIRAPINE • DELAVIRDINE <p>Rememberd as "END"</p>

Extra Mile

ZIDOVUDINE

- Most commonly used NRTI in the treatment of HIV
- Used as prophylaxis in needle stick injury and to decrease vertical transmission from HIV mother to fetus.
- **Side effect:** Bone marrow suppression.
- Drug of choice for decreasing vertical transmission from HIV mother to fetus: **NEVIRAPINE**
- Safest NRTI: **LAMIVUDINE**
- All NRTI's casues acute pancreatitis and peripheral neuropathy.
 - Maximum risk of acute pancreatitis with: **DIDANOSINE**
 - Maximum risk of peripheral neuropathy with: **STAVUDINE**
- **NRTI** causing aphthous ulcer in mouth: **Zalcitabine (withdrawn)**

196. Ans. (c) Acyclovir

Ref: Katzung, 14th ed. pg. 864–65

- Acyclovir is an acyclic guanosine derivative with clinical activity against HSV-1, HSV-2, and VZV. In vitro activity against Epstein-Barr virus (EBV), cytomegalovirus (CMV), and human herpesvirus-6 (HHV-6).

ANTI-RETROVIRAL DRUGS

- **Nucleoside reverse tanscriptase inhibitor:** Zidovudine, Stavudine, Lamivudine, Didanosine, Emtricitabine, Zalcitabine, **Abacavir**
- **Nucleotide reverse tanscriptase inhibitor:** **Tenofovir**
- **Protease inhibitors:** Indinavir, Saquinavir, **Ritonavir**, Atazanavir, Nelfinavir, Amprenavir, Lopinavir.

197. Ans. (c) CCR5 inhibitor

Ref: Katzung, 14th ed. pg. 872

- Maraviroc is an anti HIV drug which comes under fusion inhibitor category.
- This drug binds to the CCR5 receptor of CD4 cells and inhibits the fusion stage of virus and hence inhibits their speed of replication.
- There are two types of fusion inhibitors:

Drugs which bind to CCR5 receptor of CD4 cells	Drugs which bind to GP 41 subunit of viral envelope
Maraviroc: active against CCR5 receptor of CD4 cell	Enfuvirtide: Prevents entry of virus into host cell
Can be given orally	Can only be given in s.c. injection form

198. Ans. (b) Stavudine

Ref: Katzung, 14th ed. pg. 875; KDT, 6th ed. pg. 770

- NRTI's are reverse transcriptase inhibitors, which control the dsDNA formation from ssRNA
- Drugs in the category are: Zidovudine, Stavudine, Didanosine, Lamivudine, Abacavir, Zalcitabine, Emtricitabine
- All NRTI's casues acute pancreatitis, peripheral neuropathy and Lactic acidosis
 - Maximum risk of acute pancreatitis with: **DIDANOSINE**
 - Maximum risk of peripheral neuropathy with: **STAVUDINE**
 - **NRTI** has maximum risk of lactic acidosis: **STAVUDINE**
 - Least toxic NRTI: Emtricitabine

199. Ans. (d) Pyrimethamine

Ref: KDT, 6th ed. pg. 783

- The drugs which are erythrocytic schizontocides are used to terminate an episode of malarial fever. They can be divided into:

Fast-acting high-efficacy drugs	Slow-acting high-efficacy drugs
Chloroquine, amodiaquine, quinine, mefloquine, halofantrine, lumefantrine, atovaquone, artemisinin.	<i>Pronguanil</i> . Pyrimethamine , <i>sulfonamides</i> , <i>tetracyclines</i>
They can be used singly to treat attacks of malarial fever	They are used only in combination for clinical cure

Extra Mile

- DOC for malaria: **Chloroquine** (safe in pregnancy)
- DOC for cerebral malaria: **Artisunate**
- DOC for chloroquine resistant malaria: **ACT- artemisinin combination therapy** (artisunate+pyrimethamine + sulfadoxine)
- Fastest acting anti-malarial: **Artemisinin**.
- Safest anti-malarial: **Proguanil**
- Short term prophylaxis of malaria (<6 weeks): **Doxycycline** 300 mg OD (start 2 days before)
- Long term prophylaxis of malaria (>6 weeks): **Mefloquine** 250 mg weekly (start a week before)

200. Ans. (a) Praziquantel

Ref: Katzung, 14th ed. pg. 944; Harrison, 17th ed. pg. 1334

- Schistosomiasis is a type of infection caused by helminth subtypes that live in fresh water, such as rivers or lakes, in subtropical and tropical regions.
- Schistosomiasis is also known as bilharzia.
- Symptoms can develop a few weeks after someone is infected by the parasite and include flu-like symptoms, such as a high temperature (fever) above 38°C (100.4°F) and muscle aches, skin rash, cough or urinary symptoms (cystitis, hematuria)

Anti-Helminthic agents

Helminthes	Name	Drug of choice
NEMATODE	Round worm (Ascaris)	ALBENDAZOLE/ MEBENDAZOLE
	Pinworm (enterobius vermicularis)	
	Hookworm (N. Americanus, A. duodenale)	
	Whip worm (trichuris trichura)	
	Trichinea worm (trichinella spiralis)	
	Guinea worm (Dracunculus medinensis)	
	Filarial worm (W. Bancrofti, B. Malayi)	DEC/Ivermectin
	Onchocerca volvulus Threadworms (strongyloides stercoralis)	Ivermectin

Contd...

Helminthes	Name	Drug of choice
TREMATODE	Blood fluke (schistosoma japonicum, mansoni & Hematobium)	PRAZIQUANTEL EXCEPT for fasciola Hepatica (Triclabendazole)
	Lung fluke (paragonimus westermani)	
	Liver fluke (fasciola Hepatica) → DOC:	
	Triclabendazole/Bithionol	
CESTODE	Pork tapeworm (taenia solium)	PRAZIQUANTEL/ NICLOSAMIDE
	Beef tapeworm (taenia saginata)	
	Fish tapeworm (Diphyllobothrium latum)	
	Dog tapeworm (Echinococcus granulosus)	
	Dwarf tapeworm (Hymenolepis Nana)	

METRONIDAZOLE is DOC for: Trichomoniasis, Giardiasis, Bacterial vaginosis, Amoebic liver disease, Hydatid disease, Cysticercosis

201. Ans. (b) Triclabendazole

Ref: Katzung, 14th ed. pg. 939

- Drug of choice for all trematodes including blood flukes like schistosoma japonicum, mansoni & Hematobium and lung flukes paragonimus westermani is Praziquantel EXCEPT Liver fluke.
- DOC for Liver fluke (fasciola Hepatica) → **Triclabendazole/Bithionol**

202. Ans. (d) Albendazole

Ref: Katzung, 14th ed. pg. 940

Drug of choice for NCC: Albendazole

203. Ans. (a) Praziquantel

Ref: Katzung, 14th ed. pg. 939

- DOC for taenia solium (pork tapeworm) and Taenia saginata (Beef tapeworm) and fish tapeworm is: **PRAZIQUANTEL**

204. Ans. (c) Ivermectin

Ref: Katzung, 14th ed. pg. 939, 1075; KDT, 6th ed. pg. 864

- Scabies is caused by an ectoparasite sarcoptes scabiei. It is highly contagious. The mite burrows through the epidermis, laying eggs which form papules that itch intensely.
- Most common site of entry- finger webs.

• **Drugs used are:**

- **Permethrin 5%:** broad spectrum and potent insecticide, currently most efficacious.
 - ◆ It is DOC for scabies.
 - ◆ **MOA:** It causes neurological paralysis in insects by delaying depolarization.
 - ◆ Single application needed in most cases.
 - ◆ Very less toxicity; 100% cure rate.
- **Lindane:** another broad spectrum insecticide. Efficacy lower than permethrin.

MOA: kills lice and mites by penetrating through their chitinous cover and affecting the nervous system.
- **Benzyl benzoate:** Oily liquid with a faint aromatic smell.

It is applied over face and neck after a bath. A second coat is applied next day which is washed after 24 hours.
- **Crotamiton**
- **Sulfur**
- **Ivermectin:** Highly effective in scabies and pediculosis as well. Oral DOC in scabies.
 - ◆ It is the only ORALLY administered drug which is used for scabies (ectoparasitosis)
 - ◆ A single dose of 0.2 mg/kg has cured almost 90–100% of population.
 - ◆ It is contraindicated in children < 5 yrs, pregnant and lactating women.

205. Ans. (b) **Permethrin**

Ref: Katzung, 14th ed. pg. 1075; KDT, 6th ed. pg. 864

206. Ans. (a) **Metronidazole**

Must know points for tetanus (8th day illness presenting with lock jaw)

- Penicillin G was considered the drug of choice, but some now consider metronidazole to be superior in this setting. Tetracycline is an alternative for patients who are allergic to penicillin or metronidazole

Tetanus immunoglobulin is used to

- Prevent tetanus and to treat patients with circulating tetanus toxin and provides passive immunity.
- Treat all patients with active tetanus, in combination with other supportive and therapeutic treatments.

207. Ans. (d) **Ivermectin**

Ref: KDT, 6th ed. pg. 809; Katzung, 14th ed. pg. 939

- Usually DOC for filariasis is Diethyl carbamazine (DEC).
- **Since DEC was not in option, the next drug which comes under first line drug for filariasis is Ivermectin.**

- IVERMECTIN is also considered as drug of choice in following conditions:
 - Strongyloidiasis
 - Onchocerciasis
- PRAZIQUANTEL is drug of choice for:
 - Tapeworm infestation (Taenia saginata, Taenia solium, H. Nana)

208. Ans. (a) **2 mg/kg**

Ref: KD Tripathi, 7th ed. pg. 853

Diethylcarbamazine

- It is the first drug for filariasis caused by the nematodes *Wuchereria bancrofti* (90% cases) and *Brugia malayi*.
- Plasma *t*_{1/2} of usual clinical doses is 4–12 hours, depending on urinary pH.
 - Acidic pH: 2 – 3 hours
 - Alkaline pH: 8 – 10 hours
- The most important action of DEC appears to be alteration of organelle membranes of the microfilariae promoting cell death.
- The recommended doses in filariasis, Loiasis and Toxocariasis are similar i.e. 50 mg on day 1, 50 mg TDS on day 2, 100 mg TDS on day 3 and then 2 mg/kg TDS for 2–3 weeks.
- It can also be used to treat tropical eosinophilia in a dose of 2 mg/kg TDS for 7 days
- Doses of DEC in chemoprophylaxis:
 - Loiasis 300 mg weekly
 - Filariasis 50 mg monthly
- Yearly treatment with a combination of DEC (2 mg/kg) and albendazole (400 mg single dose on mass scale has brought down transmission of filariasis by reducing microfilaroma.

209. Ans. (a) **Albendazole**

Ref: KD Tripathi, 7th ed. pg. 853

- Yearly treatment with a combination of DEC (2 mg/kg) and albendazole (400 mg single dose on mass scale has brought down transmission of filariasis by reducing microfilaroma.
- **Recent** studies have revealed that:
 - 200 mg/day for 8 weeks course of doxycycline eliminated 95% of microfilariae.
 - A combination therapy of Doxycycline and Ivermectin can cause 100% elimination of microfilariae.

210. Ans. (b) **Alters permeability of fungal cell wall**

Ref: Sharama & Sharma 3rd ed. P 781

- Amphotericin binds to fungal cell membrane namely ergosterol and alters the permeability of fungal cell wall by forming pores through which macromolecules like

- Na⁺, K⁺, Mg, H⁺ leaks out causing fungal cell death.
- Resistance is due to replacement of ergosterol by other sterol in fungal plasma membrane.
 - Peak antifungal activity of the drug occurs at pH 6.0 to 7.5 and the drug is widely distributed to most tissues EXCEPT CNS.
 - Plasma half life: 15 days
 - Use:
 - Most commonly used to treat serious fungal infections from yeast or mould group.
 - Superficially can be given to treat candidiasis.
 - DOC in following conditions:**
 - Invasive aspergillosis (all patients including immunocompromised)
 - Mucormycosis
 - Disseminated histoplasmosis
 - Rapidly progressive coccidiomycosis
 - Rapidly progressive blastomycosis
 - Non AIDS cryptococcal meningitis
 - Oropharyngeal and cutaneous candidiasis
 - Kala Azar (liposomal Amp B)

211. Ans. (d) Liposomal preparation

Ref: KD Tripathi, 7th ed. pg. 788

- Amphotericin B can be administered orally (50-100 mg QID) for intestinal moniliasis; also topically for vaginitis, otomycosis.
- Conventional formulation of AMB (C-AMB)** For systemic mycosis, C-AMB is available as dry powder along with deoxycholate (DOC) for extemporaneous dispersion before use
- It is first suspended in 10 ml water and then diluted to 500 mL with glucose solution (*saline makes the suspension coarse and should be avoided*).
- Initially 1 mg test dose is injected i.v. over 20 minutes. If no serious reaction follows, 0.3 mg/kg is infused over 4-8 hours daily.

Liposomal amphotericin B (small unilamellar vesicles SUV): Consists of 10% AMB incorporated in uniform sized (60-80 nM) unilamellar liposomes made up of lecithin and other biodegradable phospholipids.

The special features of these preparations are:

- They produce milder acute reaction (especially liposomal formulation) on i.v. infusion.
- They can be used in patients not tolerating infusion of conventional AMB formulation.
- They have lower nephrotoxicity.
- They cause minimal anemia.
- The liposomal preparation delivers AMB particularly to reticuloendothelial cells in liver and spleen especially valuable for Kala Azar and immunocompromised patients.

Extra Mile

AMB combination regimen

- Amphotericin B + Rifampin or minocycline:** The latter drugs are not themselves antifungal, but enhance the action of amphotericin B.
- Amphotericin B + Flucytosine:** A shorter course is needed, specially for cryptococcal meningitis, than when amphotericin is used alone.

212. Ans. (c) Cholelithiasis

Ref: Sharma & Sharma 3rd ed. P 783

Adverse Drug reactions of Amphotericin B

- The most common, most serious and long term side effect of amphotericin B is Nephrotoxicity (renal tubular necrosis)
- This nephrotoxicity presents with hypokalemia, hypomagnesemia secondary to renal tubular acidosis, azotemia and even irreversible damage if the dose exceeds 5g.
 - In order to prevent the nephrotoxicity, prior hydration with 1L of normal saline is recommended.
 - Liposomal preparation has lesser risk of nephrotoxicity
- Hypochromic normocytic anemia is common and thrombocytopenia and leukopenia although less common but has been noted.
- Intrathecal administration: Arachnoiditis and seizure
- Hepatic impairment and Jaundice
- Infusion related toxicity (*chills, tachypnea, fever, vomiting, hypotension, anaphylaxis*)

213. Ans. (b) Renal damage

Ref: Sharma & Sharma 3rd ed. P 783

Refer to above explanation for explanation

214. Ans. (c) Amphotericin- B

Ref: Harrison's, 18th ed. Ch. 279

- The most common, most serious and long term side effect of amphotericin B is Nephrotoxicity (renal tubular necrosis)
- This nephrotoxicity presents with hypokalemia, hypomagnesemia secondary to renal tubular acidosis, azotemia and even irreversible damage if the dose exceeds 5 g.
 - In order to prevent the nephrotoxicity, prior hydration with 1L of normal saline is recommended.
 - Liposomal preparation has lesser risk of nephrotoxicity

Note: Cyclosporine also causes AKI with hypomagnesemia

**ANTITUBERCULAR AGENTS****215. Ans. (b) Liver disease**Ref: KD Tripathi, 7th ed. pg. 767

- INH is hepatotoxic and is avoided in pre-existing liver disease
- Isoniazid is an essential component of all anti-tubercular regimens. It is primarily tuberculocidal.
- Fast multiplying organisms are rapidly killed, but quiescent ones are only inhibited.
- The most common mechanism which confers high level INH resistance is by mutation of the catalase-peroxidase (*KatG*) gene.
- INH resistance may also involve mutation in the *inhA* or *kasA* genes.

Adverse effects:

- **Peripheral neuritis** is the most important dose-dependent toxic effects (slow acetylators).
 - Pyridoxine given prophylactically (10 mg/day) prevents the neurotoxicity even with higher doses.
 - Prophylactic pyridoxine must be given to diabetics, chronic alcoholics, malnourished, pregnant, lactating and HIV infected patients, but routine use is not mandatory.
- Hepatitis, a major adverse effect of INH, (seen commonly in fast acetylators) more common in older people and in alcoholics is also a well-known side effect of the drug.
- **Other adverse effects:** Xerostomia, Allergic reactions, decrease seizure threshold.

Extra Mile

- Safest ATT in renal disease patients: Rifampicin
- ATT which has no/least hepatotoxicity: Ethambutol and Streptomycin

216. Ans. (b) RifampicinRef: KD Tripathi, 7th ed. pg. 767

- Rifampicin is considered as effective as isoniazid. This agent is active against slow and intermittently dividing bacterium (spurters).
- If someone develops resistance to INH, they are most likely to develop resistance to rifampicin as well.
- In MDR-TB, there is resistance to INH and rifampicin.

217. Ans. (b) RifampicinRef: KDT 6th ed. pg. 740-44, Katzung Pharma 14th ed. pg. 845**RIFAMPICIN**

- It is a tuberculocidal agent of M. tuberculosis in addition to staph. aureus, pseudomonas, proteus, legionella etc.

- It has bactericidal action of which covers all subpopulations of TB bacilli, **but acts best on slowly or intermittently dividing ones as well as on many atypical mycobacteria.**
- Both intracellular and extracellular bacilli are affected.
- **MOA:** It inhibits DNA dependent RNA synthesis
- **Resistance** of rifampicin is due to *rpoB* gene.
- **Adverse effects:**
 - Hepatotoxicity: MC/Major side effect
 - Rifampicin imparts a harmless **orange color to urine**, sweat, tears, and contact lenses (*soft lenses may be permanently stained*).
 - Occasional adverse effects include rashes, thrombocytopenia, and nephritis.
 - It may cause cholestatic jaundice and occasionally hepatitis and flu-like symptoms.

ISONIAZID

- It is primarily tuberculocidal. *Fast multiplying organisms are rapidly killed but quiescent ones are only inhibited.*
- Acts on intracellular as well as extracellular TB bacilli and is equally active in acidic and alkaline medium.
- **MOA:** Inhibit synthesis of mycolic acid, which is a unique fatty acid component of mycobacterial cell wall.
- If given alone, resistance occurs in about 2-3 months
- **Most common mechanism of INH resistance:** Mutation of catalase-peroxidase gene > Mutation of *inh-A* gene.
- **Adverse effects:**
 - **Isoniazid-induced hepatitis** is the most common major toxic effect
 - Peripheral neuropathy is observed in 10–20% of patients
 - Neuropathy is due to a relative pyridoxine (Vit B6) deficiency. Isoniazid promotes excretion of pyridoxine, and this toxicity is readily reversed by administration of pyridoxine.
 - Central nervous system toxicity, which is less common, includes *memory loss, psychosis, and seizures.*

PYRAZINAMIDE

- It is weakly tuberculocidal. PYZ is more lethal to intracellularly located bacilli and to those at sites showing an inflammatory response.
- **MOA:** Resembles that of INH. It inhibits mycolic acid synthesis but by interacting with a different fatty acid synthase encoding gene.
- Resistance of PYZ due to mutation in *pncA* gene.
- **Adverse effects:** **Hepatotoxicity**, nausea, vomiting, drug fever, and **hyperuricemia**

ETHAMBUTOL

- Selectively tuberculostatic agent and clinically as active as streptomycin. *Fast multiplying bacilli are more susceptible* as are many atypical mycobacteria.

- **MOA:** Poorly understood, but it has been found to inhibit arabinosyl transferases involved in arabinogalactan synthesis and to interfere with mycolic acid incorporation in mycobacterial cell wall.
- Resistance of ethambutol due to alteration in the drug target gene- *emb* gene.
- **Adverse effects:** Retrobulbar neuritis, resulting in loss of visual acuity and red-green color blindness.

STREPTOMYCIN

- Tuberculocidal agent, acts only on extracellular bacilli. It penetrates the tubercular cavities but doesn't cross the CSF. *Has poor action on acidic medium.*
- **Adverse effects:** Ototoxic and nephrotoxic.
- Resistance is due to a point mutation in either the *rpsL* gene or *rrs* gene.

218. Ans. (c) Increase the permeability of cell wall

Ref: KDT, 6th ed. pg. 742

- Ethambutol inhibits arabinosyl transferases which is involved in cell wall biosynthesis. By inhibiting this enzyme, the bacterial cell wall complex production is inhibited. *This leads to an increase in cell wall permeability.*

Extra Mile

- **ATT** acting exclusively on intracellular bacilli: Pyrazinamide
- **ATT** acting exclusively on extracellular bacilli: Streptomycin

219. Ans. (d) Ethambutol

Ref: KDT, 6th ed. pg. 742

- **Side effect of Ethambutol:** Loss of visual acuity/colour vision, field defects due to **optic neuritis** is the most important dose and duration of therapy dependent toxicity.

Extra Mile

- Important side effects of antitubercular drugs:
- Peripheral neuropathy (*due to vit B6 deficiency*): ISONIAZID
- Orange color urine- RIFAMPICIN
- Flu-like symptoms- RIFAMPICIN
- Hyperuricemia/gout- PYRAZINAMIDE
- Optic neuritis- ETHAMBUTOL
- Nephrotoxic, Ototoxic, Neuromuscular Junction Blocker- STREPTOMYCIN

Other important points to remember about Anti TB drugs:

- **First line anti TB drugs are: HRZE** (Isoniazid, Rifampicin, Pyrazinamide, Ethambutol)
- All first line drugs are bactericidal EXCEPT- **Ethambutol** (it is bacteriostatic)
- Most hepatotoxic ATT-**Pyrazinamide**
- 1st line ATT with exclusive intracellular action-**Pyrazinamide**
- 1st line ATT with exclusive extracellular action-**Streptomycin**
- Which anti TB drugs are NOT hepatotoxic-**Ethambutol and Streptomycin.**

- It should not be used in children below 6 years of age because these young patients may not be able to report visual impairment.

220. Ans. (d) Ethambutol

Ref: KDT, pg. 742

- Ethambutol is selectively tuberculostatic and clinically as active as Streptomycin.

TABLE: 1st Line ATT Drugs action on bacteria and hepatotoxicity

Drug	Bactericidal/Bacteriostatic	Hepatotoxicity
Isoniazid	Cidal	+
Rifampicin	Cidal	+
Pyrazinamide	Cidal	++++
Ethambutol	STATIC	- No
Streptomycin	Cidal	- No

221. Ans. (d) Ethambutol

Ref: Katzung's Pharmacology, 14th ed. pg. 846

- **Dose of Ethambutol:** 15-25 mg/kg OD dose.
- About 20% drug is excreted in feces and 50% in urine in unchanged form.
- **Ethambutol accumulates in renal failure, and the dose should be reduced by half if creatinine clearance is less than 10 mL/min.**
- **Side effect:** Most common serious adverse event is retrobulbar neuritis, resulting in loss of visual acuity and **red green color blindness** (Patient develop **BLUE VISION**).
 - It can also cause hyperuricemia and peripheral neuritis.
- **It is also Contraindicated** in children as they are unable to report loss of visual acuity and red-green color discrimination.

222. Ans. (a) 5 mg/kg PO qday

Ref: Katzung, 14th ed. pg. 843; KD Tripathi, 6th ed. pg. 746

TABLE: Recommended doses of antitubercular drug

DRUG	Daily dose		3 × per week dose	
	mg/kg	For >50 kg	mg/kg	For >50 kg
Isoniazid (H)	5 (4-6)	300 mg	10 (8-12)	600 mg
Rifampin (R)	10 (8-12)	600 mg	10 (8-12)	600 mg
Pyrazinamide (Z)	25 (20-30)	1500 mg	35 (30-40)	2000 mg
Ethambutol (E)	15 (15-20)	1000 mg	30 (25-35)	1600 mg

223. Ans. (a) **Rifampicin**Ref: KDT, 7th ed. pg. 768**MOA OF IMPORTANT ATT**

- **Streptomycin**- inhibit protein synthesis
- **Chloroamphenicol**- inhibit protein synthesis by inhibiting transpeptidation
- **Rifampicin**- inhibit DNA dependent RNA synthesis by inhibiting RNA polymerase
- **INH & Pyrazinamide**: inhibits mycolic acid, a component of mycobacterial cell wall
- **Ethambutol**: Inhibit incorporation of mycolic acid into bacterial cell wall by inhibiting arabinosyl transferase, thus weakening the wall.

224. Ans. (c) **Vitamin B6**Ref: KDT, 6th ed. pg. 740-41

- For patients who are on isoniazid; peripheral neuropathy is observed in 10–20% of patients given dosages greater than 5 mg/kg/d but is infrequently seen with the standard 300 mg adult dose.
- Pyridoxine (Vit B6), 25–50 mg/day, is recommended for those with conditions predisposing to neuropathy, an adverse effect of isoniazid.
- **Note:** Isoniazid as a single agent is also indicated for treatment of latent tuberculosis. The dosage is 300 mg/day (5 mg/kg/day) or 900 mg twice weekly for 9 months.

225. Ans. (b) **Cycloserine**Ref: KDT, 6th ed. pg. 744;
Katzung's *pharma*, 14th ed. pg. 847

- **Cycloserine (Cys)** is a 2nd line ATT. It is a chemical analogue of D-alanine:
- Cycloserine being cell wall inhibitor is tuberculostatic in nature and inhibits some other gram-positive bacteria, *E. coli*, *Chlamydia* also.
- **MOA:** it inhibits bacterial cell wall synthesis by inactivating the enzymes which recemize L-alanine and link two D-alanine residues.
- The dosage of cycloserine in tuberculosis is **0.5–1 g/d** in two divided doses
- **Adverse effect:** The CNS toxicity of Cys is high-sleepiness, headache, tremor, depression and **psychosis**.
- **Use:** MDK. TB

Extra Mile

- 2nd line ATT, Kanamycin, Amikacin, Capreomycin have similar side effect of ototoxicity and nephrotoxicity, same as streptomycin (1st line ATT).
- Capreomycin, can induce electrolyte abnormalities.

226. Ans. (c) **Streptomycin**Ref: KDT, 6th ed. pg. 743-44

- Streptomycin has been assigned to pregnancy category D by the FDA.
- Streptomycin crosses the placenta; reported cord concentrations have been equal to or less than the mother's serum concentration.
- **There are reports of fetal eighth cranial nerve damage with subsequent bilateral deafness.** Most authorities, including the Centers for Disease Control and the American Thoracic Society, *discourage the use of streptomycin during pregnancy due to the risk of fetal ototoxicity*.
- Note: Streptomycin is no longer an ATT drug

227. Ans. (b) **Streptomycin**Ref: KDT 6th ed. pg. 743-744*Please refer to above explanation*228. Ans. (b) **Streptomycin***Please refer to above explanation.*229. Ans. (d) **5 TU**Ref: *Essentials of TB Diagnosis Children*, 3rd ed. pg. 325230. Ans. (c) **PAS**

Ref: 2008 WHO guidelines for programmatic management or drug resistant tuberculosis

- Second line ATT like PAS (para amino salicylic acid) and ethionamide can lead to hypothyroidism. Exact mechanism is poorly understood.
- PAS also causes adverse reactions like GI upset, hepatotoxicity, Hypersensitivity.

231. Ans. (b) **Pyrazinamide**Ref: Katzung, 14th ed. pg. 846; KDT, 6th ed. pg. 742

Pyrazinamide Microsomal deaminase Pyrazinoic acid (POA) → 5-hydroxypyrazinoic acid

- Pyrazinamide is hydrolyzed by microsomal deaminase to pyrazinoic acid (POA) and then hydroxylated to 5-hydroxypyrazinoic acid by xanthine oxidase for excretion by the kidneys.
- **Pyrazinamide is a first line antitubercular drug that can cause hyperuricemia (secondary to inhibition of uric acid secretion in the kidney) and hepatotoxicity.**
- This hyperuricemia leads to arthralgia due to competitive inhibition of xanthine oxidase by POA. **It should not be stopped if hyperuricemia develops**

- *Ethambutol* also produces hyperuricemia due to interference with urate excretion.

ANTICANCER DRUGS

232. Ans. (c) 5FU

Ref: Page 987: SRB 5th edition

Chemoradiation is the preferred treatment of anal cancer. 5FU is the preferred drug. Initially radiation is given for 3 weeks to the perineum and pelvis. This is followed by chemotherapy using 5FU and mitomycin C.

233. Ans. (b) Dihydrofolate reductase inhibitor

Ref: Goodman & Gillman's 13th ed. P 1179

- Pemetrexed is a most recent folate analogue which is avidly transported into cells via the reduced folate carrier and is converted to its metabolite (PGs- Polyglutamate) that inhibit Thymidylate synthase and glycine amide ribonucleotide transformylase, as well as DHFR. (Dihydrofolate Reductase)
- It is even more potent than methotrexate.
- Like MTX, it induces p53 and cell-cycle arrest, but this effect does not depend on induction of p21.
- **Use:** It has activity against ovarian cancer, mesothelioma, and adenocarcinomas of the lung.
- Other effects and side effects are similar to methotrexate like myelosuppression, GI toxicity. The toxicity can be attenuated with folate and vitamin B₁₂ supplementation.

Extra Mile

- A newer congener, **pralatrexate**, is more effectively taken up and polyglutamated than MTX and is approved for treatment of CTCL peripheral T cell lymphoma.
- Pramipexole is an antiparkinsonism drug which is a dopamine agonist.

234. Ans. (a) Methotrexate toxicity

Ref: Goodman & Gillman's 13th ed. P 1177

- Folic acid is an essential dietary factor which is converted to FH₄ by DHFR enzyme and provide methyl groups for the synthesis of precursors of DNA.
- Folic acid analogues such as MTX interfere with FH₄ metabolism, thereby inhibiting DNA replication.
- **Adverse effects:** Myelosuppression, GI toxicity.
- **Folinic acid (Leucovorin)** can reverse toxic effects; used as "rescue" in high-dose therapy.
- *Glucarpidase*, a methotrexate-cleaving enzyme, is approved to treat toxicity.

235. Ans. (a) Paclitaxel

Ref: Katzung, 14th ed. pg. 963; Cancer Medicine, 6th ed. pg. 595

TABLE: Radiosensitizers vs Radiation protection agent

Radiosensitizers	Radiation protection agent
Actinomycin	Amifostine
Gemcitabine	GM-CSF
Hydroxyurea	TL-1
Metronidazole	
Misonidazole	
5- FU	
Mitomycin	
Paclitaxel	

236. Ans. (b) Methotrexate

Ref: K.D. Tripathi, 6th ed. pg. 823

- Methotrexate is one of the oldest and highly efficacious antineoplastic drugs
- **MOA:** It inhibits dihydrofolate reductase (DHFRase)-blocking the conversion of dihydrofolic acid (DHFA) to tetrahydrofolic acid (THFA) which is an essential coenzyme required for one carbon transfer reactions in de novo purine synthesis and amino acid interconversions.
- **DHFRase inhibitors are:** methotrexate, Pemetrexed, Pralatrexate

Extra Mile

- Vincristine is a mitotic spindle formation inhibitor
- Paclitaxel is a spindle breakdown inhibitor
- Cisplatin is a platinum based compound.

237. Ans. (a) Nilotinib

Ref: KD Tripathi, 7th ed. pg. 870

- **Nilotinib** It is a second generation Bcr-Abl, PDGF-receptor β and c-kit receptor tyrosine kinase inhibitor with **20-50 fold higher affinity for these kinases than imatinib**. Thus, it can overcome resistance to imatinib due to Bcr-Abl mutation and is effective in chronic CML nonresponsive to imatinib.
- It is only 30% bioavailable orally, but absorption is improved by food. It is also useful in accelerated phase of CML. Thus, it is an alternative drug in imatinib non-tolerant or resistant cases of CML, and has now been used as a first-line drug as well.

238. Ans. (a) Letrozole

Ref: Katzung, 14th ed. pg. 739; KDT, 6th ed. pg. 305

- Adrenal cortex mainly produces androgen, and this androgen in females is converted to estrogen with the help of enzyme aromatase.

- Androgen Aromatase → Estrogen
- Excess formation of estrogen exposes a person to develop breast CA and on the other hand also protect females from osteoporosis (*estrogen is protective in bone*).
- A class of breast cancer drugs called aromatase inhibitors decreases the body's production of estrogen, at a level where there is nearly total estrogen deprivation in body.
- But at the same time it decreases bone mineral density and increase the risk of fractures in postmenopausal women.
- **Aromatase inhibitors include:** Letrozole, Anastrozole, and Exemestane.
- Letrozole is currently recommended as the first line therapy in case of advanced breast CA.
- **S/E:** Hot flushes, nausea, diarrhea, dyspepsia and thinning of hair and most commonly bone loss (osteoporosis)

Extra Mile

- **Tamoxifen** is a selective estrogen receptor modulator (SERM). It is beneficial in breast, bone and blood cancer.
- Side effect: Tamoxifen increases risk of endometrial CA.
- Only pulsatile exposure to GnRH induces LH/FSH secretion, while continuous exposure desensitizes pituitary which results in loss of GnRH release.

GnRH Agonist	GnRH Antagonist
Given in continuous manner for the treatment of breast CA, prostate CA, and precocious puberty. Drugs are: <ul style="list-style-type: none"> • Leuprolide • Nafarelin • Goserelin • Busurelin 	Given in any manner/pulsatile manner for the treatment of infertility and hypogonadism. Drugs are: <ul style="list-style-type: none"> • Ganirelix • Letrorelix • Abarelix • Cetorelix
Causes flare up reaction	Doesn't cause flare up reaction

239. Ans. (b) Endometrial cancer

Ref: KDT, 6th ed. pg. 304-5

- Tamoxifen is selective estrogen receptor modulator (SERM).
- It is having agonistic activity at uterine endometrium.

TABLE: Action of Tamoxifen

Agonistic activity	Antagonistic activity
Uterus: causes proliferation of endometrium → can cause vaginal bleeding as seen in the case	Breast CA
Bone: decrease resorption	Blood vessels
Lipid profile: decrease LDL without affecting HDL → decrease risk of CAD	

240. Ans. (c) Cladribine

Ref: KDT, pg. 819-20; Katzung, 14th ed. pg. 958-961

- **Alkylating agents** have cytotoxic and radiomimetic actions. They are mainly cell cycle non-specific, i.e. act on dividing as well as resting cells.
- Cross-linking of DNA appears to be of major importance to the cytotoxic action of alkylating agents, and replicating cells are most susceptible to these drugs.
- **Drugs are:**

Alkylating agents- cell cycle-nonspecific agents	Antimetabolites- cell cycle-specific agents
Nitrogen mustard <ul style="list-style-type: none"> • Cyclophosphamide • Ifosfamide • Mechlorethamine • Melphalan • Chlorambucil Drugs acting by Methylation <ul style="list-style-type: none"> • Procarbazine • Dacarbazine • Temozolomide 	Folic acid antagonist: Methotrexate Purine analogues <ul style="list-style-type: none"> • 6 Mercaptopurine • 6 thioguanine • Cladribine • Fludarabine Pyrimidine analogues <ul style="list-style-type: none"> • Capecitabine • Gemcitabine • Cytarabine and 5 FU
Nitrosoureas <ul style="list-style-type: none"> • Carmustine • Lomustine • Semustine • Streptozocin Miscellaneous <ul style="list-style-type: none"> • Busulfan • Altretamine • Thiotepa • Trabectedin 	

241. Ans. (a) Bleomycin

Ref: KDT, 819-20, 26; Katzung, 14th ed. pg. 951

- **Bleomycin:** This is a mixture of closely related glycopeptides antibiotics having potent antitumour activity.
- It is highly effective in testicular tumour and squamous cell carcinoma of skin, oral cavity, head and neck, genitourinary tract and esophagus.
- **Side effect:** pulmonary fibrosis and myelosuppression.
- *Please refer to above explanation for more details of alkylating agents.*

242. Ans. (d) All of the above

Ref: KDT, pg. 819-20; Katzung, 11th ed. pg. 1280

Please refer to above explanation.

243. Ans. (b) **Alkylating agent**

Ref: Katzung, 14th ed. pg. 951; KDT, pg. 819-820

- Cyclophosphamide is the most widely used alkylating agent.
- It is an inactive compound. Transformation into active metabolite occurs in liver, and a wide range of anti tumor action is exerted.
- It has prominent immunosuppressant property, so it has been particularly utilized in bone marrow transplantation. In other organ transplants it is employed only as a reserve drug.
- **Drugs of different category are:**

Alkylating agents	Antimetabolites	Platinum compound	Topoisomerase inhibitors
Cyclophosphamide Ifosfamide Mechlorethamine Melphalan Busulfan Procarbazine	Folic acid antagonist Methotrexate Purine analogues 6 Mercaptopurine 6 thioguanine Cladribine Fludarabine Pyrimidine analogues Capecitabine Gemcitabine Cytarabine and 5 FU	Cisplatin Carboplatin Oxaliplatin	TOPOI-SOMERASE- I Irinotecan TOPOI-SOMERASE-II Etoposide Anthracycline Doxorubicin Daunorubicin

244. Ans. (c) **Cytarabine**

Ref: Katzung, 14th ed. pg. 951; KDT, 6th ed. pg. 820

- Cytarabine is pyrimidine analogue

Please refer to above explanation.

Extra Mile

- DOC for hairy cell leukemia- **CLADRIBINE**
- DOC for CLL- **FLUDARABINE**
- DOC for pancreatic CA- **GEMCITABINE**
- 6 Mercaptopurine metabolized by- **XANTHINE OXIDASE**
- **DOC** for choriocarcinoma- **METHOTREXATE**

245. Ans. (a) **Purine analogue**

Ref: Katzung, 14th ed. pg. 960; KDT, 6th ed. pg. 820

- Mercaptopurine is synthetic purine used in cancer chemotherapy.
- Use: Childhood acute leukemia.

246. Ans. (d) **Cisplatin**

Ref: KDT, 6th ed. 832; Katzung, 14th ed. pg. 956, 957

- Cisplatin is considered as first line chemotherapy in cervix CA and is very effective in metastatic testicular and ovarian carcinoma.
- Cisplatin is a platinum coordination complex that is hydrolyzed intracellularly to produce a highly reactive moiety which causes cross linking of DNA by platinum compound.
- The primary binding site is the N7 of guanine, but covalent interaction with adenine and cytosine also occurs.
- Cyclophosphamide, lomustine and vincristine is considered as the 2nd line drugs for the carcinoma of cervix.

Extra Mile

- Most emetogenic anti CA drug: **CISPLATIN**
- Specific side effect of cisplatin: Nephrotoxicity and Ototoxicity.
- Nitrosoureas like Lomustine can cross BBB and is considered as DOC for brain tumor like Glioma.
- Most common marrow sparing anti CA drug- **VINCRIStINE**

247. Ans. (a) **Imatinib mesylate**

Ref: KD Tripathi, 6th ed. pg. 828 & 832

IMATINIB

- DOC for CML & GIST - Imatinib Mesylate
- It inhibits the tyrosine protein kinases in chronic myeloid leukaemia (CML) cells and c-kit receptor found in gastrointestinal stromal tumour (GIST).
- Adverse effects are fluid retention, edema, vomiting, abdominal pain, myalgia and liver damage

TABLE: Drugs of choice for some commonly asked malignancies

Malignancy	First line drugs
Chronic Lymphatic leukaemia	Fludarabine
Chronic Myeloid leukaemia	Imatinib
Hairy cell leukemia	CLADRIBINE
Multiple myeloma	Bortezomib > Melphalan
Choriocarcinoma	Methotrexate
Prostate carcinoma	Bicalutamide/Flutamide

248. Ans. (b) **Inhibit TXA₂ formation**

Ref: KDT, 6th ed. pg. 609; Katzung, 14th ed. pg. 620

- ASPIRIN has an antiplatelet effect by inhibiting the production of thromboxane.
- Thromboxane, normally helps in platelet aggregation.
- TXA₂ formation is suppressed even at very low doses of aspirin.

- PGI₂ is prostacyclin. Aspirin acts as prostacyclin analogue. It doesn't inhibit PGI₂ formation.
- TEUROTROBAN-TXA₂ receptor antagonist.

249. Ans. (a) Inhibit dihydrofolate reductase

Ref: Katzung, 14th ed. pg. 957; KD Tripathi, 6th ed. pg. 823

METHOTREXATE (MTX)

DHFA $\xrightarrow{\text{DHFRase}}$ THFA

- Methotrexate is a highly efficacious antineoplastic drug which inhibits dihydrofolate reductase (DHFRase) enzyme- blocking the conversion of dihydrofolic acid (DHFA) to tetrahydrofolic acid (THFA).
- This conversion is essential for formation of an essential coenzyme required for one carbon transfer reactions in denovo purine synthesis and amino acid interconversions.
- Methotrexate has cell cycle specific action kills cells in S phase; primarily inhibits DNA synthesis.

Extra Mile

Drug of choice for Mtx toxicity: FOLINIC ACID.

250. Ans. (b) Folinic acid

Ref: Katzung, 14th ed. pg. 957; KDT, 6th ed. pg. 823

- The toxicity of Mtx can not be overcome by folic acid, because it will not be converted to the active coenzyme form. However, folinic acid rapidly reverses the effect.
- Thymidine also counteracts the Mtx toxicity.
- Refer to above explanation.

251. Ans. (d) Methotrexate

Ref: Katzung, 14th ed. pg. 955, 957; KDT, 6th ed. pg. 823

- **Methotrexate** is an antimetabolite which act by inhibiting Dihydro folate Reductase.
- It is DOC for Choriocarcinoma, and is also considered among the first line drugs in Breast CA, testicular tumors, cervix CA and osteogenic sarcoma.
- Mtx is NOT indicated in MM.
- **Melphalan** is very effective in multiple myeloma and has been used in advanced ovarian cancer.
- First line drugs of multiple myeloma: Melphalan, Prednisolone, Cyclophosphamide.
- **Thalidomide** was used previously for morning sickness but later withdrawn due to severe teratogenic effects (phocomelia).
- It has been re-introduced due to its immunomodulatory and anti-cancer properties. It has been approved for multiple myeloma and erythema nodosum leprosum and is being tried for myelodysplastic syndrome, melanoma,

Bechet disease, HIV associated ulcers and graft versus host disease.

- **Zolendronic acid:** It is a *bisphosphonate* indicated for the treatment of bony metastases and multiple myeloma.

252. Ans. (c) Cisplatin

Ref: Katzung, 14th ed. pg. 956; KDT, 6th ed. pg. 828

- **Cisplatin** is a platinum coordination complex that is hydrolyzed intracellularly to produce a highly reactive moiety which causes cross linking of DNA by platinum compound.
- It is a highly emetic drug. Antiemetics are routinely administered before infusing cisplatin.
- **DOC for cisplatin induced vomiting:** Ondansetron
- **Major s/e of cisplatin:** Ototoxicity and nephrotoxicity.

253. Ans. (c) Cisplatin

Ref: Katzung 14th ed. pg. 956, 957

- **Cisplatin** is a widely used anti cancer drug.
- It has major antitumor activity in a broad range of solid tumors including
 - Non-small cell and small cell lung cancer
 - Esophageal and gastric cancer
 - Head and neck cancer and
 - Genitourinary cancers, particularly testicular, ovarian, and bladder cancer.
- When used in combination regimens with vinblastine and bleomycin or etoposide and bleomycin, cisplatin-based therapy has led to the cure of nonseminomatous testicular cancer.

Extra Mile

5-FU is a pyrimidine analogue used in colorectal cancer. Methotrexate is considered as DOC for choriocarcinoma.

254. Ans. (a) 6-mercaptopurine

Ref: Katzung, 14th ed. pg. 960-61; KDT, 6th ed. pg. 820

- 6 mercaptopurine (6-MP) is a purine analogue which is metabolized by xanthine oxidase
- It is a competitive inhibitor of DNA.
- Allopurinol is NOT given along with 6-MP because allopurinol inhibits xanthine oxidase enzyme, which leads to increased toxicity due to accumulation of xanthine.

Anti-neoplastic drugs	Their side effect
Cyclophosphamide, ifosfamide	Hemorrhagic cystitis
Procarbazine	Disulfiram like reaction
Bleomycin, busulfan	Pulmonary fibrosis
Vincristine, vinblastine	Peripheral neuropathy
Cisplatin	Ototoxicity, Nephrotoxicity
6Mercaptopurine, 6Thioguanine	Hepatotoxicity
Doxorubicin, Daunorubicin	Cardiotoxic

255. Ans. (d) Cyclophosphamide

Ref: Katzung, 14th ed. pg. 988; KDT, 6th ed. pg. 822

- **Cyclophosphamide** is a prodrug and is activated by hepatic biotransformation to aldophosphamide which is degraded to **acrolein**. This end product acrolein is responsible for hemorrhagic cystitis, which is considered as the adverse side effect of cyclophosphamide.
- This adverse effect can be controlled by **Mesna** (mercapto ethane sulfonic acid).
- **Note:** Cyclophosphamide is DOC for Wegener's granulomatosis (*granulomatosis with polyangiitis*)
- All natural anticancer products can cause bone marrow suppression EXCEPT bleomycin and vincristine.

256. Ans. (a) Vincristine

Ref: Katzung, 14th ed. pg. 970; Harrison, 17th ed. pg. 699

Preferred regimen for Hodgkins and Non-hodgkins lymphoma

Hodgkins lymphoma (ABVD)	Non-hodgkin's lymphoma
A: Adriamycin (Doxorubicin)	R: Rituximab
B: Bleomycin	C: Cyclophosphamide
V: Vinblastin	H: Hydroxycarbonyl (doxorubicin)
D: Dacarbazine	O: Oncovin (vincristine)
	P: Prednisolone

257. Ans. (b) Doxorubicin

Ref: Katzung, 14th ed. pg. 964-65; KDT, 6th ed. pg. 826-27

- **Doxorubicin** and daunorubicin are anti-tumor antibiotics. Activity of Daunorubicin is limited to acute leukemia while doxorubicin is effective in several solid tumors.
 - **MOA:** Cause breaks in DNA strands by activating topoisomerase II and generating quinolone type free radicals.
 - Doxorubicin and daunorubicin both these antibiotics produce cardiotoxicity as a unique adverse effect.
- **Actinomycin D (Dactinomycin)** It is a very potent antineoplastic drug, highly efficacious in Wilms' tumour and rhabdomyosarcoma
 - Prominent adverse effects are vomiting, stomatitis, diarrhoea, erythema and desquamation of skin, alopecia and bone marrow depression
- **Mitoxantrone:** Recently introduced analogue of doxorubicin with lower cardiotoxicity, probably because it does not produce quinone type free radicals. Though

cardiomyopathy can occur, major toxicity is marrow depression and mucosal inflammation.

- **Mitomycin C:** This highly toxic drug is used only in resistant cancers of stomach, cervix, colon, rectum, bladder, etc
 - Bone marrow and GIT are the primary targets of toxicity.

258. Ans. (d) Mitomycin

Ref: KDT, 6th ed. pg. 827

- After 8-10 months of start of mitomycin-C treatment, the drug leads to endothelial damage
- The Renal lesions seen are similar to those seen in idiopathic HUS and include arteriolar fibrin thrombi, expanded sub-endothelial zones in glomerular capillary walls.
- HUS can be seen with: Mitomycin C, Gemcitabine

259. Ans. (c) Amifostine

Ref: Cancer Medicine 6th ed. pg. 595

TABLE: Radiosensitizers vs Radiation protection agent

Radiosensitizers	Radiation protection agent
Actinomycin	Amifostine
Gemcitabine	GM-CSF
Hydroxyurea	TL-1
Metronidazole	
Misonidazole	
5-FU	
Mitomycin	
Paclitaxel	

CARDIOVASCULAR SYSTEM

260. Ans. (b) PPAR-α activator

Ref: Goodman & Gillman's 13th ed. P 6 13-14

Gemfibrozil

- Gemfibrozil, a PPARα activator, classified under hypolipidemic drugs, fibrates.
- The PPAR family is composed of three members: α, β and γ.
- PPARα is the target for the fibrate class of drugs, including the widely prescribed *gemfibrozil* and *fenofibrate*.
- Exact mechanism how the fibrates lower lipoprotein levels, or raise HDL levels, remains unclear.
- Fibrates bind to PPARα and:
 - Reduce triglycerides through PPARα-mediated stimulation of fatty acid oxidation
 - **Increased LPL synthesis** would enhance the clearance of triglyceride-rich lipoproteins.

- **Reduced expression of apo C-III** which serves as an inhibitor of lipolysis and receptor-mediated clearance, would enhance the clearance of VLDLs.
- Fibrate-mediated increases in HDL-C are due to PPAR α stimulation of apo A-I and apo A-II expression, which increases HDL levels.
- Fenofibrate is more effective than gemfibrozil at increasing HDL levels.

Extra Mile

- PPAR γ is the target for the thiazolidinedione class of anti-type 2 diabetic drugs, including rosiglitazone and pioglitazone. PPAR γ does not induce xenobiotic metabolism.
- Ezetimibe inhibits intestinal cholesterol absorption.
- HMG-CoA inhibitor are statins (For example, simvastatin, rosuvastatin, etc.)

261. Ans. (a) Competitive inhibition

Ref: Goodman & Gillman's 13th ed. P 609

- Statins exert their major effect—reduction of LDL levels—through a mevalonic acid-like moiety that **competitively** inhibits HMG-CoA reductase, which is the rate limiting enzyme in the cholesterol biosynthesis.
- **Drugs are** atorvastatin, rosuvastatin, fluvastatin, lovastatin, pravastatin, simvastatin, pitavastatin.

Extra Mile

- Food increases absorption of statins
- Statins are most active at night, so given at night except rosuvastatin and atorvastatin which are longest acting statins.

262. Ans. (b) Dobutamine

DOC for cardiogenic shock: Dobutamine

263. Ans. (a) Hypokalemia

Ref: KD Tripathi, 7th ed. pg. 496

- Digitalis increases force of cardiac contraction by a direct action independent of innervation. It selectively binds to extracellular face of the membrane associated Na⁺K⁺ ATPase of myocardial fibers and inhibits this enzyme.
- Inhibition of this cation pump results in progressive accumulation of Na⁺ intracellularly. This indirectly results in intracellular Ca²⁺ accumulation by reversing the direction of Na-Ca⁺ exchanger channel, which causes inotropic action.
- **Note:** in normal situation, Na-Ca⁺ exchanger pumps out Ca⁺ in exchange of Na⁺. But after blocking action of Digoxin, the direction of exchanger channel is reversed causing Pumping out Na⁺ in exchange with Ca⁺ from outside.
 - This accumulated Ca⁺ intracellular acts at sarcoplasmic reticulum and causes release of more calcium → Ionotropic action

- Higher serum potassium concentration inhibits digitalis binding to Na-K⁺ ATPase. Therefore hyperkalemia can reduce digitalis toxicity and Hypokalemia can cause digitalis toxicity.
- **Note:** Hypokalemia and hypercalcemia precipitate digoxin toxicity.
- **Action:**
 - Digitalis increases the force of contraction and decreases the heart rate due to its vagomimetic action
 - It also decreases the AV conduction, hence contraindication in WPW syndrome.
 - Causes diuresis in CHF patients
 - Causes decrease in peripheral resistance in CHF patients (*because of withdrawal of reflex sympathetic overactivity*)

1. Inhibition of Na⁺/K⁺ ATPase pump by digitalis
2. Increased Na⁺ concentration inside the cell
3. Increased exchange of Na⁺ for Ca⁺⁺
4. Increased intracellular Ca⁺⁺
5. Increased influx of Ca⁺⁺ from sarcoplasmic reticulum
6. Increased contractility of cardiac muscle

264. Ans. (b) Pumps sodium inside cell in exchange of Ca⁺

Ref: Katzung, 14th ed. pg. 217-18

- In normal situation, Na-Ca⁺ exchanger pumps out Ca⁺ in exchange of Na⁺. But after blocking action of Digoxin, the direction of exchanger channel is reversed causing Pumping out Na⁺ in exchange with Ca⁺ from outside.
- This accumulated Ca⁺ intracellular acts at sarcoplasmic reticulum and causes release of more calcium → Ionotropic action

265. Ans. (b) Labetalol

Ref: Katzung, 14th ed. pg. 183

- CCBs and Diuretics are contraindicated in pregnancy for blood pressure management.
- In this given scenario, anti hypertensive will be started for patient's PIH management.
- Drug preferred in pregnancy induced hypertension: Labetalol (DOC)
- DOC for hypertensive emergency in pregnancy: Labetalol

266. Ans. (b) Blockade of ATP sensitive K⁺ channels

Ref: Katzung, 14th ed. pg. 175–76

- K⁺ channel openers (minoxidil, diazoxide) are used as antihypertensives and not the channel blockers. Blockers of ATP sensitive K⁺ channels like sulfonylureas are used in diabetes mellitus.
- **Antihypertensive drugs can act by the following mechanisms:**
 - **Diuretics:** Thiazides and loop diuretics
- DOC for hypertension: Thiazide Diuretics
 - **Vasodilators:** These have different mechanisms like
 - ♦ NO releasers e.g. sodium nitroprusside and hydralazine
 - ♦ K⁺ channel openers e.g. minoxidil, Diazoxide
 - ♦ Ca⁺ channel blockers e.g. amlodipine, Nifedipine, Verapamil, Diltiazem
 - ♦ D1 agonist e.g. fenoldopam
 - **Sympathetic blockers:** These can have following mechanisms
 - ♦ Ganglion blockers e.g. trimethaphan
 - ♦ Adrenergic neuron blockers e.g. guanethidine
 - ♦ Alpha 2 agonists e.g. clonidine, alpha methyl dopa
 - ♦ Receptor blockers like alpha and beta blockers
 - **Renin angiotensin system blockers:** These include:
 - ♦ Renin inhibitors e.g. Enalkiren, Remikiren
 - ♦ ACE inhibitors e.g. Enalapril, Captopril, Lisinopril
 - ♦ Angiotensin receptor blockers e.g. Losartan, Telmisartan
 - ♦ Aldosterone antagonists e.g. Spironolactone, Eplerenone

267. Ans. (a) Nifedipine

Ref: Katzung, 14th ed. pg. 203–204; KDT, pg. 323

- Nifedipine is a calcium channel blocker which is used as an alternative drug for premature labor.
- Influx of calcium ions plays an important role in uterine contractions. CCBs reduce tone of myometrium and oppose contractions.
- These drugs, especially Nifedipine can postpone labor only if started early enough.
- In emergency situation, Ritodrine (β₂ selective agonist) is considered as the drug of choice to suppress preterm labor.

Extra Mile

- **Drug of choice for hypertension in pregnancy-** LABETALOL
- **Drug of choice for epilepsy in pregnancy-** Lamotrigine
- DOC for status eclampticus in pregnancy → phenobarbitone

268. Ans. (b) ACE inhibitors

Ref: KDT, 6th ed. pg. 553

Antihypertensive to be avoided during pregnancy	Antihypertensive safer during pregnancy
<ul style="list-style-type: none"> • ACE inhibitors (Ex- captopril, enalapril etc.) • Angiotensin antagonist (losartan, telmisartan) • Thiazide diuretics (Ex- hydrochlorothiazide) • Furosemide • Propanolol • Nitroprusside 	<ul style="list-style-type: none"> • Hydralazine • Methyldopa • Atenolol • Metoprolol • <i>Labetalol- DOC</i> • Nifedipine • Prazosin and Clonidine

Drugs and their Respective Risk

- **Diuretics:** Tend to reduce blood volume; increase risk of placental infarcts, fetal wastage, still birth.
- **ACE inhibitors, AT1 antagonists:** Growth retardation and fetal damage risk.
- **Propanolol:** Causes low birth weight, neonatal hypoglycemia and bradycardia.
- **Nitroprusside:** Contraindicated in eclampsia.

269. Ans. (c) Captopril

Ref: KDT, 6th ed. pg. 553

Please refer to above explanation.

270. Ans. (a) ACE inhibitors

Ref: Katzung, 14th ed. pg. 187–188

- ACE inhibitors are drug of choice for scleroderma induced hypertensive crisis. Other important points and side effects about ACE inhibitors can be remembered as:
 - C** - Cough
 - A** - Angioedema
 - P** - Prodrugs (EXCEPT captopril and Lisinopril)
 - T** - Taste disturbances
 - O** - Orthostatic hypotension (when combined with diuretics)
 - P** - Pregnancy (contraindicated)
 - R** - bilateral Renal artery stenosis (contraindicated)
 - I** - Increased K⁺ (contraindicated)
 - L** - Lower the formation of Ang II (Mechanism)

271. Ans. (b) Verapamil

Ref: Katzung, 14th ed. pg. 246

- Supra ventricular tachycardia is a condition presenting as rapid heart rhythm originating at or above the AV node. SVT can be contrasted with the potentially more dangerous ventricular tachycardias- rapid rhythms that originate within the ventricular tissue.
- Calcium channel blockers have well-documented efficacy in hypertension and supraventricular tachyarrhythmias.
- SA and AV nodal tissues, which are mainly composed of slow response cells, are affected markedly by verapamil, moderately by diltiazem, and much less by dihydropyridines.

FMGE Solutions Screening Examination

298

- Thus, verapamil and diltiazem decrease atrioventricular nodal conduction and are effective in the management of supraventricular tachycardia.

Extra Mile

DOC for paroxysmal supra ventricular tachycardia- **ADENOSINE**
 DOC for SVT- **VERAPAMIL**
 DOC for Atrial Fibrillation- **DIGITALIS (Digoxin, Digitoxin)**
 DOC for digitalis induced ventricular arrhythmia- **LIGNOCAINE**

272. Ans. (b) Adenosine

Ref: Katzung, 14th ed. pg. 246; KD Tripathi, 6th ed. pg. 509 & 518

- Paroxysmal supraventricular tachycardia (PSVT) is sudden onset episodes of atrial tachycardia (rate 150-200/min) with 1:1 atrioventricular conduction
- An attack of PSVT can be terminated by i.v. injection of verapamil, diltiazem, esmolol or digoxin; **but most cardiologists now prefer adenosine.**
- Adenosine has a very short $t_{1/2}$ in blood (~ 10 sec)
- Almost complete elimination occurs in a single passage through coronary circulation.

273. Ans. (b) ACE inhibitors

Ref: KDT, 6th ed. pg. 484

- Angiotensin converting enzyme normally helps in conversion of angiotensin I to angiotensin II, which acts as a vasoconstrictor in case of hypovolemia.
- In addition to that, ACE also helps in breakdown of bradykinin.
- When ACE inhibitors (captopril) are given, it inhibits ACE and in addition inhibits breakdown of bradykinin also, which leads to accumulation of bradykinin level in body.
- This increased level of bradykinin presents with Dry cough, rashes, urticaria and angioedema.

Other side effects of ACE inhibitors	Contraindications of ACE (-)	Safe alternative of ACE (-)
Hypotension Hyperkalemia Fetal growth retardation	Pregnancy Bilateral Renal artery stenosis Hyperkalemia	Angiotensin receptor blocker is a safe alternative in case of cough, angioedema.

Extra Mile

- Why ACEI is contraindicated in bilateral renal stenosis
 - Patients with B/L renal artery stenosis or patients with single kidney having renal artery stenosis will develop renal failure if treated with ACEI.
 - In stenosis there is reduced GFR, and body manage the adequate GFR by angiotensin II mediated efferent arteriole constriction to maintain the renal perfusion. In such patients, Inhibition of ACE can induce acute renal insufficiency.

274. Ans. (a) Act by Na+ K+ ATPase inhibition

Ref: KDT, 6th ed. pg. 540

- Thiazide and related drugs (chlorthalidone) are the diuretic of choice in uncomplicated hypertension. It acts by reducing plasma volume and by decreasing total peripheral resistance.
- Alpha receptors are present on vessel wall, which upon stimulation constricts vessel wall and increase total peripheral resistance. Alpha adrenergic blocking agents like Prazosin, terazosin, doxazosin and phentolamine inhibit the alpha receptor and decrease total peripheral resistance.
- β_1 receptors are present on heart, which upon stimulation increase the heart rate. Beta adrenergic blockers like nebivolol, metoprolol, atenolol etc. are some of the beta blockers which depress myocardial contractility, and decreases the stroke volume.
- **Na+ K+ ATPase inhibition** is done by Digitalis. Digitalis however has no role in control of hypertension. It is used in congestive heart failure and atrial fibrillation.

Extra Mile

- Digitalis MOA in atrial fibrillation: Decreases conduction.
- M/c side effect of digitalis: Nausea/vomiting.
- MC cardiac side effect (arrhythmia) caused by digitalis: Ventricular Bigeminy.
- DOC for digitalis induced arrhythmia: LIGNOCAINE

275. Ans. (c) Inhibit HMG CoA reductase

Ref: KDT 6th ed. pg. 614

- **HMG-CoA Reductase Inhibitors (statins):** This class of compound is the most efficacious and best tolerated hypolipidaemic drugs.
- **MOA:** Competitively inhibit conversion of HMG-CoA to mevalonate by the enzyme HMG-CoA reductase.
- Drugs (Statins): Lovastatin, Simvastatin, Pravastatin, Atorvastatin, Rosuvastatin

Extra Mile

- All statins are given at night except: Rosuvastatin, Atorvastatin (can be given at anytime)
- Major side effects of statins: Myopathy
- Most potent statin: Pitavastatin

276. Ans. (c) **Somatostatin**

Ref: KDT, 6th ed. pg. 235

SOMATOSTATIN

- Somatostatin inhibits the secretion of GH, TSH and prolactin by pituitary, insulin and glucagon by pancreas and most importantly. It inhibits most of G.I secretions gastrin and HCl.
- It can be used in controlling esophageal varices and bleeding peptic ulcer.

- Drugs like *simvastatin*, atorvastatin, *fluvastatin*, lovastatin and rosuvastatin are statins, which are hypolipidemic drugs. They act by inhibiting HMG-CoA Reductase.
- Fenofibrate* are from fibrates category, which has maximum triglyceride lowering activity.

Extra Mile

- Statins end with "*vastatin*"
- Maximum LDL lowering activity is by: STATINS
- Longest acting statin: ROSUVASTATIN

277. Ans. (c) **Tocainide**

Ref: KDT, 6th ed. pg. 511

TABLE: Anti arrhythmic drugs

Class	Actions	Drugs
I- (Na ⁺ #)	(Na ⁺ channel blockers)	
	Ia: Na ⁺ +K ⁺ channel blocking property	Quinidine, Procainamide, Disopyramide
	Ib: Na ⁺ # & K ⁺ channel opening property	Tocainide, Lidocaine, Phenytoin, Mexiletine
	Ic: no effect on K ⁺ channel	Flecainide, Encainide, Propafenone
II- (β#)	Antiadrenergic agents (β blockers)	Propranolol, Esmolol, (Sotalol is Class III mainly)
III- (K#)	Agents widening AP (Prolong repolarization and ERP)	Ibutilide, Sotalol, Bretylium, Amiodarone, Dronadarone, Dofetilide
IV- (Ca ⁺ #)	Calcium channel blockers	Verapamil, Diltiazem
V	Drugs with other mechanism of actions	Magnesium (DOC in torsades de pointes) Atropine: DOC for Bradycardia a and AV Block Digoxin Adenosine: DOC for PSVT

Note: Class IA agents also have Class III property; propranolol has Class I action as well; sotalol and bretylium have both class II and class III actions.

278. Ans. (d) **All of the above**

Ref: KDT 6th ed. pg. 528

TABLE: Types of calcium channel blocker

	L-Type (long lasting current)	T- Type (transient current)	N-Type (neuronal)
Locations and function	Excitation –contraction coupling in cardiac and smooth muscle SA, A-V node: conductivity Endocrine cell: Hormone release Neurons: transmitter release	Sa node- pacemaker activity "T" current and repetitive spikes in thalamic and other neurons Endocrine cells hormone release Certain arteries constriction	Only on Neurons in CNS, sympathetic and myenteric plexuses transmitter release
Blocker (drugs)	DHP's: Amlodipines, Nifedipine Non- DHP: Diltiazem, verapamil	Mibefradil, flunarizine, ethosuximide Trimethadione	ω- conotoxin

279. Ans. (a) **Hydrochlorthiazide**

Ref: KDT, 6th. pg. 274

Drugs causing glucose intolerance (hyperglycemia)		
Glucocorticoids	Diazoxide	Clozapine
Thiazides		β adrenergic agonist
Phenytoin	Protease inhibitors	Thyroid hormone
Pentamidine	β -IFN	Nicotinic acid

FMGE Solutions Screening Examination

300

Note:

- Sulfonylureas are oral hypoglycemic agents. They cause hypoglycemia.
- ACE inhibitors also cause hypoglycemia.
- Other agents causing hypoglycemia: Quinine, Pentamidine, Octreotide, Insulin.

280. Ans. (a) Losartan

Ref: KDT, 6th ed. pg. 488

- Losartan has a uricosuric effect in hypertensive patients, and causes a decrease in serum uric acid levels by 20% to 25%.
- Losartan acts by inhibiting the urate/lactate exchanger and urate/chloride exchanger in the proximal convoluted tubule and leads to uricosuria.
- The uricosuric action of losartan is not shared by other antihypertensive agents.
- ACE inhibitors and CCBs increase uric acid excretion but the effect is modest and does not decrease serum uric acid levels.
- Diuretics have a propensity to increase serum uric acid levels and may even, rarely, provoke attacks of gout. Losartan can offset the elevations in serum uric acid levels occurring with hydrochlorothiazide or Indapamide
- Allopurinol reduces approximately 30% decrease in serum uric acid, resulting from the ability of allopurinol to inhibit xanthine oxidase, the enzyme responsible for the oxidation of purine to uric acid.

281. Ans. (b) Losartan

Ref: KDT, 6th ed. pg. 488

ANGIOTENSIN RECEPTOR BLOCKERS

- This class of anti-hypertensives developed as an alternative to ACE inhibitors, as ARB's have no action on bradykinin, causing no side effect like cough, angioedema as seen with ACE inhibitors.
- These are orally active AT₁ receptor antagonists which include **losartan, candesartan, valsartan, telmisartan and irbesartan.**
- **Losartan** is a competitive antagonist and inverse agonist of A-II, 10,000 times more selective for AT₁ than AT₂ receptor.
- It does not block any other receptor or ion channel, EXCEPT Thromboxane A₂ receptor, which is responsible for its platelet anti-aggregatory property attenuation.

Extra Mile

- Telmisartan has PPAR- γ agonist action which can increase sensitivity to insulin. Therefore preferred in diabetics.

282. Ans. (c) CCB and β blockers

Ref: KDT, 6th ed. pg. 553

- Verapamil or diltiazem (CCB's) with β blockers are avoided because they may cause marked bradycardia and A-V block.
- Nitrates are used in conditions like CHF, Angina pectoris, MI, and Diffuse esophageal spasm. It can be given in combination with CCBs or β blockers.

Other antihypertensive combinations to be avoided:

- An α or β adrenergic blocker with clonidine: an apparent antagonism of clonidine action has been observed.
- **Nifedipine with diuretic:** Synergism between these two is still unproven.
- Methylopa with clonidine or any two drugs of same class.
- ACE inhibitor with ARB

283. Ans. (a) ACE inhibitor

Ref: Harrison's, 18th ed. Ch 344

- In a diabetic patient, hypertension can accelerate complications of DM, particularly cardiovascular disease and nephropathy. In these patients ACE inhibitor is preferred. It slows down the progression of diabetic nephropathy.
- **American Diabetic Association recommends that all patients with diabetes and hypertension be treated with an ACE inhibitor or an ARB.**
- Subsequently, agents that reduce cardiovascular risk (beta blockers, thiazide diuretics, and calcium channel blockers) should be incorporated into the regimen.
- While ACE inhibitors and ARBs are likely equivalent in most patients with diabetes and renal disease, the ADA notes:
 - In patients with type 1 diabetes, hypertension, and micro- or macroalbuminuria, an ACE inhibitor slowed progression of nephropathy
 - An ACE inhibitor or an ARB slowed the progression to macroalbuminuria in patients with type 2 diabetes, hypertension, and microalbumin-uria; and
 - ARB slowed the decline in GFR in patients with type 2 diabetes, hypertension, macroalbuminuria, and renal insufficiency.

HORMONES AND AUTOCIDS

284. Ans. (b) GLP-1 Analogue

Ref: Goodman & Gillman 13th ed. P 877

- **GLP-1 analogue drugs are:** Exenatide, Liraglutide, Albiglutide, Dulaglutide, Lixisenatide
- These agents activate the GLP-1 receptor \rightarrow Increased insulin biosynthesis and release

- These agents are resistant to degradation by DPP4 enzyme → Has extended activity following injection.
- **Side effect:** Nausea, vomiting, Pancreatitis

TABLE: Properties of insulin secretagogues

Class Generic name	Daily Dosage (mg)	Duration of Action (hours or dosing frequency)
Sulfonylureas		
Glimepiride	1–8	24
Glipizide	5–40	12–18
Glipizide (extended release)	5–20	24
Glyburide	1.25–20	12–24
Glyburide (micronized)	0.75–12	12–24
Nonsulfonylureas (Meglitinides)		
Nateglinide	180–360	2–4
Repaglinide	0.5–16	2–6
GLP-1 Agonists		
Albiglutide	30–50	Weekly
Dulaglutide	0.75–1.5	Weekly
Exenatideb	2	Weekly
Liraglutide	0.6–1.8	Daily
Lixisenatide	0.010–0.020	Daily
Dipeptidyl Peptidase-4 Inhibitors		
Alogliptin	25	Daily
Linagliptin	5	Daily
Saxagliptin	2.5–5	Daily
Sitagliptin	25–100	12–16
Vildagliptin	50–100	Twice daily

285. Ans. (d) Sufentanil

Ref: Goodman & Gillman 13th ed. P 376

- Fentanyl citrate and sufentanil citrate are congeners of fentanyl and are considered as potent analgesics
- After systemic delivery:
 - Fentanyl is about 100 times more potent than morphine
 - Sufentanil is about 1000 times more potent than morphine
- Time to peak analgesic effect after IV administration: ~5 minutes
- These drugs are well known to be used as epidural analgesic.

286. Ans. (d) Hepatotoxicity

Ref: Goodman & Gillman 13th ed. P 696

- Paracetamol/Acetaminophen is a non-selective COX inhibitor

- **Use:** Analgesic and antipyretic agent. Preferred in patients where aspirin is contraindicated
- **Usual dose:** 325–650 mg every 4–6 hours. Maximum FDA recommended dose is 4 gm/day
- Peak plasma concentration: 30–60 minutes
- **Half-life:** 2 hours
- Metabolism of acetaminophen in liver by:
 - Hepatic conjugation with glucuronic acid (~60%),
 - Sulfuric acid (~35%),
 - Cysteine (~3%);
 - CYP mediated N-hydroxylation to form NAPQI (N-acetyl-*p*-benzoquinone imine)
- **Note:** NAPQI is one of the highly reactive intermediate metabolite of acetaminophen metabolism. This usually reacts with sulfhydryl groups is GSH → rendered harmless.
- In hepatotoxicity condition GSH level depleted.

SIDE EFFECTS

- The most serious acute adverse effect of over dosage of acetaminophen is a potentially fatal hepatic necrosis.
- Due to hepatotoxicity there is saturation of glucuronide and sulfate conjugation and increasing amounts undergo CYP-mediated N-hydroxylation to form excess of NAPQI (it accumulates due to depletion of GSH).
- The highly reactive NAPQI causes enzymatic dysfunction, produces oxidative stress and apoptosis.
- In adults hepatotoxicity may occur after ingestion of single dose of 10–15 g. Doses of 20–25 g is potentially fatal.

TREATMENT OF ACETAMINOPHEN TOXICITY:

- Activated charcoal within 4 hours of ingestion decreases absorption by 50–90%
- **N-acetylcysteine:** antidote of choice for acetaminophen toxicity. It acts by detoxifying NAPQI by:
 - Repleting GSH stores
 - Conjugate directly with NAPQI by serving as a GSH substitute

Extra Mile

In Paracetamol Toxicity:

- Liver enzyme abnormalities typically peak 72–96 hours after ingestion
- **Biopsy:** Centrilobular necrosis with sparing of the periportal area
- **Other side effects:** Renal tubular necrosis and Hypoglycemic coma

287. Ans. (b) Early closure of PDA

Ref: Goodman & Gillman 13th ed. P 690, 697

- Indomethacin is a potent nonselective inhibitor of COX enzyme. It is considered 20 times more potent than aspirin

- Other actions are:
 - Inhibit motility of neutrophils
 - Depress biosynthesis of mucopolysaccharides
 - COX independent vasoconstrictor effect
 - Anti-inflammatory, antipyretic and analgesic action
- An IV formulation of indomethacin is approved for closure of persistent patent ductus arteriosus in premature infants.
- The regimen involves intravenous administration of 0.1–0.25 mg/kg every 12 hours for three doses, with the course repeated one time if necessary.
- Successful closure can be expected in more than 70% of neonates treated.
- An injectable formulation of ibuprofen is an alternative for the treatment of patent ductus arteriosus.
- The agent can also cause stenosis of ductus arteriosus and oligohydramnios particularly in foetuses older than 32 weeks of gestation.

288. Ans. (b) Provide stability in insulin molecule*Ref: KD Tripathi 8th ed. P 286*

- The insulin molecules namely regular human insulin and NPH insulin/lente is clear at neutral pH and exist as dimers that assemble into hexamers in the presence of two zinc ions. This provides stability in the insulin.
 - Become cloudy after adding zinc
- These hexamers are further stabilized by phenolic compounds like phenol and meta-cresol.
- Zinc is also necessary for proper processing, storage and secretion of insulin and also protect against Beta cell loss.
- Studies have shown that zinc manages the behaviour of amylin (a protein secreted from beta cell) to help slow down carbohydrate absorption. Unmanaged amylin can form clumps that interfere with insulin secretion.
- Since zinc is so closely tied to insulin functioning, its deficiency is associated with poor beta cell function and higher incidence of insulin resistance.

Extra Mile

Lente insulin (Insulin-zinc suspension): Two types of insulin-zinc suspensions have been produced.

- The one with large particles is crystalline and practically insoluble in water (ultralente). It is long-acting.
- The other has smaller particles and is amorphous (semilente), is short-acting. Their 7:3 ratio mixture is called 'Lente insulin' and is intermediate-acting

289. Ans. (a) 4 minutes*Ref: Sharma & Sharma 3rd ed. P 625*

- Parathyroid hormone is a 84 amino acid compound which is responsible for calcium homeostasis in body.
 - Acts over osteoblast → Stimulate osteoclast → Bone resorption

- Principle factor regulating parathyroid hormone synthesis and release: Hypocalcemia
- Rapidly metabolized in liver and kidney
- Plasma half-life: 2–4 minutes

Endocrine organ	Hormones	Basic structure	Half-life
Hypothalamus	Hypothalamic releasing hormones	Small: 3 to 44 amino acid peptides	1–2 min
Pituitary	"Trophic" hormones	Large glycoproteins	20 min. – 3 hrs
Thyroid	Calcitonin	32 AA	10–30 min.
Parathyroid	PTH–parathyroid hormone	84 AA	4 min.
Pancreas	Insulin, glucagon (major)	–51 AA/29 AA	5–8 min./negligible
Adipose tissue	Leptin	167 AA	30 min.
Kidney	Renin, erythropoietin	340 AA/193 AA	15 min.
Liver	IGF-1	153 AA	12–15 hrs.
Heart	ANP/BNP	28 AA/32 AA	2 min./20 min.

290. Ans. (a) 5-lipoxygenase inhibitor*Ref: Goodman & Gillman's 13th ed. P 740-41*

- In the pathway of leukotriene synthesis where phospholipase cleaves the phospholipid of cell membrane to form arachidonic acid, steroids can inhibit this particular synthesis.

Phospholipase A₂

Phospholipid -----→ Arachidonic acid
(–) Steroids

- Further the arachidonic acid is metabolized to form leukotriene and prostaglandin with the help of 5'LOX and COX enzyme respectively.

Drugs acting at different sites:

- PLA₂ inhibitor:** Steroids
- LOX inhibitor:** Zileuton
- Receptor inhibitor:** Montelukast, zafirlukast, pranlukast

291. Ans. (b) Insulin*Ref: Sharma & Sharma 3rd ed. P 636*

- Insulin in diabetes facilitates glucose uptake (through GLUT-4) and increases intracellular glucose oxidative metabolism.
- Insulin decreases glycogenolysis, increases lipogenesis, decreases lipolysis, increases FA synthesis and

triglyceride formation and storage. It also blunts lipolytic action if adreneline, growth hormone and glucagon.

- Thus insulin lowers the blood glucose levels by promoting the glucose utilization and suppressing its production.

Extra Mile

- Acarbose, miglitol and voglibose is from α -glucosidase inhibitor group. Alpha glucosidase usually facilitates digestion of complex starch, oligosaccharides, monosaccharides. If they are inhibited the sugar moiety will not be absorbed, reducing the sugar level.
- **Side effect:** Flatulence, diarrhea, abdominal pain.
- Pioglitazone can cause increase in weight gain, which is attributed to fluid retention and edema.

292. Ans. (c) 0.25%

- ALCAFTADINE is a H1 receptor antagonist, and can be used for allergic conjunctivitis
- The trial done for alcaftadine used 0.25% solution.
- **The trial states:** "When Alcaftadine was tested against placebo and olopatadine, only Alcaftadine 0.25% was shown to have a clinically significant reduction in conjunctival redness scores 7 and 15 minutes after administration"

293. Ans. (a) Sildenafil

Ref: KD Tripathi, 7th ed. pg. 303

- Sildenafil is an orally active drug for treatment of ED. Sildenafil acts by selectively inhibiting PDE-5, causing increase in cGMP and enhancing Nitric Oxide action on corpus cavernosum.
- Amrinone and Milrinone are PDE-3 inhibitor and are also called inodilators. They are used in CHF.
- Tamoxifen is a selective estrogen receptor modulator, used in breast cancer.

294. Ans. (b) Fulvestrant

Ref: KD Tripathi, 7th ed. pg. 313

- **Fulvestrant** is the first member of a distinct class of estrogen receptor (ER) ligands called 'selective estrogen receptor down-regulators' (SERDs) or 'pure estrogen antagonists' that has been introduced for the treatment of metastatic ER positive breast cancer in postmenopausal women which has stopped responding to tamoxifen.
- In contrast to tamoxifen, it inhibits ER dimerization so that ER interaction with DNA is prevented and receptor degradation is enhanced. The ER is thus downregulated resulting in more complete suppression of ER responsive gene function. This feature along with its higher **affinity** for the ER probably accounts for its efficacy in tamoxifen resistant cases.
- Fulvestrant is administered as (250 mg) monthly IM injections in the buttock. It is slowly absorbed and has an elimination $t_{1/2}$ of more than a month.

Extra Mile

Clomiphene citrate binds to both ER-alpha and ER-beta and acts as pure estrogen antagonist

Tamoxifen is selective estrogen receptor modulator

Flutamide is selective antagonist of androgen receptor.

295. Ans. (c) Antibody to VEGF receptor

Ref: KD Tripathi, 7th ed. pg. 871

- **Bevacizumab** It is a humanized **monoclonal antibody that binds VEGF-A** and hinders its access to the VEGF receptor, interrupting angiogenic signalling.
- Combined with 5-FU, bevacizumab is used in metastatic colorectal cancer. Added to conventional chemotherapy, it improves survival in metastatic non-small cell lung cancer, breast cancer, clear cell renal carcinoma and glioblastoma. Bevacizumab is administered by IV infusion every 2–3 weeks.
- Adverse effects are—rise in BP, arterial thromboembolism leading to heart attack and stroke, vessel injury and hemorrhages, heart failure, proteinurea, gastrointestinal perforations, and healing defects.

Extra Mile

- Epidermal growth factor (EGF) receptor inhibitors are: Gefitinib and Erlotinib. Mostly used in non-small cell lung cancer
- Example of VEGF 2 receptor inhibitor is sunitinib. It is used in metastatic RCC and GIST.

296. Ans. (b) Cyclosporine

- Cyclosporine and Tacrolimus are immunosuppressants, specifically inhibit antigen stimulated activation & proliferation of helper T-cells as well as expression of various cytokines including IL-2 by inhibiting calcineurin.
- **Other immunomodulators are:**
 - **IL 1 receptor inhibitor:** Anakinra
 - **IL 6 Receptor inhibitor:** Tocilizumab
 - **Co-Stimulation inhibitor:** Abatacept, Bilatacept
 - **TNF- α inhibitor:** Adalimumab, Certolizumab, Etanercept, Infliximab, Golimumab

297. Ans. (a) Prostaglandins

Ref: Anatomy and Physiology, Ch 27, Development and Inheritance pg. 832

The text states: "Rising estrogen and oxytocin during pregnancy, stimulate the production of prostaglandins in endometrium. These prostaglandins further stimulate smooth muscle contractions, thereby increasing frequency of urination and late in pregnancy cause spasms in uterine musculature."

298. Ans. (b) V2

TABLE: Vasopressin receptor location and functions

Receptor	Localization	Functions	
V1a	Vascular smooth muscle Platelets Hepatocytes Myometrium	Vasoconstriction, myocardial hypertrophy Platelet aggregation Glycogenolysis Uterine contraction	
V1b*	Anterior pituitary	ACTH release	
V2	Basolateral membrane collecting tubule	Insertion of AQP2 water channels into apical membrane, induction of AQP2 synthesis	Free water reabsorption
	Vascular endothelium Vascular smooth muscle	vWF and factor 8 release Vasodilatation	
ACTH, adrenocorticotropin hormone; AQP2, aquaporin-2. *Termed V3 in some classification schemes.			
			(KI 2006)

TABLE: Hormones from posterior pituitary

Antidiuretic hormone (ADH)/ Vasopressin	Increase water reabsorption by the kidneys and cause vasoconstriction and increased blood pressure. Acts on V2 receptor. Note: V1b is also known as V3 receptor
Oxytocin	Stimulates milk ejection from breasts and uterine contractions

299. Ans. (d) NPH

Ref: Sharma & Sharma 3rd ed. P 641; KDT, 6th ed. pg. 259

Insulin type	Onset of action (hr.)	Duration of action (hr)
Ultrashort (Rapid Acting) Insulin Lispro Insulin Aspart Insulin Glulisine	15 – 30 minutes	3–5 hrs
Short acting Regular insulin	30–60 minutes	6–8 hrs
Intermediate acting Insulin lente Neutral protamine hagedorn (NPH)/Isophane insulin	1–2 hrs	16–20 hrs
Long Acting Insulin Glargine Insulin Detemir Insulin Degludec	2–4 hrs	16–24 hrs Degludec: >24 hours
Inhaled insulin (Human insulin)-Liquid form	5–10 minutes	3–5 minutes

Extra Mile

Most common side effect of insulin: hypoglycemia
DOC for Diabetic ketoacidosis (DKA): Regular insulin

**300. Ans. (a) Insulin lispro***Ref: KDT 6th ed. pg. 259**Please refer to above explanation.***301. Ans. (a) Insulin aspart**

- Ultrashort acting insulins are the fastest acting ones.
- Onset of action within 15–30 minutes and duration of action is 3–5 hours.

302. Ans. (c) Dopamine stimulate prolactin production*Ref: KDT, 6th ed. pg. 235-236*

- Prolactin is produced from anterior pituitary and is associated with lactation.
- Prolactin is under predominant inhibitory control of hypothalamus through PRIH (Prolactin Release Inhibitory Hormone), which is Dopamine that acts on pituitary lactotrope D2 receptor.
- Dopaminergic agonist like bromocriptine, DA, cabergoline decrease plasma prolactin levels and is used to treat hyperprolactinemia
- Dopaminergic antagonists like chlorpromazine haloperidol, metoclopramide causes hyperprolactinemia by blocking D2 receptors.
- A progressive increase in prolactin occurs during pregnancy, peaking at term. After childbirth, this dopamine is inhibited and prolactin now stimulates milk production.

Extra Mile*Milk production is stimulated by: Prolactin (remember production by prolactin).**Milk secretion is stimulated by: Oxytocin
DOC for hyperprolactinemia: Bromocriptine***303. Ans. (c) Dopamine***Ref: KDT, 6th ed. pg. 235-236*

- Prolactin is under predominant inhibitory control of hypothalamus through PRIH (Prolactin Release Inhibitory Hormone), which is **Dopamine** that acts on pituitary lactotrope D2 receptor.
- A progressive increase in prolactin occurs during pregnancy, peaking at term. After childbirth, this dopamine is inhibited and prolactin now stimulates milk production.

304. Ans. (c) Metoclopramide*Ref: KDT, 6th ed. pg. 643*

- Galactorrhea is caused by increased level of prolactin.
- Normally, this prolactin is in inhibited state by Dopamine.

- Prolactin is under predominant inhibitory control of hypothalamus through PRIH (Prolactin Release Inhibitory Hormone), which is Dopamine that acts on pituitary lactotrope D2 receptor.
- Dopaminergic agonist like bromocriptine, DA and cabergoline decrease plasma prolactin levels and is used to treat hyperprolactinemia.
- Dopaminergic antagonists like chlorpromazine, haloperidol, **metoclopramide** causes hyperprolactinemia by blocking D2 receptors.

305. Ans. (b) Enhance glucose uptake by skeletal muscle*Ref: KDT, 6th ed. pg. 267*

OHA drugs	Mechanism of action
Metformin and thiazolidinediones	Inhibition of hepatic gluconeogenesis Enhance glucose uptake in skeletal muscle
Sulfonylureas and repaglinide	Stimulate insulin release from pancreas
Acarbose	Decrease absorption of glucose from intestine

306. Ans. (a) Metformin*Ref: KDT, 6th ed. pg. 267***METFORMIN**

- Metformin is an antidiabetic drug from biguanides category.
- They improve lipid profile, hence considered as DOC for DM in obese patients.
- **MOA:**
 - Increase peripheral utilization of glucose
 - Inhibit hepatic gluconeogenesis
- Metformin never causes hypoglycemia.
- Another drug from Biguanides is *Phenformin*, which is withdrawn, because it causes lactic acidosis.
- **Sulfonylureas** causes a brisk release of insulin from pancreas which stimulate the functional receptors for the intake of glucose.
 - They can cause hypoglycemia.
 - Preferred in thin patients with DM
- **Repaglinide** has same MOA as sulfonylureas, but it is short acting.
 - Used to control sudden rise of glucose after meal.
- **Acarbose** act by inhibiting G.I. absorption of sugar.
 - s/e: Can cause osmotic diarrhea.

Extra Mile

- Safest sulfonylureas: Tolbutamide (safer in elderly also)
- Remembered as: **MOST**- Metformin for Obese; Sulfonylureas for Thin.*

**307. Ans. (c) Monitoring of liver enzymes is recommended***Ref: KDT, 6th ed. pg. 304-5*

- Tamoxifen is a SERM that acts as antagonist at estrogen receptors in the breast. It decreases the risk of contralateral breast cancer and is approved for primary prevention of breast cancer in women at high risk.

Adverse Effects of Tamoxifen Therapy

- Hot flashes
- Menstrual irregularities,
- Endometrial hyperplasia
- Cataract
- Hepatotoxicity
- Development of fatty liver: Due to an idiosyncratic reaction to a metabolite of the medication
- Steatohepatitis: Minor serum aminotransferase elevations, *monitoring of serum enzymes during long term tamoxifen therapy is often recommended.*

308. Ans. (b) Finasteride*Ref: KDT, 6th ed. pg. 294*

- Hirsutism is male pattern hair growth in females. For example: Moustache, beard, chest hair.
- **Finasteride** is a 5 α -reductase inhibitor. By inhibiting 5 α -reductase it prevents conversion of testosterone to DHT by the type II isoenzyme, resulting in a decrease in serum DHT levels by about 65–70% and in prostate DHT levels by up to 85–90%.
- Decreasing the amount of DHT leads to increased hair regrowth and slower hair loss. Hair growth on other parts of the body is not affected by finasteride.
- **USES:** This medication is used to treat male pattern baldness (androgenetic alopecia) at the crown and in the middle of the scalp. Can also be used in treatment of BPH.
- **Flutamide:** Androgen receptor antagonist. Studies have shown that it is helpful in treatment of hirsutism. Can also be used in treatment of BPH.
- **Spirolactone:** Antialdosterone antiandrogenic compound, used in the treatment of hirsutism.
- **Cyproterone acetate:** A progestin that also has strong antiandrogenic action.

Drugs causing Hirsutism**Mn: MAD COP**

- Minoxidil
- Androgen
- Dioxide
- Cyclosporine
- OCP's
- Phenytoin

309. Ans. (c) Finasteride*Ref: Katzung 14th ed. pg. 1085*

- Most of the actions of testosterone are mediated by its conversion to DHT by 5- α reductase. Important amongst these are growth of prostate, male pattern baldness and hirsutism in females.
- **Finasteride and dutasteride** are 5- α reductase inhibitors useful in the treatment of BPH, male pattern baldness and hirsutism by reducing the production of DHT.

Note: Flutamide and Nilutamide act as antagonists of androgen receptors. These are useful for the treatment of prostatic carcinoma. Flutamide can cause gynaecomastia and reversible liver damage.

310. Ans. (b) Phosphodiesterase 5 inhibition*Ref: KD Tripathi, 6th ed. pg. 294-295*

- Sildenafil, Tadalafil and vardenafil are selective PDE-5 inhibitors effective in erectile dysfunction.
- **5 α -REDUCTASE INHIBITOR**
 - **Finasteride** is competitive inhibitor of the enzyme 5 α -reductase which converts testosterone into more active dihydrotestosterone responsible for androgen action in many tissues including prostate gland and hair follicles.
 - Used in treatment of BPH
- **Flutamide:** A nonsteroidal drug having specific antiandrogenic, but no other hormonal activity.
 - Used in prostate CA

Extra Mile**Tadalafil is the longest acting phosphodiesterase inhibitor.****311. Ans. (b) Inhibiting phosphodiesterase type 5****312. Ans. (c) Increased eye lashes hair growth***Ref: KDT, 6th ed. pg. 147*

- Latanoprost is a prostaglandin analogue. It is stable long acting PGF₂ α derivative which is used for glaucoma.
- **MOA:** It works by increasing aqueous humor outflow.
- Other drugs act by similar mechanism: **travoprost, bimatoprost**
- **Side effect:**
 - Latanoprost may increase the brown pigmentation in iris (**NOT corneal pigmentation**), changing eye color to brown: Heterochromia iridis
 - It may also cause eyelashes to grow longer and thicker and darken in color
 - **Other side effects:** Stinging, burning, itching, swelling of the eye, redness of the eyelids, dry eyes.

**313. Ans. (a) Timolol***Ref: KDT, 6th ed. pg. 144***LATANOPROST**

MOA: Increase of aqueous humor outflow

Side effects: Red eye and ocular irritation, increased iris pigmentation, and excessive hair growth of eye lashes.

- **Timolol** is a prototype of ocular β blockers. It is a non selective beta blocker (blocks $\beta_1 + \beta_2$) and has no anesthetic or intrinsic sympathomimetic activity.
- Timolol's ocular hypotensive action (20–35% fall in IOT) is smooth and well sustained.
- Lungs have β_2 receptor, and if they are blocked in case of asthmatic patient, the condition worsens. Therefore non selective beta blockers are always avoided in case of asthmatic patients.
- **Betaxolol** is a β_1 selective blocker, offering the advantage of less bronchopulmonary and probably less cardiac, central and metabolic side effects.
- Betaxolol is less effective in lowering IOT than timolol, because ocular beta receptors are predominantly of β_2 subtype.
- **Acetazolamide** is a carbonic anhydrase inhibitor which reduces the aqueous formation by limiting generation of bicarbonate ion in ciliary epithelium.
- **Latanoprost** is a prostaglandin analogue. It is a $\text{PGF}_{2\alpha}$ analogue which act by increasing uveoscleral outflow.

314. Ans. (d) PG F_{2α}*Ref: KD Tripathi, 6th ed. pg. 146–47*

- Low concentration of $\text{PGF}_{2\alpha}$ lowers intraocular tension without inducing ocular inflammation.
- It acts by increasing uveoscleral outflow.
- Latanoprost is a $\text{PGF}_{2\alpha}$ derivative. It has shown efficacy similar to timolol and the effect is well sustained over long-term. Therefore it has become the first choice drugs of glaucoma in developed countries.

Extra Mile

- PGE_2 , PGI_2 , TXA_2 has no role in glaucoma treatment.
- PGE_2 cause vasodilatation in most, but not all, vascular beds.
- PGI_2 is uniformly vasodilatory and is more potent hypotensive than PGE_2
- TXA_2 consistently produces vasoconstriction.

315. Ans. (c) Both mast cell stabilizer and antihistamine*Ref: Clinical Ocular Pharmacology, 1st ed. pg. 257*

- **Olopatadine hydrochloride** is an antihistamine (as well as anticholinergic and mast cell stabilizer)
- It is used as eye drop to treat itching associated with allergic conjunctivitis.

- Side effects include headache, eye burning and/or stinging, blurred vision, dry eyes, foreign body sensation, hyperemia, keratitis and taste perversion.

316. Ans. (d) Ciclesonide*Ref: KDT, 6th ed. pg. 226*

- **Hard steroids may include:** Difluprednate ophthalmic emulsion, Budesonide, prednisolone, betamethasone and dexamethasone.
- **Soft steroids may include (Mn: CFL):** Ciclesonide, Fluorometholone, Loteprednol etabonate
- **Ciclesonide:** Is an inhaled corticosteroid indicated for the maintenance treatment of asthma and as prophylactic therapy in adult and adolescent patients aged 12 years and older
- The soft steroids fluorometholone and loteprednol 0.5% are ideal for treatment of an acute inflammatory episode in dry eye.

317. Ans. (a) Anti-gout and Xanthine Oxidase inhibitor*Ref: Katzung's Pharmacology, 14th ed. pg. 662–63*

- Febuxostat is a non-purine inhibitor of xanthine oxidase and thereby reduces the formation of xanthine and uric acid and is useful in management of gout.
- It is 80% absorbed following oral administration and extensively metabolized in the liver.
- All of the drug and its metabolites appear in the urine although less than 5% appears as unchanged drug. Because it is highly metabolized to inactive metabolites, no dosage adjustment is necessary for patients with renal impairment.

318. Ans. (b) Indomethacin*Ref: Katzung, 14th ed. pg. 648*

- Primary gout is seen due to decreased uric acid excretion
- Secondary gout can be secondary to any cause causing hyperuricemia.
- **DOC for acute gout:** NSAID-DOC (Indomethacin), Colchicine and corticosteroids
 - **Colchicine** is fastest acting. It is NOT an anti-inflammatory drug but it specifically suppresses gout inflammation.
 - Not preferred over NSAID because of its side effects of GI upset.
- All NSAIDs can be given in acute gout EXCEPT aspirin as it competes with tubular excretion of uric acid leading to Hyperuricemia.
- **Probenecid:** Has uricosuric action
- **DOC for chronic gout:** Allopurinol

**RENAL, GIT AND RESPIRATORY SYSTEM****319. Ans. (a) Lactulose***Ref: Goodman & Gillman 13th ed. P 928, 940***USES OF LACTULOSE**

- Constipation caused by opioids
- Idiopathic chronic constipation
- Lactulose also used to treat hepatic encephalopathy

LACTULOSE IN HEPATIC ENCEPHALOPATHY

- Impaired liver function/severe liver disease are unable to detoxify the ammonia coming from colon which is produced by colonic bacterial metabolism of fecal urea.
- The drop in luminal pH that accompanies hydrolysis to short-chain fatty acids in the colon results in “trapping” of the ammonia by its conversion to the polar ammonium ion.
- Combined with the increase in colonic transit, this therapy significantly lowers circulating ammonia levels. The therapeutic goal in this condition is to give sufficient amounts of lactulose (usually 20–30 g three to four times per day) to produce two to three soft stools a day with a pH of 5–5.5.

320. Ans. (d) DEC*Ref: Harrison's 19th ed. P 422, 1687*

- Eosinophilia is the presence of >500 eosinophils per μL of blood and is common in many settings besides parasite infection.
- **Common causes of eosinophilia are:**
 - Allergic reaction to drugs (Iodides, aspirin, sulfonamides, nitrofurantoin, penicillins, and cephalosporins).
 - Allergies such as hay fever, asthma, eczema, serum sickness, allergic vasculitis, and pemphigus are associated with eosinophilia.
 - Collagen vascular disease like rheumatoid arthritis.
- Tropical eosinophilia is usually caused by filarial infection.
- Tropical eosinophilia due to *Wuchereria bancrofti* or *Brugia malayi* occurs most commonly in Southern Asia, Africa, and South America.
- **Drug of choice:** Diethylcarbamazine.

321. Ans. (c) Thiazides*Ref: Goodman & Gillman's 13th ed. P 466*

- Nephrogenic DI may be congenital or acquired. Causes can be:
 - Hypercalcemia, hypokalemia, postobstructive renal failure, Li^+ , foscarnet, clozapine, demeclocycline, and other drugs can induce nephrogenic DI.

- Thiazide *diuretics* reduce the polyuria of patients with DI and often are used to treat nephrogenic DI.
- **DOC for central diabetes insipidus:** Desmopressin (V_2 receptor agonist)
- **DOC for nephrogenic diabetes insipidus:** Thiazide diuretics.
- **DOC for lithium induced diabetes insipidus:** Amiloride

322. Ans. (b) Carbonic anhydrase inhibitor*Ref: Katzung's, 11th ed. pg. 416*

- **Acetazolamide** is a carbonic anhydrase inhibitor which acts on the proximal tubule of nephron.
- **In kidney**, it inhibits H^+ secretion and HCO_3^- reabsorption, which in turn reduces sodium reabsorption.
- In eye, it reduces the aqueous formation by limiting generation of bicarbonate ion in ciliary epithelium.

323. Ans. (b) Decrease placental circulation*Ref: <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2628835>*

- Diuretics causes massive fluid loss via urine, which causes decreased volume and thereby decreases placental circulation. This might compromise fetal blood supply.
- Option A: Diuretics do not increase vascular resistance, instead it decreases the resistance.
- Option C: No maternal distress. However fetal stress is a possibility
- Option D: There have been few reported cases of birth defects associated with diuretic use.

324. Ans. (a) Antacid*Ref: Katzung's, 14th ed. pg. 1089*

- This medication is used to treat symptoms caused by too much stomach acid such as heartburn, upset stomach, or indigestion.
- It is an antacid that works by lowering the amount of acid in the stomach.
- It can also be used in renal osteodystrophy with hyperphosphatemia, hypocalcemia and osteoporosis like conditions.
- It can cause metabolic alkalosis (Milk-alkali syndrome)

325. Ans. (d) All of the above*Ref: Katzung, 14th ed. pg. 775–776*

- Vitamin D has been used in treating renal osteodystrophy
- In mild forms of malabsorption, vitamin D should suffice to raise serum levels of $25(\text{OH})\text{D}$ into the normal range. Many patients with severe disease do not respond to vitamin D.
- Calcitriol and **Calcidiol** have been used successfully in treatment of renal osteodystrophy and intestinal osteodystrophy.

326. Ans. (c) **Indapamide**Ref: KDT, 6th ed. pg. 540

309

Indapamide is a thiazide diuretic

Diuretic class	Drugs	MOA	Site of action
Osmotic diuretic	Mannitol	Inhibit water and solute reabsorption	All part of tubule, but mainly proximal tubule
Loop diuretics	Furosemide Torsemide	Inhibit Na ⁺ -K ⁺ -2Cl ⁻ co-transport	Thick ascending loop of henle
Thiazide diuretic	Hydrochlorthiazide Benzthiazide Chlorthalidone Indapamide	Inhibit Na ⁺ - Cl ⁻ co-transport	Distal tubule
K ⁺ sparing diuretic	Spironolactone Triamterene Amiloride	Decrease Na ⁺ reabsorption Decrease K ⁺ secretion	Collecting tubule
Carbonic anhydrase inhibitor	Acetazolamide	Inhibit H ⁺ secretion and HCO ₃ reabsorption, which reduces Na ⁺ reabsorption	Proximal tubule

327. Ans. (a) **Thiazide diuretics**Ref: KDT, 6th ed. pg. 540

- **Drugs under thiazide diuretics:** Hydrochlorthiazide, chlorthalidone, bendroflumethiazide, indapamide and metazolone.
- **Thiazide diuretics act on DCT by blocking Na⁺ Cl channel**
- In cases of initial management of CKD (stage 1 & 2), thiazide diuretics is preferred and is considered as drug of choice, preferably Metazolone (*has anti-hypertensive action*).
- Patients with stages 1 and 2 are comparatively higher than the advanced stages.
- However, thiazide diuretics are NOT given if serum creatinine is more than 2.5 or GFR is less than 60 ml/min.
- Thiazide diuretics have limited utility in stages 3–5 CKD, such that administration of loop diuretics, including furosemide, bumetanide, or torsemide, may also be needed. (*Harrison's 18th ed. Ch 280*)
- The combination of loop diuretics with metolazone, which inhibits the sodium chloride co-transporter of the distal convoluted tubule, can help effect renal salt excretion. Ongoing diuretic resistance with intractable edema and hypertension in advanced CKD may serve as an indication to initiate dialysis.

Indapamide is longer acting and more potent than hydrochlorthiazide. It is effective as an antihypertensive at lower doses than those required for the diuretic effect (due to its direct vasodilatory action). It also produces less

metabolic adverse effects (hypokalemia, hyperglycemia, hyperuricemia etc.) and can be used as an antihypertensive in diabetic patients (whereas other thiazides are contra-indicated).

328. Ans. (a) **Bilateral renal artery stenosis**Ref: Katzung's Pharmacology, 14th ed. pg. 188

- Patients with B/L renal artery stenosis or patients with single kidney having renal artery stenosis will develop renal failure if treated with ACEI.
- In stenosis there is reduced GFR, and body manage the adequate GFR by angiotensin II mediated efferent arteriole constriction to maintain the renal perfusion. In such patients, Inhibition of ACE can induce acute renal insufficiency.

329. Ans. (c) **Proton pump inhibitors like Omeprazole**Ref: KDT, 6th ed. pg. 632

- Proton pump inhibitors (PPIs) are the drugs of choice for peptic ulcer disease (PUD) due to any etiology (even NSAID induced).
- PPIs are also the agents of choice for gastroesophageal reflux disease (GERD) and Zollinger Ellison Syndrome (ZES).
- **Misoprosotol:** Specific agent for NSAID induced ulcer.

330. Ans. (c) **Hyoscine**Ref: KD Tripathi, 6th ed. pg. 641, 642, 644, 646

**HYOSINE**

- It is the most effective drug for motion sickness.
- Suitable only for short brisk journeys.
- It act by blocking conduction of nerve impulses in the pathway leading from the vestibular apparatus to the vomiting centre and is *not effective in vomiting of other etiologies*.

ONDANSETRON

- It is considered as the drug of choice for drug induced vomiting.
- Used mainly to control cancer chemotherapy induced vomiting.
- Effective in postoperative nausea and vomiting as well.

METOCLOPRAMIDE

- It is an effective and popular drug for many types of vomiting like: Postoperative, drug induced, disease associated (especially migraine), radiation sickness, etc.

CHLORPROMAZINE

- These are from typical antipsychotic having potent antiemetic action; act by blocking D2 receptors in the CTZ.
- They have broad spectrum antiemetic action effective in:
 - Drug induced and postanaesthetic nausea and vomiting
 - Disease induced vomiting
 - Malignancy associated and cancer chemotherapy induced vomiting
 - Radiation sickness vomiting and morning sickness.

331. Ans. (b) **Hyoscine**Ref: KDT, 6th ed. pg. 646-47332. Ans. (a) **Anti-motility drugs are drug of choice for infective diarrhea**Ref: KDT, 6th ed. pg. 664

- All Anti-motility drugs are contra-indicated in infective diarrhea. These are indicated only in non-infective secretory diarrhea.

Extra Mile

- Loperamide is a non-addictive over the counter anti-diarrheal drug.
- **Diphenoxylate** is an opioid but has addictive potential if used for prolonged periods. It is always given in combination **with atropine to prevent the abuse** (atropine will produce dry mouth and other anticholinergic side effects).
- Opioids are used as anti-motility drugs used in secretory diarrhea.

333. Ans. (c) **Ambroxol**Ref: KDT 6th ed. pg. 214

- Ambroxol is a metabolite of bromhexine having mucolytic action.
- Antitussives are drugs that act in the CNS to raise the threshold of cough centre.
- Since antitussives aim to control rather than eliminate cough they are used only for dry unproductive cough or if cough is unduly tiring, disturbs sleep or is hazardous.

Mucolytics	Antitussives
Bromhexine	Opioids
Ambroxol	Codeine
Acetylcysteine	Pholcodeine
Carbocisteine	Nonopioids
	Noscapine
	Dextromethorphan
	Chlophedianol

334. Ans. (c) **Salmeterol**Ref: KDT 6th ed. pg. 218

- β_2 agonist is the drug of choice for acute attack of bronchial asthma.
- Other β_2 Agonists

SABA (Short acting β_2 agonist)	Salbutamol terbutaline	Used for acute attack of BA
LABA (Long acting β_2 agonist)	Salmeterol -slow onset of action, long duration of action Formeterol -fast onset of action, long duration of action Indacaterol -fast OOA and long DOA	Used for prophylaxis of BA

- **DOC** for acute attack of asthma: SALBUTAMOL
- **Salmeterol** is the first long acting selective β_2 agonist with slow onset of action. It is used as maintenance therapy and for nocturnal therapy BUT not for acute symptoms.
- **Formeterol** is fast acting and can be used in acute attack and for prophylaxis as well.
- **Theophylline** is a phosphodiesterase inhibitor. In acute attack sustained release oral form can be given.

335. Ans. (a) **Slow acting β_2 agonist**Ref: KD Tripathi, 6th ed. pg. 227

TABLE: Treatment of choice

Severe asthma	Status asthmaticus/ refractory asthma
<ul style="list-style-type: none"> Continuous symptoms; activity limitation; frequent exacerbations/hospitalization Regular high dose inhaled steroid + inhaled long-acting β_2 agonist (salmeterol) twice daily Rescue treatment with short acting inhaled β_2 agonist 	<ul style="list-style-type: none"> Any patient of asthma has the potential to develop acute severe asthma which may be lifethreatning. Hydrocortisone hemisuccinate 100 mg Nebulized salbutamol + ipratropium bromide High flow humidified oxygen inhalation Salbutamol/terbutaline in order to reach smaller bronchi

336. Ans. (b) Oropharyngeal candidiasis

- Most of the side effects of steroids are mainly hoarseness, oropharyngeal candidiasis, decreased growth in children with adrenal suppression.
- The plausible explanation is that since these drugs are inhaled, they avoid the first pass metabolism that orally administered steroids undergo and hence have preponderance to cause the usual manifestations of steroid toxicity.

337. Ans. (a) Ipratropium bromide

Ref: Katzung Pharmacology, 10th ed. Ch 10

- Ipratropium bromide is an anti-cholinergic agent/Muscarinic antagonists which competitively inhibit the effect of acetylcholine at muscarinic receptors.
- Ipratropium** appears to be at least as effective in patients with COPD that includes a partially reversible component. A longer-acting, selective anti-muscarinic agent, **tiotropium**, is DOC for COPD.
- Salbutamol and terbutaline** are β_2 agonist, used in acute cases of asthma.
- Salmeterol is slow acting** β_2 agonist, used for prophylaxis of asthma.

338. Ans. (a) Anti-tussive

Ref: KDT, 6th ed. pg. 215

- Forceful expulsion of air from lungs due to pulmonary irritation is called coughing. It can be productive or non-productive.
- Anti-tussive** is a class of drug which *relieves coughing by suppressing cough center*. These drugs are mainly used for dry cough. Examples of anti-tussives are:
 - Opioids:** Codeine, Phalcodeine, Ethylmorphine
 - Non-Opioids:** NOSCAPINE, Dextromethorphan

- Expectorants** are class of drugs that increase bronchial secretion or reduce its viscosity (mucolytics). They are mainly used in productive cough. Examples of expectorants are:

- Mucolytics:** Bromhexine, Ambroxol
- Bronchial secretion enhancers:** Guaiphenisine, sodium or potassium citrate.

339. Ans. (a) Cough center

Please refer to above explanation.

340. Ans. (b) Inhibits 5-lipoxygenase

- Leukotrienes are biochemical mediators that contribute to asthma symptoms
 - Contracting airway smooth muscle
 - Increasing vascular permeability and mucus secretion
 - Attracting and activating airway inflammatory cells
- Zileuton is a 5-lipoxygenase inhibitor that decreases leukotriene production**, and zafirlukast and montelukast are cysteinyl leukotriene receptor antagonists.
- They are useful to prevent asthma attacks and cause modest improvements in lung function. They lessen the need for β_2 -agonist rescue therapy.

HEMATOLOGY AND VITAMINS

341. Ans. (c) Warfarin

Ref: Goodman & Gillman 13th ed. P 593-94

- Warfarin (one of coumarin derivative) is an oral antagonist acts by antagonizing vitamin K dependent factors.
- Vitamin K dependent clotting factor: II, VII, IX, X
- Vitamin K dependent anticlotting factors: Protein C and Protein S
- Warfarin is administered as a racemic mixture of S- and R-warfarin.
- S-Warfarin is 3- to 5-fold more potent than R-warfarin and is mainly metabolized by CYP2C9.
- Because of the long $t_{1/2}$ of coagulation factors, the anti-thrombotic action of warfarin is achieved in 4-5 days

SIDE EFFECTS

- Bleeding: Most common side effect (risk high if INR >4)
- Birth defect and abortion if administered during pregnancy (fetal warfarin syndrome)
- Skin necrosis/Coumarin necrosis:** Can occur 3-10 days after initiation of warfarin. Usually due to protein C and S deficiency
- Purple toe syndrome-blue tinged discoloration of plantar surface and side of toes, that blanches with pressure. Can occur 3-8 weeks after initiation of therapy.

342. Ans. (a) Apixaban

Ref: Goodman & Gillman 13th ed. P 595

- Factor Xa inhibition results in reduced thrombin generation → suppression of platelet generation and fibrin formation.
- Factor Xa inhibitor drugs are: Rivaroxaban, Apixaban, Edoxaban
- Dose of apixaban: 5 mg BD
- Use:**
 - Stroke prevention in patients with atrial fibrillation
 - Deep vein thrombosis, Pulmonary embolism
 - Postoperative thromboprophylaxis in patients undergoing hip/knee surgery
- Contraindicated for stroke prevention in patients with mechanical heart valve
- Side effects:**
 - Bleeding-** MC side effect. Incidence 50% lesser than warfarin induced bleeding except GI bleed.
 - (GI bleed: Apixaban, Rivaroxaban > Warfarin)
- Antidote:** Andexanet Alfa, Ciraparantag

343. Ans. (b) Filgrastim

Ref: Goodman & Gillman 13th ed. P 756

- Filgrastim is G-CSF (Granulocyte Colony Stimulating Factor)
- The principal action of filgrastim is the stimulation of CFU-G to increase neutrophil production
- Forms of G-CSF are now available, including two longer-acting pegylated forms, pegfilgrastim and lipegfilgrastim.
- Use:**
 - Severe neutropenia after autologous hematopoietic stem cell transplantation
 - Neutropenia after high dose cancer chemotherapy
 - Congenital neutropenia
 - Neutropenia of any other cause
- Dose:** 1–20 µg/kg/day via IV or subcutaneous route
- Side effect:** Mild-to-moderate bone pain

344. Ans. (b) Deferoxamine

Ref: Goodman & Gillman's 13th ed. P 63, 1314

- Iron chelating agent is: Deferoxamine

TABLE: Antidotes of different poisoning

Poisoning indication(s)	Antidote
Acetaminophen	Acetylcysteine
Organophosphorus and carbamate pesticides	Atropine sulfate
Drug-induced dystonia	Benzotropine
Na ⁺ channel blocking drugs	Bicarbonate, sodium

Contd...

Poisoning indication(s)	Antidote
Neuroleptic malignant syndrome	Dantrolene
Ca ²⁺ channel blocking drugs, fluoride	Calcium gluconate or chloride
Valproate hyperammonemia	Carnitine
North American crotaline snake envenomation	Crotalidae polyvalent immune Fab
Malignant hyperthermia	Dantrolene
Iron	Deferoxamine
Cardiac glycosides	Digoxin immune Fab
Drug-induced dystonia	Diphenhydramine
Lead, mercury, arsenic	Dimercaprol (BAL)
Lead	EDTA, CaNa ₂
Methanol, ethylene glycol	Ethanol
Methanol, ethylene glycol	Fomepizole
Benzodiazepines	Flumazenil
β adrenergic antagonists	Glucagon hydrochloride
Cyanide	Hydroxocobalamin hydrochloride
Hyperkalemia	Insulin (High dose)
Methotrexate	Leucovorin calcium
Methemoglobinemia	Methylene blue
Opioids	Naloxone hydrochloride
Sulfonylurea-induced hypoglycemia	Octreotide acetate
Carbon monoxide	Oxygen, hyperbaric
Lead, mercury, copper	Penicillamine
Anticholinergic syndrome	Physostigmine salicylate
Organophosphorus pesticides	Pralidoxime chloride (2-PAM)
Isoniazid seizures	Pyridoxine hydrochloride
Lead, mercury, arsenic	Succimer (DMSA)
Cyanide	Thisosulfate, sodium
Coumarin, indanedione	Vitamin K ₁ (Phytonadione)

345. Ans. (b) Vitamin K antagonist

Ref: KD Tripathi, 7th ed. pg. 620, 621

- Warfarin and its congeners act as anticoagulants only in vivo (body), NOT in vitro (lab).
- It acts by inhibiting Vitamin K. Due to overdose, hematuria is the *first manifestation* noted.
- Dose monitoring is done by INR
- Antidote of warfarin overdose: Vitamin K

346. Ans. (c) **Heparin toxicity**Ref: KD Tripathi, 7th ed. P 618-620

PT (Prothrombin Time)	aPTT (Activated Partial Thromboplastin Time)
<ul style="list-style-type: none"> Assess activity of extrinsic coagulation pathway. Used when on warfarin treatment. WePT: Warfarin for extrinsic; PT value assessed. 	<ul style="list-style-type: none"> Assess activity of intrinsic coagulation pathway. Used while on heparin treatment. HINT: Heparin for Intrinsic; aPTT value assessed.

347. Ans. (c) **Factor II**Ref: KD Tripathi, 7th ed. pg. 620

- Direct thrombin inhibitors are a class of medication that act as anticoagulants (delaying blood clotting) by **directly inhibiting the enzyme thrombin (factor II)**.
- Argatroban** is a synthetic non-peptide compound which **binds reversibly to the catalytic site of thrombin**, but not to the substrate recognition site.
- Administered by IV infusion, it can be used in place of lepirudin for short-term indications in patients with heparin-induced thrombocytopenia.
- Other direct thrombin inhibitors are:**
 - PARENTERAL ROUTE: **Lepirudin, Bivalirudin, Desirudin**
 - Oral route: **Dabigatran**
- Note:** Heparin is indirect thrombin inhibitor which acts by antithrombin 3 mediated inhibition of factor IIa and Xa.

348. Ans. (d) **Heparin**Ref: KD Tripathi, 6th ed. pg. 597

- Heparin is a powerful and instantaneously acting anticoagulant, effective both in vivo and in vitro.
- It acts indirectly by *activating* plasma antithrombin III
- The heparin –AT III complex then binds to clotting factors of the intrinsic and common pathways (Xa, IIa, IXa, XIa, XIIa and XIIIa) and inactivates them.
- Heparin is the anticoagulant of choice in pregnancy**
- Warfarin on the other hand is effective only in vivo (body). It acts by inhibiting vitamin K.

Extra Mile

Heparin is monitored by aPTT**Low molecular heparin inhibits** factor X_a only. It does not require monitoring because of consistent bioavailability.**Antidote for heparin overdose:** Protamine Sulfate.**Warfarin monitoring is done by:** INR**Antidote of warfarin overdose:** Vitamin K.**TOC for warfarin induced** bleeding: FFP349. Ans. (c) **Lepirudin**Ref: Katzung's, 11th ed. pg. 593-594

- Heparin is a powerful and instantaneously acting anticoagulant, effective both in vivo and in vitro.
- It acts indirectly by *activating* plasma antithrombin III
- The heparin –AT III complex then binds to clotting factors of the intrinsic and common pathways (Xa, IIa, IXa, XIa, XIIa and XIIIa) and inactivates them.
- HIT syndrome** is a condition which arises as a potential side effect of heparin use where heparin binds with platelet factor 4 and causes thrombocytopenia (*usually seen 3–4 days after heparin use*).
- To treat this condition, direct thrombin inhibitors are used. Drugs under direct thrombin inhibitors are: Lepirudin, bivalirudin, hirudin, dabigatran, argatroban, melagatran.**

Extra Mile

- Enoxaparin: It is low molecular weight heparin
- Warfarin is oral anticoagulant, which act by inhibiting vitamin K dependent clotting factors (Factor II, VII, IX, X).

350. Ans. (c) **Used as first line treatment in bleeding conditions**Ref: KDT, 6th ed. pg. 594, 595**VITAMIN K**

- It is a fat-soluble dietary principle required for the synthesis of clotting factors.
- Action:** Vit. K acts as a cofactor at a late stage in the synthesis of coagulation proteins prothrombin, factors VII, IX and X.
- Utilization:** Fat-soluble forms absorbed from the intestine via lymph; while water-soluble forms are absorbed directly into portal blood.
- Vitamin K has 3 forms:**
 - K1- fat soluble: Phytonadione
 - K2- fat soluble: Menaquinone, Acetomenaphthone
 - K3- water soluble: *Menadione sod. Bisulfate and Diphosphate*
- Use:** vit K is used in prophylaxis (NOT as first line treatment) and treatment of bleeding due to deficiency of clotting factors in the following situations:
 - *Dietary deficiency*
 - *Prolonged antimicrobial therapy*
 - *Obstructive jaundice or malabsorption syndrome*
 - *Liver disease (cirrhosis, viral hepatitis)*
 - *Newborns*
 - *Overdose of oral anticoagulants*
- In case of bleeding disorders, stop the anticoagulant immediately and fresh frozen plasma is recommended.

351. Ans. (d) **Tranexamic acid**Ref: KDT, 6th ed. pg. 608

- Antiplatelet drugs interfere with platelet function and are useful in prophylaxis of thromboembolic disorders.
- Platelets express several glycoprotein (GP) receptors on their surface like GP IIa/IIIb.
- These receptors are not exposed normally, but once exposed due to some injury they make the platelets sticky.
- Upon injury thromboxane A₂ (TXA₂) and ADP produced, which expose the sticky receptors (GP IIa/IIIb) that crosslinks the platelets, inducing aggregation.
- Prostacyclin (PGI₂) synthesized in the intima of blood vessel is an inhibitor of TXA₂. Normally, a balance between PGI₂ and TXA₂ is required to control thrombus formation.

TABLE: Antiplatelet drugs and their target of inhibition

Antiplatelet drugs	Target of inhibition
Aspirin	Inhibit TXA ₂
Clopidogrel and Ticlopidine	Inhibit ADP irreversibly by binding with P2Y ₁₂ receptor
Cangrelor, Ticagrelor	Inhibit ADP reversibly
Abciximab Tirofiban Eptifibatide	Inhibit GP IIb/IIIa

Extra Mile

Fibrin is associated with clotting. Agents which lyse this fibrin is known as Fibrinolytics.

Overdose of fibrinolytic agents causes results in excessive intravascular fibrinolysis resulting in bleeding.

Tranexamic acid is a specific antidote for fibrinolytic agents.

Antifibrinolytic drugs are:

- Epsilon Amino Caproic acid (EACA)
- Tranexamic acid

352. Ans. (d) **Thromboxane**Ref: KDT, 6th ed. pg. 609; Katzung, 9th ed. pg. 446

Thromboxane helps in platelet aggregation.

- TXA₂ formation is suppressed at very low doses of **aspirin**.
- Aspirin blocks thromboxane formation by inhibiting COX activity by enzyme COX1 and TX- synthase irreversibly.

353. Ans. (b) **Inhibit TXA₂ formation**Ref: KDT, 6th ed. pg. 609; Katzung 9th ed. pg. 446

Please refer to above explanation

354. Ans. (a) **Inhibit antithrombin 3**Ref: KD Tripathi, 6th ed. pg. 597

- Heparin is a powerful and instantaneously acting anticoagulant, effective both in vivo and in vitro.
- It acts indirectly by *activating* plasma antithrombin III. Antithrombin mediated inhibition of factor IIa and Xa mainly.
 - The heparin –AT III complex then binds to clotting factors of the intrinsic and common pathways (Xa, IIa, IXa, XIa, XIIa and XIIIa) and inactivates them.
- Warfarin on the other hand effective only in vivo (body). it act by inhibiting vitamin K.

Extra Mile

Heparin is monitored by aPTT (remembered as **HINT: Heparin-Intrinsic**)

Low molecular heparin inhibits factor X_a only. It doesn't require monitoring because of consistent bioavailability.

Antidote for heparin overdose: **Protamine Sulfate**.

Warfarin monitoring is done by: **INR**

Antidote of warfarin overdose: **Vitamin K**.

355. Ans. (b) **Acts both in vivo and in vitro**

- Oral anticoagulant is warfarin. It is used only in vivo (body), not in vitro (lab).
- Warfarin is not used to store blood.
- It acts by inhibiting Vitamin K. Due to overdose, hematuria is the first manifestation noted.
- Dose monitoring is done by INR.
- Antidote of warfarin overdose: Vitamin K

PT (Prothrombin Time)	aPTT (activated Partial Thromboplastin Time)
Assess activity of Extrinsic coagulation pathway Used when on warfarin treatment WePT: Warfarin for extrinsic; PT value assessed.	Assess activity of Extrinsic coagulation pathway. Used while on heparin treatment. HINT: Heparin for Intrinsic; aPTT value assessed.

356. Ans. (a) **Ciprofloxacin**Ref: KDT, 6th ed. pg. 64

- G6PD is an enzyme present on RBC membrane provides strength to RBC which can counteract free radicals and oxidizing stress of drugs.
- In absence of G6PD enzyme, these cells can't bear the stress and results in Hemolysis.
- **Drugs causing Hemolysis in G6PD deficiency patients are:**
 - Anti malarials (Primaquine, chloroquine)
 - Antibiotic (Nitrofurantoin)

- Anti emetic (Furazolidone)
- Sulfonamide (dapsone)
- Fava beans
- **Ciprofloxacin** is one of the quinolones, effective against G+ and G- including pseudomonas.
- It is contraindicated in pregnancy and children below 18 years of age because it effects growing bone and tendons.
- Ciprofloxacin is considered as oral DOC for enteric fever.
- DOC for enteric fever: Ceftriaxone

357. Ans. (c) Chloroquine

Ref: KDT 6th ed. pg. 64

Please refer to above explanation

358. Ans. (b) Enoxaparin

- Enoxaparin is a low molecular weight heparin.
- It acts by inhibiting factor Xa.
- LMWH usually doesn't need monitoring because of consistent bioavailability.
- **Drugs under LMWH:**
 - Enoxaparin
 - Dalteparin
 - Tinzaparin
 - Rabiparin

Extra Mile

Hirudin along with Lepirudin and Bivalirudin is an anticoagulant which is act by direct thrombin (factor IIa) inhibition.
Tranexamic acid is an anti-fibrinolytic agent.

359. Ans. (c) Factor Xa

Ref: KD Tripathi, 6th Ed. pg. 597-598

- Low molecular heparin inhibits factor Xa mainly, having some action at factor IIa as well. It doesn't require monitoring because of consistent bioavailability.
- Heparin is a powerful and instantaneously acting anticoagulant, effective both in vivo and in vitro.
- It acts indirectly by *activating* plasma antithrombin III
- The heparin -AT III complex then binds to clotting factors of the intrinsic and common pathways (Xa, IIa, IXa, XIa, XIIa and XIIIa) and inactivates them.
- Warfarin on the other hand is effective only in vivo (body). It acts by inhibiting vitamin K.

Note

- Fondaparinaux is synthetic LMWH acts exclusively at factor Xa.

360. Ans. (b) It acts by inhibiting both factor IIa and factor Xa

Ref: KDT, 6th ed. pg. 599-600

- Low molecular weight heparin, Enoxaparin, inhibits only factor Xa whereas unfractionated heparin inhibits both factor IIa and factor Xa.

361. Ans. (a) Isotretinoin

Ref: Katzung, 11th ed. pg. 1308, 1455; KDT, pg. 854

- **13-cis-Retinoic acid (Isotretinoin)** is an analogue of **vitamin A**. It is used for the treatment of severe cystic acne
- Isotretinoin (Accutane) is a synthetic retinoid currently restricted to the treatment of severe cystic acne that is refractory to standard therapies.
- It appears to act by inhibiting sebaceous gland size and function.
- Half life- 10-20 hours.
- **Common side effect:** Hypervitaminosis A, dryness of skin and mucous membrane.
- **Teratogenic effect:** Extremely high risk of CNS, face, ear, and other malformations. Risk is equal throughout all the three trimester.

Extra Mile

- **Al-trans vitamin A (Tretinoin):** Effective topical agent in the treatment of acne vulgaris. It is a potent comedolytic and stimulate epidermal cell turnover, resulting in peeling.
- **Benzoyl peroxide** is an effective topical agent in the treatment of acne vulgaris
- MOA of benzoyl peroxide- its antimicrobial activity against *P acnes* and to its peeling and comedolytic effects.
- **Azelaic acid** effective in the treatment of acne vulgaris.
- MOA of azelaic acid-antimicrobial activity against *P acnes* as well as an in vitro inhibitory effect on the conversion of testosterone to dihydrotestosterone.

362. Ans. (a) I/M

Ref: KDT, 6th ed. pg. 588

VITAMIN B12

- Present in two forms: Cyanocobalamin and hydroxocobalamin.
- Dietary sources: Liver, kidney, sea fish, egg yolk, meat and cheese.
- Only vegetable source: Legumes (pulses)
- Daily requirement: 1-2 µg/day. In cases of pregnancy and lactation: 3-5 µg/day.

Manifestation of Deficiency

- **Megaloblastic anemia-** the first manifestation.
 - Hypersegmented neutrophils and giant platelets.
- **SACD:** subacute combined degeneration of spinal cord; peripheral neuritis, paresthesias.
- **Glossitis, GI disturbance:** Damage to epithelial structures.

**Preparation Dose and Administration**

- Cynocobalamin: 35 µg/5ml liquid; 100, 500, 1000 µg Inj.
- Hydroxycobalamin: 500, 1000 µg Inj.
- Methylcobalamin: 0.5 mg tab.
- In case of severe anemia (like pernicious anemia), Vit B12 should be given by I.M or deep s.c (but not by I.V.) injection.
- Parenteral administration is necessary to bypass the defective absorptive mechanism.
- Hydroxycobalamin has been preferred for parenteral use because of better retention.

363. Ans. (c) **Avidin**Ref: KD Tripathi, 6th ed. pg. 876**BIOTIN**

- Biotin is a sulfur containing organic acid found in egg yolk, liver, nuts and many other articles of food.
- It is well absorbed from intestine and excreted mainly unchanged in urine.
- **Avidin**, a heat labile protein in egg white, binds and prevents the absorption of biotin.

364. Ans. (b) **Niacin**Ref: KDT, 6th ed. pg. 875

- Lipids that are liberated from adipose tissue are used to build very-low-density lipoproteins (VLDL) in the liver, which are precursors of low-density lipoprotein (LDL)
- Because niacin blocks the breakdown of fats, it causes a decrease in free fatty acids in the blood and, as a consequence, decreases the secretion of VLDL and cholesterol by the liver.
- When niacin is added to statins, it reduces carotid intima-media thickness, a marker of atherosclerosis.

365. Ans. (a) **Hallucination**Ref: Katzung, 9th ed. pg. 1604; KDT 6th ed. pg. 376

- Ketamine is the only intravenous anesthetic that possesses analgesic properties and produces cardiovascular stimulation.
- It is pharmacologically related to the hallucinogen Phencyclidine; induces a so called "dissociative anesthesia" characterized by profound analgesia, immobility, amnesia and feeling of dissociation from one's own body and the surrounding.
- It causes:
 - **Hallucination**
 - Delusion and illusion.
 - Profound analgesia

- Ketamine increases all pressures like:
 - BP (hypertension)
 - Intracranial tension (ICT)
 - Intraocular pressure (IOP)
- It is contraindicated in intracerebral mass/hemorrhage.

MUST KNOW ABOUT KETAMINE: (Remembered as)

K	Kids: Can be given to kids
E	Emergence reaction: s/e occurring during recovery
T	Thalamo-cortical junction affected: Dissociative Anesthesia
A	Analgesia strongest
M	Meal: Can be given with full stomach
I	Increase: BP/IOP/ICT
N	NMDA receptor blocker
E	Excellent bronchodilator: Inducing agent of choice in asthma patient.

Extra Mile**PROPOFOL** causes myocardial depression and fall in BP.**MISCELLANEOUS**366. Ans. (c) **Propranolol**

- Propranolol, a nonselective β-blocker can cause intra-uterine growth retardation.

367. Ans. (a) **Chloroquine****Class of Drugs contraindicated in pregnancy and its safer alternative**

Class of drug	Contraindicated	Safer alternative
Antibacterials (systemic bacterial infections)	Cotrimoxazole, Fluoroquinolones (X), Tetracycline (X), Doxycycline (X), Chloramphenicol (X), Gentamicin, Streptomycin (X), Kanamycin (X), Tobramycin (X), Clarithromycin, Azithromycin, Clindamycin, Vancomycin, Nitrofurantoin,	Penicillin G, Ampicillin Amoxicillin-clavulanate, Cloxacillin, Piperacillin, Cephalosporins, Erythromycin
Antitubercular	Pyrazinamide, Streptomycin (X)	Isoniazid, Rifampicin, Ethambutol

Contd...

Class of drug	Contraindicated	Safer alternative
Antimalarial	Artemether, Artesunate Primaquine (X)	Chloroquine, Mefloquine, Proguanil Quinine (only in 1st trimester), Pyrimethamine + Sulfadoxine (only single dose.)
Antihypertensives	ACE inhibitors (X), Angiotensin antagonists (X). Thiazide diuretics Furosemide, Propranolol Nitroprusside	Methyldopa, Hydralazine, Atenolol Metoprolol, Pindolol, Nifedipine Prazosin, Clonidine

368. Ans. (c) Safer for pregnant lady and infants

Ref: Wound Healing and Ulcers of the skin-Diagnosis and Therapy, pg. 154

- Silver sulfadiazine is prepared as a water soluble cream in a concentration of 1%.
- It is composed of silver nitrate and sodium sulfadiazine, both having antibacterial qualities.
- SSD is commonly used in the management of burns and cutaneous ulcers.
- It is effective against wide range of pathogenic bacteria, including staph aureus. E. Coli, proteus, enterococci and pseudomonas strain.

• Contraindications:

- In G6PD patients.
- They can cause kernicterus, hence it is contraindicated in pregnancy or during the first 2 months of life.

369. Ans. (c) Mitotane

Mitotane alters steroid peripheral metabolism, directly suppresses the adrenal cortex and alters cortisone metabolism leading to hypocortisolism.

370. Ans. (c) PENMT

Ref: KDT, 6th ed. pg. 116

- PENMT is Phenylethanolamine N- methyl transferase and is found in the cytosol of only cells of adrenal medullary cells.
- PENMT uses S- adenosylmethionine (SAMe) as a cofactor to donate the methyl group to norepinephrine, creating epinephrine.
- Epinephrine is synthesized in the medulla of the adrenal gland in an enzymatic pathway that converts the amino acid tyrosine into a series of intermediates and, ultimately, adrenaline.
- Tyrosine is first oxidized to L-DOPA, which is subsequently decarboxylated to give dopamine. Oxidation gives norepinephrine.
- The final step is methylation of the primary amine of noradrenaline by phenylethanolamine N-methyltransferase (PNMT) in the cytosol of adrenergic neurons and cells of the adrenal medulla (chromaffin cells).

ANSWERS TO BOARD REVIEW QUESTIONS

469. Ans. (a) **Nimodipine**

Ref: KDT 6/e, p 172

470. Ans. (a) **SSRI**

Ref: KDT 6/e, p 119, 12, 135

471. Ans. (d) **Metoclopramide**

Ref: KDT 6/e, p 642

472. Ans. (c) **Inhibit folate synthesis**

Ref: KDT 6/e, p 683

473. Ans. (a) **Inhibits plasminogen**

Ref: Lippincott's Pharmacology 4/e, p 265

474. Ans. (d) **Hypokalemia**

Ref: KDT 6/e, p 567

475. Ans. (c) **8 weeks**

Ref: Mayo clinic gastroenterology and Hepatology Board review edited by Stephen Hauser 4/e, p 13, Pharmacology by George M. Brenner, Craig Stevens, 4/e, p 297

476. Ans. (c) **Safety**

Ref: KDT 7/e, p 54/55

477. Ans. (c) **Osteoporosis**

Ref: Harrison 18/e/ 3133, 3134

478. Ans. (d) **Glargine**

Ref: KDT 6/e/ 262

479. Ans. (c) **Desmopressin**

Ref: Goodman Gillman 11/e, Chapter 29, Harrison's Internal Medicine 17/e, Chapter 334

480. Ans. (c) **Aspirin**

Ref: Harrison's 18/e, Chapter 106

481. Ans. (c) **Yohimbine**

Ref: KDT 6/e, p 132

482. Ans. (b) **IV hydrocortisone**

Ref: Harrison's 18/e, Chapter 342

483. Ans. (d) **Valproate**

484. Ans. (d) **Valproate**

Ref: KDT 6/e, p 408

485. Ans. (d) **Inhibits COX1 and COX 2 irreversibly**

Ref: KDT 6/e, p 193, Goodman and Gillman's 11/e, p 440

486. Ans. (c) **Pyrazinamide**

Ref: Goodman Gillman's 10/e, Chapter 47

487. Ans. (a) **Bromocriptine**

Ref: Harrison 18/e, Chapter 350

Pathology

MOST RECENT QUESTIONS 2019

1. **Berry aneurysm most commonly occurs due to?**
 - a. Endothelial injury of vessel due to HTN
 - b. Muscle intimal elastic lamina layer defect
 - c. Endothelial layer defect
 - d. Adventitia defect
2. **A 45-year patient working in a factory for past 20 years presents with breathlessness. HRCT chest shows pleural thickening and fibrosis. Diagnosis is?**
 - a. Asbestosis
 - b. Coal worker pneumoconiosis
 - c. Silicosis
 - d. Berylliosis
3. **Most commonly observed autosomal aneuploidy leading to spontaneous abortions is?**
 - a. Trisomy 16
 - b. Trisomy 21
 - c. Monosomy
 - d. Trisomy 18
4. **Which of these is a Nephritic syndrome?**
 - a. Minimal change disease
 - b. Membranous Glomerulopathy
 - c. Post infectious Glomerulonephritis
 - d. Focal segmental glomerulosclerosis
5. **The following serological status is noted in a patient: HbsAg positive and HbeAg positive. Diagnosis is?**
 - a. Acute viral hepatitis
 - b. Chronic viral hepatitis
 - c. Acute viral hepatitis with infectivity
 - d. Remote infection
6. **Chronic viral hepatitis is seen with?**
 - a. HBV
 - b. HCV
 - c. HDV
 - d. HEV
7. **Acute auto-graft rejection occurs within?**
 - a. Few hours
 - b. < 1 month
 - c. < 6 months
 - d. 6-12 months
8. **Type II Hypersensitivity is seen in?**
 - a. Pernicious anaemia
 - b. Serum sickness
 - c. Arthus phenomenon
 - d. Pathergy phenomenon

9. **Which of the following is a causative agent of Farmer's Lung?**
 - a. Thermophilic Actinomycetes
 - b. Aspergillus Fumigatus
 - c. Actinobacter
 - d. Aspergillus Flavus

10. **Comment on the diagnosis.**

- a. Malaria
 - b. Hereditary spherocytosis
 - c. G6PD deficiency
 - d. Babesia
11. **Whipple's disease is caused by.**
 - a. Bacteria
 - b. Virus
 - c. Protozoa
 - d. Helminths
12. **Most common site of Brain metastasis is?**
 - a. Lung cancer
 - b. Head and neck cancer
 - c. Prostate cancer
 - d. Breast cancer
13. **Which is not seen in Tumour lysis Syndrome?**
 - a. Hypophosphatemia
 - b. Hypocalcemia
 - c. Hyperuricemia
 - d. Hyperkalemia
14. **Comment on the diagnosis for SAP normal, PTH normal, Vitamin D3 normal with elevated serum Calcium values?**
 - a. Vitamin D intoxication
 - b. Hyperparathyroidism
 - c. Multiple myeloma
 - d. Nutritional rickets
15. **Which of the following interfere with iron absorption?**
 - a. Vitamin C
 - b. Phytates
 - c. Oxalate
 - d. Myoglobin
16. **Most sensitive and specific marker for MI is?**
 - a. Troponin
 - b. Cytokeratin
 - c. Myoglobin
 - d. CPK- MM

17. Antecedent diagnosis of Group A streptococcal infection in Acute rheumatic fever can be made by?

- a. ASO
- b. CRP
- c. ESR elevation
- d. Low C3 levels

18. Most common anterior mediastinal tumour?

- a. Thymoma
- b. Neurofibroma
- c. Pericardial cyst
- d. Bronchogenic cyst

19. Most characteristic finding of diabetic nephropathy?

- a. Kimmelstein Wilson disease
- b. Diffuse glomerulosclerosis
- c. Focal segmental glomerulosclerosis
- d. Armani Ebstein change

20. First line of defence against tumour and virus?

- a. NK cell
- b. T cell
- c. Histocyte
- d. Macrophage

21. Most sensitive indicator for Iron deficiency anaemia?

- a. Serum Ferritin
- b. TIBC
- c. Percentage saturation of transferrin
- d. Bone marrow iron

22. Most common cardiac defect in Down syndrome is?

- a. Endocardial cushion defect
- b. Ventricular septal defect
- c. Peripheral pulmonary stenosis
- d. Anomalous origin of left coronary artery from pulmonary artery (A.L.C.A.P.A)

23. MC cause of atypical pneumonia?

- a. Mycoplasma pneumoniae
- b. Klebsiella pneumoniae
- c. Hemophilus influenzae
- d. Chlamydia

24. Correct about of Anaemia of chronic disease

- a. High ferritin
- b. Increased percentage of saturation of transferrin
- c. High transferrin
- d. High serum iron

CELL INJURY AND INFLAMMATION

25. Stellate granuloma is found in:

(Recent Pattern Question 2018-19)

- a. Cat scratch disease
- b. Leprosy
- c. Coccidiomycosis
- d. Histoplasmosis

26. Which proteoglycan is involved in process of healing?

(Recent Pattern Question 2018-19)

- a. Chondroitin sulphate
- b. Dermatan sulphate
- c. Keratan sulphate
- d. Syndecan

27. Secondary healing mechanism is?

(Recent Pattern Question 2018-19)

- a. Granuloma formation
- b. Scab formation
- c. Granulation tissue
- d. Neovascularization

28. Rolling of leucocytes on endothelial cells is mediated by:

(Recent Pattern Question 2018)

- a. Selectins
- b. Integrins
- c. Transferrin
- d. PECAM-1

29. Liquefactive necrosis is seen in which of the following?

(Recent Pattern Question 2018)

- a. Kidney
- b. Heart
- c. Cerebrum
- d. Intestine

30. P53 regulates which phase of cell cycle?

(Recent Pattern Question 2018)

- a. G1S
- b. G2
- c. G2M
- d. S

31. Pro-apoptotic gene and anti-apoptotic gene belong to which gene family?

(Recent Pattern Question 2017)

- a. p53
- b. Bcl
- c. BRAF
- d. Rb

32. Colliquative necrosis is seen in?

(Recent Pattern Question 2017)

- a. Arthus phenomenon
- b. Malignant hypertension
- c. Tuberculoma
- d. Lung abscess

33. DNA synthesis is seen in which phase of cell cycle?

(Recent Pattern Question 2017)

- a. Resting phase
- b. Synthetic phase
- c. Mitotic phase
- d. Premitotic phase

34. Which of the following is an opsonin?

(Recent Pattern Question 2017)

- a. C3a
- b. C3b
- c. C5a
- d. C5b

35. Councilman bodies are formed due to process of ____?

(Recent Pattern Question 2017)

- a. Necrosis
- b. Cirrhosis
- c. Apoptosis
- d. Necroptosis

36. Stellate shaped granuloma is seen in?

(Recent Pattern Question 2017)

- a. Sarcoidosis
- b. Cat scratch
- c. Crohn's disease
- d. Tuberculosis

37. Which of the following helps in cell to cell adhesion?

(Recent Pattern Question 2016)

- a. Interleukins
- b. Interferons
- c. E- Cadherin
- d. Matrix metallo proteinase

38. A reversible change occurring in which a mature cell type is replaced by another mature cell, is called:

- a. Dysplasia
- b. Metaplasia
- c. Hyperplasia
- d. Hypertrophy

39. A patient who was previously with good muscle mass, now presents with decreased muscle mass. There is history of RTA which led him to be bedridden for 6 months. This decrease in muscle mass is best explained by:

- a. Metaplasia
- b. Dysplasia
- c. Hypertrophy
- d. Atrophy

40. A pregnant uterus is an example of:

- a. Metaplasia
- b. Dysplasia
- c. Atrophy
- d. Hypertrophy

41. In individuals who donate one lobe of the liver for transplantation, the remaining organ soon grows back to its original size. This is an example of which adaptive mechanism?
- Hypertrophy
 - Atrophy
 - Hyperplasia
 - Metaplasia
42. Apoptosis is?
- Internally controlled, programmed cell death
 - Externally controlled, programmed cell death
 - Internally controlled, programmed enzyme degradation
 - Externally controlled, programmed karyolysis
43. All are true about apoptosis EXCEPT?
- Considerable apoptosis may occur in a tissue before it becomes apparent in histology
 - Apoptotic cells appear as round mass of the intensely eosinophilic cytoplasm with dense nuclear chromatin fragments
 - Apoptosis of cells induce inflammatory reaction
 - Condensation of chromatin
44. All are true about apoptosis EXCEPT?
- Inflammation is present
 - Chromosomal breakage
 - Clumping of chromatin
 - Cell shrinkage
45. Light microscopic characteristic feature of apoptosis is?
- Intact cell membrane
 - Eosinophilic cytoplasm
 - Nuclear moulding
 - Condensation of the nucleus
46. Apoptosis is inhibited by?
- Bcl-2
 - Bax
 - Bad
 - P53
47. In apoptosis, protein hydrolysis is due to activation of:
- Caspases
 - Upases
 - Transglutaminase
 - Catalase
48. Caspases are associated with which of the following?
- Hydropic degeneration
 - Collagen hyalinization
 - Embryogenesis
 - Fatty degeneration
49. Caspases are involved in?
- Necrosis
 - Apoptosis
 - Atherosclerosis
 - Inflammation
50. Earliest feature of reversible cell injury is:
- Amorphous densities
 - Ribosomal detachment
 - Hydropic swelling
 - Bleb formation
51. All of the following statements are true regarding reversible cell injury, EXCEPT:
- Diminished generation of ATP
 - Formation of blebs in the plasma membrane
 - Condensation of nuclear chromatin
 - Detachment of ribosomes from the granular endoplasmic reticulum
52. Which of the following type of necrosis is most commonly associated with ischemic injury:
- Coagulative necrosis
 - Casaeous necrosis
 - Liquefactive necrosis
 - Fat necrosis
53. Inter-nucleosomal cleavage of DNA is characteristic of?
- Reversible cell injury
 - Irreversible cell injury
 - Necrosis
 - Apoptosis
54. Integrins include receptor EXCEPT?
- Fibronectin
 - Glycoprotein on platelet surface
 - Leukocyte adhesion molecule
 - Platelet derived growth factor
55. Exudation of plasma and leucocytes in acute inflammation is from?
- Venules
 - Capillaries
 - Arterioles
 - Arterioles and capillaries
56. Dystrophic calcification is seen in?
- Rickets
 - Hyperparathyroidism
 - Atheromatous plaque
 - Vitamin A intoxication
57. Digestion of foreign material by a neutrophil or macrophage during phagocytosis is mainly due to?
- Complement
 - Hydrogen peroxide
 - Kinins
 - Lysosomal enzymes
58. Which of the following is a peroxisomal free radical scavenger?
- Superoxide dismutase
 - Glutathione peroxidase
 - Catalase
 - All of the above
59. Which among the following is the hallmark of acute inflammation?
- Vasoconstriction
 - Stasis
 - Vasodilation and increase in permeability
 - Leukocyte margination
60. Which of the following is not an inflammatory mediator?
- Tumor necrosis factor
 - Myeloperoxidase
 - Interferons
 - Interleukin
61. All of the following host tissue responses can be seen in acute infection, EXCEPT?
- Exudation
 - Vasodilation
 - Margination
 - Granuloma formation
62. Oxygen dependent killing is done through?
- NADPH oxidase
 - Superoxide dismutase
 - Catalase
 - Glutathione peroxidase
63. Which of the following is required for post-translational modification?
- Vitamin B₁₂
 - Biotin
 - Beta-carotene
 - Vitamin C
64. Cell swelling is seen in all EXCEPT?
- Infection
 - Malignancy
 - Calcification
 - Hypoxia

**65. Fat necrosis occurs at all sites EXCEPT?**

- a. Pancreas b. Liver
- c. Breast d. Peritoneum

66. Morphological changes seen in chronic non-specific inflammation include an increase in:

- a. Neutrophils, lymphocytes and liquefactive necrosis
- b. Neutrophils, macrophages and fibrosis
- c. Lymphocytes, plasma cells and fibrosis
- d. giant cells, macrophages and coagulative necrosis

67. Foci of granulomatous inflammation show all of the following EXCEPT?

- a. Eosinophils b. Epithelioid cells
- c. Fibrosis d. Lymphocytes

68. All are true about white infarcts EXCEPT?

- a. Edema is present
- b. Occurs in organs with end arterial supply
- c. Well-defined margins
- d. Coagulative necrosis

HEMODYNAMICS

69. All are true about components of Virchow's triad EXCEPT?

- a. Vasculitis b. Stasis in veins
- c. Turbulence in artery d. Increased protein C

70. All are true about arterial thrombosis EXCEPT?

- a. Retrograde growth
- b. Line of Zahn
- c. White thrombus
- d. Complete lumen obstruction

71. Which is the most common site of arterial embolization?

- a. Brain
- b. Kidney
- c. Mesentery
- d. Lower extremities

72. Chicken fat appearance is seen in?

- a. Antemortem clots
- b. Postmortem clots
- c. Fat necrosis
- d. Fibrinoid necrosis

73. All of the following are true in respect of angioneurotic edema EXCEPT?

- a. It is caused by deficiency of complement proteins
- b. It is more common in females
- c. It manifests as pitting edema
- d. It is an autosomal dominant disorder

74. Hypersensitivity angitis is seen in?

- a. SLE
- b. Polyarteritis Nodosa
- c. Henoch Schonlein purpura
- d. Burgers disease

NEOPLASIA

75. Which of the following is true about Anaplasia?

(Recent Pattern Question 2018-19)

- a. Loss of cohesion between cells
- b. Loss of differentiation
- c. Change of epithelium types
- d. Benign and fully reversible

76. Cell that can form any other cell in the body is called?

(Recent Pattern Question 2018-19)

- a. Totipotent b. Multipotent
- c. Pluripotent d. Lineage stem cells

77. Hyaline globules are seen in all EXCEPT:

(Recent Pattern Question 2018)

- a. Hepatoblastoma b. Yolk Sac tumor
- c. Teratoma d. Hepatocellular carcinoma

78. Which is the most common tumor associated with superior vena cava syndrome?

(Recent Pattern Question 2018)

- a. Lung cancer b. Lymphoma
- c. Metastasis d. Thyroid cancer

79. Which is the most common cancer which results in death?

(Recent Pattern Question 2018)

- a. Oral cancer b. Breast cancer
- c. Prostate cancer d. Lung cancer

80. Which of the following shows breast necrosis and calcification?

(Recent Pattern Question 2018)

- a. Comedo subtype of DCIS
- b. Cribriform subtype of DCIS
- c. Colloid carcinoma
- d. Lobular carcinoma in situ

81. Mucosal melanosis and hamartomatous polyps are seen in?

(Recent Pattern Question 2018)

- a. Peutz-Jeghers syndrome
- b. Cronkhite Canada syndrome
- c. Familial adenomatous polyposis
- d. Hereditary non polyposis colonic cancer

82. Jumping gene is known as?

(Recent Pattern Question 2017)

- a. Transposon b. Retroposon
- c. Insertion sequence d. Integron

83. Which is correct about non-seminomatous germ cell tumour?

(Recent Pattern Question 2017)

- a. Spreads via lymphatics
- b. Testicular contour distorted
- c. Prognosis better than germ cell tumour
- d. Radiosensitive

84. Warthin tumour is?

(Recent Pattern Question 2017)

- a. Adenolymphoma b. Pleomorphic adenoma
- c. Mucoepidermoid carcinoma
- d. Acinic cell carcinoma

85. Loss of polarity is a feature of?

(Recent Pattern Question 2017)

- a. Metaplasia
- b. Dysplasia
- c. Necroptosis
- d. All of the above

86. L-myc leads to?

(Recent Pattern Question 2017)

- a. Burkitt lymphoma
- b. Neuroblastoma
- c. Oat cell cancer
- d. GIST

87. Which of the following Cancer is not due to infectious etiology?

(Recent Pattern Question 2017)

- a. Small cell cancer of lung
- b. H.C.C
- c. Naso-pharyngeal cancer
- d. MALToma

88. Most common middle mediastinal tumour?

(Recent Pattern Question 2017)

- a. Bronchogenic cyst
- b. Pericardial cyst
- c. Neurofibroma
- d. Lymphoma

89. The lesion shown below is caused by?

(Recent Pattern Question 2017)

- a. HPV
- b. HSV
- c. HIV
- d. EBV

90. In a FAP patient which is an important CA risk

(Recent Pattern Question 2016)

- a. Retinoblastoma
- b. Brain tumour
- c. Colorectal CA
- d. Prostate CA

91. Esophageal irradiation causes damage by

(Recent Pattern Question 2016)

- a. Decreasing secretion
- b. Glandular dysplasia
- c. Stricture formation
- d. Glandular hypertrophy

92. Oncocytes are seen in all of the following EXCEPT?

- a. Pituitary
- b. Thyroid
- c. Pancreas
- d. Thymus

93. Tumor marker for mesotheliomas is?

- a. Desmin
- b. Keratin
- c. Vimentin
- d. Alpha-feto protein

94. Tongue cancer NOT seen with?

- a. Alcohol
- b. Smoking
- c. Chewing tobacco
- d. Aphthous ulcer

95. Most radiosensitive tumour is?

- a. Ewing's sarcoma
- b. Seminoma
- c. Osteosarcoma
- d. Osteoid osteoma

96. Radiation exposure during infancy has been linked to which of the following carcinoma?

- a. Breast
- b. Melanoma
- c. Thyroid
- d. Lung

97. UV radiation has which of the following effects on the cells?

- a. Prevents formation of pyrimidine dimers
- b. Stimulates formation of pyrimidine dimers
- c. Prevents formation of purine dimers
- d. All of the above

98. The most radiosensitive cells are:

- a. Neutrophils
- b. Lymphocytes
- c. Erythrocytes
- d. Megakaryocytes

99. The following parasitic infections predispose to malignancies?

- a. Paragonimus westermani
- b. Guinea worm infection
- c. Clonorchiasis
- d. Ancylostoma

IMMUNITY AND HYPERSENSITIVITY

100. Xenograft is: (Recent Pattern Question 2018-19)

- a. Graft across species
- b. Graft from same species
- c. Graft from same individual
- d. Graft from same organ

101. Which of the following is a Type 2 Hypersensitivity reaction? (Recent Pattern Question 2018-19)

- a. Chronic Kidney Rejection episode
- b. Autoimmune Hemolytic anaemia
- c. Arthus reaction
- d. Mitsuda reaction

102. Acute graft rejection occurs within?

(Recent Pattern Question 2018-19)

- a. Minutes
- b. Days to weeks
- c. >6 weeks to 6 months
- d. >6 months

103. Neonatal lupus is screened by which antibody?

(Recent Pattern Question 2018)

- a. Anti-Ro
- b. Anti-smith
- c. Antiribonucleoprotein antibody
- d. Antiphospholipid antibody

104. Class MHC 2 antigen attaches to?

(Recent Pattern Question 2017)

- a. CD4
- b. CD8
- c. CD16
- d. CD34

105. Which is not an antibody mediated hypersensitivity reaction? (Recent Pattern Question 2017)

- a. Type 1
- b. Type 2
- c. Type 3
- d. Type 4

106. Which is a flow cytometric B cell marker?

(Recent Pattern Question 2017)

- a. CD 2
- b. CD 3
- c. CD 7
- d. CD 19

107. Caplan syndrome is characterised by?

(Recent Pattern Question 2017)

- a. Pneumoconiosis with HLA B27
- b. Pneumoconiosis with reactive arthritis
- c. Pneumoconiosis with progressive massive fibrosis
- d. Pneumoconiosis with rheumatoid arthritis

108. HLAB27 is maximally associated with?

(Recent Pattern Question 2017)

- a. Rheumatoid arthritis
- b. Ankylosing spondylitis
- c. Reiter syndrome
- d. Psoriasis

109. Which is the first line of defence in viral infection?

(Recent Pattern Question 2017)

- a. B lymphocyte
- b. Macrophages
- c. T lymphocytes
- d. Large granular lymphocyte

110. TH1 is involved in which type of hypersensitivity?

(Recent Pattern Question 2017)

- a. Type 1
- b. Type 2
- c. Type 3
- d. Type 4

111. Which of the following is an example of Type 3 hypersensitivity?

(Recent Pattern Question 2016)

- a. Asthma
- b. Contact dermatitis
- c. SLE
- d. AIHA

112. Which is true about type II hypersensitivity reaction?

(Recent Pattern Question 2016)

- a. Immune complex mediated
- b. Antigen – antibody mediated
- c. Arthus phenomenon
- d. Granulomatous reaction

113. Highest molecular weight immunoglobulins are

(Recent Pattern Question 2016)

- a. IgG
- b. IgA
- c. IgM
- d. IgD

114. Primary immune response is by which cell?

- a. B cell
- b. T cell
- c. B and T cell both
- d. Complement mediated

115. Steven Johnson Syndrome is seen with what kind of hypersensitivity reaction?

- a. Type 1
- b. Type 2
- c. Type 3
- d. Type 4

116. Patch test is what type of hypersensitivity?

- a. Type 1
- b. Type 2
- c. Type 3
- d. Type 4

117. Which of these is not an antigen presenting cell?

- a. Bipolar cells
- b. Dendritic cell
- c. Follicular dendritic cell
- d. Tissue macrophages

118. Which interleukin is associated with growth of natural killer cells?

- a. IL-2
- b. IL-7
- c. IL-8
- d. IL-13

119. In graft rejection, which type of HLA is involved?

- a. MHC class I
- b. MHC class II
- c. MHC class III
- d. MHC class IV

120. HLA-B27 is associated with?

- a. Osteoarthritis
- b. Sjgren syndrome
- c. Behçet disease
- d. Reiter's syndrome

121. Nitro-blue tetrazolium test is done for?

- a. Chronic glomerulonephritis
- b. Chronic granulomatous disorder
- c. Acute granulomatous disease
- d. Chediak Higashi syndrome

122. C1 is controlled by?

- a. Magnesium
- b. Manganese
- c. Phosphate
- d. Calcium

123. Which among the following is not an autoimmune disease?

- a. Myasthenia gravis
- b. Systemic lupus erythematosus
- c. Grave's disease
- d. Sickle cell disease

124. Tuberculin test is which type of hypersensitivity?

- a. Type 1
- b. Type 2
- c. Type 3
- d. Type 4

HEMATOLOGY

125. All are reduced in Iron deficiency anaemia EXCEPT:

(Recent Pattern Question 2018-19)

- a. T.I.B.C
- b. Percentage saturation of Transferrin
- c. Hemoglobin
- d. Ferritin

126. Which type of anemia is seen in patients of rheumatoid arthritis?

(Recent Pattern Question 2018)

- a. Normocytic and hypochromic anemia
- b. Microcytic and hypochromic anemia
- c. Normocytic and normochromic anemia
- d. Macrocytic anemia

127. Which of the following is the correct sequence of early erythropoiesis in a developing fetus?

(Recent Pattern Question 2018)

- a. Yolk sac, bone marrow and liver
- b. Yolk sac, liver and bone marrow
- c. Liver, bone marrow and yolk sac
- d. Bone marrow, yolk sac and liver

128. WHO cut off for diagnosis of anemia in nonpregnant female is < _____?

(Recent Pattern Question 2018)

- a. 07 g%
- b. 10 g%
- c. 11 g%
- d. 12 g%

129. Which of the following tests is to be done to screen a lady with family history of thalassemia?

(Recent Pattern Question 2018)

- a. Hb A2 Levels
- b. NESTROFT
- c. High performance liquid chromatography
- d. P. smear and reticulocyte count

130. Which of the following is best to confirm diagnosis of thalassemia trait in a lady with positive family history of thalassemia?
 a. Elevated HbA2 b. Reticulocytosis
 c. NESTROFT d. Peripheral Smear
131. Heinz bodies are composed of?
(Recent Pattern Question 2017)
 a. DNA b. RNA
 c. Iron d. Denatured haemoglobin
132. Positive coombs test is seen in which haemolytic anaemia?
(Recent Pattern Question 2017)
 a. SLE b. PAN
 c. TTP d. HUS
133. Arsenic is used in treatment of?
(Recent Pattern Question 2017)
 a. A.M.L b. C.M.L
 c. Myeloproliferative disease d. A.L.L
134. Which virus leads to Aplastic Crisis?
(Recent Pattern Question 2017)
 a. Pox virus b. Parvo virus B19
 c. Hepatitis A d. Hepatitis B
135. Which of the following will lead to X-ray appearance of crew hair cut appearance with Gamma Gandy bodies?
(Recent Pattern Question 2017)
 a. Sick cell anaemia b. Hereditary spherocytosis
 c. Acute myeloid leukemia d. Osteoporosis
136. Gamma gandy bodies are seen in?
(Recent Pattern Question 2017)
 a. Portal hypertension b. Plasma cell dyscrasia
 c. Plasma cell leukemia d. Primary sclerosing cholangitis
137. Rosenthal syndrome occurs due to deficiency of?
(Recent Pattern Question 2017)
 a. Factor 2 b. Factor 5
 c. Factor 9 d. Factor 11
138. Which of the following is a B-cell disease?
(Recent Pattern Question 2016)
 a. Amyloidosis b. Multiple myeloma
 c. ALL d. Mycosis fungoides
139. Lacunar Reed Sternberg cell is found in which type of Hodgkin's lymphoma?
(Recent Pattern Question 2016)
 a. Mixed cellularity b. Lymphocyte rich
 c. Nodular sclerosis d. Lymphocyte depleted
140. JAK -2 mutation is seen in?
 a. Polycythemia vera b. I.T.P
 c. C.M.L d. C.M.M.L
141. Gamma Gandy bodies contain hemosiderin and _____?
 a. Na⁺ b. Ca⁺⁺
 c. Mg⁺⁺ d. K⁺
142. The cause of the severe hemorrhage in acute promyelocytic leukemia is?
 a. Disseminated intravascular coagulation
 b. Immune complex deposits on blood vessels
 c. Thrombocytopenia d. Thrombocytosis
143. Which is the most common Hodgkin's lymphoma?
 a. Nodular sclerosis b. Mixed cellularity
 c. Lymphocyte depleted d. Lymphocyte rich
144. Which is the percentage of blasts in AML
 a. 8% b. 15%
 c. 20% d. 25%
145. Presence of >10% plasma cells with no lytic lesion and M protein in serum is seen in?
 a. Smoldering myeloma
 b. Multiple myeloma
 c. Monoclonal Gammopathy of unknown significance
 d. Nonsecretory myeloma
146. Langerhans cell CD marker is?
 a. CD1 b. CD2
 c. CD4 d. CD56
147. RBC contains?
 a. Iron b. Folic acid
 c. Vitamin C d. Biotin
148. Leucopenia is NOT seen in?
 a. New born b. Starvation
 c. Enteric fever d. Viral or protozoal infection
149. Prevalence of Burkitt's lymphoma is highest in?
 a. Australia b. Africa
 c. Asia d. America
150. Reticulocytosis is NOT seen in:
 a. Thalassemia b. Hereditary spherocytosis
 c. Chronic renal failure d. Sick cell anemia
151. GLUT present on surface of RBC?
 a. GLUT 1 b. GLUT 2
 c. GLUT 3 d. GLUT 4
152. Splenectomy is useful in which of the following:
 a. Chronic ITP b. Sick cell anemia
 c. Tuberculosis d. Good pasture syndrome
153. Extrinsic pathway of clotting factors is measured by?
 a. Prothrombin time
 b. Activated partial thromboplastin time
 c. Bleeding time
 d. Clotting time
154. Which of following viruses cause hemolysis of red blood cells?
 a. Rubella b. Human parvo virus B19
 c. Measles d. Dengue virus
155. G6PD helps in maintaining the integrity of RBC by:
 a. Controlling oxidative stress on RBC
 b. Controlling reduction stress on RBC
 c. Maintaining flexibility of cell membrane
 d. Component of electron transport chain
156. Low TIBC is seen in:
 a. Anemia of chronic disease
 b. Iron deficiency anemia
 c. Fanconi anemia
 d. Aplastic anemia

FMGE Solutions Screening Examination

328

157. Comment on type of anemia in peripheral smear:

- a. Pernicious anemia
- b. Iron deficiency anemia
- c. Sickle cell anemia
- d. Hereditary spherocytosis

158. Fetal hemoglobin has features which of these?

- a. Most susceptible to denaturation by acid
- b. Resistant to denaturation by alkali
- c. By 20 weeks 90% of fetal Hb is HbF
- d. It has 2 alpha and 2 beta chains

159. Which is the life span of transfused RBC?

- a. 30 days
- b. 45 days
- c. 60 days
- d. 120 days

160. Schistocytes are seen in?

- a. HUS
- b. HSP
- c. Abetalipoproteinemia
- d. Myelofibrosis

161. All are seen in thalassemia major EXCEPT:

- a. Transfusion dependency
- b. Splenohepatomegaly
- c. Ineffective erythropoiesis
- d. Macrocytic anemia

162. Low iron & low TIBC is seen in:

- a. Anaemia of chronic disease
- b. Sideroblastic anaemia
- c. Iron deficiency anaemia
- d. Aplastic anemia

163. Reticulocytes are stained with:

- a. Brilliant cresyl blue
- b. Sudan black
- c. Warthin starry
- d. Hematoxylin-eosin stain

164. Which is the storage form of iron:

- a. Transferrin
- b. Ferritin
- c. Hepcidin
- d. Ferroportin

165. Which is the most common type of Hodgkin's lymphoma?

- a. Nodular sclerosis
- b. Mixed cellularity
- c. Lymphocyte predominant
- d. Lymphocyte depleted

166. Which is the most common ALL subtype?

- a. Pre B cell
- b. Pre T cell
- c. T cell
- d. B cell

167. All cause Reticulocytosis EXCEPT:

- a. Aplastic anemia
- b. Thalassemia
- c. Sickle cell anemia
- d. Chronic blood loss

168. Hodgkins lymphoma is caused by:

- a. EBV
- b. CMV
- c. HHV6
- d. HHV8

169. Which of the following leukemia almost never develops after radiation?

- a. Acute myeloblastic leukemia
- b. Chronic myeloid leukemia
- c. Acute lymphoblastic leukemia
- d. Chronic lymphocytic leukemia

170. Which is the most common defectively produced antibody in multiple myeloma?

- a. Ig G
- b. Ig M
- c. Ig A
- d. Ig D

CARDIOVASCULAR PATHOLOGY

171. Histopathological finding 12 hours after ischemic injury to heart is? *(Recent Pattern Question 2018-19)*

- a. Karyorrhexis of myocytes
- b. Neocapillary invasion of myocytes
- c. Hyper-eosinophilia of myocytes
- d. Coagulation necrosis of myocytes

172. Which of the following is the correct description for type of heart lesion seen in patients of rheumatic arthritis? *(Recent Pattern Question 2018)*

- a. Osler's nodes
- b. McCallum patch
- c. Floppy valves
- d. Myxomatous degeneration

173. Which is the most common cause of death in rheumatic heart disease? *(Recent Pattern Question 2017)*

- a. Cardiac failure
- b. Bacterial endocarditis
- c. Mural thrombus
- d. Coronary insufficiency

174. Which is the earliest histopathological change in myocardial infarction? *(Recent Pattern Question 2017)*

- a. Stretching and waviness of fibers
- b. Neutrophilic infiltration
- c. Coagulative necrosis
- d. Fibrovascular response

175. Most common primary cardiac tumour? *(Recent Pattern Question 2017)*

- a. Myxoma
- b. Rhabdomyoma
- c. Rhabdomyosarcoma
- d. Angiosarcoma

176. Which is the first organ to be affected in left ventricular failure?

- a. Lungs
- b. Liver
- c. Kidney
- d. Brain

177. Which of the following is pathognomonic for rheumatic fever?

- a. Aschoff nodules
- b. Anitschkow cells
- c. McCallum's patch
- d. Vegetations along the cusps

- 178. All are true about myocardial response and changes to myocardial infarction EXCEPT?**
- Neutrophilic infiltrates in first 48 hours
 - Loss of contractility within 2 minutes
 - Reversible injury within 20–40 minutes
 - Waviness of fibres at border of infarct
- 179. All are complications of atherosclerosis EXCEPT?**
- Ulceration
 - Thrombosis
 - Embolism
 - Necrosis
- 180. Which is incorrect about Buerger's disease?**
- Ischemia of nerves
 - Deep vein thrombosis
 - Segmental inflammation
 - Superficial thrombophlebitis
- 181. Why is Troponin C not used for MI diagnosis?**
- Troponin C binds to calcium
 - Troponin C is present in both cardiac and smooth muscle
 - Troponin C is present in both cardiac and skeletal muscle
 - It elevates late after onset of MI.
- 182. Postmortem findings of myocardial infarction are all EXCEPT:**
- Coagulative necrosis
 - Glycogen depletion
 - Granulation with type 4 collagen
 - Loss of nuclei
- 183. The most common primary neoplasm of the heart in adults is?**
- Lipoma
 - Myxoma
 - Papillary fibroelastoma
 - Rhabdomyoma
- 184. Which is the most common cardiac tumor?**
- Myxoma
 - Rhabdomyosarcoma
 - angiosarcoma
 - Metastasis
- 185. Which is the most common site of rhabdomyoma?**
- Left atrium
 - Right atrium
 - Left ventricle
 - Right ventricle
- 186. Which is the most common cardiac valve tumor?**
- Myxoma
 - Rhabdomyoma
 - Papillary fibroelastoma
 - Secondaries
- 187. Tree bark like calcification in chest X-ray is seen in?**
- Syphilitic aneurysm
 - Aorto-Arteritis
 - Neurofibromatosis
 - Atherosclerosis
- 188. Exudate in rheumatic fever is?**
- Serous
 - Purulent
 - Fibrinous
 - Myxomatous
- 189. Fibrinoid necrosis may be observed in all of the following, EXCEPT?**
- Malignant hypertension
 - Polyarteritis nodosa
 - Diabetic glomerulosclerosis
 - Aschoff's nodule
- 190. Polyarteritis Nodosa (PAN) typically involves which of the following?**
- Large elastic arteries
 - Small- or medium-sized muscular arteries
 - Arterioles
 - Capillaries
- 191. Medial calcification is seen in?**
- Atherosclerosis
 - Arteriolosclerosis
 - Monckeberg's sclerosis
 - Dissecting aneurysm
- 192. All are examples of medium vessel vasculitis EXCEPT?**
- Classic PAN
 - Kawasaki disease
 - Buerger disease
 - SLE

LUNGS

- 193. Curschmann spirals are characteristic of which of the following airway disease?**
- Chronic bronchitis
 - Emphysema
 - Atelectasis
 - Bronchial asthma
- 194. Simmond focus in tuberculosis is seen in?**
- Brain
 - Lungs
 - Liver
 - Blood vessels
- 195. All are true about chronic bronchitis EXCEPT?**
- Increased Reid's index
 - Submucosal gland hypertrophy
 - Eosinophilic infiltration of airways
 - Bronchorrhea
- 196. All are true about silicosis EXCEPT?**
- Egg shell calcification
 - Nodular fibrosis
 - Bloody pleural effusion
 - Quartz is the main form implicated in pathogenesis
- 197. Kveim test is used for diagnosis of?**
- Sarcoidosis
 - Sicca syndrome
 - Scleroderma
 - C.R.E.S.T. syndrome
- 198. Schaumann body is seen in cases of:**
- Silicosis
 - Asbestosis
 - Sarcoidosis
 - Anthraxis
- 199. Which is the most common clinical presentation of sarcoidosis?**
- Pleural plaque
 - Hilar lymphadenopathy
 - Pulmonary fibrosis
 - Interstitial calcification
- 200. Lung cancer is most commonly associated with?**
- Silicosis
 - Berylliosis
 - Asbestosis
 - Anthraxis
- 201. Which is the most common type of lung cancer?**
- Small cell lung cancer
 - Large cell lung cancer
 - Squamous cell cancer
 - Adenocarcinoma

202. Which is the most common lung cancer in females?

- a. Squamous cell CA
- b. Adenocarcinoma
- c. Small cell lung CA
- d. Large cell CA

203. Which is the most aggressive lung CA?

- a. Squamous cell CA
- b. Adenocarcinoma
- c. Small cell lung CA
- d. Large cell CA

204. Azzopardi effect is seen in:

- a. Squamous cell CA
- b. Adenocarcinoma
- c. Small cell lung CA
- d. Large cell CA

205. Which is the most common cancer associated with asbestosis?

- a. Mesothelioma
- b. Adenocarcinoma lung
- c. Squamous cell cancer of lung
- d. Large cell cancer lung

KIDNEY

206. Most characteristic feature of diabetic nephropathy:

(Recent Pattern Question 2018-19)

- a. Kimmel stein Wilson Change
- b. Armani Ebstein change
- c. Focal segmental glomerulosclerosis
- d. Membrano proliferative glomerulonephritis

207. Fatty change is seen in? (Recent Pattern Question 2017)

- a. Brain
- b. Kidney
- c. Adrenal
- d. Bladder

208. The presence of sub-epithelial humps on electron microscopic examination of kidney biopsy is seen in?

- a. PSGN *(Recent Pattern Question 2017)*
- b. Chronic glomerulonephritis
- c. Crescentic glomerulonephritis
- d. Membranous glomerulopathy

209. Crescent formation is seen in?

(Recent Pattern Question 2017)

- a. FSGS
- b. MGN
- c. RPGN
- d. PSGN

210. Adult polycystic kidney disease is

(Recent Pattern Question 2016)

- a. Autosomal recessive
- b. Autosomal dominant
- c. X-linked recessive
- d. X-linked dominant

211. Owl eye inclusions in urine are seen in?

(Recent Pattern Question 2016)

- a. EBV
- b. HSV-1
- c. HSV-2
- d. CMV

212. Hydropic degeneration of the renal tubular epithelium occurs in?

- a. Chronic alcoholism
- b. Carbon tetrachloride poisoning
- c. Excessive renal sodium loss
- d. Hypokalemia

213. Podocytes are seen in?

- a. Bowman's capsule
- b. Proximal convoluted tubule
- c. Distal convoluted tubule
- d. Collecting tubule

214. Maximum endo-capillary proliferation is seen in:

- a. Membranous glomerulonephritis
- b. Mesangio-proliferative glomerulonephritis
- c. Focal segmental glomerulonephritis
- d. Post streptococcal GN

215. Wire loop lesions are seen in?

- a. SLE
- b. Diabetic nephropathy
- c. Benign nephrosclerosis
- d. Wegener's granulomatosis

216. The drug which causes renal papillary necrosis is?

- a. Acetophenetidin
- b. Gentamicin
- c. Gold
- d. Methicillin

217. Which of the following statement is incorrect about ADPKD?

- a. Autosomal dominant
- b. Chromosome 4 and 16 are involved
- c. Cysts in liver and pancreas
- d. Bilateral kidney transplantation

218. WBC cast is seen in?

- a. Pyelonephritis
- b. Glomerulonephritis
- c. Chronic renal failure
- d. Hyaline cast

219. RBC cast is seen in?

- a. Minimal change disease
- b. Renal vein thrombosis
- c. Bladder schistomiasis
- d. Rapidly progressive glomerulonephritis

220. Which is the most common glomerulonephritis associated with HIV?

- a. Focal segmental glomerulosclerosis
- b. Diffuse glomerulosclerosis
- c. Membranoproliferative glomerulonephritis
- d. Crescentic glomerulonephritis

221. Which of the following is true about complications of hemodialysis?

- a. A beta amyloid deposition
- b. Cardiovascular complications
- c. Renal rickets
- d. Metabolic acidosis

222. Which is the most common malignant tumor of kidney:

- a. Papillary carcinoma
- b. Papillary adenoma
- c. Renal cell CA
- d. Wilm's tumor

223. Which is the most common risk factor for RCC?

- a. Urinary tract infection
- b. Renal calculi
- c. Smoking
- d. Hypertension

224. Which is the RCC with best prognosis?

- a. Clear cell CA
- b. Papillary CA
- c. Medullary CA
- d. Chromophobe

225. Which is the most common type of RCC associated with dialysis?

- a. Clear cell CA
- b. Papillary CA
- c. Medullary CA
- d. Chromophobe

226. Which is the most common type of RCC?
 a. Papillary CA b. Clear cell CA
 c. Medullary CA d. Chromophobe
227. Which of the following organ is least likely to be affected in cases of ADPKD?
 a. Brain b. Heart
 c. Liver d. Lung
228. Which is the most common organ associated with polycystic disease?
 a. Brain b. Heart
 c. Liver d. Lung
229. Which is the least common cause of death in case of polycystic disease?
 a. Coronary heart disease b. Infection
 c. Berry aneurysm rupture d. Pancreatic cyst

LIVER

230. Mallory hyaline bodies are seen in?
(Recent Pattern Question 2017)
 a. Acute viral hepatitis b. Wilson disease
 c. Fulminant hepatitis d. All of the above
231. Conjugated hyperbilirubinemia is seen in?
(Recent Pattern Question 2017)
 a. Crigler Najar type 1 b. Crigler Najar type 2
 c. Gilbert syndrome d. Dubin Johnson syndrome
232. Pathologic changes or clinical manifestations which occur in patients with primary hemochromatosis include all of the following EXCEPT?
 a. Congestive heart failure b. Diabetes mellitus
 c. Testicular atrophy d. Photosensitivity dermatitis
233. Elevated alpha-fetoprotein is seen in all EXCEPT?
 a. Hepatocellular cancer b. Colonic cancer
 c. Tuberculoma d. Pancreatic cancer
234. Unconjugated hyperbilirubinemia is seen in:
 a. Rotor's syndrome
 b. Crigler Najar syndrome
 c. Dubin Johnson syndrome
 d. All of above
235. Which of the following hereditary hyperbilirubinemia is autosomal dominant?
 a. Dubin Johnson syndrome
 b. Rotor syndrome
 c. Crigler Najar syndrome type I
 d. Crigler Najar syndrome type II
236. Which of the following hereditary hyperbilirubinemia is most fatal?
 a. Dubin Johnson syndrome
 b. Rotor syndrome
 c. Crigler–Najar syndrome type I
 d. Crigler–Najar syndrome type II

237. "Onion skin" fibrosis of bile duct is seen in:
 a. Primary biliary cirrhosis
 b. Primary sclerosing cholangitis
 c. Extrahepatic biliary fibrosis
 d. Congenital hepatic fibrosis
238. The complications of gallstones include all of the following EXCEPT:
 a. Adenocarcinoma of ampulla of Vater
 b. Acute intrahepatic cholangitis
 c. Acute pancreatitis
 d. Gangrenous cholecystitis
239. Most common tumor of liver is:
 a. Cavernous hemangioma
 b. Hepatocellular carcinoma
 c. Adenoma
 d. Metastasis
240. What accumulates in the space of Disse in cirrhosis?
 a. Collagen type 1 & 4 b. Collagen type 2 & 3
 c. Collagen type 1 & 3 d. Collagen type 2 & 4
241. Which of the following is not a function of liver?
 a. Production of albumin
 b. Detoxification of ammonia
 c. Production of vitamin K
 d. Metabolism of drugs
242. Which of the following is a thorium induced tumor?
 a. Renal cell carcinoma
 b. Lymphoma
 c. Angiosarcoma of liver
 d. Astrocytoma

GASTROINTESTINAL TRACT

243. Whipple's disease is caused by:
(Recent Pattern Question 2018)
 a. Bacteroides
 b. Acinetobacter
 c. H. pylori
 d. Tropheryma whippelii
244. Which of the following is called chronic hypertrophic gastritis?
(Recent Pattern Question 2017)
 a. Type A gastritis b. Type B gastritis
 c. Menetrier's disease d. Type AB gastritis
245. Serpiginous ulcers with deep fissures are seen in?
(Recent Pattern Question 2017)
 a. Crohn's disease b. Ulcerative colitis
 c. Neutropenic colitis d. Amoebic dysentery
246. Duodenal villous atrophy is seen in
(Recent Pattern Question 2016)
 a. Crohn's disease
 b. Ulcerative colitis
 c. Celiac disease
 d. Cystic fibrosis

258. Which is the most common tumor of the spleen?
- a. Hemangioma
 - b. Lymphoma
 - c. Angiosarcoma
 - d. Metastasis
259. Which is the most common site of lymphoma?
- a. Duodenum
 - b. Pancreas
 - c. Mesenteric lymph nodes
 - d. Stomach
260. Which of the following is not associated with Crohn's disease?
- a. Pseudo-polyps
 - b. Fistula
 - c. Malignancy
 - d. Perineal sepsis
261. Which antibody is suggestive of diagnosis of ulcerative colitis?
- a. p-ANCA
 - b. c-ANCA
 - c. aMA
 - d. a.NA

262. Which enzyme protects the brain from free radical injury?

- a. Myeloperoxidase
- b. Superoxide dismutase
- c. MAO
- d. Hydroxylase

263. Negri bodies are found in:

- a. Cerebellum
- b. Hypothalamus
- c. Hippocampus
- d. Brain stem

264. Lewy's body is seen in?

- a. Alzheimer's
- b. Rabies
- c. Parkinsonism
- d. Multi infarct dementia

265. Ubiquitin deposit in neurons is seen in?

- a. Huntington's chorea
- b. Pick's disease
- c. Cortical dementia
- d. AIDS related dementia

266. Glioma Retinae is?

- a. Retinoblastoma
- b. Meningioma
- c. Optic nerve glioma
- d. Giant cell astrocytoma

267. Which of the following is correct about MEN 2 A Syndrome? *(Recent Pattern Question 2018-19)*

- a. Parathyroid adenoma
- b. Pituitary adenoma
- c. Pancreas adenoma
- d. Cavernous angioma

268. Pheochromocytoma produces all except? *(Recent Pattern Question 2018-19)*

- a. Nor-epinephrine
- b. Secretin
- c. Vasoactive intestinal polypeptide
- d. Calcitonin

269. Which of the following is not directly related to Hashimoto's thyroiditis?

- a. Hypothyroidism
- b. Slow onset
- c. Neuropathy
- d. Autoimmune disease

- 270. Amyloid stroma is seen with?**
 a. Papillary carcinoma Thyroid
 b. Medullary carcinoma Thyroid
 c. Follicular carcinoma Thyroid
 d. Anaplastic carcinoma Thyroid
- 271. Which is the most common cause of death in a diabetic patient?**
 a. Cardiac
 b. Renal
 c. Hypoglycemia
 d. Infection
- 272. Hyperparathyroidism is seen in all EXCEPT?**
 a. MEN I
 b. MEN IIA
 c. MEN IIB
 d. Parathyroid hyperplasia
- 273. All are included in MEN-IIB EXCEPT?**
 a. Pheochromocytoma
 b. Hyperparathyroidism
 c. Mucosal neuroma
 d. Marfanoid habitus
- 274. Which is incorrect about Neuroblastoma?**
 a. Most common abdominal tumor in infants
 b. X-ray abdomen shows calcification
 c. Can show spontaneous regression
 d. Urine contains 5 H.I.A.A.
- 275. Which is characteristic histo-pathological feature of kidney in DM?**
 a. Nodular sclerosis
 b. Fibrin cap
 c. Papillary necrosis
 d. Diffuse glomerulosclerosis
- 276. Psammoma bodies are seen in?**
 a. Papillary carcinoma thyroid
 b. Medullary carcinoma thyroid
 c. Follicular carcinoma thyroid
 d. Anaplastic carcinoma
- 277. Orphan Annie eye nucleus is seen in?**
 a. Papillary thyroid cancer
 b. Follicular Lymphoma
 c. Hurthle cell tumor
 d. paraganglioma
- 278. Which is produced by Phaeochromocytoma in M.E.N 2A Sipple syndrome?**
 a. Epinephrine
 b. Nor epinephrine
 c. Dopamine
 d. 5- H.I.
- 279. Pseudo-myxoma peritonei occur due to?**
 a. Dysgerminoma
 b. Brenner's tumor
 c. Theca cell tumor
 d. Mucinous cystadenosarcoma
- 281. Consanguinity is seen with which pattern of inheritance?** *(Recent Pattern Question 2018-19)*
 a. AR
 b. AD
 c. XLR
 d. XLD
- 282. Which of the following is regarded as outward expression of gene?** *(Recent Pattern Question 2018)*
 a. Phenotype
 b. Proteomics
 c. Genotype
 d. Anticipation
- 283. Which of the following has a polygenic pattern of inheritance?** *(Recent Pattern Question 2018)*
 a. Diabetes mellitus
 b. Familial hypercholesterolemia
 c. G6PD
 d. Resistant rickets
- 284. BRCA 1 is located on which chromosome?** *(Recent Pattern Question 2017)*
 a. Chromosome 13q21
 b. Chromosome 17q21
 c. Chromosome 17q23
 d. Chromosome 13q23
- 285. The defect Marfan syndrome is?** *(Recent Pattern Question 2017)*
 a. Fibrillin 1
 b. Fibrillin 2
 c. Fibrillin 3
 d. Fibrillin 4
- 286. Klinefelter syndrome genotype is?** *(Recent Pattern Question 2017)*
 a. 45XO
 b. 46XXY
 c. 47XYY
 d. 47XXY
- 287. Which of the following is responsible for the lesion shown in the image?**

- a. 11q (14-15)
 b. 11q(22-23)
 c. 13q14
 d. Inv 16

- 288. Which is correct about autosomal recessive condition, in case of one homozygous and one heterozygous parent?**
 a. 50% carrier and 50% affected
 b. 25% carrier and 75% affected
 c. 75% carrier and 25% affected
 d. 50% carrier and 25% affected
- 289. Karyotyping is useful in diagnosis of?**
 a. Autosomal recessive disorders
 b. X-linked recessive disorders
 c. Chromosomal abnormalities
 d. Biochemical abnormalities

GENETICS

- 280. Which of the following disease has XLR pattern of inheritance?** *(Recent Pattern Question 2018-19)*
 a. Hurler Syndrome
 b. Thalassemia
 c. Hereditary Spherocytosis
 d. G6PD

- 290. Anticipation is seen in?**
 a. Translocation b. Chromosome breaking
 c. Trinucleotide - repeat expansion
 d. Mitochondrial mutation
- 291. Hereditary retinoblastomas develop due to abnormality in which of the following chromosome?**
 a. 13ql4 b. 13pl4
 c. 14pl3 d. 14ql3
- 292. A 22-year-old man has features of arm span greater than height, subluxed lenses, flattened and dilation of the aortic bulb. Which is the most likely diagnosis?**
 a. Ehlers-Danlos syndrome b. Marfan syndrome
 c. Werner's syndrome
 d. Laurence-Moon-Biedl syndrome
- 293. Shortest chromosome is**
 a. Chromosome 1 b. Chromosome 13
 c. Chromosome 21 d. Chromosome 22
- 294. Autoimmune thyroiditis is seen with?**
 a. Down syndrome b. Marfan syndrome
 c. Louis Barr syndrome d. Edward syndrome
- 295. All are true about Lyon's hypothesis EXCEPT?**
 a. Only one of X chromosomes is genetically active
 b. Only X chromosome from the mother undergoes pyknosis
 c. Inactivation occurs on 16th day of embryonic life
 d. Gene Xist causes gene silencing
- 296. Preferential expression of gene depending on parent of origin is called:**
 a. Genomic imprinting
 b. Mosaicism
 c. Chimerism
 d. Cloning
- 297. All are true about F.I.S.H EXCEPT?**
 a. Can detect numeric abnormalities of chromosomes
 b. Can detect complex translocation of chromosomes
 c. Can be performed on prenatal samples
 d. All of the above
- 298. Sickle cell anemia is:**
 a. Autosomal recessive b. Autosomal dominant
 c. X-linked recessive d. X-linked dominant
- 299. Duchene-muscular dystrophy is:**
 a. Autosomal dominant b. Autosomal recessive
 c. X-linked dominant d. X-linked recessive
- 300. Which of the following is autosomal recessive?**
 a. Albinism
 b. Duchenne muscular dystrophy
 c. Marfan's syndrome
 d. Incontinentia pigmentia
- 301. Which of the following is XLR?**
 a. Cystic fibrosis
 b. Haemophilia
 c. Hereditary spherocytosis
 d. Neurofibromatosis
- 302. Which of the following is an X-linked dominant disorder?**
 a. Vitamin D resistant rickets
 b. Familial hypercholesterolemia
 c. Red green color blindness
 d. Achondroplasia
- 303. Which is false about Hurler syndrome?**
 a. X-linked b. Mental retardation
 c. Joint stiffness d. Coarse facial features
- 304. Which is true about Down syndrome?**
 a. Decrease in AFP b. Increase in AFP
 c. Increase in hCG d. Increased progesterone
- 305. Alpha fetoprotein is decreased in?**
 a. Down syndrome b. Marfan's syndrome
 c. Omphalocele d. Turner syndrome
- 306. BRCA 1 gene is located on which chromosome?**
 a. Chromosome 13 b. Chromosome 17
 c. Chromosome 19 d. Chromosome 21
- 307. All are familial breast cancer gene is all EXCEPT?**
 a. BRCA1 b. P53
 c. P16 d. PTEN
- 308. Klinefelter syndrome is?**
 a. 47 XXXY b. 47XXY
 c. 47 XX d. 47 XY
- 309. Cat eye syndrome is seen with?**
 a. Retinoblastoma
 b. Chromosome 22 defect
 c. Zonular cataract
 d. Cridu-chat syndrome

RESPIRATORY SYSTEM

- 310. Which organ is involved in Good-pasture syndrome?**
(Recent Pattern Question 2018-19)
 a. Liver b. Adrenals
 c. Kidney d. Brain
- 311. Not a feature of bronchial asthma:**
(Recent Pattern Question 2018-19)
 a. Thickening of bronchial wall
 b. Increase in number of goblet glands
 c. Hypertrophy of smooth muscle
 d. Increased Ig E
- 312. Which of the following condition is characterized by presence of hyaline deposits in alveolar walls?**
(Recent Pattern Question 2018)
 a. Interstitial lung disease
 b. Asthma
 c. Hyaline membrane disease
 d. Chronic bronchitis
- 313. Asthma is associated with?**
 a. IL-1 b. IL-2
 c. IL-4 d. IL-6

MISCELLANEOUS

314. The most abundant glycoprotein present in basement membrane is?
 a. Laminin b. Fibronectin
 c. Collagen type 4 d. Heparan sulphate
315. All of the following are characteristically found in cases of Ochronosis EXCEPT?
 a. Alkaptonuria
 b. Arthritis
 c. Deposition of melanin-like pigment
 d. Photosensitivity
316. PAS stains all of the following EXCEPT?
 a. Glycogen b. Lipids
 c. Fungal cell wall
 d. Basement membrane of bacteria
317. The stain used to detect amyloid is?
 a. Gram's stain b. Congo red
 c. Oil red O d. Reticulin stain
318. Acridine orange is a fluorescent dye used to bind:
 a. DNA and RNA b. Protein
 c. Lipid d. Carbohydrates
319. Which is a source of vitamin B₁₂?
 a. Animal source b. Plant source
 c. Milk d. Fruits
320. Which is the percentage of formalin used for histopathological preservative?
 a. 5% b. 10%
 c. 20% d. 40%
321. Manganese deficiency leads to?
 a. Parkinsonism
 b. Impaired skeletal growth
 c. Impaired glucose tolerance
 d. Anaemia
322. Which stain is used for fat?
 a. Oil red-O b. Congo red
 c. Perl stain d. PAS
323. Fluorescein stain color is –
 a. Blue b. Pink
 c. Green d. Red
324. Which stain is not used for lipids?
 a. Oil red O b. Congo red
 c. Sudan III d. Sudan black
325. Group 120 antigen on HIV surface will lead to?
 a. Fusion b. Attachment
 c. Resistance d. Virus entry
326. Treatment for Asymptomatic HIV is done when CD4 count is below:
 a. 200 b. 350
 c. 400 d. 500

BOARD REVIEW QUESTIONS

327. Most commonly involved organ in graft versus host disease are all EXCEPT?
 a. Gut b. Liver
 c. Skin d. Kidney
328. Herring bodies are seen in?
 a. Pars tuberalis b. Pars intermedia
 c. Pars nervosa d. All of the above
329. Sterile vegetation are seen in all EXCEPT?
 a. SLE b. Infective endocarditis
 c. Rheumatic fever d. Marantic endocarditis
330. Kimmelstiel wilson lesion is characteristic of?
 a. Diabetic nephropathy b. Hypertensive nephropathy
 c. HIV nephropathy d. Analgesic nephropathy
331. HER-2/NEU receptor gene mutation is seen in which cancer?
 a. Squamous cell carcinoma
 b. Breast cancer
 c. Glioblastoma
 d. All of the above
332. Reilly bodies are seen in?
 a. Gangliosidosis b. Behçet's disease
 c. Gaucher's disease d. Hurler disease
333. Cigar bodies are seen in?
 a. Sporotrichosis b. Chromoblastomycosis
 c. Mycetoma d. Basidiomycosis
334. Histopathology of mitral valve prolapse shows what kind of change?
 a. Myxomatous b. Fibrinoid
 c. Granulomatous d. Fibrous
335. Thalassemia shows which kind of inheritance?
 a. Autosomal recessive b. Autosomal dominant
 c. X-linked recessive d. X-linked dominant
336. Range of micro albuminuria is?
 a. 10-99 mg/day b. 20-199 mg/day
 c. 30-299 mg/day d. 40-399 mg/day
337. Which of the following is an anti-apoptotic gene?
 a. C-myc b. p53
 c. bcl-2 d. bax
338. Enzyme that protects the brain from free radical injury is:
 a. Myeloperoxidase b. Superoxide dismutase
 c. MAO d. Hydroxylase
339. Which of the following helps in generating oxygen burst in the neutrophils?
 a. NADPH oxidase b. Superoxide dismutase
 c. Catalase d. Glutathione peroxidase

- 340. Heterotopic calcification occurs in**
 a. Ankylosing spondylitis
 b. Reiter's syndrome
 c. Rheumatoid arthritis
 d. Gouty arthritis
- 341. Neutrophil secretes:**
 a. Superoxide dismutase b. Lysosomal enzyme
 c. Catalase d. Cathepsin G
- 342. Liquefactive necrosis is typically seen in**
 a. Ischemic necrosis of the heart
 b. Ischemic necrosis of the brain
 c. Ischemic necrosis of the intestine
 d. Tuberculosis
- 343. Psammoma bodies show which type of calcification?**
 a. Metastatic b. Dystrophic
 c. Secondary d. Any of the above
- 344. "Russel's body" are accumulation of**
 a. Cholesterol b. Immunoglobulins
 c. Lipoproteins d. Phospholipids
- 345. Dystrophic calcification is seen in**
 a. Atherosclerosis b. Paget's disease
 c. Renal osteodystrophy d. Milk-alkali syndrome
- 346. Nitroblue tetrazolium test is used for?**
 a. Phagocytes b. Complement
 c. T cell d. B cell
- 347. Interleukin secreted by macrophages, stimulating lymphocytes is:**
 a. INF alpha b. TNF alpha
 c. IL-1 d. IL-6
- 348. Absolute lymphocytosis is seen in**
 a. SLE b. T.B.
 c. CLL d. Brucellosis
- 349. Which complement fragments are called 'anaphylatoxins'?**
 a. C3a and C3b b. C3b and C5b
 c. C5a and C3b d. C3a and C5a
- 350. First sign of wound injury is:**
 a. Epithelization b. Dilatation of capillaries
 c. Leukocytic infiltration d. Localized edema
- 351. Birbeck's granules in the cytoplasm are seen in**
 a. Langerhans cells b. Mast cells
 c. Myelocytes d. Thrombocytes
- 352. Virchow's triad includes all EXCEPT?**
 a. Injury to vein b. Venous thrombosis
 c. Venous stasis
 d. Hypercoagulability of blood
- 353. Heart failure cells are found in:**
 a. Myocardium b. Lung
 c. Liver d. Spleen
- 354. White infarcts are seen in the following EXCEPT**
 a. Liver b. Kidney
 c. Spleen d. Heart
- 355. Lines of Zahn are found in**
 a. Thrombus
 b. Infarct tissue
 c. Postmortem clot
 d. All
- 356. The approximate number of genes contained in the human genome is:**
 a. 40,000 b. 30,000
 c. 80,000 d. 1,00,000
- 357. Catastrophic variant of Ehler Danlos syndrome is**
 a. I b. II
 c. III d. IV
- 358. Barr Body is not seen in:**
 a. Klinefelter syndrome b. Turner syndrome
 c. Normal female d. XXX syndrome
- 359. Arthus reaction is what type of hypersensitivity reaction?**
 a. Localized immune complex
 b. Ag – Ab reaction
 c. Compliment mediated
 d. Ab mediated
- 360. What is the best method for confirming amyloidosis?**
 a. Colonoscopy b. Abdominal fat pad biopsy
 c. Rectal biopsy d. Tongue biopsy
- 361. Which one of the following stains is specific for Amyloid?**
 a. Periodic Acid Schiff (PAS)
 b. Alizarin red
 c. Congo red
 d. Von – Kossa
- 362. Antigen presenting cells are**
 a. Langerhan's cell b. Macrophage
 c. Cytotoxic T cells d. Helper T cells
 e. B lymphocyte
- 363. Perforins are produced by**
 a. Cytotoxic T cells b. Suppressor T cells
 c. Memory helper T cells d. Plasma cells
 e. NK cells
- 364. A man develops rashes after consuming sea food. It is due to**
 a. IgE mediated response b. Complement activation
 c. Cell mediated response d. None of the above
- 365. LE cell phenomenon is seen in**
 a. Lymphocyte b. Neutrophil
 c. Monocyte d. Eosinophil
- 366. Onion peel appearance of splenic capsule is seen in**
 a. SLE b. Scleroderma
 c. RA d. Sjogren syndrome
- 367. Lardaceous spleen is due to deposition of amyloid in**
 a. Sinusoids of red pulp
 b. White pulp
 c. Pencillary artery
 d. Splenic trabeculae

- 368. Which of the following type of hypersensitivity reaction occurs in Farmer's lung?**
 a. Type I b. Type II
 c. Type III d. Type IV
- 369. CD3 is a marker for**
 a. Monocyte b. T cell
 c. B cell d. None
- 370. Autoimmune hemolytic anemia is seen in**
 a. ALL b. AML
 c. CLL d. CML
- 371. Earliest feature of correction of iron deficiency anemia is**
 a. Reticulocytosis
 b. Increase in serum ferritin
 c. Increase in RBC count
 d. Increase in serum iron level immediately
- 372. Hypersegmented neutrophils are seen in**
 a. Thalassemia b. Iron deficiency
 c. Megaloblastic anemia d. All
- 373. Howell Jolly bodies are seen in**
 a. Alcoholics b. Cirrhosis
 c. Nephrotic syndrome d. Post splenectomy
- 374. Storage form of Iron in body is**
 a. Ferritin b. Transferrin
 c. Ceruloplasmin d. None
- 375. Microcytic hypochromic anemia is seen in**
 a. Hereditary spherocytosis
 b. Thalassemia major
 c. Iron deficiency anemia
 d. Pernicious anemia
- 376. "Pappenheimer" bodies are composed of:**
 a. Copper b. Iron
 c. Lead d. Zinc
- 377. The most common site of Ectopic Pheochromocytoma is:**
 a. Organ of zuckerkandl b. Bladder filum terminate
 c. Filum terminate d. Celiac plexus
- 378. "HMB 45" is a marker for:**
 a. Sarcoma b. Melanoma
 c. Carcinoma d. None of the above
- 379. In Nephrotic syndrome all of the following proteins are reduced EXCEPT?**
 a. Transferrin b. Albumin
 c. Fibrinogen d. Ceruloplasmin
- 380. Arthritis "mutilans" is a feature of**
 a. Dermatomyositis b. Psoriasis
 c. SLE d. Tinea versicolor
- 381. Marker for Hairy cell Leukemia is**
 a. CD 30 b. CD 103
 c. CD1 d. CD4
- 382. "Berger Nephropathy" is due to mesangial deposition of:**
 a. Fibrin and C3 b. IgD and C3
 c. IgE and C3 d. IgA and C3
- 383. Which of the following is not Premalignant:**
 a. FAP b. PZ syndrome
 c. Juvenile polyp d. Juvenile polyp syndrome
- 384. "Michaelis Gutmann" Bodies are seen in:**
 a. Malakoplakia b. Nail Patella syndrome
 c. Leukoplakia d. Pyelonephritis
- 385. Which is an example of apoptosis?**
 a. Council man bodies b. Gamma Gandy body
 c. Russel body d. None of the above
- 386. "Nut meg" liver is seen in:**
 a. CVC liver b. Liver infarction
 c. Amyloidosis d. Budd chiari syndrome
- 387. The Common "Primary" Tumor of Heart is**
 a. Rhabdomyoma b. Fibroma
 c. Myxoma d. Lipoma
- 388. The commonest site of diverticulosis is:**
 a. Ascending colon b. Transverse colon
 c. Descending colon d. Sigmoid colon
- 389. "Gamma Gandy" bodies contains hemosiderin and:**
 a. Na⁺ b. Ca⁺⁺
 c. Mg⁺⁺ d. K⁺
- 390. Chromosomes 15, 17 translocation is seen in which leukemia?**
 a. APML b. CML
 c. CLL d. None of the above
- 391. Most common cause of Aortic Aneurysm is:**
 a. Atherosclerosis b. Syphilis
 c. Trauma d. Congenital
- 392. APUD cells are seen in:**
 a. Bronchial adenoma
 b. Bronchial carcinoid
 c. Hepatic adenoma
 d. Villous adenoma
- 393. Spontaneous regression though rare is seen in:**
 a. Burkitt's lymphoma b. Wilm's tumor
 c. Neuroblastoma
 d. Melanoma
- 394. Immunoglobulin present in local secretions is?**
 a. IgG b. IgA
 c. IgM d. IgD
- 395. Guardian angel against obesity is the name given to?**
 a. Adiponectin b. Fibronectin
 c. HDL d. Insulin
- 396. LAP score is maximum in?**
 a. CML
 b. AML
 c. Essential thrombocytosis
 d. Polycythemia vera
- 397. Hyperplasia of smooth muscle of airway is seen in?**
 a. Emphysema b. Asthma
 c. Alveolar proteinosis d. Bronchiectasis

- 398. CD marker of Angiosarcoma is?**
a. CD 10 b. CD 19
c. CD 25 d. CD 31
- 399. CD marker of Langerhans histiocytosis is?**
a. CD 17 b. CD 23
c. CD 1a d. CD 117
- 400. Gene responsible for mutation of HBV is?**
a. X gene b. S gene
c. P gene d. C gene
- 401. Michaelis gutmann bodies are found in?**
a. Malakoplakia
b. Xanthogranulomatous pyelonephritis
c. Nail patella syndrome
d. Xanthelesma
- 402. Dohle bodies are seen in?**
a. Lysosomes b. Endoplasmic reticulum
c. Mitochondria d. Toxic neutrophil granules
- 403. Which is the most common site of Mc Callum's patch?**
a. Right atrium b. Left atrium
c. Left ventricle d. Right ventricle
- 404. Which is the predominant cell after 72 hours of myocardial infarction?**
a. Neutrophile b. Lymphocyte
c. Macrophages d. Mast cells
- 405. Histopathology of a lung cancer shows 'clara cells' probable diagnosis is:**
a. Squamous cell cancer b. Bronchio alveolar cancer
c. Large cell cancer d. Papillary carcinoma
- 406. Bronchogenic carcinoma commonly metastasises to which endocrine organ?**
a. Ovaries b. Testes
c. Thyroid d. Adrenals
- 407. Small cell cancer commonly metastasizes to**
a. Brain b. Liver
c. Bone d. Kidney
- 408. Linitis plastica is seen in all except:**
a. Syphilis b. Ca stomach
c. Sarcoidosis d. Leiomyosarcoma
- 409. Nesidioblastoma is due to hyperplasia of**
a. Alpha cell b. Beta cell
c. Acinus d. D cells
- 410. Garre's osteomyelitis commonly involves:**
a. Jaw b. Femur
c. Ribs d. Small bones of hand
- 411. Gomori's aldehyde fuchsin specifically stains**
a. Insulin b. Glucagon
c. Lipase d. Amylase
- 412. The thinnest portion of myocardial wall is the**
a. Left ventricle b. Left atrium
c. Right atrium d. B and C
- 413. Prion includes**
a. DNA and RNA b. Only RNA
c. Proteins d. Only DNA
- 414. Reticular pattern is seen in:**
a. Sarcoma
b. Lymphoma
c. Carcinoma
d. None
- 415. Microdeletion is seen in?**
a. Beta Thalassemia
b. Di George syndrome
c. Marfan's syndrome
d. All
- 416. In malignant hypertension necrosis is of which type?**
a. Caseous Necrosis
b. Fibrinoid necrosis
c. Liquifactive necrosis
d. Coagulative necrosis
- 417. Marfan's syndrome is due to defect of?**
a. Elastin b. Collagen
c. Fibrillin d. Laminin
- 418. Kaposi sarcoma is related to which virus?**
a. HPV 16 b. HHV-8
c. EBV d. CMV
- 419. CA 125 is used for?**
a. Follow up of ovarian cancer
b. Diagnosis of pancreatic cancer
c. Diagnosis of stomach cancer
d. Diagnosis of ovarian cancer
- 420. Stem cells are taken from?**
a. Skin
b. Bone marrow
c. Oral mucosa
d. Elementary tract
- 421. Ehler Danlos syndrome is due to defect in?**
a. Elastin b. Collagen
c. Keratin d. Laminin
- 422. Interleukin responsible for pyrexia is?**
a. IL1 b. IL6
c. INF gamma d. IFN alpha
- 423. CD marker for Langerhan's Histiocytosis is?**
a. CD 17 b. CD 23
c. CD 1a d. CD 117
- 424. Teratozoospermia refers to?**
a. Absence of semen
b. Absence of sperm
c. All dead sperms in ejaculate
d. Morphologically defective sperms
- 425. Rise in hemoglobin levels after one unit of whole blood transfusion is?**
a. 0.55 b. 1%
c. 1.5% d. 2%

426. In massive transfusion of blood, citrate toxicity is primarily due to?
- Hemolysis
 - Coagulopathy
 - DIC
 - Direct binding to calcium
427. "Orphan Annie eye nuclei" is seen in?
- Papillary carcinoma of thyroid
 - Medullary carcinoma of thyroid
 - Anaplastic carcinoma of thyroid
 - Follicular carcinoma of thyroid
428. Duchenne muscular dystrophy is?
- Autosomal recessive
 - Autosomal dominant
 - X linked recessive
 - X linked dominant
429. Tuberous sclerosis is inherited as?
- Autosomal dominant
 - Autosomal recessive
 - X linked dominant
 - X linked recessive
430. In adults, most common autoimmune disease of liver is?
- Autoimmune hepatitis
 - Sclerosing cholangitis
 - al antitrypsin deficiency
 - Primary biliary cirrhosis
431. Which of the following causes malignant mesothelioma?
- Smoking
 - Asbestosis
 - Silicosis
 - Pneumoconiosis
432. Tumor marker CA 15-3 is associated with?
- Ovary
 - Breast
 - Prostate
 - Kidney
433. MIC-2 is a marker of?
- Ewing sarcoma
 - Chronic lymphocytic leukemia
 - Mantle Cell Lymphoma
 - All of these
434. Ferruginous bodies are seen in?
- Sarcoidosis
 - Silicosis
 - Asbestosis
 - Coal worker's pneumoconiosis
435. Pathology in wet lung is?
- Diffuse alveolar damage
 - Surfactant deficiency
 - Collection of pus
 - Hemorrhage in lungs

IMAGE-BASED QUESTIONS

340

436. The image shows presence of?

- a. Howell Jolly bodies
- b. Heinz bodies
- c. Cabot rings
- d. Pappenheimer's Bodies

439. Identify the cell

- a. Gaucher cell
- b. Reed Sternberg cell
- c. Anitschkow Cell
- d. Pop-corn cell

437. Identify the cell marked

- a. Orphan Annie eye nucleus
- b. Reed Sternberg cell
- c. Owl eye inclusions
- d. Russel bodies

440. Spot the diagnosis

- a. Iron deficiency anaemia
- b. Thalassemia
- c. Acute leukemia
- d. Hodgkin Lymphoma

438. What is the diagnosis?

- a. Lymphoblast
- b. Myeloblast
- c. Megakaryoblast
- d. Normoblast

441. The following image shows

- a. Hairy cell Leukaemia
- b. Target cell
- c. Acanthocyte
- d. Pseudo-Pelger Huet anomaly

442. The following image shows presence of:

- a. Target cell
- b. Schistocyte
- c. Sickle cell
- d. Spherocyte

445. Which is true about the image shown?

- a. Hyaline arteriosclerosis
- b. Hyperplastic arteriosclerosis
- c. Monckeberg's arteriosclerosis
- d. Fibrinoid necrosis

443. What is correct about the histopathological slide?

- a. Lipofuscin in cardiac tissue
- b. Melanin in cardiac tissue
- c. Hemosiderin in kidney tubules
- d. Hemopexin in hepatocytes

446. The histopathological slide shows

- a. Coagulative necrosis
- b. Liquefactive necrosis
- c. Caseous necrosis
- d. Fat necrosis

444. Which is true about the image shown?

- a. Monckeberg's arteriosclerosis
- b. Hyaline arteriosclerosis
- c. Hyperplastic arteriosclerosis
- d. Fibrinoid necrosis

447. Postmortem lung specimen of a patient who developed severe respiratory distress and petechiae after fracture of shaft of femur is given below. All are true about the condition given below EXCEPT?

- a. Oil Red O stain for fat
- b. Noncardiogenic pulmonary edema
- c. Gurd criteria
- d. Diffuse white matter petechial hemorrhage

448. Kidney biopsy depicted in the image shows

- a. Focal segmental glomerulosclerosis
- b. Nodular glomerulosclerosis
- c. Armani-ebstein changes
- d. Membranoproliferative glomerulonephritis

451. Identify the RBC shown in the figure

- a. Acanthocyte
- b. Echinocyte
- c. Schistocyte
- d. Spherocyte

449. The following liver specimen shows?

- a. Postnecrotic cirrhosis
- b. Dubin-Johnson syndrome
- c. Miliary tuberculosis (TB)
- d. Nutmeg liver

452. A 6-year-old boy presents with acute abdomen and non-healing ulcer on medial malleolus. Peripheral smear is shown. The most likely cause of this condition is?

- a. Trinucleotide repeat
- b. Antibody to RBC membrane
- c. Substitution of single amino acid base
- d. Genomic imprinting

450. All are true about the marking X in histopathological specimen from a patient of fatty liver EXCEPT?

- a. Eosinophilic aggregates of prekeratin
- b. Intracellular inclusions
- c. Best visualised with Masson trichrome
- d. Also seen in Indian childhood cirrhosis

453. What is your diagnosis on the basis of image given?

- a. Langerhans cell histiocytosis
- b. Plasmacytoma
- c. Viral encephalitis
- d. Leukemia

454. A 45-year-old person presents with complaint of paraesthesia in hand and feet with progressive spastic weakness. On examination absent ankle jerk with Babinski sign is noted. Peripheral smear is given below. The diagnosis is

- a. Lead poisoning b. Macrocytic anemia
c. Miller fisher syndrome d. Devis's disease

457. Which stain is preferred to diagnose these RBC inclusions seen in patients with elevated serum ferritin and serum iron?

- a. Perl stain b. Rubeanic acid
c. Supravital stain d. Congo red

455. Spot the diagnosis

- a. Lead poisoning
b. Macrocytic anemia
c. Howell-Jolly bodies
d. Heinz bodies

458. The following RBC inclusion is composed of?

- a. DNA b. RNA
c. Iron d. Denatured hemoglobin

456. A 6-year-old child presents with lethargy and abdominal pain. Hemoglobin is 8 g% with increased serum iron and increased serum ferritin. Peripheral smear is shown. Which is correct about the image?

- a. Pappenheimer body b. Heinz body
c. Lead poisoning d. Howell-Jolly body

459. The following RBC inclusions are seen in?

- a. HbH disease b. Hemoglobin Barts
c. Pernicious anemia d. Malaria

460. The following image shows presence of?

- a. Dohle bodies
- b. Toxic granules
- c. Critical green inclusions
- d. Normal inclusions

463. Identify the cell

- a. Eosinophil
- b. Basophil
- c. Monocyte
- d. Lymphocyte

461. A 70-year-old man presents with painless cervical lymphadenopathy with progressive pallor and petechiae on ankles. Peripheral smear shows presence of?

- a. Acute ITP
- b. Chronic ITP
- c. CLL
- d. Richter syndrome

464. Identify the cell

- a. Eosinophil
- b. Basophil
- c. Neutrophil
- d. Monocyte

462. Which will the patient with following peripheral smear and X-ray spine present with?

- a. Hand Foot syndrome
- b. Black urine
- c. Elevated haptoglobin
- d. Splenomegaly with gall stones

465. Name the test given

- a. Osmotic fragility
- b. NESTROFT
- c. Sickling test
- d. ESR measurement

466. Name the anticoagulant used in the following method?

- a. EDTA
- b. Heparin
- c. Trisodium citrate
- d. Dalteparin

468. The image shows electrophoresis report of multiple myeloma. The spike is present in?

- a. Alpha 1 globulin
- b. Alpha 2 globulin
- c. Beta globulin
- d. Gamma globulin

467. This test is used as a screening tool for?

Negative

Positive

- a. Hereditary spherocytosis
- b. G6PD
- c. Thalassemia
- d. Megaloblastic anemia

469. The following image shows:

- a. Microcytic hypochromic cells
- b. Evidence of hemolysis
- c. Sickling crisis
- d. Rouleaux formation

470. Comment on the histopathological specimen

- a. Teratoma
- b. Rhabdomyoma
- c. Rhabdomyosarcoma
- d. Neuroblastoma

ANSWERS WITH EXPLANATIONS

346

MOST RECENT QUESTIONS 2019

1. Ans. (b) Muscle intimal elastic lamina layer defect

Ref: Harrison 20th, P 2084

As an aneurysm develops, it typically forms a neck with a dome. The length of the neck and the size of the dome vary greatly and are important factors in planning neurosurgical obliteration or endovascular embolization. The arterial internal elastic lamina disappears at the base of the neck. The media thins, and connective tissue replaces smooth-muscle cells. At the site of rupture (most often the dome), the wall thins, and the tear that allows bleeding is often ≤ 0.5 mm long. Aneurysm size and site are important in predicting risk of rupture. Those >7 mm in diameter and those at the top of the basilar artery and at the origin of the posterior communicating artery are at greater risk

2. Ans. (a) Asbestosis

Ref: Harrison 20th edition page 691; Robbins 9th edition, Page 1978

Pleural thickening and calcification are a feature of asbestosis. The history of occupational exposure further helps in diagnosis

3. Ans. (a) Trisomy 16

Ref: Nelson 20th edition, Page 615

The most common autosomal aneuploidy leading to spontaneous abortion is trisomy 16.

4. Ans. (c) Post infectious Glomerulonephritis) Trisomy 16

Ref: Harrison 20th edition, P 2137

- Choices A, B and D present as Nephrotic syndrome
- Post infectious Glomerulonephritis occurs after skin and throat infection with particular M types of streptococci.
- Post streptococcal glomerulonephritis due to impetigo develops 2-6 weeks after skin infection and 1-3 weeks after streptococcal pharyngitis. The renal biopsy shows subepithelial deposits which appear as humps.

5. Ans. (c) Acute viral hepatitis with infectivity

Ref: Harrison 20th edition, P 2350

- The presence of HBsAg indicates replication of virus and high infectivity of the patient.

- Choice A requires HBsAg positivity with IgM anti HbcAg positivity
- Choice B requires HBsAg positivity with IgG anti HbcAg positivity
- Choice D will have only IgG anti- HBcAg indicating past infection.

6. Ans. (b) HCV

Ref: CMDT 2019, P 698

- Most common cause of chronic viral hepatitis is Hepatitis C
- Leading cause of transfusion of associated hepatitis is Hepatitis B.
- Leading cause of fulminant viral hepatitis is hepatitis D (superinfection).
- Leading cause of Fulminant viral hepatitis in pregnancy is hepatitis E.

7. Ans. (c) <6 months

Ref: Bailey and Love: 26th edition, P 1410

Rejection Stage	Pathogenesis	Time Course
Hyperacute	Antibody mediated due to pre-existing antibodies, resulting in complement activation and thrombosis	Minutes to hours
Acute	Acute cellular rejection due to activated lymphocytes Humoral rejection due to antidonor antibodies produced after transplant	First 6 months
Chronic	Antibody and cell-mediated rejection	Months to years

8. Ans. (a) Pernicious anaemia

Ref: Robbins Pathology E-Book, P 139

- Pernicious anaemia is associated with anti-parietal cell antibodies and is an example of type 2 hypersensitivity reaction.
- Choice B and C are type 3 hypersensitivity reactions.
- Choice D is type 4 hypersensitivity phenomenon.

Extra Mile

Disease	Target Antigen	Mechanisms of Disease	Clinicopathologic Manifestations
Autoimmune hemolytic anemia	Red blood cell membrane proteins	Opsonization and phagocytosis of red blood cells	Hemolysis. anemia
Autoimmune thrombocytopenic purpura	Platelet membrane proteins (GpIIb/IIIa integrin)	Opsonization and phagocytosis of platelets	Bleeding
Pemphigus vulgaris	Proteins in intercellular junctions of epidermal cells (desmogleins)	Antibody-mediated activation of proteases, disruption of intercellular adhesions	Skin vesicles (bullae)
Vasculitis caused by ANCA	Neutrophil granule proteins, presumably released from activated neutrophils	Neutrophil degranulation and inflammation	Vasculitis
Goodpasture syndrome	Protein in basement membranes of kidney glomeruli and lung alveoli	Complement- and Fc receptor—mediated inflammation	Nephritis. lung hemorrhage
Acute rheumatic fever	Streptococcal cell wall antigen: antibody cross-reacts with myocardial antigen	Inflammation. macrophage activation	Myocarditis. arthritis
Myasthenia gravis	Acetylcholine receptor	Antibody inhibits acetylcholine binding. down-modulates receptors	Muscle weakness, paralysis
Graves disease (hyperthyroidism)	TSH receptor	Antibody-mediated stimulation of TSH receptors	Hyperthyroidism
Pernicious anemia	Intrinsic factor of gastric parietal cells	Neutralization of intrinsic factor, decreased absorption of vitamin B12	Abnormal erythropoiesis. anemia

9. Ans. (a) **Thermophilic Actinomycetes**

Ref: Harrison 20th edition, P 1970

Farmer's lung is a hypersensitivity pneumonitis which is caused by thermophilic actinomycetes. The same organism grows on sugarcane dust and is the antigen leading to Bagassosis.

Disease	Antigen	Source
Farming/Food Processing		
Farmer's lung	Thermophilic Actinomycetes (e.g., <i>Saccharopolyspora rectivirgula</i>); fungus	Grain, moldy hay, silage Sugarcane
Bagassosis	Thermophilic actinomycetes	

10. Ans. (a) **Malaria**

Ref: Manson Tropical diseases: 23rd edition, P 1237

The peripheral smear shows banana-shaped gametocyte of *falciparum malaria*.

11. Ans. (a) **Bacteria**

Ref: CMDT 2019, P 647

Whipple's disease is caused by *Tropheryma whipplei* which is an intra-cellular rod shaped gram positive bacteria found in macrophages of the gut. The lamina propria of gut harbours macrophages inside which these bacteria are demonstrated using PAS stain. The small intestinal malabsorption occurs in these patients leading to osmotic diarrhea. The investigation of choice is Small intestinal mucosal biopsy/ Duodenal biopsy.

FMGE Solutions Screening Examination

12. Ans. (a) Lung cancer

Ref: Bailey and Love 26th edition, P 614

The leading cause of brain metastasis is lungs > Breast > Melanoma

TABLE Tissue of origin for brain metastases (approximate).

Origin	Percentage
Lung	40
Breast	15
Melanoma	10
Renal/GU	10
Other Unknown	25

13. Ans. (a) Hypophosphatemia

Ref: Harrison 20th edition, P 519

- Hyperphosphatemia can be caused by the release of intracellular phosphate pools by lysis of tumour cells.
- It produces a reciprocal depression in serum calcium, which causes severe neuromuscular irritability and tetany.
- Deposition of calcium phosphate in the kidney and hyperphosphatemia may cause renal failure. Potassium is the principal intracellular cation, and massive destruction of malignant cells may lead to hyperkalemia.
- The break-down of DNA from nucleus will produce urate crystals that will block kidney tubules and lead to urate nephropathy.

14. Ans. (c) Multiple myeloma

Ref: CMDT 2019, P 546

Vitamin D3 intoxication	Ruled out as serum vitamin D3 levels are elevated
Hyperparathyroidism	Ruled out as PTH are elevated
Multiple Myeloma	Myeloma cells produce IL-6 leading to enhanced osteoclastic activity. SAP hence remains normal while the enhanced osteoclastic activity leads to increased serum calcium values.
Nutritional rickets	Leads to low calcium and less vitamin D3 levels

15. Ans. (b) Phytates

Ref: Harrison 20th edition, P 684

Iron deficiency is a major world health problem, that is, to a great extent, caused by poor iron absorption from the diet. Several dietary factors can influence this absorption.

Absorption enhancing factors are ascorbic acid and meat, fish and poultry; inhibiting factors are plant components in vegetables, tea and coffee (e.g., polyphenols, phytates), and calcium.

16. Ans. (a) Troponin

Ref: Harrison 20th edition, P 384

Cardiac specific markers of myocardial damage include quantitative determination of CK-MB, Troponin I and Troponin T. Troponins can become elevated by 3 hours. The circulating values remain elevated up to a week.

17. Ans. (a) ASO

Ref: Nelson 20th edition, P 1333

Because other illnesses may closely resemble Acute rheumatic fever, antecedent group A Streptococcal Infection is needed whenever possible. The tests are

- Increasing or rising Anti-Streptolysin O titer or other streptococcal antibodies indicates recent streptococcal infection
- A Positive throat Culture
- A Positive Rapid group streptococcal carbohydrate antigen test in a child

Extra Mile

TABLE: Guidelines for the Diagnosis of Initial or Recurrent Attack of Rheumatic Fever (Jones Criteria, Updated 20'15)¹

Major manifestations	Minor manifestations	Supporting evidence of antecedent group A streptococcal infection
Carditis Polyarthritis Erythema marginatum Subcutaneous nodules Chorea	Clinical features: Arthralgia Fever Laboratory features: Elevated acute phase reactants: Erythrocyte sedimentation rate C-reactive protein Prolonged P-R interval	Positive throat culture or rapid streptococcal antigen test Elevated or increasing streptococcal antibody titer

18. Ans. (a) Thymoma

Ref: Bailey and Love, 26th edition, P 868

Most common anterior mediastinum tumour is thymoma. Choice B is seen in posterior mediastinum. Choice C and D are found in middle mediastinum.

19. Ans. (a) Kimmelstein Wilson disease

Ref: Robbins basic pathology , E-Book, P 781

- Nodular glomerulosclerosis is also called inter-capillary glomerulosclerosis or Kimmelstiel-Wilson disease.

- It presents as ovoid, spherical, laminated hyaline masses in periphery of the glomerulus. It is PAS+ and finally obliterates the glomerular tuft.
- It is specific for diabetes mellitus, membranoproliferative glomerulonephritis, light chain disease and amyloidosis.

20. Ans. (a) NK cell

Ref: Robbins review E-Book, P 67

- NK cells have the ability to respond without prior sensitization.

- They carry receptors for MHC class I molecules which inhibit their lytic function. When expression of class I MHC molecules is reduced on a cell surface by viral interference, inhibitory receptors on NK cells do not receive a negative signal and the targeted cells are destroyed.
- NK cells have CD16, Fc receptor that allows them to bind to opsonised cells and lyse them. This is a form of type II hypersensitivity with antibody mediated disease.

21. Ans. (a) Serum Ferritin

Ref: CMDT 2019, P 512

- Low ferritin levels < 12 ng/ ml is a highly reliable indicator of reduced iron stores. Serum ferritin can increase in response to inflammation and hence normal or elevated ferritin level does not exclude diagnosis of IDA.
- As iron deficiency progresses iron levels will be less than 30 mcg/dl and transferrin levels rise to compensate.
- The elevated transferrin leads to lower saturation to < 15%.

22. Ans. (a) Endocardial cushion defect

Ref: Nelson 20th edition, P 2165

SYNDROME	FEATURES
CHROMOSOMAL DISORDERS Trisomy 21 (Down syndrome) Trisomy 21 p (cat eye syndrome) Trisomy 18 Trisomy 13	Endocardial cushion defect, VSD, ASD Miscellaneous, total anomalous pulmonary venous return VSD, ASD, PDA, coarctation of aorta, bicuspid aortic or pulmonary valve VSD, ASD, PDA, coarctation of aorta, bicuspid aortic or pulmonary valve

23. Ans. (a) Mycoplasma pneumoniae

Ref: Harrison 20th edition, P 910

- Atypical bacterial pneumonia is caused by atypical organisms that are not detectable on Gram stain and cannot be cultured using standard methods.
- The most common organisms are Mycoplasma pneumoniae, Chlamydia pneumoniae, and Legionella pneumophila. Atypical bacterial pneumonia generally is characterised by a symptom complex that includes headache, low-grade fever, cough, and malaise.
- CAP is caused by pneumococcus. If question says hospitalized patient of CAP the answer is still pneumococcus. Do not confuse with word hospital acquired pneumonia which is caused by Staphylococcus aureus.

FMGE Solutions Screening Examination

350

Extra Mile

TABLE Microbial Causes of Community-Acquired Pneumonia, by Site of Care

Outpatients	Hospitalized Patients	
	Non-ICU	ICU
<i>Streptococcus pneumoniae</i> <i>Mycoplasma pneumoniae</i> <i>Haemophilus influenzae</i>	<i>S. pneumoniae</i> <i>M. pneumoniae</i> <i>Chlamydia pneumoniae</i> <i>H. influenzae</i>	<i>S. pneumoniae</i> <i>Staphylococcus aureus</i> <i>Legionella</i> spp. Gram-negative bacilli

24. Ans. (a) High ferritin

Ref: CMTD 2019, P 512

- Anemia of chronic disease leads to release of Hepcidin from the liver.
- Hepcidin leads to inhibition of release of iron from stores leading to stores/ ferritin being normal to increased since consumption is reduced.
- TIBC shows an inverse relation to serum ferritin always and hence is reduced.

Variable	Anemia of Chronic Disease	Iron-Deficiency Anemia
Iron	Reduced	Reduced
Transferrin	Reduced to normal	Increased
Transferrin saturation	Reduced	Reduced
Ferritin	Normal to increased	Reduced
Soluble transferrin receptor	Normal	Increased
Ratio of soluble transferrin receptor to log ferritin	Low (<1)	High (>2)
Cytokine levels	Increased	Normal

CELL INJURY AND INFLAMMATION

25. Ans. (a) Cat scratch disease

Ref: Robbins E-Book, P 462

- Cat-scratch disease is a nodal manifestation of infection by *Bartonella henselae* characterized by necrotizing granulomatous inflammation exhibiting a characteristic stellate shape.

26. Ans. (d) Syndecan

Ref: Robbins E-book, P 22-23

- Choice A, B and C are Glycosaminoglycans and hence are ruled out.
- Proteoglycans have core proteins or glycoproteins with large GAG side-chains and they participate in cell-cell and cell-matrix interactions, cell proliferation, and migration associated with wound healing.
- Proteoglycans involved in wound healing are:

- Small leucine-rich Proteoglycans
- Glypicans
- Versican-v3 isoform
- Perlecan
- Syndecans-1 and syndecans-4

27. Ans. (c) Granulation tissue

Ref: Robbins E-book, P 95

- Secondary healing is where a full-thickness wound is allowed to close and heal. It results in an inflammatory response that is more intense than with primary wound healing.
- In addition, a larger quantity of granulation tissue is fabricated because of the need for wound closure.
- Secondary healing results in pronounced contraction of wounds. Fibroblastic differentiation into myofibroblasts, which resemble contractile smooth muscle, is believed to contribute to wound contraction. These myofibroblasts are maximally present in the wound from the 10th – 21st days.

28. Ans. (a) Selectins

Ref: Robbins 9th ed. P 75-78

TABLE: Three phases of leucocyte recruitment at the sites of inflammation

Leukocyte adhesion to endothelium	Transmigration of diapedesis	Chemotaxis of leukocytes
<ul style="list-style-type: none"> • Margination:^Q Leukocyte flow peripherally along endothelial surface at inflamed site (normal location—axial) 	<ul style="list-style-type: none"> • Leukocyte migration through endothelium 	<ul style="list-style-type: none"> • Leukocytes migration in the tissues toward the site of injury is called as chemotaxis
<ul style="list-style-type: none"> • Rolling^Q (transient adhesion) of leucocytes to endothelium—mediated by selectins {leukocytes (L-selectin^Q, endothelium (E-selectin^Q, and on platelet and endothelium (P-selectin^Q)}^Q 	<ul style="list-style-type: none"> • Mediated by CD31 or PECAM-1 (platelet endothelial cell adhesion molecule)^Q 	Examples: Exogenous chemo attractants —bacterial products Endogenous chemo attractants —IL-8, C5a and leukotriene B4 (LTB4) ^Q
<ul style="list-style-type: none"> • Firm adhesion^Q of leucocytes of endothelium—brought about by integrins 		

29. Ans. (c) Cerebrum

Ref: Robbins 9th ed. P 41-44

Liquefactive/colliquative necrosis occurs due to digestion of dead cells and results in transformation of tissue into liquid viscous mass. The most common site involved is central nervous system.

30. Ans. (a) G1S

Ref: Robbins 9th ed. P 25-26, 292-293

- The guardian of genome mediates cell cycle arrest. It occurs in *late G1 phase* and is caused by p53 dependent transcription of CDK1.
- This prevents phosphorylation of RB essential for cells to enter G1 phase.
- Such a pause in cell cycling is welcome as it gives some breathing time for cells to repair the DNA damage.

**FIGURE:** Various check points in cell division cycle**31. Ans. (b) Bcl**

- The major mechanism of intrinsic mitochondrial pathway of apoptosis is by pro- and anti-apoptotic members of *bcl* proteins.
- Bcl protein was first detected on B cell lymphoma and hence its name.
- It is located on mitochondrial inner membrane and regulates cell growth and cell death.
- Pro-apoptotic mechanisms can damage mitochondrial membranes and allow leakage of cytochrome C into the cytoplasm. Cytochrome C is the life-line of intact mitochondria.

Growth promoter/anti-apoptotic proteins

Bcl-2, Bcl-X and Mcl-1

Pro-apoptotic proteins

Bim, Bad and Bid

32. Ans. (d) Lung abscess

Liquefaction or colliquative necrosis also occurs commonly due to ischaemic injury and bacterial or fungal infections but hydrolytic enzymes in tissue degradation have a dominant role in causing semi-fluid material. The *common examples are infarct brain and abscess cavity*.

33. Ans. (b) Synthetic phase

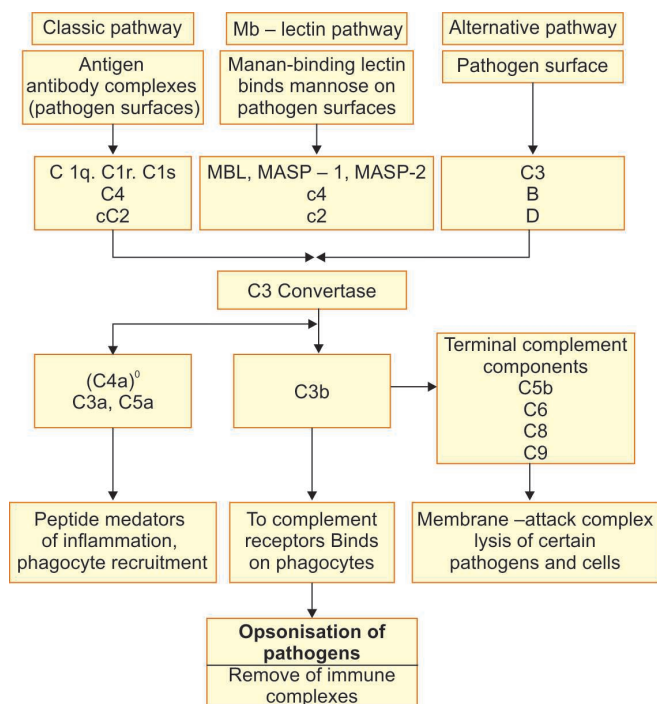

- Cell cycle is defined as the sequence of events that causes cell division.
- It consists of following phases:
 - G1 phase (Presynthetic growth)
 - S phase (DNA synthesis)
 - G2 (Premitotic growth), and
 - M phase (mitotic).
- Quiescent cells that are not actively cycling are said to be in the G0 state. Cells can enter G1 either from the G0 quiescent cell pool, or after completing a round of mitosis, as for continuously replicating cells.

FMGE Solutions Screening Examination

34. Ans. (b) C3b

- The C3b molecules act as opsonins; they bind covalently to the pathogen and thereby target it for destruction by phagocytes equipped with receptors for C3b.
- Anaphylatoxins, or complement peptides, are fragments (C3a, C4a and C5a) that are produced as part of the activation of the complement system.

35. Ans. (c) Apoptosis

The councilman bodies are formed due to process of apoptosis in viral hepatitis.

Important pathological process associated with apoptosis:

- Tumours exposed to chemotherapeutic agents
- Graft versus host disease
- Rejection episodes
- Depletion of CD4 cells in AIDS
- Prostatic atrophy after orchidectomy
- Alzheimer's disease
- MI (20% necrosis and 80% apoptosis)

Important physiological processes with apoptosis

- Organised cell destruction during formation of embryo
- Endometrial shedding, regression of lactating breast
- Involution of thymus
- Normal cell destruction followed by replacement proliferation such as intestinal epithelium

36. Ans. (b) Cat scratch

Necrotising noncaseating granulomas are present in cat Scratch disease caused by Bartonella Henselae. The granulomas show *stellate microabscess* surrounded by palisading histiocytes.

37. Ans. (c) E-cadherin

Ref: Robbin's Pathology, 9th ed. pg. 307

- Normal epithelial cells are tightly glued to each other and the ECM by a variety of adhesion molecules.
- E-cadherin, a cell surface protein, maintains intercellular adhesiveness serving to hold the cells together and relay signals between the cells.
- In several epithelial tumors, including adenocarcinomas of the colon, stomach, and breast, E-cadherin function is lost.

Extra Mile

- TNF and IL-1 (interleukins) serve critical roles in leukocyte recruitment by promoting adhesion of leukocytes to endothelium and their migration through vessels.
- Interferons are inflammatory cytokines.
- Matrix metalloproteinase (MMP) regulate tumor invasion by:
 - Remodelling insoluble components of the basement membrane and interstitial matrix
 - By releasing ECM-sequestered growth factors.

38. Ans. (b) Metaplasia

Ref: Robbin's Pathology, 9th ed. pg. 37

- **Metaplasia** is an *adaptive response* of a cell in response to stress.
- It is a reversible change in which a *differentiated (mature) cell type is replaced by another differentiated cell type*.
- *It can be of two types:*
 - **Epithelial metaplasia**
 - ♦ **Squamous metaplasia:** MC seen in respiratory tract (in response to smoking) where columnar epithelium is replaced by squamous epithelium.
 - ♦ **Glandular metaplasia:** Metaplasia of squamous epithelium into columnar (glandular) epithelium. Example Barret's esophagus (metaplasia of stratified squamous epithelium of esophagus is replaced by intestinal-like columnar cells).
 - **Connective tissue metaplasia:**
 - ♦ One type of connective tissue is replaced by another.
 - ♦ **Example: Myositis ossificans.**

Extra Mile

- **Hypertrophy:** Increased cell **size** in response to increase in workload. It occurs in tissues incapable of cell division.
- **Hyperplasia:** increase in cell number in response to growth factors or hormones.
- **Atrophy:** Decrease in cell and organ size as a result of disuse or decreased nutrient supply.

39. Ans. (d) Atrophy

Ref: Robbin's Pathology, 9th ed. pg. 36

- Prolonged disuse of muscle can cause atrophy of muscle leading to decreased muscle mass in this patient (*atrophy of disuse*).

Other Causes of Atrophy can be:

- Loss of innervation (denervation atrophy)
- Diminished blood supply (ischemic/senile atrophy)
- Inadequate nutrition

- Loss of endocrine stimulation
- Pressure

40. Ans. (d) Hypertrophy

Ref: Robbin's Pathology, 9th ed. pg. 34

- **Hypertrophy refers to an increase in the size of cells**, that results in an increase in the size of the affected organ.
- The most common stimulus for hypertrophy of muscle is increased workload.
- A gravid uterus is an example of hypertrophy and hyperplasia both, but mainly hypertrophy.
- **Robbin's 9th ed. pg. 34 states:** "The massive physiologic growth of the uterus during pregnancy is a good example of hormone-induced enlargement of an organ that results mainly from hypertrophy of muscle fibers".
- Breast enlargement at puberty and at pregnancy is also an example of hypertrophy and hyperplasia both.

41. Ans. (c) Hyperplasia

Ref: Robbin's Pathology, 9th ed. pg. 36

- In individuals who donate one lobe of the liver for transplantation, the remaining cells proliferate so that the organ soon grows back to its original size. This is a classic example of compensatory hyperplasia.

42. Ans. (a) Internally controlled, programmed cell death

Ref: Robbin's Pathology, 9th ed. pg. 52

- Apoptosis is internally controlled, programmed cell death

Salient Features of Apoptosis:

- No inflammation
- Cell shrinkage
- Formation of apoptotic bodies

Example

- **Physiological:** Embryogenesis, organogenesis, Menstruation
- **Pathological:** Acute viral hepatitis—Councilman bodies.

43. Ans. (c) Apoptosis of cells induce inflammatory reaction

Ref: Robbin's Pathology, 9th ed. pg. 52-53

Remember Important Features of Apoptosis:

- Formation of cytoplasmic blebs and apoptotic bodies
- **Cell shrinkage:** The cells are smaller in size and the cytoplasm is dense
- **Chromatin condensation:** This is the most characteristic feature of apoptosis
- Absence of inflammation
- Gel electrophoresis of DNA shows 'step ladder pattern'.

FMGE Solutions Screening Examination

354

44. Ans. (a) Inflammation is present

Ref: Robbin's Pathology, 9th ed. pg. 52-55

Since in apoptosis the dead cell is rapidly cleared, before its contents have leaked out, therefore cell death by this pathway does not elicit an inflammatory reaction in the host.

45. Ans. (d) Condensation of the nucleus

Ref: Robbin's Pathology 9th ed. pg. 53-54

The Morphologic Features Characteristic of Apoptosis include:

- **Cell shrinkage:** The cell is smaller in size having dense cytoplasm and the organelles are tightly packed.
- **Chromatin condensation:** This is the *most characteristic feature of apoptosis*.
- Formation of cytoplasmic blebs and apoptotic bodies.

46. Ans. (a) Bcl-2

Ref: Robbin's Pathology, 9th ed. pg. 53-54

- Apoptosis is inhibited by anti-apoptosis genes which are mostly Bcl family genes.
 - **Example:** Bcl-2, Bcl-X, Bcl-XL
- **Pro-apoptotic genes:** they initiate and are involved in apoptosis.
 - **Example:** BAD, BIM, BAX, BAK
- **P53 is a tumor suppressor gene and it causes apoptosis when there is excess DNA damage which cannot be repaired**

47. Ans. (a) Caspases

Ref: Robbin's Pathology, 9th ed. pg. 53-54

- **Caspases**, or cysteine-*as*partic proteases are a family of cysteine proteases that play essential roles in apoptosis, necrosis, and inflammation.
- Caspases are essential in cells for apoptosis, or programmed cell death, in development and most other stages of adult life, and have been termed "executioner" proteins for their roles in the cell.
- Some caspases are also required in the immune system for the maturation of lymphocytes.

48. Ans. (c) Embryogenesis

Ref: Robbin's Pathology, 9th ed. pg. 53-54

- Caspases are cysteine proteases and are critical for the process of apoptosis. Physiologically, apoptosis is required to eliminate the cells no longer required and to maintain a steady number of various cell populations in tissues.

- The programmed cell death (apoptosis) is required at the time of different processes in embryogenesis like implantation, organogenesis, developmental involution and metamorphosis.

49. Ans. (b) Apoptosis

Ref: Robbin's Pathology, 9th ed. pg. 53-54

Caspases are present in normal cells as inactive proenzymes and when they are activated they cleave proteins and induce apoptosis. These are cysteine proteases.

50. Ans. (c) Hydropic swelling

Ref: Robbin's Pathology, 9th ed. pg. 40

REVERSIBLE CELL INJURY

- Cell swelling

- Detachment of ribosomes from granular endoplasmic reticulum
- Dissociation of polysomes into monosomes.
- Plasma membrane blebbing, blunting, villous distortion, myelin figures, mitochondrial swelling, rarefaction.
- Nuclear disaggregation of granular and fibrillar elements.

51. Ans. (c) Condensation of nuclear chromatin

Ref: Robbin's Pathology, 9th ed. pg. 40

Refer to the explanation of the above question

52. Ans. (a) Coagulative necrosis

Ref: Robbin's Pathology, 9th ed. pg. 41-43, 50

COAGULATIVE NECROSIS

- This pattern of necrosis is typically seen in hypoxic environments, such as infarction.
- Coagulative necrosis occurs primarily in tissues such as the kidney, heart and adrenal glands.
- **Severe ischemia most commonly causes coagulative necrosis.**

- Coagulation occurs as a result of protein denaturation, causing the albumin in protein to form a firm and opaque state.
- It is characterized by the formation of a gelatinous (gel-like) substance in dead tissues in which the architecture of the tissue is maintained, and can be observed by light microscopy.

Extra Mile

LIQUEFACTIVE NECROSIS

- It is characterized by the digestion of dead cells to form a viscous liquid mass. This is typical of bacterial, or sometimes fungal, infections because of their ability to stimulate an inflammatory response.
- The necrotic liquid mass is frequently creamy yellow due to the presence of dead leukocytes and is commonly known as pus.
- Hypoxic infarcts in the brain presents as this type of necrosis, because the brain contains little connective tissue but high amounts of digestive enzymes and lipids, and cells therefore can be readily digested by their own enzymes.

CASEOUS NECROSIS

- It can be considered a combination of coagulative and liquefactive necroses, typically caused by mycobacteria, fungi and some foreign substances.
- **The necrotic tissue appears as white and friable, like clumped cheese.**
- Microscopic examination shows **amorphous granular debris** enclosed within a distinctive inflammatory border. Granuloma has this characteristic.

FAT NECROSIS

- It is specialized necrosis of fat tissue, resulting from the action of activated lipases on fatty tissues such as the pancreas.
- In the pancreas it leads to acute pancreatitis, a condition where the pancreatic enzymes leak out into the peritoneal cavity, and liquefy the membrane by splitting the triglyceride esters into fatty acids through fat saponification.
- Calcium, magnesium or sodium may bind to these lesions to produce a chalky-white substance. The calcium deposits are microscopically distinctive and may be large enough to be visible on radiographic examinations. To the naked eye, calcium deposits appear as gritty white flecks.

Fibrinoid necrosis is a special form of necrosis usually caused by **immune-mediated vascular damage**. It is marked by complexes of antigen and antibodies, sometimes referred to as “immune complexes” deposited within arterial walls together with fibrin.

53. Ans. (d) Apoptosis

Ref: Robbin's Pathology, 9th ed. pg. 52-53

The inter nucleosomal cleavage of DNA into oligonucleosomes (in multiples of 180-200 base pairs) is brought about by Ca^{+} and Mg^{2+} dependent endonucleases and is characteristic of apoptosis.

54. Ans (d) Platelet derived growth factor

Ref: Robbin's Pathology, 9th ed. pg. 52-53

Integrin superfamily consists of proteins that promote cell to cell, or cell to matrix adhesion. In contrast, selectins promote only cell to cell adhesion.

The Extracellular Domain Binds to:

- Matrix glycoproteins
- Adhesions molecules on other cells
- Activated complement components

55. Ans. (a) Venules

Ref: Robbin's Pathology, 9th ed. pg. 73-74

- Post capillary venules are an important point of interchange between the lumen of the vessels and the surrounding tissue.
- Moreover both vascular leakage and leucocyte exudation occur preferentially in venules in many types of inflammation.

56. Ans. (c) Atheromatous plaque

Ref: Robbin's Pathology, 9th ed. pg. 65-66

- Atheromatous plaque would have dead cells, so there is presence of dystrophic calcification.

57. Ans. (d) Lysosomal enzymes

Ref: Robbin's Pathology, 9th ed. pg. 81, 94

- The polymorphonuclear leukocyte (PMN) (Neutrophil) is particularly important in acute inflammation. The PMNs contain lysosomes.
- These granules contain several potent lytic enzymes which make it possible for these cells to destroy many types of bacteria and to liquefy the cell fragments resulting from tissue injury.
- The formation of hydrogen peroxide within neutrophils contributes to the bactericidal effect of these cells, as does the presence of superoxide, myeloperoxidase, and halide ion.

58. Ans. (d) All of the above

Ref: Robbin's Pathology, 9th ed. pg. 48

- Catalase is present in peroxisomes and decomposes H_2O_2 into O_2 and H_2O .
- Superoxide dismutase is found in many cell types and converts superoxide ions to H_2O_2 . This group includes both manganese-superoxide dismutase, which is localized in mitochondria, and copper-zinc-superoxide dismutase, which is found in the cytosol.
- Glutathione peroxidase also protects against injury by catalyzing free radical breakdown.

FMGE Solutions Screening Examination

356

59. Ans. (c) Vasodilation and increase in permeability

Ref: Robbin's Pathology, 9th ed. pg. 73

- Hallmark of acute inflammation is **increased vascular permeability** leading to the escape of protein-rich exudate into the extravascular tissue, causing edema.

60. Ans. (b) Myeloperoxidase

Ref: Robbin's Pathology, 9th ed. pg. 82-83

Myeloperoxidase (MPO) is an enzyme present in primary (or azurophilic) granules of the neutrophils. In the presence of a halide such as Cl^- , MPO converts H_2O_2 to HOCl (hypochlorous radical) during the process of respiratory burst.

61. Ans. (d) Granuloma formation

Ref: Robbin's Pathology, 9th ed. pg. 97

- Granuloma formation is characteristic of chronic granulomatous inflammation and is not seen in acute inflammation.
- Vasodilation, increase in permeability, exudation, margination, rolling etc. are seen in acute inflammation.

62. Ans. (a) NADPH oxidase

Ref: Robbin's Pathology, 9th ed. pg. 79

- The generation of reactive oxygen intermediates is due to the rapid activation of an enzyme; NADPH oxidase which is involved in oxygen dependent killing.
- Catalase, superoxide dismutase and glutathione peroxidase are free radical scavengers that prevent oxygen mediated injury.

63. Ans. (d) Vitamin C

Ref: Robbin's Pathology, 9th ed. pg. 8

- As the collagen molecule is produced, it undergoes many changes, termed post-translational modifications.
- These modifications take place in the Golgi compartment of the ER.
- Collagen, like most proteins that are destined for transport to the extracellular spaces for their function or activity, is produced initially as a larger precursor molecule called procollagen.
- Procollagen contains additional peptides at both ends that are unlike collagen. On one end of the molecule, called the amino terminal end, special bonds called disulfide bonds are formed among three procollagen chains and ensure that the chains line up in the proper alignment. This step is called registration. Once registration occurs, the three chains wrap around each other forming a string-like structure.

- One of the first modifications to take place is the very critical step of hydroxylation of selected proline and lysine amino acids in the newly synthesized procollagen protein.

64. Ans. (c) Calcification

Ref: Robbin's Pathology, 9th ed. pg. 40-41, 65

- Cellular swelling may occur due to cellular hypoxia, which damages the sodium-potassium membrane pump; it is reversible when the cause is eliminated.
- Cellular swelling is the first manifestation of almost all forms of injury to cells.
- On microscopic examination, small clear vacuoles may be seen within the cytoplasm; these represent distended and pinched-off segments of the endoplasmic reticulum.
- This pattern of non-lethal injury is sometimes called hydropic change or vacuolar degeneration.
- The ultrastructural changes of reversible cell injury include: Blebbing blunting, distortion of microvilli, loosening of intercellular attachments, mitochondrial changes, dilation of the endoplasmic reticulum.

65. Ans. (b) Liver

Ref: Robbin's Pathology, 9th ed. pg. 50-51

- In fat necrosis the enzyme lipase releases fatty acids from triglycerides.
- The fatty acids then complex with calcium to form soaps. These soaps appear as white chalky deposits.
- It is usually associated with trauma of the pancreas or acute pancreatitis.
- It can also occur in the breast, the salivary glands, neonates after a traumatic delivery but rarely in peritoneum.

66. Ans. (c) Lymphocytes, plasma cells and fibrosis

Ref: Robbin's Pathology, 9th ed. pg. 93

67. Ans. (a) Eosinophils

Ref: Robbin's Pathology, 9th ed. pg. /97

- A special form of chronic inflammation is seen in response to tissue invasion by *Mycobacterium tuberculosis*.
- Macrophages and multinucleated giant cells accumulate about the organisms, and fibrous tissue form about these small focal lesions or tubercles.
- This combination of macrophages and fibrosis is granulomatous inflammation.
- Epithelioid cells and multinucleated Langhans giant cells are present. The former are derived from macrophages and the latter by cytoplasmic fusion of macrophages.
- These lesions may heal by scarring and become calcified, or they undergo caseation necrosis.

68. Ans. (a) **Edema is present**Ref: Robbin's Pathology, 9th ed. pg. /130

White infarct	Red infarct
<ul style="list-style-type: none"> Occurs in solid organs with end arterial circulation Occurs in solid organs Have well-defined margins Edema is absent 	<ul style="list-style-type: none"> Occurs in organs with dual blood supply Venous occlusion leads to red infarct, like in ovarian torsion Ill-defined haemorrhagic margins Edematous tissues

All infarcts are wedge shaped and have features of ischemic coagulative necrosis.

HEMODYNAMICS69. Ans. (d) **Increased protein C**Ref: Robbin's Pathology, 9th ed. pg. 122**Virchow's triad (in thrombosis) includes:**

1. Endothelial injury
2. Stasis or turbulent blood flow
3. Hypercoagulability

Vasculitis	Vasculitis implies endothelial injury and is important for thrombus formation in coronary circulation.
Stasis in veins	Contributes to venous thrombosis
Turbulence in artery	Contributes to arterial thrombosis
Increased protein C	Protein C deficiency contributes to blood hyperviscosity whereas increased protein C would lead to bleeding

70. Ans. (d) **Complete lumen obstruction**Ref: Robbin's Pathology, 9th ed. pg. 124-125

Arterial thrombus	Venous thrombus
<ul style="list-style-type: none"> Associated with active blood flow leading to endothelial injury Grows in retrograde manner Line of Zahn is produced by alternating pale layers of platelets mixed with fibrin and darker layers containing more cells Incomplete lumen obstruction leading to ischemia and organ infarction 	<ul style="list-style-type: none"> Stasis of blood Antegrade growth from point of attachment Line of Zahn is absent Complete vessel occlusion

71. Ans. (d) **Lower extremities**Ref: Robbin's Pathology, 9th ed. pg. 124-126

- The site of arterial emboli is the heart and major site of embolization are lower extremities Brain > intestines > kidneys, etc.
- Most common site for venous thrombosis is deep leg veins below the knees**
- Most of pulmonary emboli arise in deep leg veins above (femoral veins) the level of the knee.

72. Ans. (b) **Postmortem clots**Ref: Robbin's Pathology, 9th ed. pg. 125

- Postmortem clots may have a yellow appearance at upper end and red at the lower. These are sometimes called "chicken fat" clots. The surface is still shiny and smooth indicating a clot, not a thrombus.
- The yellow portion represents clotted plasma and the red cells have settled out and clotted at the bottom of the clot.

73. Ans. (c) **It manifests as pitting edema**Ref: Robbin's Pathology, 9th ed. pg. 1162

- Angio-neurotic edema is a localized nonpitting edema involving deeper layers of the skin and subcutaneous tissue. It is an autosomal dominant clinical condition caused by **deficiency of C1 inhibitor protein** (a complement regulatory protein) and associated with elevated levels of bradykinin. It is more common in females.
- Diagnosis of hereditary angioedema is suggested by the presence of lack of pruritus and urticarial lesions, prominence of recurrent gastrointestinal attacks of colic and episodes of laryngeal edema. The levels of complement proteins C1 is normal but levels of C2 and C4 are depleted.
- Danazol is the drug which can be used for hereditary angioedema.

74. Ans. (c) **Henoch Schonlein purpura**Ref: Robbin's Pathology, 9th ed. pg. 506, 510

Cutaneous small-vessel vasculitis (also known as "Cutaneous leukocytoclastic angiitis and "Hypersensitivity angiitis") is an inflammation of small blood vessels, characterized clinically by palpable purpura.

Subtypes of Small-Vessel Vasculitis Include:

- Henoch-Schonlein purpura
- Acute hemorrhagic edema of infancy
- Urticarial vasculitis
- Cryoglobulinemic vasculitis

NEOPLASIA

358

75. Ans. (b) Loss of differentiation

Ref: Robbins E-Book, P 192

- Anaplasia implies reversion of cells to a more primitive or undifferentiated form. In another words, there is complete loss of differentiation of normal cell.

Extra Mile

Metaplasia

Conversion of a mature, differentiated cell into another form of a mature cell type, often following injury or insult

Conversion in cell type

Occurs in various types of tissues

An adaptive process that occurs due to an external stimulus

A reversible process

Does not lead to the formation of cancer

Dysplasia

Development of abnormal types of cells within a tissue, which may signify a stage preceding the development of cancer

Change in the phenotype of cells or a tissue

Mainly occurs in the epithelium

Occurs due to the alternation of genetic material

An irreversible process

May cause cancer

76. Ans. (a) Totipotent

Ref: Robbins E-book, P 25-26

- **Totipotent cells** can form all the cell types in a body, plus the extraembryonic, or placental, cells. Embryonic cells within the first couple of cell divisions after fertilization are the only cells that are totipotent.
- **Pluripotent cells** can give rise to all of the cell types of the three germ cell layers; embryonic stem cells are considered pluripotent.
- **Multipotent cells** can develop into more than one cell type, but are more limited than pluripotent cells; adult stem cells and cord blood stem cells are considered multipotent.

77. Ans. (c) **Teratoma**

Ref: Robbins 9th ed. P 977

All tumors that produce α -fetoprotein have hyaline globules. These are eosinophilic round bodies found in following causes:

Malignant causes	Benign causes
<ul style="list-style-type: none"> • Yolk sac tumor • Hepatocellular carcinoma • Clear cell carcinoma • Kaposi sarcoma • Choroid plexus carcinoma • Adenoid cystic carcinoma 	<ul style="list-style-type: none"> • Meningioma • Pleomorphic adenoma • α-1 anti-trypsin deficiency

78. Ans. (a) **Lung cancer**

Ref: Harrison 19th ed. P 1987

- SVC syndrome leads to severe reduction in venous return from head, neck and upper extremities and the causes are:

Malignant	Benign
Lung cancer Lymphoma Metastasis	Central line catheter Pacemaker leads Defibrillator leads

79. Ans. (d) **Lung cancer**

Ref: Harrison 19th ed. P 467

- The most common cancer leading to death in both males and females.
- The prevalence of carcinoma lung as contributor to death in males is 28% as compared to prostate cancer as 10%.
- The prevalence of carcinoma lung as contributor to death in females is 26% compared to breast cancer as 15%.

Distribution of Cancer related deaths

Male (%)		Female(%)	
Lung	28	Lung	26
Prostate	10	Breast	15
Colorectal	8	Colorectal	9
Pancreas	7	Pancreas	7

Extra Mile

The table given below from 19th edition of Harrison mentions prostate cancer as most common in males (27%) and breast cancer (29%) as most common in females.

Distribution of cancer incidence			
Male		Female	
Sites	%	Sites	%
Cancer incidence			
Prostate	27	Breast	29
Lung	14	Lung	13
Colorectal	8	Colorectal	8
Bladder	7	Endometrial	6
Melanoma	5	Thyroid	6
Kidney	4	Lymphoma	4
Lymphoma	4	Melanoma	4
Oral cavity	4	Kidney	3

80. Ans. (a) **Comedo subtype of DCIS**

Ref: Robbins E-book, P. 743

- The distinctive *comedo*-subtype is characterized by extensive central necrosis.
- This produces necrotic tissue with tooth paste consistency.
- Calcifications are frequently encountered in DCIS due to calcification of necrotic tissue and are easily picked up by mammography.
- Cribriform subtype of DCIS is a low grade tumor and hence necrosis is not seen.
- Colloid carcinoma produces abundant mucin both intracellularly and extracellularly.
- LCIS tends to be bilateral and may not be detected on mammography as it does *not* produce calcification.

81. Ans. (a) **Peutz-Jeghers syndrome**

Ref: Harrison 19th ed., P 240

- Peutz-Jeghers syndrome is characterized by dark brown spots on lips, buccal mucosa, nose and around eyes. There is concomitant intestinal polyposis. The most common location of polyps is in jejunum.
- It is an autosomal dominant disorder with STK11 mutation.
- The malignant potential of polyps ranges from never to rare transformation.

82. Ans. (a) Transposon

- Transposons, also called jumping genes, are pieces of DNA that move readily from one site to another.
- They move either within or between the DNAs of bacteria, plasmids and bacteriophages in a manner, that plasmid genes can become part of the chromosomal complement of genes.
- Interestingly, when transposons transfer to a new site, it is usually a copy of the transposon that moves, while the original remains in situ (like photocopying).
- Transposons can code for metabolic or drug resistance enzymes and toxins. They may also cause mutations in the gene into which they insert or alter the expression of nearby genes.
- In contrast to plasmids or bacterial viruses, transposons cannot replicate independently of the recipient DNA. More than one transposon can be located in the DNA for example, resistance genes. Thus, transposons can jump from:
 - The host genomic DNA to a plasmid
 - One plasmid to another
 - A plasmid to genomic DNA.
- An *insertion sequence* is a short DNA sequence that acts as a simple transposable element. Insertion sequences have two major characteristics: they are small relative to other transposable elements (generally around 700 to 2500 bp in length) and only code for proteins implicated in the transposition activity (they are thus different from other transposons, which also carry accessory genes such as antibiotic resistance genes).

83. Ans. (b) Testicular contour distorted

TABLE: Distinguishing features of seminomatous (SGCT) and non-seminomatous (NSGCT) germ cell tumours of testis

Features	SGCT	NSGCT
Primary tumor	Large confined to testis for sufficient time, testicular contour retained	Similar at times indistinct: Testicular contour may be distorted
Metastasis	Generally to regional lymph nodes	Haematogenous spread early
Response to radiation	Radiosensitive	Radio-resistant
Serum markers	hCG: generally low levels	hCG, AFP, or both high levels
Prognosis	Better	Poor

84. Ans. (a) Adenolymphoma

- Warthin's tumour is called papillary cystadenoma lymphomatosum or adenolymphoma.

- It is a *benign tumour* of parotid comprising 8% of all parotid tumours seen in men from 4th to 7th decades of life.
- A common *wrong answer* from most candidates is pleomorphic adenoma. It is the most common tumour of the parotid.
- Most common malignant salivary gland tumour is mucoepidermoid carcinoma.

85. Ans. (b) Dysplasia

Loss of polarity implies loss of architectural orientation of cells which is seen in dysplasia.

TABLE: Differences between metaplasia and dysplasia

Feature	Metaplasia	Dysplasia
Definition	Change of one type of epithelial or mesenchymal cell to another type of adult epithelial or mesenchymal cell	Disordered cellular development may be accompanied with hyperplasia or metaplasia
Types	Epithelial (squamous columnar) and mesenchymal (osseous, cartilaginous)	Epithelial only
Tissues affected	Most commonly affects bronchial mucosa, uterine endocervix; other mesenchymal tissues (cartilage, arteries)	Uterine cervix, bronchial mucosa
Cellular changes	Mature cellular development	Disordered cellular development (pleomorphism, nuclear hyperchromasia, mitosis, loss of polarity)
Natural history	Reversible on withdrawal of stimulus	May regress on removal of inciting stimulus, or may progress higher grades of dysplasia or carcinoma in situ

86. Ans. (c) Oat cell cancer

c-myc	Burkitt's lymphoma
L-myc	Lung cancer
N-myc	Neuroblastoma
KIT (CD117)	Gastrointestinal stromal tumours

87. Ans. (a) **Small cell cancer of lung**

H.C.C	Hepatitis B virus
Nasopharyngeal cancer	EBV
MALToma	<i>H. pylori</i>

88. Ans. (d) **Lymphoma**

TABLE: Mediastinal tumor & masses

Anterior	Middle	Posterior
<ul style="list-style-type: none"> MC Thymoma Lymphoma 	<ul style="list-style-type: none"> MC Lymphoma 	<ul style="list-style-type: none"> Neurogenic tumors – neuroblastoma/ ganglioneuroblastoma/ ganglioneuroma, Schutannoma
<ul style="list-style-type: none"> Metastatic CA Thyroid lesions 	<ul style="list-style-type: none"> Bronchopulmonary of foregut malformations – bronchogenic cyst, oesophageal duplication Pericardial cyst 	<ul style="list-style-type: none"> Lymphoma Bronchogenic cyst Gastroenteric hernia
<ul style="list-style-type: none"> Teratoma 		<ul style="list-style-type: none"> Spinal tumours – PNET
<ul style="list-style-type: none"> Thymic infiltration – leukaemia/ lymphoma/ histiocytosis 		<ul style="list-style-type: none"> Trauma – vertebral haematoma
Morgagni hernia ^a		
Lymphangioma/ haemangioma		

- MC site of mediastinal massess → Anterosuperior (59%)

89. Ans. (a) **HPV**

Human papillomavirus (HPV) which is the most common sexually transmitted infection, is a cause of anal dysplasia and cancer.

The approximately 40 HPV subtypes that can cause anogenital infections are divided into:

1. **Low-risk types (e.g. types 6 and 11)** that cause anal warts (condyloma acuminata)

2. **High-risk types (e.g. types 16, 18 and 33)** that can cause anal dysplasia and cancer.

HPV infection is associated with cervical, vulvar, vaginal, and penile cancers, and some patients have HPV-related dysplasia or cancer in multiple sites. Approximately 90% of anal cancers are attributable to HPV infection.

90. Ans. (c) **Colorectal CA**

Ref: Robbins Pathology, 9th ed. pg. 809

- Familial adenomatous polyposis (FAP) is an autosomal dominant disorder in which patients develop numerous colorectal adenomas as teenagers.
- Robbins states: “Colorectal adenocarcinoma develops in 100% of untreated FAP patients, often before age 30 and nearly always by age 50”**
- As a result, prophylactic colectomy is the standard therapy for individuals carrying *APC* mutations. Colectomy prevents colorectal cancer, but patients remain at risk for neoplasia at other sites.
- FAP is also associated with a variety of extraintestinal manifestations:**
 - Congenital hypertrophy of the retinal pigment epithelium
 - Gardner syndrome and
 - Turcot syndrome

91. Ans. (c) **Stricture formation**

Ref: Harrisons, 19th ed. pg. 532

TABLE: Some etiologic factors associated with squamous cell cancer of the esophagus

- Excess alcohol consumption
- Cigarette smoking
- Other ingested carcinogens
 - Nitrates (converted to nitrites)
 - Smoked opiates
 - Fungal toxins in pickled vegetables
- Mucosal damage from physical agents
 - Hot tea
 - Lye ingestion
 - Radiation-induced strictures
 - Chronic achalasia
- Hot susceptibility
- Esophageal web with glossitis and iron deficiency (i.e., Plummer-Vinson or Paterson-Kelly syndrome)
- Congenital hyperkeratosis and pitting of the palms and soles (i.e. tylosis palmaris et plantaris)
- Dietary deficiencies of selenium, molybdenum, zinc, and vitamin A

FMGE Solutions Screening Examination

TABLE: Some etiologic factors associated with adenocarcinoma of the esophagus

- Chronic gastroesophageal reflux
- Obesity
- Barrett's esophagus
- Male gender
- Cigarette smoking

92. Ans. (d) Thymus

- Oncocytes have been found to arise in various glandular and secretory epithelia. In the head and neck area, oncocytic change has been noted in numerous organs such as: the **salivary glands, pituitary, thyroid, parathyroid, nasal cavities, sinuses, ocular caruncle, lacrimal glands, buccal mucosa, Eustachian tube and the larynx.** They have also been **called oxyphilic cells, Askanazy cells and Hurthle cells in the thyroid gland.**
- The parotid gland is the most common site where oncocytic changes may occur, usually at the ductal or acinar cell level.

93. Ans. (b) Keratin

Ref: Robbin's Pathology, 9th ed. pg. 724

- *Keratin expression is helpful in determining epithelial origin in anaplastic cancers.*
- ***Tumors that express keratin include carcinomas, mesotheliomas, thymomas, sarcomas and trophoblastic neoplasms.***
- *Furthermore, the precise expression pattern of keratin subtypes allows prediction of the origin of the primary tumor when assessing metastases.*

94. Ans. (d) Aphthous ulcer

Ref: Robbin's Pathology 9th ed. pg. 728-730; Sternberg's Diagnostic Surgical Pathology, 5th ed. pg. 777

- Most cases of tongue CA are associated with lifestyle habits of smoking and drinking, tobacco chewing.
- **Most significant etiologic agent is tobacco.**
- Alcohol appears to act synergistically with tobacco as either a co-carcinogen (increasing the risk) or a promoter (decreasing the lag time) of neoplastic transformation.
- The neoplasm most often develops as an area of leukoplakia, chronic ulcer, or erythroplakia on the **lateral aspect of the middle one-third of the tongue.**

95. Ans. (a) Ewing's sarcoma

Ref: Robbin's Pathology, 9th ed. pg. 1203

HIGHLY RADIOSENSITIVE TUMOURS = W.E.L.M.S

- Wilms
- Ewing tumour
- Lymphoma

- Malignant myeloma
- Seminoma

96. Ans. (c) Thyroid

Ref: Robbin's Pathology, 9th ed. pg. 109

- The most radio-sensitive organ sites in children in the order of sensitivity are thyroid, breasts, bone marrow and brain.
- Exposure to ionizing radiation in first 2 decades predisposes a person for development of papillary CA.

97. Ans. (b) Stimulates formation of pyrimidine dimers

Ref: Robbin's Pathology, 9th ed. pg. 324-25

- The carcinogenicity of UV-B light is attributed to the formation of pyrimidine dimers in DNA. This type of DNA damage is repaired by nucleotide excision repair pathway.
- In patients with Xeroderma Pigmentosum, defective DNA repair is illustrated by appearance of high frequency of cancers.

98. Ans. (b) Lymphocytes

Ref: Robbin's Pathology, 9th ed. pg. 325-26

- The most radiosensitive blood cell is lymphocyte as it has a large nucleus.
- The least radiosensitive blood cell is platelets.

99. Ans. (c) Clonorchiasis

Ref: Robbin's Pathology, 9th ed. pg. 874-75

- **Clonorchis Sinesis:** Cholangiocarcinoma
- **Schistosoma Hematobium:** Squamous cell cancer of urinary bladder
- **Schistosoma Japonicum:** Colorectal cancer

IMMUNITY AND HYPERSENSITIVITY**100. Ans. (a) Graft across species**

Ref: CMDT 2018, P 157

- Autologous graft (autograft): Within an individual, auto transplantation
- Syngeneic graft (syngraft, isograft): Identical twins, isotransplantation
- Allogeneic graft (allograft, homograft): Non-identical, allotransplantation
- Xenogeneic graft (heterologous graft, heterograft): Between species, xenotransplantation

101. Ans. (b) Autoimmune Hemolytic anaemia

Ref: Robbins E-Book, P 135

- Choice A is type of type 4 Hypersensitivity reaction.
- Choice C is type of type 3 Hypersensitivity reaction.
- Choice D is type of type 4 Hypersensitivity reaction.

EXAMPLES OF TYPE II HYPERSENSITIVITY

Disease	Target antigen	Mechanism of disease	Clinicopathologic Manifestations
Autoimmune hemolytic anemia	Erythrocyte membrane proteins (Rh blood group antigens, I antigen)	Opsonization and phagocytosis of erythrocytes, complement mediated lysis	Hemolysis, anemia
Autoimmune thrombocytopenic purpura	Platelet membrane proteins (gplib-IIIa integrin)	Opsonization and phagocytosis of platelets	Bleeding
Pemphigus vulgaris	Proteins in intercellular junctions of epidermal cells (desmoglein)	Antibody mediated activation of proteases, disruption of intercellular adhesions	Skin vesicles (bullae)
Vasculitis caused by ANCA	Neutrophil granule proteins, presumably released from activated neutrophils	Neutrophil degranulation and inflammation	Vasculitis
Goodpasture's syndrome	Non-ecellagerous NCI protein of basement membrane in glomeruli and lung	Complement and Fc receptor mediated inflammation	Nephritis, lung hemorrhage
Acute rheumatic fever	Streptococcal cell wall antigen; antibody cross reacts with myocardial antigen	Inflammation, macrophage activation	Myocarditis, arthritis

Contd...

Disease	Target antigen	Mechanism of disease	Clinicopathologic Manifestations
Myasthenia gravis	Acetylcholine receptor	Antibody inhibits acetylcholine binding and down regulates the receptors.	Muscle weakness, paralysis
Graves' disease (hyperthyroidism)	TSH receptor	Antibody mediated stimulation of TSH receptors	Hyperthyroidism
Pernicious anemia	Intrinsic factor of gastric parietal cells	Neutralization of intrinsic factor, decreased absorption of vitamin B ₁₂	Abnormal erythropoiesis, anemia

102. Ans. (b) Days to weeks

Ref: Robbins E-Book, P 164

- Acute rejections appear within days or weeks and hence choice B is correct.
- Choice C is a close choice but it mentions only after 6 weeks of graft deployment while acute rejection can occur earlier as well.
- **Acute rejection is mediated by T cells and antibodies that are activated by alloantigens in the graft.** It occurs within days or weeks after transplantation, and is the principal cause of early graft failure. It also may appear suddenly months or even years later, after immunosuppression is tapered or terminated. Based on the role of T cells or antibodies, acute rejection is divided into two types, although in most rejecting grafts, both patterns are present

103. Ans. (a) Anti-Ro

Ref: Nelson 20th ed. P 1152

In SLE, Anti-Ro antibody can easily cross the placenta and damage the A-V node of the developing fetus. This leads to the baby being born with *complete heart block*. Right from day 0 of life the presentation is bradycardia and syncope. The baby may have a *malar rash* in butterfly distribution. This is called as neonatal lupus.

Antismith antibody	Most specific test for SLE
Antiribonucleoprotein antibody	Leads to psychosis in SLE
Antiphospholipid antibody	APLAS leading to recurrent abortions

FMGE Solutions Screening Examination

364

104. Ans. (a) CD4

- Class I MHC antigens have loci as HLA-A, HLA-B and HLA-C. CD8+ (i.e. T suppressor) lymphocytes carry receptors for class I MHC: These cells are used to identify class I antigens on them.
- Class II MHC antigens have single locus as HLA-D. These antigens have further 3 loci: DR, DQ and DP. Class II MHC is identified by 8 cells and CD4+ (i.e. T helper) cells.
- Class III MHC antigens are some components of the complement system (C2 and C4) coded on HLA complex but are not associated with HLA expression and are not used in antigen identification.
- In view of high polymorphism of class I and Class II genes, they have a number of alleles on loci numbered serially like HLA-A 1, HLA-A 2, HLA-A3 etc.
- MHC antigens present on the cell surface help the macrophage in its function of recognition of bacterial antigen, i.e. they help of identify self from foreign and accordingly present the foreign antigen to T cells (CD4+ or CD8+) or to B cells.

105. Ans. (d) Type 4

TABLE: Comparative features of four types of hypersensitivity reactions

Feature	Type 1 (Anaphylactic, atopic)	Type 2 (Antibody – mediated, cytotoxic)	Type 3 (Immune – complex, arthus reaction)	Type 4 (Delayed T cell – mediated)
Definition	Rapidly developing immune response in a previously sensitised person	Reaction of humoral antibodies that attack cell surface antigens and cause cell lysis	Results from deposition of antigen antibody complexes of tissues	Cell-mediated slow and prolonged response
Peak action time	15–30 minutes	15–30 minutes	Within 6 hours	After 24 hours
Mediated by	IgE antibodies	IgG or IgM antibodies	IgG, IgM antibodies	Cell mediated
Etiology	Genetic basis, pollutants, viral infections	HLA – linked, exposure to foreign tissues/cells	Persistence of low grade infection, environmental antigens, auto-immune process	Cutaneous antigens

106. Ans. (d) CD 19

- B cell markers are CD 19, 20, 21 and 23.
- T_H cell markers are CD 4, 3, 7, 2
- T_C cell markers are CD 8, 3, 7, 2
- NK cell markers are CD 2, 16, 56

107. Ans. (d) Pneumoconiosis with rheumatoid arthritis

- Progressive massive fibrosis of pneumoconiosis in association with *rheumatoid arthritis* is known as *Caplan syndrome*.
- Unlike lesions caused by progressive massive fibrosis, which congregate in the upper lobes, these lesions known as Caplan lesions tend to coalesce in the peripheral lung fields.

108. Ans. (b) Ankylosing spondylitis

Clinical Associations with HLA – B27

Disorder	HLA – B27 (%)
Ankylosing spondylitis	90
Reactive arthritis (Reither's syndrome)	40–80
Juvenile SpA	70
Inflammatory bowel disease	35–75
Psoriatic arthritis	
With spondylitis	50
With peripheral arthritis	15
Undifferentiated SpA	70
Acute anterior uveitis	50
Aortic insufficiency, heart block	80

109. Ans. (d) Large granular lymphocyte

- The natural killer cells are called as large granular lymphocytes and are responsible for A.D.C.C (Antibody dependant cell cytotoxicity). This mechanism is particularly effective against viruses and tumour cells.
- NK cells are a part of natural or innate immunity and recognise antibody coated cells. Thus they bring about killing of target cells directly.

110. Ans. (d) Type 4

- Delayed type of hypersensitivity is mediated by T cell dependant effector mechanisms involving both CD4+ TH1 cells and CD8 Cytotoxic T cells.
- Antibodies do not play a role in type IV hypersensitivity reactions. The activated TH1 cells release Cytokines that will cause accumulation and activation of macrophages which will cause local damage.
- TH 2 cells release IL-4 and are involved in Type 1 Hypersensitivity reaction.

111. Ans. (c) SLE

Ref: Chapter 5; Robbins, 8th ed.

TABLE: Hypersensitivity reactions

Type I (IgE mediated)	Type II (IgG, IgM and complement mediated)
<ul style="list-style-type: none"> Eczema Hay fever Asthma atopy Urticaria Anaphylactic shock Acute dermatitis Theobald smith phenomenon Prausnitz Kustner (PK) reaction Casoni's test Schultz-Dale phenomenon 	<ul style="list-style-type: none"> Blood transfusion reactions Erythroblastosis fetalis AIHA or thrombocytopenia or agranulocytosis Pemphigus vulgaris Good pasture syndrome Bullous pemphigoid Pernicious anemia Acute rheumatic fever
	<ul style="list-style-type: none"> Diabetes mellitus Graves disease Myasthenia gravis
Type III (IgG, IgM, complement and leucocyte mediated)	Type IV (Cell mediated)
<ul style="list-style-type: none"> Local-Arthus reaction Systemic-serum sickness Schick test Polyarteritis nodosa (PAN) SLE Acute viral hepatitis Penicillamine toxicity Hyperacute graft rejection Type 2 lepra reaction (ENL) Hypersensitivity pneumonitis R.A Infective endocarditis Henoch schonlein purpura 	<ul style="list-style-type: none"> Tuberculin test Lepromin test Sarcoidosis Tuberculosis Contact dermatitis Granulomatous inflammatin Type I lepra reaction Patch test Temporal arteritis Jones mote reaction (cutaneous basophilic HSN) Graft rejection Fairleys test Frie's test

112. Ans. (b) Antigen - antibody mediated

Type II or Cytotoxic Hypersensitivity depends on the abnormal production of IgG or IgM directed against tissue antigens or a normal reaction to foreign antigens expressed on host cells. There are three main mechanisms of injury in Type II reactions:

- Activation of complement followed by complement mediated lysis or phagocytosis and removal by leukocytes
- Antibody dependent cellular cytotoxicity
- Inactivation of a biologically active molecule

113. Ans. (c) IgM

Ref: Ananthanarayan and Paniker's, 8th ed. pg. 100

TABLE: Immunoglobulins and their salient features

Immunoglobulins	Salient features
IgG	<ul style="list-style-type: none"> Most abundant Ig, makes as about 80% Marker of chronic infection Only Ig that can cross placenta
IgA	<ul style="list-style-type: none"> 2nd most abundant, 10–13% Found in glandular secretion like saliva, tear, ileum, and mucosal secretion like bronchial secretion
IgM	<ul style="list-style-type: none"> 5–8% of total Ig; aka pentameric Ig → has highest molecular weight First Ig to be synthesized by fetus (20 weeks AOG) Marker of acute infection
IgD	<ul style="list-style-type: none"> Present mostly intravascular Serve as recognition receptor for antigens
IgE	<ul style="list-style-type: none"> Mostly extravascular in distribution Highly elevated levels in case of type-I HPS reaction Produced chiefly in the linings of respiratory and intestinal tracts

TABLE: Immunoglobulin and their effective valency

Antibody	Effective valency
• IgM	5
• IgG	2
• IgD	2
• IgE	2
• IgA	2,4

Extra Mile

- Ig having maximum molecular weight: IgM
- First antibody produced by newborn: IgM
- All immunoglobulins are heat stable except: IgE
- Ig present in breast milk: IgA
- Ig with maximum half-life: IgG
- Ig with minimum half-life: IgE
- Ig having maximum serum concentration: IgG
- Ig having least serum concentration: IgE

114. Ans. (a) B cells

Ref: Robbin's Pathology, 9th ed. pg. 187, 191

PRIMARY COMPLEMENT IMMUNE RESPONSE

- The first exposure to a foreign antigen, a lag phase occurs in which no antibody is produced, but activated B cells are differentiating into plasma cells. The lag phase can be as short as 2–3 days, but often is longer, sometimes as long as weeks or months.

FMGE Solutions Screening Examination

366

- The amount of antibody produced is usually relatively low.
- Over time, antibody level declines to the point where it may be undetectable.
- The first antibody produced is mainly IgM (although small amounts of IgG are usually also produced).

115. Ans. (d) Type 4

Ref: Chapter 55, Harrison, 19th edition

Clinical Features of Severe Cutaneous Drug Reactions

Diagnosis	Mucosal lesions	Typical skin lesions
Stevens-Johnson syndrome	Erosions usually at two or more sites	Small blisters on dusky purpuric macules or atypical targets; rare areas of confluence; detachment $\leq 10\%$ of body surface area
Diagnosis	Mucosal Lesions	Typical skin lesions
Toxic epidermal necrolysis	Erosions usually at two or more sites	Individual lesions like those seen in Stevens-Johnson syndrome; confluent erythema; outer layer of epidermis separates readily from basal layer with lateral pressure; large sheet of necrotic epidermis; total detachment of $>30\%$ of body surface area

TABLE: Classification of Adverse Drug Reactions Based on Immune Pathway

Hypersensitivity type	Key pathway	Adverse drug reaction type
Type I	IgE	Urticaria, angioedema, anaphylaxis
Type II	IgG-mediated cyto-toxicity	Drug induced hemolysis
Type III	Immune complex	Vasculitis, serum sickness, drug-induced lupus
Type IV b	T lymphocyte-mediated eosinophil inflammation	Tuberculin skin test, contact dermatitis
Type IV c	T lymphocyte-mediated cytotoxic lymphocyte inflammation	Drug-induced hypersensitivity syndrome Morbilliform eruption
Type IV d	T lymphocyte-mediated neutrophil inflammation	Acute generalized exanthematous pustulosis

116. Ans. (d) Type 4

Ref: Robbin's Pathology, 8th ed. ch. 5

Refer to Explanation of Question 99.

117. Ans. (a) Bipolar cells

Ref: Robbin's Pathology 9th ed. pg. 191-192; Pocket Companion to Robbin's Pathology, 8th ed. pg. 119

T cells cannot be activated by soluble antigens. Therefore presentation of processed antigen by **antigen presenting cells** is required for activation of T cells.

Important Antigen Presenting Cells are:

- Macrophage
- B cells
- Dendritic cells (**most potent APCs**)
- Langerhans cells

Bipolar cell is a type of neuron which has two extensions. Bipolar cells are specialized sensory neurons for the transmission of special senses. As such, they are part of the sensory pathways for smell, sight, taste, hearing and vestibular functions.

118. Ans. (a) IL-2

Ref: Robbin's Pathology, 9th ed. pg. 192-93

Salient Features of NK Cell

- Growth factor for NK cell-IL2 (proliferate in response to IL2) and IL-15.
- NK cell activity is augmented by interferon
- They secrete perforin which results in formation of transmembrane pore resulting in cell death
- Cytotoxic against virus infected cells, tumour cells, transplanted foreign cells
- Its activity is neither antibody dependent nor MHC restricted.
- Component of innate immunity.
- NK cells + for-CD 16, CD56

119. Ans. (a) MHC class I

Ref: Robbin's Pathology, 9th ed. pg. 231, 232

- In transplantation immunology, the major impact in graft loss comes from the effects of HLA-B and -DR antigens
- The histocompatibility antigens [human leukocyte antigens (HLA)] are cell surface antigens that induce as response leading to rejection of allografts
- The principal physiologic function of the cell surface histocompatibility molecules is the bind peptide fragments foreign proteins for presentation to antigen specific T cells.
- The histocompatibility antigens are encoded by a closely linked multiallelic cluster of genes. Mix histocompatibility complex (MHC) or human leukocyte antigens complex (HLA complex)

- HLA complex of genes is located on the short arm of chromosome 6.
- It consists of three separate clusters of genes:

TABLE: HLA Complex (MHC complex)

Class I	Class II	Class III
<ul style="list-style-type: none"> • Comprising A, B and C loci • Responsible for graft rejection and cell mediated cytotoxicity • Found on the surface of all nucleated cells and platelets 	<ul style="list-style-type: none"> • 'D' region → DR, DQ, DP • Responsible for <ul style="list-style-type: none"> ▪ Graft versus host response ▪ Mixed leucocyte reaction • Found only on cells of the immune system 	Complement region encodes <ul style="list-style-type: none"> • C₂ and C₄ • Properdin factor B • Heat shock protein • TNF – α and β • Enzyme 21-hydroxylase

Remember**Histocompatibility Reactions**

Graft versus host disease	Host versus graft disease (Graft rejection)
<ul style="list-style-type: none"> • HLA class II is primarily involved • T-helper cells (CD-4) 	<ul style="list-style-type: none"> • HLA class I is primarily involved • Cytotoxic T cell (CD-8)

120. Ans. (d) Reiter's syndrome

Ref: Robbin's Pathology, 9th ed. pg. 116, 787

In addition to its association with ankylosing spondylitis, HLA-B27 is implicated in other types of seronegative spondyloarthropathy

- Reactive arthritis (Reiter's syndrome)
- Acute anterior uveitis and iritis
- Psoriatic arthritis
- Ulcerative colitis associated spondyloarthritis

121. Ans. (b) Chronic granulomatous disorder

Ref: Robbin's Pathology, 9th ed. pg. 237-238

Nitro blue tetrazolium is used in a diagnostic test, particularly for chronic granulomatous disease. When there is an NADPH oxidase defect, the phagocyte is unable to make reactive oxygen species or radicals required for bacterial killing. As a result, bacteria may thrive within the phagocyte. The higher the blue score, the better the cell is at producing reactive oxygen species.

122. Ans. (d) Calcium

Ref: Robbin's Pathology, 9th ed. pg. 89, 238

- The initial enzyme, C1, is a complex formed through a calcium-dependent association between two reversibly interacting subunits, C1q and C1r2s2.

- In the absence of an immune response, approximately 70% of C1 exists as a complex between these two subunits.
- C1 occurs in serum as a proenzyme that tends to undergo autoactivation (in which the two subunits are bound together) but is strictly controlled by C1-inhibitor (C1-In or C1 esterase).

123. Ans. (d) Sickle cell disease

Ref: Robbin's Pathology, 9th ed. pg. 211-15, 635

- Sickle cell disease is a genetic condition which is characterized by mutation in beta globin chain of hemoglobin (**glutamic acid is replaced with valine in the 6th position of beta chain**).
- Other given choices like SLE, Grave's and MG are all autoimmune conditions.

124. Ans. (d) Type 4

Ref: Robbin's Pathology, 9th ed. pg. 208-209

HEMATOLOGY**125. Ans. (a) T.I.B.C**

Ref: Robbins E- Book, P 454

Iron deficiency anaemia has all parameters reduced except Total iron binding capacity.

	Iron deficiency anemia
Hematocrit	↓ to ↓↓↓
MCV	↓ to ↓↓↓
MCHC	↓
Serum iron	↓ to ↓↓↓
Serum TIBC	Normal to ↑
Serum ferritin	↓ to ↓↓
Stainable iron in marrow	Absent
Reticulocytes	Normal to ↓

126. Ans. (c) Normocytic and normochromic anemia

Ref: Robbins 9th ed. P 652

- Rheumatoid arthritis leads to development of anemia of chronic disease.
- A more common presentation of anemia of chronic disease is normocytic normochromic anemia. In late presentation microcytic hypochromic anemia is noted.

127. Ans. (b) Yolk sac, liver and bone marrow

Ref: Robbins 9th ed. P 579-580

- Erythropoiesis starts in the yolk sac at 2 weeks of gestation and leads to production of embryonic hemoglobin.
- It shifts to liver spleen at 14 weeks of gestation and leads to production of fetal hemoglobin.
- At birth the hematopoiesis shifts to the bone marrow. The major hemoglobin at birth is fetal hemoglobin.

FMGE Solutions Screening Examination

128. Ans. (d) 12 g%

368

Ref: Robbins 9th ed. P630-631

TABLE: Hemoglobin levels to diagnose anemia at sea level (g/L)±

Population	Non-anemia*	Anemia*		
		Mild	Moderate	Severe
Children 6–59 months of age	110 or higher	100–109	70–99	Lower than 70
Children 5–11 years age	115 or higher	110–114	80–109	Lower than 80
Children 12–14 years of age	120 or higher	110–119	80–109	Lower than 80
Nonpregnant women (15 years of age and above)	120 or higher	110–119	80–109	Lower than 80
Pregnant women	110 or higher	100–109	70–99	Lower than 70
Men (15 years of age and above)	130 or higher	110–129	80–109	Lower than 80

129. Ans. (b) NESTROFT

Ref: Textbook of hematology Dr. Tejender singh 2nd ed.

P 90-92,

Hemoglobinopathies by Anupam sachdev 1st ed. P 100

Initial screening test for diagnosis of β -thalassemia carriers is NESTROFT. The naked eye single tube osmotic fragility test is based on osmotic fragility using 0.36% buffered saline.

Procedure

- Two test tubes labeled as Buffered saline (2 mL) and distilled water 2 mL) are taken and a drop of water is added to each of tubes, which is left undisturbed for half an hour at room temperature. Following this contents of the tube are shaken and held against a white paper on which a thin black line is drawn.

Interpretation

- The line is clearly visible through the DW tube and if the same is seen in Buffered saline tube, it indicates that the test is negative.

Positive NESTROFT

Negative NESTROFT

Extra Mile

- Thalassemia syndrome is the most common genetic syndrome worldwide.
- IOC for thalassemia is HPLC >> Hb electrophoresis.

130. Ans. (a) Elevated HbA2

Ref: Robbins 9th ed. P 640

- Quantification of HbA2 and Hb variant via HPLC gives an accurate estimate of HbA2 levels
- Values of HbA2 >4.0% with reduced RBC indices are indicative of β -thalassemia carriers.
- The earlier cut off of HbA2 >3% must be interpreted with caution as per current guidelines.

Extra Mile

Hemoglobin	Structure	Levels at birth	Levels in adults	Comments
A	$\alpha_2\beta_2$	20–25%	97%	Reaches adult levels by 1 year of age
A ₂	$\alpha_2\delta_2$	0.5%	2.5%	Elevated in β thalassemia trait
F	$\alpha_2\gamma_2$	75–80%	<1%	Reaches adult levels by 1 year of age
HbH	β_4	15–20% in HbH disease	NA	HbH produces heinz bodies in the erythrocytes and hemolysis
HB Bart	γ_4	100% in hydrops fetalis, 15–25% in HbH disease	NA	Increase in carriers of α thalassemia trait at birth

NA = not applicable.

131. Ans. (d) **Denatured haemoglobin****Summary of Inclusions in RBCs**

Howell jolly bodies	DNA
Basophilic stippling	RNA remnants
Siderotic granules/ pappenheimer bodies	Iron
Heinz bodies	Denatured Haemoglobin

132. Ans. (a) **SLE**

Positive coombs test is seen in autoimmune haemolytic anaemia caused by SLE.

The remaining three choices of the question are examples of microangiopathic haemolytic anaemia.

TABLE: Causes of Microangiopathic Haemolytic Anemia

Thrombocytic thrombocytopenic purpura
Haemolytic uremic syndrome
 Disseminated intravascular coagulation
 Infections: gram-negative septicaemia
 Snake bites
 Hemolytic transfusion reactions
 Obstetric complications: abruptio placentae, amniotic fluid embolism, retained dead fetus, eclampsia
Malignant hypertension
 Immunologic disorders: Vasculitis
 Acute glomerulonephritis
Polyarteritis nodosa
 Wegner's granulomatosis
 Systemic lupus erythematosus
 Scleroderma
 Renal and hepatic allograft rejection
 Disseminated carcinoma:

133. Ans. (a) **A.M.L**

- Arsenic trioxide is used in management of *M3 AML/ Acute Pro-myelocytic Leukemia*. Also used is *A.T.R.A (All-trans- Retinoic acid)*.
- Acute Pro-Myelocytic Leukemia has high risk of early hemorrhagic death due to disseminated intravascular coagulation and hyperfibrinolysis. The prognosis of APL has improved dramatically following the introduction of all-trans retinoic acid (ATRA) and its combination with anthracycline-based chemotherapy during induction and consolidation
- Arsenic trioxide and A.T.R.A are considered in frail or elderly patients. This combination can also be used in patients who are unable to tolerate anthracycline-based therapy.

134. Ans. (b) **Parvo virus B19**

- Hepatitis B, C and D can lead to aplastic anaemia. In contrast Parvo virus B19 leads to a transient bone marrow illness called aplastic crisis.
- Parvovirus B19 (B19V) is a single-stranded DNA virus of the family Parvo-viridae and genus Erythrovirus.
- It has a unique tropism for human erythroid progenitor cells. The virus requires the P blood antigen receptor (also known as globoside) to enter the cell.

135. Ans. (a) **Sickle cell anaemia**

Gamma-Gandy bodies (GGB) are siderotic nodules present in the spleen.

Causes of Gamma Gandy bodies are:

1. Portal hypertension
2. Sickle cell anaemia
3. Acquired hemochromatosis
4. Paroxysmal nocturnal hemoglobinuria
5. Angio-sarcoma.

136. Ans. (a) **Portal hypertension**

Refer to explanation of the question no. 88.

137. Ans. (d) **Factor 11**

- Rosenthal syndrome is Factor XI deficiency/Haemophilia C/Plasma thromboplastin antecedent deficiency.
- These patients will experience severe bleeding after dental extractions. FXI deficiency is inherited in an autosomal recessive pattern.

138. Ans. (c) **ALL**

Ref: Robbins, 9th ed. pg. 590

Acute Lymphoblastic Leukemia/Lymphoma

- **Acute lymphoblastic leukemia/lymphomas (ALLs) are neoplasms composed of immature B (pre-B) or T (pre-T) cells, which are referred to as lymphoblasts.**
- About 85% are B-ALLs, which typically manifest as childhood acute "leukemias."
- The less common T-ALLs tend to present in adolescent males as thymic "lymphomas."
- **ALL is the most common cancer of children.**

Extra Mile

- **Multiple myeloma** is a plasma cell neoplasm commonly associated with lytic bone lesions, hypercalcemia, renal failure, and acquired immune abnormalities.
- **Amyloidosis** is a disorder characterized by the extracellular deposits of misfolded proteins that aggregate to form insoluble fibrils.
- **Mycosis fungoides/Sezary syndrome** is a disorder of helper T cells among adults. Patients present with cutaneous patches, plaques, nodules or generalized erythema.

139. Ans. (c) **Nodular sclerosis**

Ref: Harsh Mohan, 7th ed. pg. 350

TABLE: Type of Hodgkin's lymphoma

Nodular sclerosis	Most common type of Hodgkin lymphoma	Lacunar Reed-Sternberg cell variants in a mixed inflammatory background; broad sclerotic bands of collagen usually also present	CD15 ⁺ , CD30 ⁺ Reed-Sternberg cells	Most common in young adults, often arises in the mediastinum cervical lymph nodes
Mixed cellularity type	Second most common form of Hodgkin lymphoma	Frequent classic Reed-Sternberg cells in a mixed inflammatory background	CD15 ⁺ , CD30 ⁺ , Reed-Sternberg cells	Most common in men, more likely to present at advanced stages than the nodular sclerosis type EBV+in 70% of cases

140. Ans. (a) **Polycythemia vera**

Ref: Robbin's Pathology, 9th ed. pg. 616

JAK-2 Mutation is seen in:

1. Polycythemia vera
2. Primary myelofibrosis
3. Essential thrombocytosis

141. Ans. (b) **Ca⁺⁺**

Ref: Radiopaedia.org.

142. Ans. (a) **Disseminated intravascular coagulation**

Ref: Robbin's Pathology, 9th ed. pg. 317-18, 612, 663

- Acute promyelocytic leukemia (APL) is characterized by more severe hemorrhagic phenomena than those of other acute leukemias.
- The hemorrhagic diathesis results from disseminated intravascular coagulation.
- About 40% of patients with APL have a chromosomal abnormality with translocation from the long arm of 17 to 15 (t 15q;17q)
- The patient may present with massive ecchymoses, hematuria, epistaxis, or meno-metrorrhagia.

143. Ans. (a) **Nodular sclerosis**

Ref: Robbin's Pathology, 9th ed. pg. 606-607; Harrison 18th ed. Chapter 110

Hodgkin's Disease Nodular lymphocyte
Predominant Hodgkin's disease
Classical Hodgkin's disease Nodular sclerosis Hodgkin's disease Lymphocyte-rich classic Hodgkin's disease Mixed-cellularity Hodgkin's disease Lymphocyte-depletion Hodgkin's disease

144. Ans. (c) **20%**

Ref: Nelson 18th ed. ch. 495

- The characteristic feature of AML is that >20% of bone marrow cells on bone marrow aspiration or biopsy touch preparations constitute a fairly homogeneous population of blast cells, with features similar to those that characterize early differentiation states of the myeloid-monocyte-megakaryocyte series of blood cells. The most common classification of the subtypes of AML is the FAB system.

TABLE: French-American-British (FAB) Classification of Acute Myelogenous Leukemia

Subtype	Common name
M1	Acute myeloblastic leukemia without maturation
M2	Acute myeloblastic leukemia with maturation
M3	Acute promyeloblastic leukemia
M4	Acute myelomonocytic leukemia
M5	Acute monocytic leukemia
M6	Erythro leukemia
M7	Acute megakaryocytic leukemia

145. Ans. (a) **Smoldering myeloma**

Ref: Harrison, 19th ed. pg. 715

TABLE: Diagnostic Criteria for Multiple Myeloma

MONOCLONAL Gammopathy of Undetermined Significance is defined by the presence of three criteria:

- Serum monoclonal M protein (M-protein) concentration <3 g/dL
- Bone marrow plasma cell concentration <10%
- No evidence of end organ damage

Smoldering MM is present when

- Serum M protein concentration is >3 g/dL
- Bone marrow plasma cell concentration is >10%
- No evidence of end-organ damage.

Contd...

Symptomatic myeloma is present when

- M-protein ≥ 30 g/L
- Bone marrow clonal cells $\geq 10\%$
- Must have evidence of ROTI (end-organ damage) that can be attributed to the plasma cell proliferative process; manifested by CRAB (calcium, renal failure, anemia, and bone lesions).

146. Ans. (a) **CD1**

Ref: Robbin's Pathology, 9th ed. pg. 590

- Langerhans cells are characterized by two types of markers: an ultrastructural marker, the **Birbeck granule** and different membrane markers: **HLA-D antigens, T4 antigen, and some of the CD1 antigens.**
- These antigens which are specific for the epidermal Langerhans cells, are not expressed by the other epidermal cells. Three CD1 antigens are biochemically defined on human thymocytes, they display a glycoprotein chain non covalently attached to beta-2-microglobulin.

147. Ans. (a) **Iron**

Ref: Robbin's Pathology, 9th ed. pg. 631, 649

148. Ans. (d) **Viral or protozoal infection**

Ref: Robbin's Pathology, 9th ed. pg. 582-83

- Leucocytosis is seen with viral infections on account of increase in number of natural killer cells.

Leucopenia MNEMONIC _ VINDICATE

V- Vascular causes like MI

I- Infection like sepsis

N- Neoplasm like CLL

D-

I- DRUG INTOXICATION like lithium

C- Congenital like DOWN

A- Autoimmune like polyarteritis nodosa.

T- Trauma

E - Endocrinologic causes like cushing's disease

149. Ans. (b) **Africa**

Ref: Robbin's Pathology, 9th ed. pg. 588

- Globally, Burkitt lymphoma (BL) is endemic in certain regions of equatorial Africa and other tropical locations between latitudes 10° south and 10° north. Incidence in these areas of endemic disease is 100 per million children.
- Epstein-Barr virus (EBV) infection is found in nearly all areas. In endemic areas, there seems to be a correlation with the geographic distribution of endemic malaria.

- Malaria infection also probably plays a role in the pathogenesis of BL, as it can lead to inhibition of EBV-specific immune response. The exact mechanism of EBV-mediated lymphomagenesis, however, is not well understood, but evidence exists for a significant interaction between viral and cellular microRNA (miRNA) interfering with normal gene expression and translation. EBV can be detected in 25–40% of immunodeficiency-associated cases.

150. Ans. (c) **Chronic renal failure**

Ref: Robbin's Pathology, 9th ed. pg. 631-35, 638

- The same question was asked in different exams with different choices.
- Choices a, b, d are examples of hemolytic anemias and hence the answer by exclusion is chronic renal failure.
- CRF has low erythropoietin levels due to less production and has normocytic normochromic anaemia.

151. Ans. (a) **GLUT 1**

Ref: Harrison's, 19th ed. pg. 2402

Basic Rule

- **GLUT 1 and 3** = Everywhere in body (for Basal Absorption of Glucose) including RBC
- **GLUT 2** = In liver and pancreas
- **GLUT 4** = In muscle and adipose

Energy-yielding metabolism in erythrocytes depends on a constant supply of glucose from the blood plasma, where the glucose concentration is maintained at about 5 mm. Glucose enters the erythrocyte by facilitated diffusion via a specific glucose transporter, at a rate about 50,000 times greater than un-catalyzed transmembrane diffusion.

152. Ans. (a) **Chronic ITP**

Ref: Robbin's Pathology, 9th ed. pg. 658-59

- Splenectomy may be done in patients with chronic ITP, as platelets which have been bound by antibodies are taken up by macrophages in the spleen (which have Fc receptors).
- The procedure is potentially risky in ITP cases due to the increased possibility of significant bleeding during surgery.
- Durable remission following splenectomy is achieved in 60–65% of ITP cases, less so in older subjects. However, the use of splenectomy to treat ITP has diminished since the development of steroid therapy and other pharmaceutical remedies.

FMGE Solutions Screening Examination

372

Remember**Drug treatment in ITP**

- **Steroids** and steroid sparing agents
- **Anti-D:** Suitable for Rh-positive, non-splenectomized patients is intravenous administration of Rho(D) immune globulin. Following administration, anti-D-coated red blood cell complexes saturate Fc γ receptor sites on macrophages, resulting in preferential destruction of red blood cells, therefore sparing antibody-coated platelets.
- **Romiplostim:** A thrombopoiesis stimulating Fc-peptide fusion protein that is administered by subcutaneous injection.
- **Eltrombopag** is an orally-administered agent with an effect similar to that of romiplostim. It too has been demonstrated to increase platelet counts and decrease bleeding in a dose-dependent manner.

153. Ans. (a) Prothrombin time*Ref: Robbin's Pathology, 9th ed. pg. 116-18*

Prothrombin time	Extrinsic pathway	Factor 5/7
Activated partial thromboplastin time	Intrinsic pathway	Factor 8
Bleeding time	Platelet function and platelet count	Platelet function and count

154. Ans. (b) Human parvo virus B19*Ref: Robbin's Pathology, 9th ed. pg. 635-36*

- Human parvo virus B19 is responsible for aplastic crisis that can be life threatening in cases of sickle cell anaemia and hereditary spherocytosis. It is treated with blood transfusion.
- **Remember:** Parvovirus infection in pregnant women is associated with hydrops fetalis due to severe fetal anemia, sometimes leading to miscarriage or stillbirth. The risk of fetal loss is about 10% if infection occurs before pregnancy week 20 (*especially between weeks 14 and 20*), but minimal after then.

155. Ans. (a) Controlling oxidative stress on RBC*Ref: Robbin's Pathology, 9th ed. pg. 634*

- G6PD helps in neutralizing the effect of oxidative stress on the RBC.
- Oxidative stress is induced by drugs like primaquine and hence in patients of G6PD there is accelerated hemolysis (intravascular during the hemolytic episode) resulting in hemoglobinuria and passage of shockingly black urine by the patient.

156. Ans. (a) Anemia of chronic disease*Ref: Robbin's Pathology, 9th ed. pg. 652*

- In anemia of chronic disease, in response to inflammatory cytokines, the liver produces increased amounts of hepcidin.
- Hepcidin in turn causes increased internalisation of ferroportin molecules on cell membranes *which prevents release from iron stores*.
- Since stores of iron are un-utilized, serum ferritin is increased. TIBC levels are inverse of serum ferritin.
- Low serum iron and low ferritin levels with an elevated TIBC are diagnostic of iron deficiency.

157. Ans. (a) Pernicious anemia*Ref: Robbin's Pathology, 9th ed. pg. 647-648*

- Since **hypersegmented neutrophils** are seen with oval RBC at 6 o'clock to neutrophils the answer is pernicious anemia.

158. Ans. (b) Resistant to denaturation by alkali*Ref: Robbin's Pathology, 9th ed. pg. 635*

- Fetal blood contains fetal hemoglobin composed of **two alpha and two gamma subunits**.
- This difference in composition gives the different types of hemoglobin different chemical properties.
- Fetal hemoglobin is resistant to alkali (basic) denaturation, whereas adult hemoglobin is susceptible to such denaturation. Therefore, exposing the blood specimen to sodium hydroxide (NaOH) will denature the adult but not the fetal hemoglobin. The fetal hemoglobin will appear as a pinkish color under the microscope while the adult hemoglobin will appear as a yellow-brownish color.

159. Ans. (c) 60 days*Ref: Harrison, 18th ed. /ch. 113*

- Life span of transfused RBC is **60-80 days**
- Life span of fetal RBC = 100 days
- Life span of neutrophil = 6 hours
- Life span of neutrophil in tissues = 6 days
- Life span of platelets = 5-7 day
- Life span of transfused platelets = 2-3 days

160. Ans. (a) HUS*Ref: Robbin's Pathology, 9th ed. pg. 644***Characteristic of Schistocytes/Helmet Cells**

- Fragmented part of a red blood cell.
- Irregularly shaped, jagged, and have two pointed ends
- Does not have central pallor.

Seen in

- Hemolytic uremic syndrome

- Thrombotic thrombocytopenic purpura
- Disseminated intravascular coagulation
- Metallic prosthetic valves

161. Ans. (d) Macrocytic anemia

Ref: Robbin's Pathology, 9th ed. pg. 638

- Thalassemia major presents before 1 year of age with severe anemia which necessitates packed RBC transfusions every 2–3 months. The child is said to be transfusion dependent as survival is decided by RBC being transfused.
- The ineffective erythropoiesis in bone marrow results in shift of hematopoiesis to liver and the bone marrow. Hence the liver and spleen enlarge in size. But the net result is defective microcytes being produced. The type of anaemia is *microcytic hypochromic anaemia*.
- **Remember: causes of macrocytic anaemia: "ABCDEF":**
 - Alcohol + liver disease
 - B12 deficiency
 - Compensatory reticulocytosis (blood loss and hemolysis)
 - Drug (cytotoxic and AZT)/ Dysplasia (marrow problems)
 - Endocrine (hypothyroidism)
 - Folate deficiency/Fetus (pregnancy)

162. Ans. (a) Anemia of chronic disease

Ref: Robbin's Pathology 9th ed. pg. 652

Parameter	Iron deficiency anemia	Sideroblastic anemia	Anemia of chronic disease
Serum iron	Low	High	Low
Serum ferritin	Low	High	High
T.I.B.C	Increased	Decreased	Low

163. Ans. (a) Brilliant cresyl blue

Ref: Robbin's Pathology, 9th ed. pg. 631-32

- Reticulocytes are immature red blood cells, typically composing about 1% of the red cells in the human body. Reticulocytes develop and mature in the red bone marrow and then circulate for about a day in the blood stream before developing into mature red blood cells. Like mature red blood cells, reticulocytes do not have a cell nucleus. **They are called reticulocytes because of a reticular (mesh-like) network of ribosomal RNA that becomes visible under a microscope with certain stains.**
- The most common supravital stain is performed on reticulocytes using new methylene blue or

brilliant cresyl blue, which makes it possible to see the reticulofilamentous pattern of ribosomes characteristically precipitated in these live immature red blood cells by the supravital stains.

- By counting the number of such cells the rate of red blood cell formation can be determined, providing an insight into bone marrow activity and anemia.

164. Ans. (b) Ferritin

Ref: Robbin's Pathology, 9th ed. pg. 650

- **Ferritin is the storage and transferrin is the transport form of iron.**
- Hepcidin is released by liver in setting of anemia of chronic disease. Ferroportin is a transmembrane protein that transports iron from the inside of a cell to the outside of it.
- **Remember:** Ferroportin is inhibited by hepcidin, which binds to ferroportin and internalises it within the cell. This results in the retention of iron within cells, and a reduction in iron levels within the plasma. This is especially significant in enterocytes which are shed at the end of their lifespan where ferroportin is expressed on the basolateral membranes. The extra iron retained within them is not only prevented from entering the bloodstream but ends up being excreted into the faeces. **Hepcidin is thus the "master regulator" of human iron metabolism.**
- In the setting of anemia, low serum ferritin is the most specific lab test for iron deficiency anemia. However, it is less sensitive, since its levels are increased in the blood by infection or any type of chronic inflammation, and these conditions may convert what would otherwise be a low level of ferritin from lack of iron, into a value in the normal range. For this reason, low ferritin levels carry more information than those in the normal range. **Low ferritin may also indicate hypothyroidism, vitamin C deficiency or celiac disease.**

165. Ans. (a) Nodular sclerosis

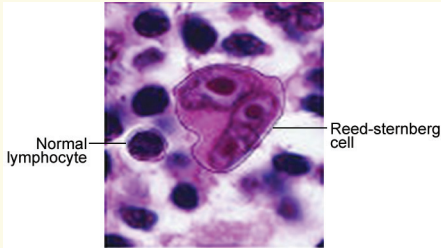

Ref: Robbin's Pathology, 9th ed. pg. 607-610

TABLE: Types of Hodgkins lymphoma

Nodular sclerosis	It is the most common subtype and is composed of large tumor nodules showing scattered lacunar classical RS cells set in a background of reactive lymphocytes, eosinophils and plasma cells with varying degrees of collagen fibrosis/sclerosis
-------------------	--

Contd...

FMGE Solutions Screening Examination

Mixed cellularity	<p>Most common format seen in India; also the most common in HIV positive patients. Biopsy shows classic Reed Sternberg cells</p>  <p>Normal lymphocyte Reed-sternberg cell</p>
Lymphocyte depleted	<p>It is a rare subtype, composed of large numbers of often pleomorphic RS cells with only few reactive lymphocytes which may easily be confused with diffuse large cell lymphoma. Many cases previously classified within this category would now be reclassified under anaplastic large cell lymphoma</p>
Lymphocyte rich	Good/best prognosis
Nodular lymphocytic predominant	Expresses CD ₂₀ ⁺ and is classified as a form of non-classical Hodgkin's.

- Microscopic examination of the lymph node biopsy reveals complete or partial effacement of the lymph node architecture by scattered large malignant cells known as **Reed-Sternberg cells (RSC)** admixed within a reactive cell infiltrate composed of variable proportions of lymphocytes, histiocytes, eosinophils, and plasma cells.
- The Reed-Sternberg cells are identified as large often bi-nucleated cells with prominent nucleoli and an unusual CD45⁻, CD30⁺, CD15^{+/+} immunophenotype. In approximately 50% of cases, the Reed-Sternberg cells are infected by the Epstein-Barr virus.
- Characteristics of classic Reed-Sternberg cells include large size (20–50 micrometres), abundant, amphophilic, finely granular/homogeneous cytoplasm; two mirror-image nuclei (**owl eyes**) each with an eosinophilic nucleolus and a thick nuclear membrane (chromatin is distributed close to the nuclear membrane).

166. Ans. (a) Pre B cell

Ref: Robbins's Pathology, 9th ed. pg. 590-93

- **Most common subtype of ALL is L1 according to older classification and Pre B cell variety by the latest WHO classification.**
- The recent WHO International panel on ALL recommends that the FAB classification be abandoned, since the morphological classification has no clinical or prognostic relevance. It instead advocates the use of the immunophenotypic classification:

- Acute lymphoblastic leukemia/lymphoma.
 - Synonyms: Former Fab L1/L2

Precursor B Acute Lymphoblastic Leukemia/Lymphoma. Cytogenetic Subtypes

1. t(12;21)(p12,q22)
2. t(1;19)(q23;p13)
3. t(9;22)(q34;q11)
4. t(V,11)(V;q23)

Precursor T Acute Lymphoblastic Leukemia/Lymphoma

- Burkitt's leukemia/lymphoma. Synonyms: Former FAB L3
- Biphenotypic acute leukemia

167. Ans. (a) Aplastic anemia

Ref: Robbins's Pathology, 9th ed. pg. 631

- **Aplastic anemia is characterized by destruction of bone marrow and thereby reduction in pluri-potent stem cells and their progeny. Henceforth the production of reticulocytes is less.**
- Thalassemia and sickle cells are hemolytic anemias having extra-vascular hemolysis and thereby reticulocytosis.
- In chronic blood loss the loss of RBC provoke the bone marrow to be more aggressive and release reticulocytes in circulation.
- **Remember:** Reticulocytopenia may be a result of viral Parvovirus B19 infection, which invades and destroys red blood cell precursors and halts the red cell production.

168. Ans. (a) EBV

Ref: Robbins's Pathology, 9th ed. pg. 588-90, 606

EBV	Nasopharyngeal cancer, Burkitt lymphoma, Hodgkins and non-Hodgkin lymphoma; Infectious mononucleosis (Paul Bunnell test).
CMV	CMV retinitis
HHV 6	Primary effusion lymphoma
HHV 8	Kaposi sarcoma

169. Ans. (d) Chronic lymphocytic leukemia

Ref: Robbins's Pathology, 9th ed. pg. 324-325

Cancers associated with radiation:

- ALL, AML, CML
- Thyroid cancer
- Breast cancer
- Lung cancer
- Bladder, ovarian cancer

Cancers not seen with radiation:

- CLL
- Hodgkin's lymphoma
- Prostate cancer, testis cancer and cervical cancer

170. Ans. (a) Ig G

Ref: Robbin's Pathology, 9th ed. pg. 598-99

- The over production of light chains of IgG is the most common abnormality in multiple myeloma. In Waldenstrom cryoglobulinemia, IgM is overproduced.
- Most common presentation of multiple myeloma is anemia > bone pain.
- Least common presentation of multiple myeloma is hyperviscosity
- Investigation of choice for multiple myeloma is bone marrow biopsy
- Screening test for multiple myeloma is serum electrophoresis showing M spike
- Most common cause of death in multiple myeloma is infections
- Most common cause of kidney damage in multiple myeloma is hypercalcemia.

CARDIOVASCULAR PATHOLOGY**171. Ans. (c) Hyper-eosinophilia of myocytes**

Ref: Robbins E-Book, P 853

HISTOPATHOLOGICAL CHANGES AFTER MI

- First half an hour no changes are seen, which is followed by glycogen depletion and development of waviness of fibers.
- Between 12- and 24-hours *Hyper-eosinophilia* of the cytoplasm of myocytes as assessed by hematoxylin-eosin staining is characteristic of myocardial damage.
- *Neutrophil infiltration* is present by 24 hours at the border areas.
- As the infarct progresses between 24 and 48 hours, *coagulation necrosis* is established, with various degrees of nuclear pyknosis, early karyorrhexis, and karyolysis.
- The myocyte striations are preserved and the sarcomeres elongate. The border areas show prominent neutrophil infiltration by 48 hours.
- At 3-5 days, the central portion of the infarct shows loss of myocyte nuclei and striations; in smaller infarcts, neutrophils invade the infarct and fragment, resulting in more severe *karyorrhexis* (nuclear dust).
- By 5-7 days, *macrophages and fibroblasts begin to appear* in the border areas.
- By 1 week, neutrophils decline and *granulation tissue is established with neo-capillary invasion* and lymphocytic and plasma cell infiltration.

172. Ans. (b) McCallum patch

Ref: Robbins 9th ed. P 557-59

- Acute rheumatic mitral valvulitis leads to chordal elongation and defective coaptation of valve leaflets.

- This leads to a posterolaterally directed jet of mitral regurgitation which is directed towards an area of fibrotic thickening on posterior left atrial wall.
- This *fibrotic thickening in left atrium* is called *McCallum patch*.

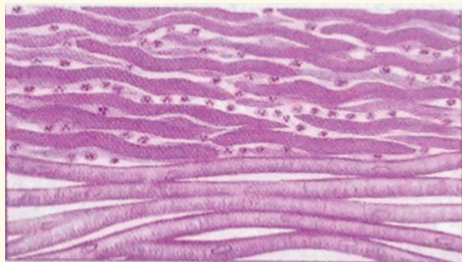

173. Ans. (a) Cardiac failure

Rheumatic endocarditis leads to death most commonly due to cardiac failure.

Causes of Mortality in RHD (Decreasing Incidence wise):

- CHF
- Bacterial endocarditis
- Cerebral embolism of left atrial appendage
- Coronary insufficiency

174. Ans. (a) Stretching and waviness of fibers

Time frame	Light microscopy
0–6 hours	No change, stretching and waviness of fibres
6–12 hours	Coagulative necrosis begins with neutrophilic infiltration
48–72 hours	Coagulative necrosis is complete
3 rd –7 th day	Initiation of resorption of necrosed fibres and fibrovascular response
	
3 rd week	Necrosed muscles removed and in growth of fibrocollagenous tissue.

175. Ans. (a) Myxoma

- The most common primary tumour of the heart is myxoma. It constitutes 50% of all primary cardiac tumours.
- Most common site is left atrium.
- Most common tumour of heart is metastasis from lung cancer.
- Most common tumour of heart valves is papillary elastoma

176. Ans. (a) Lungs

Ref: Robbin's Pathology, 9th ed. pg. 529-30

- In left ventricular failure, the pooling of blood in lungs will lead to development of pulmonary edema which causes hypoxia and findings of dyspnea, orthopnea, pink frothy sputum and death. Hence, lungs are immediately affected following LVF.

FMGE Solutions Screening Examination

376

- Subsequently due to low BP the kidneys shall be affected and in severe LVF brain perfusion shall also be affected.

177. Ans. (a) Aschoff nodules

Ref: Robbin's Pathology, 9th ed. pg. 558

- The pathognomonic feature of rheumatic fever is *aschoff nodules*. They are the foci of eosinophilic staining collagen surrounded by *T-lymphocytes*, plasma cells and plump macrophages called Anitschkow cells.
- The Anitschkow cells have abundant cytoplasm and central round to ovoid nucleus in which chromatin has wavy ribbon fashion because of which they are called *caterpillar cells*
- The involvement of endocardium by aschoff nodules along the line of closure of valves leads to improper closure of leaflets. This leads to *leakage of blood which hits the free wall of left atria* and leads to *MacCallum's patch*.

178. Ans. (c) Reversible injury within 20–40 minutes

Ref: Robbin's Pathology, 9th ed. pg. 540-41

TABLE: Evolution of Morphological Changes in MI

Time	Gross findings	Light microscopy
0–30 minutes	None	None
30 minutes–4 hours	None	Waviness of fibres at border
4–12 hours	Occasional dark mottling	Beginning of coagulative necrosis, oedema, haemorrhage
12–24 hours	Dark mottling	Ongoing coagulative necrosis, marginal band contraction necrosis and beginning of neutrophilic infiltration

TABLE: Myocardial response

Feature	Time
Cessation of aerobic respiration or onset of ATP depletion	Seconds
ATP reduced to 50% of normal	10 minutes
Irreversible cell injury	20–40 minutes
Microvascular injury	>1 hour

179. Ans. (d) Necrosis

Ref: Robbin's Pathology, 9th ed. pg. 512-15

TABLE: Complications of Atherosclerosis and their Importance

Aneurysm formation	Aortic aneurysm >5.5 cm can rupture
Calcification	Dystrophic calcification
Ulceration	Increases thrombus formation
Thrombosis	Occlusion of coronary arteries
Embolism	Erosion of plaque

180. Ans. (b) Deep Vein thrombosis

Ref: Robbin's Pathology, 9th ed. pg. 512-15;

Robbins, 8th ed. pg. 517

- Buerger disease is associated with HLA B-5 and HLA-A9.
- In thromboangiitis obliterans there is acute and chronic segmental inflammation of vessels with thrombosis in the lumen
- Typically, the thrombus contains microabscesses with a central focus of neutrophils surrounded by inflammation
- Later, the inflammatory process extends into contiguous veins and nerves and in time all the arteries, veins and nerves become encased in fibrous tissue, a characteristic that is very rare with vasculitis.

181. Ans. (b) Troponin C is present in both cardiac and smooth muscle

Ref: Harrison, 19th ed. pg. 265e-7

- Troponins of cardiac origin are regulatory proteins that control the calcium mediated interaction of Actin and Myosin.
- The troponin complex consists of three subunits: Troponin T, which binds to Tropomyosin and facilitates contractions; Troponin I, which binds to Actin and inhibits Actin/Myosin interaction; and Troponin C, which binds the calcium ions.
- The amino acid sequence of the skeletal and cardiac isoforms of Troponin T and Troponin I are sufficiently dissimilar and therefore detectable by monoclonal antibody assay.
- *Troponin C is not used clinically because both cardiac and smooth muscles share Troponin C isoforms.*

182. Ans. (c) **Granulation with type 4 collagen**Ref: Robbin's Pathology, 9th ed. pg. 540-43

377

Time	Gross examination	Histopathology (light microscopy)
0–0.5 hours	None	None
0.5–4 hours	None	Glycogen depletion, as seen with a PAS stain Possibly waviness of fibers at border
4–12 hours	Sometimes dark mottling	Initiation of coagulation necrosis Edema Hemorrhage
12–24 hours	Dark mottling	Ongoing coagulation necrosis Karyopyknosis Hypereosinophilia of myocytes Contraction band necrosis in margins Beginning of neutrophil infiltration
1–3 days	Infarct center becomes yellow-tan	Continued coagulation necrosis Loss of nuclei and striations Increased infiltration of neutrophils to interstitium
3–7 days	Hyperemia at border Softening yellow-tan center	Beginning of disintegration of dead muscle fibers Necrosis of neutrophils Beginning of macrophage removal of dead cells at border
7–10 days	Maximally soft and yellow-tan Red-tan margins	Increased phagocytosis of dead cells at border Beginning of granulation tissue formation at margins
10–34 days	Red-gray and depressed borders	<i>Mature granulation tissue with type I collagen</i>
2–8 weeks	Gray-white granulation tissue	Increased collagen deposition Decreased cellularity
More than 2 months	Completed scarring	Dense collagenous scar formed

183. Ans. (b) **Myxoma**Ref: Robbin's Pathology, 9th ed. pg. 575-76

- **MC tumor of heart:** Secondaries
- MC site of primary for cardiac secondaries: Lungs
- Most common **primary** neoplasm of heart in **adult:** **Myxoma**
- Most common **primary** neoplasm of heart in **child:** **Rhabdomyoma**
- Most common **malignant** cancer of heart in adults: Angiosarcoma
- Most common **malignant** cancer of heart in children: Rhabdomyosarcoma
- Myxoma is a soft mass, consisting of edematous connective tissue irregularly covered by thrombus, commonly attached to the endocardium by a pedicle, and hanging free into a cavity, **usually the left atrium.** (MC site of myxoma: Left atrium)
- It may block the mitral orifice, producing a murmur similar to that of mitral stenosis.
- Embolism from the surface of the neoplasm or an overlying thrombus is common.
- The papillary fibroelastoma is very rare and occurs on heart valves. **Therefore most common cardiac valve tumor is papillary fibroelastoma.**

Extra Mile

- MC site of myxoma: Left atrium
- MC site of rhabdomyoma: Left ventricle
- Myxoma is MC seen in **females**
- MC age group of myxoma: 3rd–6th decade

184. Ans. (d) **Metastasis**Ref: Robbin's Pathology, 9th ed. pg. 575-76*Please refer to above explanation*185. Ans. (c) **Left ventricle**Ref: Robbin's Pathology 9th ed. pg. 575-76*Please refer to above explanation*186. Ans. (c) **Papillary fibroelastoma**Ref: Robbin's Pathology, 9th ed. pg. 575-77*Please refer to above explanation*187. Ans. (a) **Syphilitic aneurysm**Ref: Harrison, 19th ed. pg. 1638

- Syphilitic aortitis, an inflammatory aortitis involving the ascending aorta, sinuses of Valsalva and the aortic valve, is observed most commonly in patients older than 50 years.

FMGE Solutions Screening Examination

- Syphilitic aortitis is associated with aortic insufficiency, ascending aortic aneurysms, and a positive serologic test for syphilis. In these patients, angina resulting from occlusion of the ostia of the coronary vessels also can be present.
- Calcification occurs in a linear pattern along the ascending aorta.
- On gross specimen examination, the aorta has been described as revealing a “tree-bark” appearance.

188. Ans. (c) Fibrinous

Ref: Robbin's Pathology, 9th ed. pg. 557-56

An exudate is any fluid that filters from the circulatory system into lesions or areas of inflammation.

Types of Exudate

- *Purulent or suppurative exudate consists of plasma with both active and dead neutrophils, fibrinogen, and necrotic parenchymal cells. This kind of exudate is consistent with more severe infections, and is commonly referred to as pus.*
- *Fibrinous exudate is composed mainly of fibrinogen and fibrin. It is characteristic of rheumatic carditis, but is seen in all severe injuries such as strep throat and bacterial pneumonia. Fibrinous inflammation is often difficult to resolve due to the fact that blood vessels grow into the exudate and fill the space that was occupied by fibrin. Often, large amounts of antibiotics are necessary for resolution.*
- *Catarrhal exudate is seen in the nose and throat and is characterized by a high content of mucus.*
- *Serous exudate (sometimes classified as serous transudate) is usually seen in mild inflammation, with little protein content. Its consistency resembles that of serum, and can usually be seen in certain disease states like tuberculosis.*

189. Ans. (c) Diabetic glomerulosclerosis

Ref: Robbin's Pathology, 9th ed. pg. 509-510, 558

Fibrinoid necrosis is a distinctive morphological pattern of cell injury characterized by deposition of fibrin like proteinaceous material in walls of arteries. Areas of fibrinoid necrosis appear as smudgy eosinophilic regions with obscured underlying cellular details.

Fibrinoid necrosis is seen in:

- Malignant hypertension
- Vasculitis like PAN
- Acute rheumatic fever

190. Ans (b) Small- or medium-sized muscular arteries

Ref: Robbin's Pathology, 9th ed. pg. 506-507

- PAN typically involves small- to medium-sized muscular arteries. In contrast, large arteries and the aorta are involved in Takayasu arteritis.

- Small arteries and arterioles are involved in a number of other diseases, including systemic lupus erythematosus.
- Active lesions in PAN demonstrate a neutrophilic infiltration of the involved vessel wall with thrombosis and segmental, fibrinoid necrosis. Intermittent healing produces fibrosis of the arterial wall and intimal thickening, which may lead to obstruction and infarction.
- Aneurysmal dilations may arise as a result of asymmetrical involvement. Although the lesions in PAN resemble other immune mediated vascular lesions, the exact etiology of the disorder has not been elucidated.
- PAN generally affects middle-aged men and has a poor prognosis, although steroids may be beneficial.

191. Ans. (c) Monckeberg's sclerosis

Ref: Robbin's Pathology, 9th ed. pg. 491

- Monckeberg's arteriosclerosis, also called medial calcific sclerosis, is a form of arteriosclerosis or vessel hardening, where calcium deposits form in the middle layer of the walls of medium sized vessels (the tunica media)
- It is usually more benign than other forms of arteriosclerosis because it does not cause narrowing of the lumen, but can still be associated with important medical conditions. Monckeberg's arteriosclerosis is most commonly found in the radial or ulnar arteries causing “pipestem” arteries, which will present as a bounding pulse.
- It is associated with trophic foot ulceration and peripheral artery occlusive disease.
- Its presence predicts risk of cardiovascular events and leg amputation in diabetic patients.

192. Ans. (d) SLE

Ref: Robbin's Pathology, 9th ed. pg. 506, 509-10

Large vessel vasculitis	Medium vessel vasculitis	Small vessel vasculitis
<ul style="list-style-type: none"> • Giant cell arteritis • Takayasu's arteritis 	<ul style="list-style-type: none"> • Classic PAN • Kawasaki • Buerger disease 	Immune complex mediated <ul style="list-style-type: none"> • SLE • HSP • Cryoglobulin vasculitis • Good pasture syndrome
		Pauci- immune <ul style="list-style-type: none"> • Wegener's granulomatosis • Microscopic polyangitis • Churg Strauss syndrome

LUNGS

193. Ans. (d) Bronchial asthma

Ref: Robbin's Pathology, 9th ed. pg. 682

Findings in Bronchial Asthma in Broncho-Alveolar Lavage or in Sputum

- **Curschmann spirals**, is a finding in bronchial asthma which may result from extrusion of mucus plugs from subepithelial mucous gland ducts or bronchioles.
- **Charcot-Leyden crystals**: It is composed of an eosinophilic protein called **galectin-10**.

The other characteristic histologic findings of asthma, collectively called "airway remodeling" include:

- Airway wall thickening
- An increase in the size of the submucosal glands and number of airway goblet cells
- Subbasement membrane fibrosis (due to deposition of type I and III collagen)
- Increased vascularity
- Hypertrophy and/or hyperplasia of the bronchial wall muscle

194. Ans. (c) Liver

Rich focus	Cortex of brain
Simon focus	Healed site of primary infection at lungs apex
Simmond focus	Liver
Weigart focus	Intima of blood vessels

195. Ans. (c) Eosinophilic infiltration of airways

Ref: Robbin's Pathology, 9th ed. pg. 678-679

- Chronic bronchitis is characterised by **lymphocytic infiltration** of airways coupled with submucosal gland hypertrophy
- **Reid's index** is ratio of mucus gland layer thickness to thickness of wall between epithelium and cartilage. Normal value is 0.4 and is increased in chronic bronchitis
- Bronchorrhea is due to low grade infection since the ciliated columnar epithelium and Muco-ciliary clearance is compromised.

Extra Mile

- **Earliest feature of chronic bronchitis**: Mucus hypersecretion in large airways
- Reid index increased in chronic bronchitis (**normal = 0.4**)

196. Ans. (c) Bloody pleural effusion

Ref: Robbin's Pathology, 9th ed. pg. 688-690

- Silicosis is a nodular fibrosing disease due to inhalation of silica, and is the most common chronic occupational disease in world.
- Mostly the form implicated is Quartz.
- Involvement of upper lobes of the lungs
- **CXR**: shows presence of **egg shell calcification**
- Polarised microscopy shows presence of birefringent silica particles

197. Ans. (a) Sarcoidosis

Ref: Harrison, 19th ed. pg. 2210

The **Kveim-Siltzbach test** is a skin test used to detect sarcoidosis, where part of a spleen from a patient with known sarcoidosis is injected into the skin of a patient suspected to have the disease. If noncaseating granulomas are found (4–6 weeks later), the test is positive.

198. Ans. (c) Sarcoidosis

Ref: Robbin's Pathology, 9th ed. pg. 693

- Schaumann body is laminated concretions of calcium and protein, which is a characteristic finding of sarcoidosis.

Findings of Sarcoidosis:

- Non-necrotizing granulomas
- Asteroid body
- Schaumann body

Extra Mile

Sarcoidosis

- **MC clinical presentation of sarcoidosis**: Bilateral hilar lymphadenopathy (90% of cases) > Eye
- Sarcoidosis MC seen in patients below 40 years (F > M)
- **Marker of disease activity**: TNF concentration in broncho-alveolar fluid
- **Mikulicz syndrome**: Bilateral sarcoidosis of parotid, sub-maxillary and sublingual gland.

199. Ans. (b) Hilar lymphadenopathy

Ref: Robbin's Pathology, 9th ed. pg. 692-93

200. Ans. (c) Asbestosis

Ref: Robbin's Pathology, 9th ed. pg. 690-92

FMGE Solutions Screening Examination

380

- Sufferers may experience severe dyspnea (shortness of breath) and are at an increased risk for certain malignancies, including lung cancer but especially mesothelioma.
- **The most common anatomical site for mesothelioma is the pleura**, but it can also arise in the peritoneum, the pericardium or the tunica vaginalis.
- Most people who develop mesothelioma have worked in jobs where they inhaled or ingested asbestos fibers, or were exposed to airborne asbestos dust and fibers in other ways. Washing clothes of a family member who worked with asbestos also creates a risk for developing mesothelioma.
- *Unlike lung cancer, there seems to be **no** association between mesothelioma and tobacco smoking*, but smoking greatly increases the risk of other asbestos-induced cancers.

Extra Mile

- Anthracosis is a pneumoconiosis, which is seen among coal workers.
- There is no association between anthracosis and development of tuberculosis or lung cancer.

201. Ans. (d) Adenocarcinoma

Ref: Robbins's, 9th ed. pg. 714–15

According to Robbins 9th ed. the frequency of major lung cancer and their proportion are:

- Adenocarcinoma (38%)
- Squamous cell carcinoma (20%)
- Small cell carcinoma (14%)
- Large cell carcinoma (3%)
- Other (25%)

Extra Mile

LUNG CA

- MC CA overall: lung CA
- MC CA causing death: lung CA
- MC risk factor for lung CA: Smoking
- Peak age for development for lung CA: 50–60's
- MC lung cancer in females: Adenocarcinoma
- Most aggressive type of lung CA: Small cell lung CA
- Lung CA MC associated with paraneoplastic syndrome: Small cell lung CA
- Lung CA associated with smoking: Squamous cell CA and small cell lung CA
- Centrally located lung CA: Squamous cell CA and small cell lung CA
- Peripherally located lung CA: Adenocarcinoma and large cell CA

202. Ans. (b) Adenocarcinoma

Ref: Robbins's, 9th ed. pg. 714–15

203. Ans. (c) Small cell lung CA

Ref: Robbins's Pathology, 9th ed. pg. 717

- **Small cell carcinoma** is a highly malignant tumor with a strong relationship to cigarette smoking.
- **Around** 1% occurs in nonsmokers.
- They are the most aggressive of lung tumors, metastasizing widely and are always fatal.

204. Ans. (c) Small cell lung CA

Ref: Robbins's Pathology, 9th ed. pg. 717

- **Azzopardi effect** is basophilic staining of vascular walls due to encrustation by DNA from necrotic tumor cells.
- It is seen in small cell lung carcinoma.

205. Ans. (b) Adenocarcinoma lung

Ref: Robbins's Pathology, 9th ed. pg. 690–92

- The answer has been triple checked from standard textbooks and is a denocarcinoma.
- *Mesothelioma is mentioned as associated with asbestosis but not most common.*

KIDNEY

206. Ans. (a) Kimmel stein Wilson Change

Ref: Robbins E-Book, P 781

- The characteristic finding of Diabetic nephropathy is Kimmelstein Wilson change and is also referred as nodular glomerulosclerosis.
- Most common light microscopy finding is diffuse diabetic glomerulopathy. Large acellular accumulations also may be observed within these areas. These are circular on section and are known as the Kimmelstiel-Wilson lesions/nodules.
- *Armani-Ebstein change* consists of deposits of glycogen in the tubular epithelial cells (pars straight of proximal convoluted tubule and loop of Henle).

207. Ans. (b) Kidney

- Fatty change is particularly common in the liver but may occur in other non – fatty tissues as well, e.g. in the heart,

skeletal muscle, kidneys (lipoid nephrosis or minimum change disease) and other organs.

- Fatty change, steatosis or fatty metamorphosis is the intracellular accumulation of neutral fat within parenchymal cells.
- It includes, now abandoned, terms of fatty degeneration and fatty infiltration because fatty change neither necessarily involves degeneration nor an infiltration. The deposit is in the cytosol and represents an absolute increase in the intracellular lipids.

208. Ans. (a) PSGN

- The presence of lumpy bumpy appearance due to sub-epithelial deposits is a characteristic appearance in PSGN.
- The Sub-epithelial spikes on electron microscopy are a feature of membranous glomerulopathy.

209. Ans. (c) RPGN

Type	Clinical features	Pathogenesis	Pathology	
			LM	EM
Acute GN	Acute nephrotic syndrome	Immune complex disease (local or circulating)	Diffuse proliferation, leucocytic infiltration	Subepithelial deposits (humps)
RPGN	Acute renal failure	(i) Type I: anti GBM type (ii) Type II: Immune complex type (iii) Type III: Pauci-immune RPGN	Proliferation crescents ^Q	(i) Linear deposits along GBM (ii) Subepithelial deposits (iii) No deposits
Minimal change disease	Nephrotic syndrome (higher selective proteinuria)	Reduction of normal negative charge on GBM Cell-mediated mechanism	Normal glomeruli, lipid vacuolation in tubules	Loss of foot processes, no deposits
Membranous GN	Nephrotic syndrome	Immune complex disease (local)	Diffuse thickening of capillary wall	Subepithelial deposits (Spikes)
Membrano-Proliferative GN	Nephrotic syndrome	Type I: immune complex disease Type II: Dense deposit disease (alternate pathway activation) Type III: Rare, with systemic disease and drugs	Lobular proliferation of mesangial cells increased mesangial matrix, double contour of GBM	Type I: subendothelial deposits Type II: Dense intramembranous deposits Type III: Subendothelial and subepithelial deposits

210. Ans. (b) Autosomal dominant

Ref: Robbin's Pathology, 9th ed. pg. 946

- ADPKD is autosomal dominant—Polycystic kidney disease.
- Occurs due to mutation in PKD 1 and PKD 2 gene
- MC type of mutation: PKD 1. (80–85%)
- Pathological feature:** Large multicystic kidney. It also involves commonly:
 - MC: Liver-Polycystic liver disease (40%)

- Heart: Mitral valve prolapse (20–25%)
- Brain: Berry aneurysm

211. Ans. (d) CMV

Ref: Harsh Mohan, 7th ed. pg. 175

Cytomegalic cells in vivo (presumed to be infected epithelial cells) are two to four times larger than surrounding cells and often contain an 8–10 µm intranuclear inclusion that is eccentrically placed and is surrounded by a clear halo, producing an "owl's eye" appearance.

Smaller granular cytoplasmic inclusions are demonstrated occasionally. Cytomegalic cells are found in a wide variety of organs, including the salivary gland, lung, liver, kidney, intestine, pancreas, adrenal gland, and central nervous system

212. Ans. (d) Hypokalemia

Ref: Robbin's Pathology, 9th ed. pg. 1127, 1143

- Hydropic (vacuolar) degeneration results from a more severe degree of water imbibition into the cell cytoplasm.
- It occurs in some severe bacterial infections with high fever, certain types of poisoning, and hypokalemia.
- Potassium is drawn from cells and replaced by sodium and water in large amounts.
- In its most striking form, hydropic degeneration involves the renal tubular epithelium.

213. Ans. (a) Bowman's capsule

Ref: Robbin's Pathology, 9th ed. pg. 900-901

- Podocytes (or visceral epithelial cells) are cells in the Bowman's capsule in the kidneys that wrap around the capillaries of the glomerulus.
- The Bowman's capsule filters blood, holding back large molecules such as proteins, and passing through small molecules such as water, salts, and sugar, as the first step in forming urine.

214. Ans. (d) Post streptococcal GN

Ref: Robbin's Pathology, 9th ed. pg. 909-910

- PSGN is characterized by enlarged hyper-cellular glomeruli.
- There is also swelling of endothelial cells & combination of proliferation, swelling, leukocyte infiltration obliterates capillary lumen.
- Endo-capillary proliferation is also seen in MPGN

215. Ans. (a) SLE

Ref: Robbin's Pathology, 9th ed. pg. 221-225

Sub-endothelial deposits create a homogeneous thickening of the capillary wall called wire loop lesion, which can be seen by means of light microscopy when they are extensive. They usually reflect active disease.

216. Ans. (a) Acetophenetidin

Ref: Robbin's Pathology, 9th ed. pg. 423, 936t

- Renal papillary necrosis due to acetophenetidin/phenacetin is a gradual process with slow loss of renal function.
- The most common cause of renal papillary necrosis is diabetic glomerulopathy.

217. Ans. (d) Bilateral kidney transplantation

Ref: Robbin's Pathology, 9th ed. pg. 945-947

- The kidney transplantation is always unilateral. The left kidney is preferred for transplantation and is deployed in right iliac fossa.
- The most common extra-hepatic manifestation of polycystic kidney disease is hepatic cysts.
- ADPKD is autosomal dominant gene which is genetically heterogeneous with two genes identified: PKD1 (chromosome region 16p13.3; around 85% cases) and PKD2 (4q21; around 15% cases)

218. Ans. (a) Pyelonephritis

Causes of WBC casts

- Acute pyelonephritis
- Interstitial nephritis
- Lupus nephritis

Causes of RBC Casts

- Acute glomerulonephritis
- Goodpasture syndrome
- Lupus nephritis
- Renal infarction
- Right sided heart failure
- Renal vein thrombosis
- Polyarteritis Nodosa

219. Ans. (d) Rapidly progressive glomerulonephritis

Ref: Robbin's Pathology, 9th ed. pg. 912-915

- RBC casts are a feature of glomerular damage. Normally <3 RBC/HPF are going to leak. But in case of glomerular damage the number of RBC in urine will exceed the limit mentioned above and these RBC get impinged on tamm-horsfall protein. The resultant RBC casts can be seen under microscopic examination of urine.
- Bladder schistosomiasis will cause hematuria and eosinophiluria.
- Renal vein thrombosis is a complication of severe dehydration and causes a painful enlarged kidney with hematuria.
- Minimal change disease is the most common cause of nephritic syndrome and causes proteinuria.

Extra Mile

Different Renal Casts and conditions where they are seen:

- **Hyaline cast: MC type;** seen in normal individuals in dehydration or vigorous exercise
- **Muddy brown cast:** Seen in acute tubular necrosis
- **Waxy casts:** Nephrotic syndrome
- **Fatty casts:** Pathognomonic for high urinary protein nephrotic syndrome.
- **White blood cell casts:** Pyelonephritis

220. Ans. (a) Focal segmental Glomerulosclerosis

Ref: Robbin's Pathology, 9th ed. pg. 918-920

Depending on the cause, focal segmental glomerulosclerosis is broadly classified as:

- Primary, when no underlying cause is found; usually presents as nephrotic syndrome
- Secondary, when an underlying cause is identified; usually presents with kidney failure and proteinuria. *This is actually a heterogeneous group including numerous causes such as Infections such as HIV (known as HIV-Associated Nephropathy)*

Other Causes of FSGS

- Toxins and drugs such as heroin and pamidronate
- Chronic pyelonephritis
- VUR

221. Ans. (b) Cardiovascular complications

- Hypotension is the most common acute complication of hemodialysis.
- Numerous factors appear to increase the risk of hypotension, including excessive ultrafiltration with inadequate compensatory vascular filling, impaired vasoactive or autonomic responses, osmolar shifts.
- A beta 2 amyloid deposition is seen in dialysis dementia and thus rules out choice A.
- Metabolic acidosis is treated with dialysis and thus rules out choice D.
- Cardiovascular disease constitutes the major cause of death in patients with ESRD.
- Cardiovascular mortality and event rates are higher in dialysis patients than in patients post-transplantation, although rates are extraordinarily high in both populations.

222. Ans. (c) Renal cell CA

Ref: Robbin's Pathology, 9th ed. pg. 952

- Robbins 9th ed. States: "by far the **most common malignant tumor is renal cell carcinoma**, followed by Wilms tumor, which is found in children.
- Incidence of RCC is: 85%
- M > F (2:1)
- Most of the RCC are **sporadic** > AD (familial)

Extra Mile

KIDNEY CA (extract from Robbins 9th ed.)

- MC benign tumor of kidney: Renal papillary adenoma
- MC malignant tumor of kidney: RCC > Wilm's tumor
- MC kidney tumor associated with tuberous sclerosis: Angiomyolipoma
- MC type of RCC: Clear cell CA (70–80%)
- MC type of renal CA associated with dialysis: Papillary CA
- MC renal CA associated with sickle cell trait: Medullary CA
- Renal CA having best prognosis: Chromophobe type

223. Ans. (c) Smoking

Ref: Robbin's Pathology, 9th ed. pg. 953

Robbins states: "Tobacco is the most significant risk factor. Cigarette smokers have double the incidence of renal cell carcinoma".

Risk factors for RCC:

- **MC risk factor: Smoking**
- **Obesity (F > M), Hypertension, asbestos exposure, CKD, tuberous sclerosis**
- **VHL (Von Hippel-Lindau syndrome):** Around half to 2/3rd of the patients with VHL develop renal cyst and bilateral RCC.

224. Ans. (d) Chromophobe

Ref: Robbin's Pathology, 9th ed. pg. 954

225. Ans. (b) Papillary CA

Ref: Robbin's Pathology, 9th ed. pg. 952-54

226. Ans. (b) Clear cell CA

Ref: Robbin's Pathology, 9th ed. pg. 952-54

227. Ans. (d) Lung

Ref: Robbins, 9th ed. pg. 946

Please refer to Explanation of Question 194.

228. Ans. (c) Liver

Ref: Robbins, 9th ed. pg. 946

229. Ans. (d) Pancreatic cyst

Ref: Robbins, 9th ed. pg. 946

Since pancreas is among the least commonly involved organs, the cause of death will also be less as compared to other mentioned conditions.

Cause of death in case of PKD (according to Bailey 26th ed. and Robbins 9th ed.)

- **MC cause of death:** Chronic renal failure
- Coronary/hypertensive heart disease: ~40% of cases
- Infection: 25% of cases
- Rupture of berry aneurysm: ~15% of cases

LIVER

230. Ans. (b) Wilson disease

Mallory hyaline bodies are eosinophilic intracytoplasmic inclusions seen in peri-nuclear location with swollen and ballooned hepatocytes.

Causes of Mallory hyaline bodies are:

- Primary biliary cirrhosis
- Indian childhood cirrhosis
- Cholestatic syndrome
- Wilson disease
- Intestinal bypass surgery
- Focal nodular hyperplasia
- Hepatocellular carcinoma

231. Ans. (d) Dubin Johnson syndrome

TABLE: Causes of Hereditary Hyperbilirubinemia

Unconjugated hyperbilirubinemia	Conjugated hyperbilirubinemia
Gilbert disease (defect in ligandin leading to defective uptake of unconjugated hyperbilirubinemia)	Dubin Johnson syndrome (Black Liver due to deposition of epinephrine).
Crigler Najjar syndrome (absent UDPGT activity) Type 1 : more severe due to complete absence enzyme Type 2: less severe due to partial absence of enzyme	Rotor syndrome (Milder variant of Dubin Johnson but liver texture and color are normal).

232. Ans. (d) Photosensitivity dermatitis

Ref: Robbin's Pathology, 9th ed. pg. 650-651, 847-849

TABLE: Hereditary hyperbilirubinemias

Disorder	Inheritance	Detects in bilirubin metabolism	Liver pathology	Clinical course
Crigler-najjar syndrome type I	Autosomal recessive	Absent UGT 1A1 activity	None	Fatal in neonatal period
Crigler-Najjar syndrome type II	Autosomal dominant with variable penetrance	Decreased UGT1A1 activity	None	Generally mild, occasional kernicterus
Gilbert syndrome	Autosomal recessive	Decreased UGT1A1 activity	None	Innocuous
Conjugated hyperbilirubinemia				
Dubin-Johnson syndrome	Autosomal recessive	Impaired biliary excretion of bilirubin glucuronides due to mutation in canalicular multidrug resistance protein 2 (MRP2)	Pigmented cytoplasmic globules	Innocuous
Rotor syndrome	Autosomal recessive	Decreased hepatic uptake and storage Decreased biliary excretion	None	Innocuous
UGT1A1, Uridine diphosphate glucuronosyltransferase family, peptide A1				

PRIMARY HEMOCHROMATOSIS

In the skin, hemosiderin deposits occur in the dermis around sweat glands, and there is also an increase in melanin deposition in the epidermis. (Bronzing of skin)

- The pancreas is usually slightly enlarged, firm, and deeply pigmented. (Type 1 Diabetes Mellitus)
- The liver is usually enlarged, rusty red or ochre in color, and nodular and lobules are separated by dense fibrous tissue (Pigmentary cirrhosis)
- Restrictive cardiomyopathy

233. Ans. (c) Tuberculoma

ALPHA-FETO PROTEIN (AFP)

- It is a glycoprotein synthesized normally early in fetal life by the yolk sac, fetal liver and fetal GIT.

AFP is raised in:

- Liver cancer
- Lung cancer
- Colon cancer
- Pancreatic cancer
- Non-seminoma germ cell tumor of testis
- Cirrhosis and hepatitis
- Pregnancy

234. Ans (b) Crigler Najjar Syndrome

Ref: Robbins Pathology, 9th ed. pg. 853-54

- In **Crigler-Najjar Syndrome** due to absence of UDP glucuronyltransferase enzyme, conjugation of bilirubin is not possible and this results in elevation of unconjugated bilirubin to very high levels in the first 24 hours of life of neonate.

235. Ans. (d) **Crigler Najjar syndrome type II**

Ref: Robbins Pathology, 9th ed. pg. 853-54

236. Ans. (c) **Crigler Najjar syndrome type I**

Ref: Robbins Pathology, 9th ed. pg. 853-54

237. Ans. (b) **Primary sclerosing cholangitis**

Ref: Robbin's Pathology, 9th ed. pg. 860

PRIMARY SCLEROSING CHOLANGITIS

- Leads to obstructive jaundice leading to elevation of serum transaminases, gamma glutamyl transferase and alkaline phosphatase
- Typical onion skin fibrosis of bile ducts
- Percutaneous transhepatic cholangiography demonstrates irregularity and beading of the hepatic and common bile ducts in three patients.
 - Onion skin appearance in kidney seen in hyperplastic arteriosclerosis
 - Onion skin like lesions due to arteritis seen in Lyme's and SLE
 - Onion skin fibrosis around bile ducts seen in PSC
 - Onion skin pattern of deposition of reactive bone in ewing's sarcoma
 - Onion bulb appearance in sural nerves seen in CIDP due to recurrent demyelination and remyelination

238. Ans. (a) **Adenocarcinoma of ampulla of Vater**

The complications of gallstones include gangrenous cholecystitis by pressure on the mucosa and blood vessels in an acutely inflamed gallbladder

- Cholangitis by blocking the major biliary ducts and allowing bacteria to ascend into the liver
- Obstructive jaundice by blocking the common duct
- Acute pancreatitis by blocking the ampulla of Vater or a major pancreatic duct
- Gallstone ileus.

239. Ans. (d) **Metastasis**

Ref: Harrison, 19th ed. pg. 544

- Most common tumor of liver is metastasis
- Most common benign tumor of liver is cavernous hemangioma
- Most common cause of hepatocellular cancer is hepatitis B.

240. Ans. (c) **Collagen type 1 & 3**

Ref: Robbin's Pathology, 9th ed. pg. 823-824

- In cirrhosis, types I and III collagen and other ECM components are deposited in the space of Disse. In advanced fibrosis and cirrhosis, fibrous bands separate nodules of hepatocytes throughout the liver.
- In the normal liver, extracellular matrix (ECM) consisting of interstitial collagens (fibril-forming collagens types I, III, V, and XI) is present only in the liver capsule, in portal tracts, and around central veins. The liver has no true basement membrane; instead, a delicate framework containing type IV collagen and other proteins lies in the space between sinusoidal endothelial cells and hepatocytes (the space of Disse).

241. Ans. (c) **Production of vitamin K**

Ref: Robbin's Pathology, 9th ed. pg. 821

- **Vitamin K is produced by the bacteria of gut** and is used by liver for gamma carboxylation of factor 2/7/9/10.
 - Liver produces albumin which falls in liver cirrhosis producing ascites/edema.
 - Ammonia is combined with carbon dioxide to produce urea which in turn is excreted by the liver.
 - The cytochrome P450 is responsible for metabolism of drugs.

242. Ans. (c) **Angiosarcoma of liver**

Ref: Harrison, 19th ed. pg. 2027

Agents Leading to Angiosarcoma of Liver

- Arsenic
- Thorotrast (Liberates Alpha particles)
- Vinyl chloride

GASTROINTESTINAL TRACT

243. Ans. (d) **Tropheryma whippelii**

Ref: Harrison 19th ed. P 1092-93

- Whipple's disease is a malabsorption syndrome caused by *Tropheryma whippelii*. It is an intracellular bacteria found in gut macrophages.

Mnemonic: WHIPPLE

Weight loss
Hyperpigmentation
Infection with *Tropheryma whippelii*
PAS positive granules in macrophages
Polyarthritis
Lymphadenopathy
Steatorrhea

FMGE Solutions Screening Examination

386

Extra Mile

IOC for Whipple's disease is small intestinal biopsy.
Most common *heart valve* involved in Whipple's disease is aortic valve.
Culture negative endocarditis is seen with duke' criteria not being satisfied.
CNS features are in form of cognition defect progressive to dementia.
MC extraintestinal manifestation of Whipple's disease is CNS feature of dementia.
Current treatment is ceftriaxone for 2 weeks and oral doxycycline for 1 year.

244. Ans. (c) Menetrier's disease

- Menetrier's disease has chronic hypertrophic gastritis with foveolar cell hyperplasia. The rugosities of stomach are enlarged with atrophy of parietal cells.
- Type A gastritis is autoimmune gastritis and has body-fundus involvement.
- Type B gastritis is *H. pylori* related and involves the antrum. It is also called hyper-secretory gastritis.
- Type AB gastritis affects the mucosal region of A as well as B types and is overall the most common type of gastritis in all age groups.

245. Ans. (a) Crohn's disease

Serpiginous ulcers are features of Crohn's Disease. Pseudo-polyps are seen in ulcerative colitis.

Feature	Crohn's disease	Ulcerative colitis
Distribution	Segmental with skip areas	Continuous without skip areas
Location	Commonly terminal ileum and/or ascending colon	Commonly rectum, sigmoid colon and extending upwards
Extent	Usually involves the entire thickness of the affected segment of bowel wall	Usually superficial, confined to mucosal layer
Ulcers	Serpiginous ulcers may develop into deep fissures	Superficial mucosal ulcers without fissures
Pseudo-polyps	Rarely seen	Commonly present
Fibrosis	Common	Rare
Shortening	Due to fibrosis	Due to contraction of muscularis

246. Ans. (c) Celiac disease

Ref: Robbins, 9th ed. pg. 783

HPE Findings of Celiac Disease

- Biopsy specimens from the second portion of the duodenum or proximal jejunum, which are exposed to the highest concentrations of dietary gluten, are **generally diagnostic in celiac disease**.
- The histopathology is characterized by increased numbers of intraepithelial CD8+ T lymphocytes (**intraepithelial lymphocytosis**), crypt hyperplasia, and **villous atrophy**.

247. Ans. (b) Amylase

Ref: Sabiston, 19th ed. pg. 1524-1525, 1531; Schwartz, 9th ed. pg. 1200-1203; Bailey, 26th ed. pg. 1133-1134

PSEUDOPANCREATIC CYST

- A chronic collection of pancreatic fluid surrounded by a non-epithelialized wall of granulation tissue and fibrosis
- Pseudo-cysts account for 75% of cystic lesions of the pancreas.
- MC complication of chronic pancreatitis.

- Located anywhere from the mediastinum to the scrotum
- Found most often in the lesser sac or anterior para-renal space
- Traumatic pseudocysts tend to occur anterior to the body of the gland
- Chronic pancreatitis pseudocysts are commonly located within the substance of the gland

- Alcohol is the MC cause of pancreatitis related pseudocysts

Diagnosis

- No definitive laboratory findings are available to establish a diagnosis of pancreatic pseudocyst.
- **Elevated serum amylase and lipase concentrations may occur in half of these patients.**
- **Persistently elevated amylase after resolution of acute pancreatitis should prompt investigation for a pseudocyst.**
- CECT abdomen is investigation of choice for diagnosis of a pancreatic pseudocyst.

248. Ans. (d) Hypertension

Ref: Robbin's Pathology, 9th ed. pg. 884-86

- Acute pancreatitis is seen chiefly in males after age 40 and often associated with obesity and alcoholism.
- In about 50% of the cases, gallstones are also present.
- Pancreatitis occurs in about 10% of cases of hyperparathyroidism.

- Long term thiazides can also contribute to development of pancreatitis.
- In some cases calculi resulting from the hypercalcemia of hyperparathyroidism develop in pancreatic ducts and lead to obstruction and inflammation.

249. Ans. (c) Chronic gastritis

Ref: Robbin's Pathology, 9th ed. pg. 763, 804

- Gastric polyps are not common. When they occur, they are usually hyperplastic polyps consisting of hyperplastic mucosal epithelium over an inflamed edematous stroma.
- They are most often seen in association with the chronic mucosal damage found in chronic gastritis.

250. Ans. (d) Pernicious anemia

Ref: Robbin's Pathology, 9th ed. pg. 764

- Antiparietal cell antibodies are found in patients with the autoimmune disease known as pernicious anemia.
- The antineutrophilic cytoplasmic antibodies are found in patients with Wegener granulomatosis.
- Wegener granulomatosis may also present with pulmonary and renal involvement but will have associated upper respiratory tract findings, e.g. sinusitis and sinus abscesses.

251. Ans. (d) Majority seen in duodenum

Ref: Robbin's Pathology, 9th ed. pg. 775-76

- Majority of gastrointestinal stromal tumours originate from stomach. The cell of origin is interstitial cell of Cajal which are present in muscularis propria.
- The useful marker is c-kit (CD 117) detectable in 95% of patients.
- PET scan is the imaging modality of choice
- Treatment is tyrosine kinase inhibitors like imatinib mesylate.

252. Ans. (d) Coagulative necrosis

Ref: Robbin's Pathology, 9th ed. pg. 795-96

- The typical flask shaped ulcer in amoebiasis is due to liquefactive necrosis affecting caecum and ascending colon and rectum.
- Once the infection spreads hematogenously from the gut to the liver it results in generation of liver abscess which has presence of anchovy sauce pus.

253. Ans. (d) Prophylactic polypectomy is recommended as standard therapy

Ref: Robbin's Pathology, 9th ed. pg. 809

- In FAP as many as >100 polyps may be present in colon, and anyone of these can turn malignant any day, hence

prophylactic colectomy is recommended as standard treatment.

- Most of the polyps are tubular polyps. In *attenuated FAP* (30 Polyps) are seen in proximal colon.
- The defect is in APC gene on chromosome 5, due to mutation in nucleotide excision base excision repair gene.

Extra Mile

- **Turcot Syndrome:** Adenomatous colonic polyposis + CNS tumours (2/3 medulloblastomas and 1/3 are gliomas)
- **Gardener syndrome:** Intestinal polyps + Epidermal cysts + Fibromatosis + Osteomas

254. Ans. (d) Increased MCV of RBC

Ref: Robbin's Pathology, 9th ed. pg. 764

Type A gastritis is autoimmune gastritis. The antiparietal cell antibodies lead to decreased intrinsic factor production. This leads to decreased absorption of vitamin B₁₂ and resultant increased MCV.

255. Ans. (d) Superficial spreading

Ref: Robbins's Pathology, 9th ed. pg. 772-73

256. Ans. (d) Rectum is commonly involved

Ref: Robbin's Pathology, 9th ed. pg. 798-99

- Crohn's disease can lead to formation of perianal fistula which leads to poor perianal hygiene.
- The stricture formation seen in Crohn's disease occurs due to transmural inflammation.
- Most common part of GIT involved is ileum in Crohn's disease and rectum is spared.

Extra Mile

- **Fecal lactoferrin** is a highly sensitive and specific marker for detecting intestinal inflammation.
- **Fecal calprotectin** levels correlate well with histological inflammation and predict relapses and detect pouchitis.

257. Ans. (b) Thinning of mucosal layer

- The normal esophageal mucosa undergoes continuous cell turnover and renewal. Acute radiation esophagitis is primarily due to effects on the basal epithelial layer. This causes a thinning of the mucosa, which can progress to denudation.

Acute toxicity is manifested clinically as dysphagia, odynophagia, and substernal discomfort, and usually occurs within two to three weeks after the initiation of radiation therapy (RT). Patients may describe a sudden, sharp, severe chest pain radiating to the back.

FMGE Solutions Screening Examination

388

258. Ans. (a) Hemangioma

Ref: Robbin's Pathology, 9th ed. pg. 625

- Most common tumor of spleen is **hemangioma**
- Most common malignant tumor of spleen is **lymphoma**
- Most common malignant non-lymphoid tumor of spleen is **angiosarcoma**

259. Ans. (d) Stomach

Ref: Robbin's Pathology, 9th ed. pg. 773

- MALT lymphoma (MALToma) is a form of lymphoma involving the mucosa-associated lymphoid tissue (MALT), frequently of the stomach, but virtually any mucosal site can be afflicted. It is a cancer originating from B cells in the marginal zone of the MALT, and is also called extranodal marginal zone B cell lymphoma.
- Gastric MALT lymphoma is frequently associated (72–98%) with chronic inflammation as a result of the presence of *Helicobacter pylori*.

260. Ans. (a) Pseudo-polyps

Ref: Robbin's Pathology, 9th ed. pg. 798

- Pseudo-polyps are seen in ulcerative colitis. An **inflammatory pseudopolyp** is an island of normal colonic mucosa which only appears raised because it is surrounded by atrophic tissue (denuded ulcerative mucosa).
- It must be distinguished from inflammatory polyps, which are regions of inflamed and elevated mucosa surrounded by granular mucosa.

261. Ans. (a) p-ANCA

Ref: Robbin's Pathology, 9th ed. pg. 600

- p-ANCA, or Perinuclear Anti-Neutrophil Cytoplasmic Antibodies, show a perinuclear staining pattern. It is directed against myeloperoxidase.
- It is fairly specific, but not sensitive for ulcerative colitis, so is not useful as a sole diagnostic test. When measured together with Anti-saccharomyces cerevisiae antibodies (ASCA), p-ANCA has been estimated to have a specificity of 97% and a sensitivity of 48% in differentiating patients with ulcerative colitis from normal controls.
- It is also seen in about 50% of cases of Churg-Strauss syndrome
 - Primary sclerosing cholangitis
 - Microscopic polyangiitis
 - Focal necrotising and crescentic glomerulonephritis
 - Rheumatoid arthritis

CENTRAL NERVOUS SYSTEM

262. Ans. (b) Superoxide dismutase

Ref: Robbin's Pathology, 9th ed. pg. 48, 80

- Antioxidant enzymes include glutathione peroxidase, SOD and catalase.
- Deficiency of SOD 1 gene may result in motor neuron disorder.

263. Ans. (c) Hippocampus

Ref: Robbin's Pathology, 9th ed. pg. 277

- **Negri bodies** are eosinophilic, sharply outlined, pathognomonic inclusion bodies (2–10 µm in diameter) **found in the cytoplasm of certain nerve cells containing the virus of rabies, especially in Ammon's horn of the hippocampus.**
- They are also found in the cells of the medulla and various other ganglia. Negri bodies can also be found in the neurons of the salivary glands, tongue, or other organs. Staining with Mann's, giemsa, or Sellers stains can permit differentiation of rabies inclusions from other intracellular inclusions. With these stains, Negri bodies appear magenta in color and have small (0.2 µm to 0.5 µm), dark-blue interior basophilic granules.
- Histologic examination of tissues from clinically rabid animals show Negri bodies in about 50% of the samples; in contrast, the dFA test shows rabies antigen in nearly 100% of the samples.
- In other cases, non-rabid tissues have shown inclusions indistinguishable from Negri bodies. **Because of these problems, the presence of Negri bodies should not be considered diagnostic for rabies.**

Extra Mile

Some other important bodies

- Lewy bodies: Parkinson's disease
- Russel bodies: multiple myeloma
- Mallory bodies: Alcoholism
- Donovan bodies: Leishmaniasis
- Heinz bodies: G-6-PD
- Howell jolly bodies: Sickle cell anemia
- Councilman bodies: yellow fever

264. Ans. (c) Parkinsonism

Ref: Robbin's Pathology, 9th ed. pg. 1294-95

Lewy body is an eosinophilic cytoplasmic inclusion consisting of a dense core surrounded by a halo of 10-nm-wide radiating fibrils, the primary structural component of which is alpha-synuclein. It is seen in Parkinsonism, Dementia with lewy bodies, shy dragger syndrome.

• Alzheimer disease	Hirson bodies/neurofibrillary tangles
• Rabies	Negri bodies
• Parkinsonism, dementia with lewy bodies	Lewy bodies
• Pick bodies	Picks disease

265. Ans. (a) **Huntington's chorea**

Ref: Robbin's Pathology, 9th ed. pg. 1297-98

- The neuropathology of Huntington's disease consists of prominent neuronal loss and gliosis in the caudate nucleus and putamen; similar changes are also widespread in the cerebral cortex.
- *Intraneuronal inclusions containing aggregates of ubiquitin and the mutant protein huntingtin are found in the nuclei of affected neurons.*
- HD is caused by an increase in the number of polyglutamine (CAG) repeats (>40) in the coding sequence of the Huntington gene located on the short arm of chromosome 4.

266. Ans. (a) **Retinoblastoma**

Ref: Robbin's Pathology, 9th ed. pg. 1339; Dorland Medical Dictionary

- Glioma retinae is a congenital blastoma occurring in both hereditary and sporadic forms and is composed in tumour arising from embryonic retinal cells.
- It appears in one or both eyes in children under 5 years of age and is usually diagnosed initially by a bright white pupillary reflex (Leucocoria). It is caused by germline or somatic mutations or both, in both the alleles of retinoblastoma gene (Rb1)

ENDOCRINE SYSTEM

267. Ans. (a) **Parathyroid adenoma**

Ref: Harrison 20th edition, P 2747

MEN 2A is called Sipple syndrome and includes the following

- Medullary carcinoma thyroid (MC of all of these)
- Pheochromocytoma
- Parathyroid adenoma

The defect lies on chromosome 10 and *RET* proto-oncogene is responsible.

Extra Mile

MEN 2B (also known as MEN 3)	MTC (>90%) Pheochromocytoma (>50%) Associated abnormalities (40–50%) • Mucosal neuromas • Marfanoid habitus • Medullated corneal nerve fibers • Megacolon	MEN 4 (12p13)	Parathyroid adenoma Pituitary adenoma Reproductive organ tumors
------------------------------	---	---------------	---

268. Ans. (b) **Secretin**

Ref: Harrison 20th edition, P 2741

- Pheochromocytomas can produce *calcitonin, opioid peptides, somatostatin, corticotropin, and vasoactive intestinal peptide.*
- Corticotropin hypersecretion causes Cushing syndrome, and vasoactive intestinal peptide overproduction leads to watery diarrhea.
- Calcitonin is also produced by medullary carcinoma of thyroid which is related to Pheochromocytoma.

269. Ans (c) **Neuropathy**

Ref: Robbin's Pathology, 9th ed. pg. 1086-87

- Hashimoto's thyroiditis or chronic lymphocytic thyroiditis is an autoimmune disease in which the thyroid gland is gradually destroyed by a variety of cell and antibody mediated immune processes.
- Physiologically, antibodies against thyroid peroxidase and/or thyroglobulin cause gradual destruction of follicles in the thyroid gland. Accordingly, the disease can be detected clinically by looking for these antibodies in the blood. It is also characterized by invasion of the thyroid tissue by leukocytes, mainly T-lymphocytes. It is associated with non-Hodgkin lymphoma.

270. Ans. (b) **Medullary carcinoma thyroid**

Ref: Robbin's Pathology, 9th ed. pg. 1099

MEDULLARY CARCINOMA THYROID

- Accounts for approximately 7% of malignant tumour of thyroid
- It arises from ultimobranchial bodies (from the parafollicular C cells derived from thyroid follicles).
- *It contains amyloid stroma*
- Familial medullary carcinomas occur in 25% of patients (Marfanoid habitus, Amyloid disease also occur in patients with familial medullary cancer).
- Medullary carcinoma occurs in association with (MEN 2A) syndrome.
- All patients with medullary carcinoma of thyroid should be screened for RET proto-oncogene.
- Medullary Carcinoma thyroid secretes calcitonin, this *does not cause hypocalcemia*

271. Ans. (a) **Cardiac**

Ref: Robbin's Pathology, 9th ed. pg. 1115

- *Cardiovascular insufficiency and cerebrovascular accidents are the most common causes of mortality.* The

FMGE Solutions Screening Examination

impact of cardiovascular disease can be gauged by its involvement in as many as 80% of deaths of type 2 diabetics; in fact, diabetics have a 3 to 7.5 times greater incidence of death from cardiovascular causes than nondiabetic populations.

- The hallmark of cardiovascular disease is *accelerated atherosclerosis* of the large and medium-sized arteries (i.e., macrovascular disease).

272. Ans. (c) MEN II B

Ref: Robbin's Pathology, 9th ed. pg. 1137

MEN type 1

- Parathyroid hyperplasia or adenoma
- Islet cell hyperplasia, adenoma, or carcinoma
- Pituitary hyperplasia or adenoma
- Other, less common manifestations: foregut carcinoid, pheochromocytoma, subcutaneous or visceral lipomas

MEN IIA

- Medullary Thyroid Cancer (MTC)
- Pheochromocytoma
- Parathyroid hyperplasia or adenoma

MEN IIB

- MTC
- Pheochromocytoma
- Mucosal and gastrointestinal neuromas
- Marfanoid features

273. Ans. (b) Hyperparathyroidism

Please refer to above explanation

274. Ans. (d) Urine contains 5H.I.A.A

Ref: Robbin's Pathology, 9th ed. pg. 476

- **Neuroblastoma (NB) is the most common extracranial solid cancer in childhood and the most common cancer in infancy.**
- Neuroblastoma is one of the few human malignancies known to demonstrate spontaneous regression from an undifferentiated state to a completely benign cellular appearance.
- *The most common location for neuroblastoma to originate (i.e., the primary tumor) is the adrenal glands.* This occurs in 40% of localized tumors and in 60% of cases of widespread disease.
- Neuroblastoma can also develop anywhere along the sympathetic nervous system chain from the neck to the pelvis.
- N-myc oncogene amplification within the tumor is a common finding in neuroblastoma. The degree of amplification shows a bimodal distribution: either 3- to 10-fold, or 100- to 300-fold. The presence of this mutation is highly correlated to advanced stages of disease

- Since it originates from chromaffin cells, in about 90% of cases of neuroblastoma, elevated levels of catecholamines or their metabolites are found in the urine or blood. Catecholamines and their metabolites include dopamine, homovanillic acid (HVA), and/or vanillyl mandelic acid (VMA)

275. Ans. (d) Diffuse glomerulosclerosis

Ref: Robbin's Pathology, 9th ed. pg. 111

- Diabetic nephropathy is a common cause of end-stage renal disease worldwide. It is characterised by diffuse or nodular glomerulosclerosis, afferent and efferent hyaline arteriosclerosis, and tubulointerstitial fibrosis and atrophy.
- **Note-** *HPS finding of HIV nephropathy- Focal segmental glomerulosclerosis (FSGS)*

276. Ans. (a) Papillary carcinoma thyroid

Ref: Robbin's Pathology, 9th ed. pg. 1095

- Psammoma bodies are associated with the papillary histo-morphology and are thought to arise from:
 - 1 The infarction and calcification of papillae tips
 - 2 Calcification of intra-lymphatic tumor thrombi
- **Psammoma bodies are commonly seen in certain tumors such as:**
 - Papillary thyroid carcinoma
 - Papillary renal cell carcinoma
 - Ovarian papillary serous cyst-adenocarcinoma
 - Endometrial adenocarcinomas (Papillary serous carcinoma ~3%-4%)
 - Meningiomas, in the central nervous system
 - Peritoneal and Pleural Mesothelioma
 - Somatostatinoma
 - Prolactinoma
 - Mesothelioma, in membranes that line body cavities

277. Ans. (a) Papillary thyroid cancer

Ref: Robbin's Pathology, 9th ed. pg. 1095-96

Orphan Annie Eye Nucleus is Seen in

- Papillary carcinoma thyroid
- Polymorphous low grade adenocarcinoma
- Hashimoto Thyroiditis
- Grave's disease
- Nodular goiter

278. Ans. (a) Epinephrine

Ref: Robbin's Pathology, 9th ed. pg. 1134-36

- *Phaeochromocytoma size <5 cm and associated with MEN 2A can produce epinephrine due to sufficient methyl transferase enzyme.*

- However if pheochromocytoma is >5 cm or is an extrarenal pheochromocytoma due to absence of methyl transferase enzyme, produces only nor-epinephrine.

279. Ans. (d) Mucinous cystadenosarcoma

Ref: Robbin's Pathology, 9th ed. pg. 1027

- Pseudomyxoma peritonei (PMP) is a clinical condition caused by cancerous cells (mucinous adenocarcinoma) that produce abundant mucin or gelatinous ascites.
- The primary tumor appears to arise from the MUC2 expressing goblet cells and most commonly from these cells in the appendix. The K-Ras and p53 genes may be involved in the oncogenesis. It may be diagnosed with a range of conditions.
- While the majority of these cases are associated with appendiceal carcinomas other conditions may also be found, including disseminated peritoneal adenomucinosis (DPAM), peritoneal carcinomas, several mucinous tumors (mucinous adenocarcinoma, mucinous cystadenoma, and mucinous cystadenocarcinoma), as well as other disease states
- This will result in compression of organs and will destroy the function of colon, small intestine, stomach, or other organs. Prognosis with treatment in many cases is optimistic, but the disease is lethal if untreated, with death by cachexia, bowel obstruction, or other types of complications.

GENETICS

280. Ans. (d) G6PD

Ref: CMDT 2019, P 521

- Glucose-6-phosphate dehydrogenase (G6PD) deficiency is an XLR enzyme defect that causes episodic hemolytic anemia because of the decreased ability of red blood cells to deal with oxidative stresses. G6PD deficiency leads to excess oxidized glutathione (hence, inadequate levels of reduced glutathione) that forces hemoglobin to denature and form precipitants called Heinz bodies.

281. Ans. (a) AR

Ref: Robbins E-Book, P 246

- Marriage amongst cousins/close relatives is called as consanguinity.
- The high consanguinity rates, could induce the expression of autosomal recessive diseases, including very rare or new syndromes.

282. Ans. (a) Phenotype

Ref: Robbins 8th ed. P 136-37

Phenotype	Physical appearance ascribed to a particular genetic make-up
Proteomics	Measurement of all proteins expressed in a cell or tissue
Genotype	Genetic composition describing number of chromosomes
Anticipation	Increase in severity of disease with successive generations

283. Ans. (b) Familial hypercholesterolemia

Ref: CMDT 2017, P 1212

Disease with Polygenic Pattern of Inheritance

- Hypertension
- Diabetes mellitus
- Gout
- Schizophrenia
- Bipolar disorder

284. Ans. (b) Chromosome 17q21

- The Cytogenetic Location of BRCA1 gene is 17q21.31, which is the long (q) arm of chromosome 17 at position 21.31
- Cytogenetic Location: 13q13.1, which is the long (q) arm of chromosome 13 at position 13.1
- BRCA1- and BRCA2-associated hereditary breast and ovarian cancer syndrome (HBOC) is characterized by an increased risk for female and male breast cancer, ovarian cancer (includes fallopian tube and primary peritoneal cancers).

285. Ans. (a) Fibrillin 1

- Fibrillin is the major component of extracellular microfibrils and is widely distributed in connective tissue throughout the body.
 - Mutations in the fibrillin-1 (FBN1) gene, on chromosome 15q21.1, have been found to cause Marfan syndrome, a dominantly inherited disorder characterised by clinically variable skeletal, ocular, and cardiovascular abnormalities.
 - Fibrillin-1 mutations have also been found in several other related connective tissue disorders, such as severe neonatal Marfan syndrome, dominant ectopia lentis, familial ascending aortic aneurysm, isolated skeletal features of Marfan syndrome, and Shprintzen-Goldberg syndrome.

286. Ans. (d) 47XXY

287. Ans.(b) 11q(22-23)

- The image shows dilated blood vessels in the sclera which is called telangiectasia. It is seen in Ataxia-telangiectasia.

FMGE Solutions Screening Examination

- The gene for ataxia-telangiectasia has been localized to band 11q22-23.
- The main abnormalities on physical examination are ocular and cutaneous telangiectasia and neurologic symptoms (ataxia and abnormal eye movements present in virtually all cases) and choreo-athetosis.

288. Ans. (a) **50% carrier and 50% affected**

Ref: Harsh Mohan, 7th ed. pg. 255

289. Ans. (c) **Chromosomal abnormalities**

Ref: Robbin's Pathology, 9th ed. pg. 158

Karyotyping is the study of chromosomes and is used in cytogenetics to study the chromosomal abnormalities. After arresting the cells in metaphase the chromosomes are examined to check for:

- Change in Number of chromosomes - To detect abnormalities in chromosome numbers such as aneuploidy (trisomy, tetrasomy), polyploidy.
- For detection of structural chromosomal anomalies such as translocation, deletions, inversion of chromosomes.

290. Ans. (c) **Trinucleotide - repeat expansion**

Ref: Robbin's Pathology, 9th ed. pg. 168

- Anticipation is a phenomenon where by the symptoms of a genetic disorder become apparent at an earlier age as it is passed to next generation. In most cases, an increased severity of symptoms is also noted.
- In triplet nucleotide repeat mutation, the DNA fragment is unstable and tends to expand further during cell division. So, in successive generations the expanded repeat increases and the manifestations of disease may worsen or may be observed at an earlier age; this phenomenon is referred to as anticipation.

291. Ans. (a) **13q14**

Ref: Robbin's Pathology, 9th ed. pg. 1339

• Wilm's tumor-Aniridia complex (WAGR syndrome)	11 p 13 part of (deletion of short arm of chromosome)
• Retinoblastoma	13q 14.11 (deletion of part of long arm of chromosome 13)
• Prader-Willi syndrome Angelman syndrome	15q 11-13 (deletion of part of long arm of chromosome 15)
• DiGeorge's syndrome Velo-Cardio-facial syndrome	22q11 (deletion of part of long arm of chromosome -22)

292. Ans. (b) **Marfan syndrome**

Ref: Robbin's Pathology, 9th ed. pg. 144

- The presentation in the question is of a patient with Marfan syndrome.
- Marfan syndrome is caused by a mutation in a single allele of the fibrillin gene (FBN1).
- The gene product is a major component of elastin-associated microfibrils. Long, thin extremities; ectopic lentis; and aortic aneurysms are the classical triad.
- Mutations in the FBN2 gene can also cause Marfan syndrome, but without aneurysms.

293. Ans. (c) **Chromosome 21**

Ref: Robbin's Pathology, 9th ed. pg. 158

- In karyotyping the image of stained chromosome pairs in metaphase stage is arranged in order of decreasing length.
- **Chromosome 21 is the smallest human chromosome**, with 48 million nucleotides, representing about 1.5 percent of the total DNA in cells
- Chromosome 1 is the largest chromosome.

294. Ans. (a) **Down Syndrome**

Ref: Robbin's Pathology, 9th ed. pg. 161

Autoimmune Thyroiditis is Seen with

- Down syndrome
- Turner syndrome
- Congenital rubella syndrome
 - Autoimmune thyroiditis is *not* seen with Marfan's Syndrome.
 - LouisBarr syndrome is known as ataxia telangiectasia. It characterised by deficiency of IgA with increased incidence of lympho-reticular malignancy.
 - Edward syndrome is eighteen trisomy which is characterised by clenched hand and *overlapping of fingers* where the index finger of the neonate overlaps third finger and fifth finger overlaps the fourth finger.

295. Ans. (b) **Only X chromosome from the mother undergoes pyknosis**

Ref: Robbin's Pathology, 9th ed. pg. 164

Lyon hypothesis is:

- Only one of the X chromosome is genetically active
- Other X chromosome which can be of paternal or maternal origin undergoes pyknosis and is rendered inactive.
- Inactivation of either paternal or maternal X chromosomes occurs at random among the cells of blastocyst by about 16th day of embryonic life
- Inactivation of X is because of a gene called Xist which causes gene silencing DNA methylation.

296. Ans. (a) **Genomic imprinting**

Ref: Robbin's Pathology, 9th ed. pg. 172-173

Preferential expression of an allele depending on parental origin is genomic imprinting.

- **Prader wili syndrome:** Deletion of paternal chromosome 15
- **Angelman syndrome:** Deletion of maternal chromosome 15
- **Beckwith weidmann syndrome:** have two paternal but no maternal copies of chromosome 11
- **Albright's hereditary osteodystrophy:** mutation in Gs alpha subunit leading to short stature, brachydactyl and PTH resistance only when mutation is inherited from the mother.

297. Ans. (d) **All of the above**

Ref: Robbin's Pathology, 9th ed. pg. 177-178

- FISH can be performed in prenatal samples, like samples obtained by amniocentesis, Cordocentesis, chorionic villus sampling or umbilical cord blood, peripheral blood lymphocytes.
- Since it does not need dividing cells, it is extremely useful for rapid diagnosis

Advantages of FISH

- Can detect numerical abnormalities of chromosomes like aneuploidy
- It can detect minor micro-deletions
- Can detect complex translocations
- For gene amplification analysis
- For mapping of recently isolated genes to their chromosomal locus

298. Ans. (a) **Autosomal recessive**

Ref: Robbin's Pathology, 9th ed. pg. 141

AUTOSOMAL DOMINANT

- One mutated copy of the gene in each cell is sufficient for a person to be affected by an autosomal dominant disorder.
- Autosomal dominant disorders tend to occur in every generation of an affected family.

- Associated diseases can be remembered as "DOMINANT"

D= Dystrophy Myotonic.

O- Ostogenesis Imperfecta.

M- Marfan's syndrome.

I- Intermittent Porphyria.

N- Noonan's Syndrome.

A- Adult Polycystic Kidney, Achondroplasia.

N- Neurofibromatosis.

T- Tuberous sclerosis.

AUTOSOMAL RECESSIVE

- Two mutated copies of the gene are present in each cell when a person has an autosomal recessive disorder.
- Autosomal recessive disorders are typically not seen in every generation of an affected family.

- **Diseases can be remembered as "ABCDEFGH SPW":**

A- Albinism, Alpha 1 Antitrypsin Deficiency

B- Beta Thalassemia

C- Cystic Fibrosis, CGD, CAH

D- Deafness (SNHL), Dubin Johnson

E- Enzyme Deficiencies (Glycogen Storage And Lysosomal Storage)

F- Friedrich's Ataxia, Fanconi Anemia

G- Galactosemia

H- Hemochromatosis, Hurler syndrome

S- Sickle Cell Disease

P- Phenylketonuria

W- Wilson's disease

X-LINKED DOMINANT

- X-linked dominant disorders are caused by mutations in genes on the X chromosome.
- *Females are more frequently affected than males*, and the chance of passing on an X-linked dominant disorder differs between men and women.
- Families with an X-linked dominant disorder often have both affected males and affected females in each generation. *A characteristic of X-linked inheritance is that fathers cannot pass X-linked traits to their sons (no male-to-male transmission).*
- Ex: hypophosphatemic rickets, also called vitamin D-resistant rickets.

X-LINKED RECESSIVE

- X-linked recessive disorders are also caused by mutations in genes on the X chromosome.
- *Males are more frequently affected than females*, and the chance of passing on the disorder differs between men and women.
- Families with an X-linked recessive disorder often have affected males, but rarely affected females, in each generation.

FMGE Solutions Screening Examination

- A characteristic of X-linked inheritance is that fathers cannot pass X-linked traits to their sons (no male-to-male transmission).
- Diseases under this are:
 - G6PD
 - Duchenne muscular dystrophy
 - Hemophilia A

299. Ans. (d) **X-linked recessive**

Ref: Robbin's Pathology, 9th ed. pg. 142

300. Ans. (a) **Albinism**

Ref: Robbin's Pathology, 9th ed. pg. 141

301. Ans (b) **Haemophilia**

Ref: Robbin's Pathology, 9th ed. pg. 142

"Less hCG is Detected Clinically in A Woman"

- Lesch-Nyhan syndrome
- Hemophilia, Hunter's syndrome
- Chronic granulomatous disease
- G6PD deficiency
- Duchenne muscular dystrophy
- Color blindness
- Agammaglobulinemia
- Wiskott-Aldrich syndrome

302. Ans. (a) **Vitamin D resistant rickets**

Ref: Robbin's Pathology, 9th ed. pg. 142

Vitamin D resistant rickets	PHEX gene. X linked dominant
Familial hypercholesterolemia	Autosomal recessive
Red green colour blindness	X linked recessive
Achondroplasia	Autosomal dominant

303. Ans. (a) **X-linked**

Ref: Robbin's Pathology, 9th ed. pg. 155

- HURLER syndrome is autosomal recessive while HUNTER SYNDROME is X linked recessive
- HURLER syndrome is marked by progressive deterioration, hepatosplenomegaly, dwarfism and unique facial features. There is a progressive mental retardation, with death frequently occurring by the age of 10 years
- Hurler is due to defective IDUA gene, which has been mapped to the 4p16.3 site on chromosome 4. The gene is named IDUA because of its iduronidase enzyme protein product.

304. Ans. (a) **Decrease in AFP**

*Ref: Robbin's Pathology, 9th ed. pg. 161,
Nelson, 18th ed. ch. 81*

AFP	UE3	hCG	Associated conditions
Low	Low	High	Down syndrome
Low	Low	Low	Trisomy 18 (Edward's syndrome)
High	n/a	n/a	Neural tube defects (like spina bifida that may have associated increased levels of acetylcholinesterase in the amniotic fluid), omphalocele, gastroschisis, multiple gestation triplets, or an underestimation of gestational age.

305. Ans. (a) **Down syndrome**

Ref: Nelson, 18th ed. ch. 81

306. Ans. (b) **Chromosome 17**

Ref: Robbin's Pathology, 9th ed. pg. 291

- The BRCA2 gene is located on chromosome 13 and encodes over 3000 amino acids. It appears that BRCA2 plays an important role in male breast cancer.
- The human BRCA1 gene is located on the long (q) arm of chromosome 17

307. Ans. (c) **P16**

Ref: Robbin's Pathology, 9th ed. pg. 1054-55

- Genes called BRCA1, BRCA2, TP53 or PTEN are linked with breast cancer.
- P16 plays an important role in cell cycle regulation by decelerating cell progression from G1 phase to S phase, and therefore acts as a tumor suppressor that is implicated in the prevention of cancers, notably melanoma, oropharyngeal squamous cell carcinoma, cervical cancer, and esophageal cancer.

308. Ans. (b) **47XXY**

Ref: Robbin's Pathology, 9th ed. pg. 165

309. Ans. (b) **Chromosome 22 defect**

Ref: Harrison, 19th ed. pg. 83e-6

- Cat Eye Syndrome is a rare condition caused by the short arm (p) and a small section of the long arm (q) of human Chromosome 22 being present three (trisomic) or four times (tetrasomic) instead of the usual two times.

- The term “Cat Eye” syndrome was coined because of the particular appearance of the vertical colobomas in the eyes of some patients. Preauricular skin tags and/or pits constitute the most consistent features and suggest the presence of a supernumerary bisatellited marker chromosome 22 derived from duplication of the CES critical region.
- **Please do not confuse with retinoblastoma in which there is an abnormal appearance of the pupil, leukocoria, also known as amaurotic cat’s eye reflex.**
- Other signs and symptoms include deterioration of vision, a red and irritated eye with glaucoma, and faltering growth or delayed development. Some children with retinoblastoma can develop a squint. Retinoblastoma presents with advanced disease in developing countries and eye enlargement is a common finding.

RESPIRATORY SYSTEM

310. Ans. (c) Kidney

Ref: Robbins E-Book, P 519

Good pasture disease is a term used to describe glomerulonephritis, with or without pulmonary hemorrhage, and the presence of circulating anti-glomerular basement membrane (anti-GBM) antibodies

311. Ans. (a) Thickening of bronchial wall

Ref: Robbin E-book, P 502-504

- Increased numbers of goblet cells (goblet cell hyperplasia) is part of airway remodelling in asthma.
- The remodelling also includes epithelial proliferation, thickening of the reticular basement membrane, increased bronchial vascularity and hypertrophy of smooth muscle and submucosal glands.
- *Thickening of bronchial wall is seen in bronchiectasis.*

312. Ans. (c) Hyaline membrane disease

Ref: Robbins 9th ed. P 672

The immature lungs in hyaline membrane disease show eosinophilic hyaline membranes in alveoli, alveolar ducts and terminal bronchioles.

The membranes contain necrotic epithelial cells admixed with extravasated plasma proteins.

313. Ans. (c) IL-4

Ref: Robbin’s Pathology, 9th ed. pg. 204

- Asthma is a chronic allergic inflammatory disease, the initiation and progression of which is dependent on the cytokines interleukin IL-4 and IL-13 acting through related receptor complexes.
- Disease pathogenesis is affected by intracellular signaling pathways that couple primarily to specific motifs within the intracellular domain of the IL-4 receptor alpha chain, a subunit that is common to the IL-4 and IL-13 receptor complexes.

314. Ans. (a) Laminin

Ref: Robbin’s Pathology, 9th ed. pg. 105

Laminin is the most abundant glycoprotein in basement membranes. Type IV collagen, laminin and nidogen are present in basement membranes.

315. Ans. (d) Photosensitivity

Ref: Robbin’s Pathology, 9th ed. pg. 64

- Ochronosis in its endogenous form is a rare, recessively transmitted, congenital disorder of melanin-like pigmentation due to an inborn error in tyrosine metabolism which is due to deficiency of homogentisic acid oxidase.
- Homogentisic acid (an intermediate in the oxidation of tyrosine) is not oxidized, so it accumulates in the extracellular fluid.
- The compound is selectively deposited in cartilage, which becomes ochre colored or black due to melanin-like pigment.
- Deposits within synovium produce ochronotic arthritis, and involvement of the intervertebral disks is seen.

316. Ans. (b) Lipids

Ref: Robbin’s Pathology, 9th ed. pg. 354

PAS (periodic acid – Schiff) stain is versatile and has been used to stain many structures including glycogen, mucin, mucoprotein, glycoprotein, as well as fungi. PAS is useful for outlining tissue structures, basement membranes, glomeruli, blood vessels and glycogen in the liver.

317. Ans. (b) Congo red

Ref: Robbin’s Pathology, 9th ed. pg. 257

- In biochemistry and histology, Congo red is used to stain microscopic preparations especially as a cytoplasm and erythrocyte stain.

FMGE Solutions Screening Examination

396

- Apple-green birefringence of Congo red stained preparations under polarized light is indicative for the presence of amyloid fibrils.
- Additionally, Congo Red is used in microbiological epidemiology to rapidly identify the presence of virulent serotype 2A *Shigella Flexneri*, where the dye binds the bacterium's unique lipopolysaccharide (LPS) structure

318. Ans. (a) DNA and RNA

Ref: Harrison, pg. 150e-2

- Acridine orange is a nucleic acid selective-fluorescent cationic dye useful for cell cycle determination.
- It is cell-permeable, and interacts with DNA and RNA by intercalation or electrostatic attractions respectively and emits green and red light respectively.
- Acridine orange can be used in conjunction with ethidium bromide to differentiate between live and apoptotic cells.

319. Ans. (a) Animal Source

Ref: Harrison, pg. 640

Only source of vitamin B₁₂ for humans is food of animal origin, e.g., meat, fish, and dairy products. Vegetables, fruits, and other foods of non-animal origin are free from cobalamin unless they are contaminated by bacteria. Cobalamin is synthesized solely by microorganisms.

320. Ans. (b) 10%

Ref: Handbook of Histopathological and Histochemical Techniques 3rd ed. pg. 40-45

- Formalin is generally the preferred fluid for fixation and is widely used. Formalin is often sold as 37-40% aqueous Formaldehyde.
- To make a solution of 10% Formalin, nine parts of water are added to one part of 40% (aqueous) Formaldehyde.
- Therefore, a 10% solution of Formalin is the equivalent of a 4% solution of Formaldehyde.
- Formaldehyde is a gas produced by the oxidation of methyl alcohol, whereas 100% Formalin is a saturated solution of this gas in water.

Other Histopathological Preservatives:

- Glutaraldehyde: 25%-for electron microscopy (with osmium tetra-chloride)
- Acetaldehyde acrolein
- Mercuric chloride
- Potassium dichromate

321. Ans. (b) Impaired skeletal growth

Ref: Harrison /96e-9

- Manganese deficiency leads to impaired growth and skeletal development whereas toxicity leads to parkinsonism like features. Impaired glucose tolerance is seen with chromium deficiency.

TABLE: Deficiencies and Toxicities of Metals

Element	Deficiency	Toxicity
Manganese	Impaired growth and skeletal development, reproduction, lipid and carbohydrate metabolism; upper body rash	<ul style="list-style-type: none"> • Parkinsonism like symptoms • Encephalitis-like syndrome
Calcium	Reduced bone mass, osteoporosis	Renal insufficiency (milk-alkali syndrome), nephrolithiasis
Copper	Anemia, growth retardation, defective keratinisation and pigmentation of hair, degenerative changes in aortic elastin, osteopenia	Vomiting, diarrhea, hepatic failure, tremor, mental deterioration, haemolytic anemia, renal dysfunction
Chromium	Impaired glucose tolerance	Occupational: Renal failure, dermatitis
Fluoride	↑Dental caries	Dental and skeletal fluorosis, osteosclerosis
Iodine	Thyroid enlargement, ↓ T ₄ , cretinism	Thyroid dysfunction, acne-like eruptions
Selenium	Cardiomyopathy, heart failure, striated muscle degeneration	Alopecia, nausea, vomiting, abnormal nails, emotional lability, peripheral neuropathy, lassitude, garlic odor to breath, dermatitis Occupational: Lung and nasal carcinomas
Zinc	Growth retardation, ↓ taste and smell, alopecia, dermatitis, diarrhea, immune dysfunction, failure to thrive, congenital malformations	Reduced copper absorption, gastritis, sweating, fever, nausea, vomiting

322. Ans. (a) **Oil-Red O**Ref: *Robbin's pathology 9th ed. /151*

Oil-Red O	Fat
Congo red	Amyloid
Perl stain	Iron
PAS	Glycogen

323. Ans. (c) **Green**

- The color of its aqueous solution varies from green to orange as a function of the way it is observed: by reflection or by transmission
- Topical fluorescein is used in the diagnosis of corneal abrasions, corneal ulcers and herpetic corneal infections.
- Fluorescein is also used extensively in photographic retinal vasculature imaging during fundus fluorescein angiography. The dye sodium fluorescein can be used

either in concentration of 10% or 20% in the form of intravenous bolus injection. It is used to image retinal, choroidal, optic disc, or iris vasculature, or a combination of these. It is used diagnostically as well as in planning for many retinal laser procedures. It has a very important role in management of diabetic retinopathy, vein occlusion, and age-related macular degeneration.

324. Ans. (b) **Congo red**Ref: *Robbin's Pathology, 9th ed. pg. 354*

Congo red is used for staining amyloid and not lipids

Stains for Lipids

- Oil red O
- Sudan black
- Sudan III and IV
- Filipin
- Schultz
- Nile blue sulfate

325. Ans. (b) **Attachment**Ref: *Robbin's Pathology, 9th ed. pg. 245-46*

- Envelope glycoprotein GP120 (or gp120) is a glycoprotein exposed on the surface of the HIV envelope.
- The 120 in its name comes from its molecular weight of 120 kDa.
- Gp120 is essential for virus entry into cells as it *plays a vital role in attachment to specific cell surface receptors*.

- Binding to CD4 induces the start of a cascade of conformational changes in gp120 and gp41 that lead to the fusion of the viral membrane with the host cell membrane.
- Gp120 is coded by the HIV *env* gene, which is around 2.5 kb long and codes for around 850 amino acids

326. Ans. (b) **350**Ref: *Robbin's pathology 9th ed. /251-52*

- Under the revised guidelines the treatment of AIDS patients with respect to opportunistic infections has undergone a change with H.A.A.R.T being initiated at a threshold of CD4 count <350 cells/cu.mm instead of previous 200 cells/cu.mm.

ANSWERS TO BOARD REVIEW QUESTIONS

ANSWERS TO IMAGE-BASED QUESTIONS (HISTOPATHOLOGICAL SLIDE INTERPRETATION)

436. Ans. (a) **Howell jolly Bodies**

437. Ans. (b) **Reed Sternberg cell**

The image shows presence of Reed Sternberg cell with bilobed nucleus and prominent nucleoli which lead to prominent owl eye appearance.

438. Ans. (b) **Myeloblast**

- The image shows presence of Myeloblasts and you can see the Auer rods in the cytoplasm of these cells. (Arrow Marked)
- The image shows presence of Howell-Jolly bodies—which are dense blue circular inclusions representing

nuclear remnants. The presence of Howell jolly bodies implies defective splenic function.

439. Ans. (a) **Gaucher cell**

- The image shows presence of an enlarged macrophage showing crumpled tissue paper appearance of cytoplasm. The cell contains undigested glucocerebroside.
- Reed Sternberg cell is found in Hodgkin's Lymphoma
- Anitschkow cell is seen in rheumatic fever and pop-corn cell is seen in nodular lymphocyte predominant variety of Hodgkin lymphoma.

440. Ans. (b) **Thalassemia**

The image shows a child with prominent cheek bones due to marrow expansion. The peripheral smear shows presence of Target cells (Notice the target in the centre of RBC)

441. Ans. (a) **Hairy cell Leukemia**

The image shows presence of immature B cell with hairy projection on the surface.

442. Ans. (b) **Schistocyte**

Notice the projection on the edge of the RBC.

443. Ans. (a) **Lipofuscin in cardiac tissue**

Ref: Page 25, Harsh Mohan, 7th ed.

- The image shows presence of *wear and tear pigment* which is lipofuscin. It is a yellowish brown pigment accumulating in central part of cells around the nuclei.
- By electron microscopy it is *intralysosomal* electron dense granules in *perinuclear location*.
- It can be seen in:

- Myocardial fibers and is associated with wasting and hence called as brown atrophy.
- Intraneuronal in senile dementia
- Leydig cells of testis
- Hepatocytes

444. Ans. (b) **Hyaline arteriosclerosis**

Ref: Harsh Mohan, 7th ed. pg. 372

The image shows an *eosinophilic hyaline material* in tunica media and intima. The lumen of blood vessel is narrowed. This is suggestive of diagnosis of hyaline arteriosclerosis.

FMGE Solutions Screening Examination

402

445. Ans. (b) **Hyperplastic arteriosclerosis**Ref: Harsh Mohan, 7th ed. pg. 372

The image shows *loosely placed concentric layers* in a small artery leading to *onion skin* appearance. The presence of hyperplastic intimal smooth muscle cells with severe intimal sclerosis leads to narrowed blood vessel.

446. Ans. (a) **Coagulative necrosis**Ref: Pocket Companion to Robbins, 9th ed. pg. 6

The image shows eosinophilic amorphous deposit at 12 o'clock position with surrounding infiltrate showing langhans type giant cell with nuclei arranged in horse shoe pattern. This is seen in caseous necrosis.

447. Ans. (b) **Noncardiogenic pulmonary edema**Ref: Pocket Companion to Robbins, 9th ed. pg. 79

- The image shows lung specimen stained with Oil Red O stain and clinical history is *consistent with fat embolism*.
- Non-cardiogenic pulmonary edema is seen with ARDS and not fat embolism.
- In contrast the development of fat embolism is due to a series of biochemical cascades resulting from the mechanical insult sustained in major trauma. Release of fat emboli leads to occlusion of the microvasculature.
- Findings from noncontrast computed tomography (CT) of the head performed because of alterations in mental status may be normal or may reveal diffuse white-matter petechial hemorrhages consistent with microvascular injury.
- GURD criteria are used for diagnosis of fat embolism and one major criterion, four minor criteria, and the presence of macroglobulinemia are required for the diagnosis.

448. Ans. (b) **Nodular glomerulosclerosis**Ref: Harsh Mohan, 7th ed. pg. 665

- The image shows presence of *intense eosinophilic deposits in nodular fashion all over glomerulus* leading to compression of glomerular capillaries which are hardly visible. This is seen in nodular glomerulosclerosis.
- The lesion shown is also called Kimmelstiel-Wilson change and is specific for type 1 diabetes or islet cell antibody positive diabetes.
- Armanni-Ebstein change is seen in uncontrolled diabetes in epithelial cells of proximal convoluted tubules.

449. Ans. (d) **Nutmeg liver**Ref: Harsh Mohan, 7th ed. pg. 92

- The specimen shows presence of *mottled appearance of liver* where dark congestion is noted. This is diagnostic of nutmeg liver.
- Dubin-Johnson has a black liver texture and is therefore ruled out.
- Postnecrotic cirrhosis has visible scarring on surface and is therefore ruled out
- Miliary tuberculosis (TB) will show studded appearance.

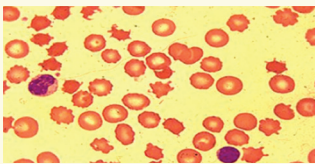

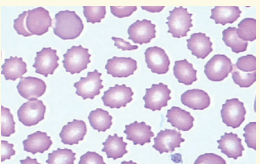

450. Ans. (b) **Intranuclear inclusions**Ref: Harsh Mohan, 7th ed. pg. 607

- The image shows Mallory hyaline body which is marked as X. These are eosinophilic, *intracytoplasmic inclusions* in perinuclear location with swollen and ballooned hepatocytes.
- They are formed from aggregates of cytoskeletal intermediate filaments called prekeratin.
- Aniline Blue and Masson trichrome which are connective tissue stains are best for visualization of Mallory hyaline bodies.
- Conditions that exhibit Mallory hyaline bodies are—I
WILL STAY SOBER

- Indian childhood cirrhosis
- Wilson disease
- Surgery (Intestinal bypass)
- Focal nodular hyperplasia
- Biliary cirrhosis (primary)
- Hepatocellular carcinoma

451. Ans. (b) **Echinocyte**Ref: Oski's Pediatric Hematology, 7th ed. pg. 773

- The image shows presence of spiculated red cells with uniform projections over the entire circumference of cell. This is an echinocyte.
- In contrast acanthocytes have only few spicules of varying size that project irregularly from cell surface.

Acanthocyte	Echinocyte
	
Fewer spicules <i>irregularly</i> placed	Multiple spicules <i>regularly</i> placed
Also called as spur cells and found in liver disease	Also called as burr cells and found in renal disease

452. Ans. (c) Substitution of single amino acid base

Ref: Robbins, 8th ed. pg. 645-647

Point mutation in 6th codon of β -globin that leads to replacement of glutamate by valine residue.

453. Ans. (b) Plasmacytoma

Ref: Page 364, Harsh Mohan, 7th edition and Bone Marrow Pathology by Bain 4th ed. Page 50

The image shows presence of *Mott cells* which are plasma cells characterized by an accumulation of multiple Russell bodies, globular cytoplasmic inclusions composed of immunoglobulin.

454. Ans. (b) Macrocytic anemia

Ref: Chapter 26, Wintrobe's Hematology, 12th ed.

The image shown reveals the following findings:

- **Marked variation** in size and shape of RBC.
- **Macrocytes** are seen and have a wide central pale area. Immature RBC with bluish cytoplasm is noted in middle.
- The combination of clinical findings and reports mentioned in the question point to diagnosis of B_{12} deficiency
- Loss of reflexes due to an associated peripheral neuropathy in a patient who also has Babinski signs is an important diagnostic clue.

455. Ans. (a) Lead poisoning

Ref: Harsh Mohan, Textbook of Pathology, 7th ed. pg. 236

The image shows basophilic stippling of red blood cells. The causes are:

- Mnemonic: **LUNATIC**
- Lead poisoning
 - Unstable hemoglobin
 - Nucleotidase deficiency
 - Anemia due to B_{12} deficiency
 - Thalassemia
 - Infections
 - Cirrhosis

The closest answer Pappenheimer bodies are basophilic erythrocytic inclusions that are usually located at the periphery of the cell. They contain iron and stain with Prussian blue. Prussian blue is the stain that is used to identify that these Pappenheimer bodies are pure iron deposits, and not heme as in Heinz bodies.

456. Ans. (a) Pappenheimer body

Ref: Harsh Mohan, Textbook of Pathology, 7th ed. pg. 277

- The image shows presence of *Pappenheimer bodies* which are basophilic erythrocytic inclusions that are usually located at the periphery of the cell.
- They are composed of *ferritin aggregates* and stain on Romanowsky stain because of clumps of ribosomes which are precipitated with iron containing organelles.

457. Ans. (a) Perl stain

Ref: Harsh Mohan, Textbook of Pathology, 7th ed. pg. 98

- The image shows presence of *blue deposits* called *Pappenheimer bodies* and they contain iron and stain with perls' Prussian blue.
- Ferric iron deposits in tissue react with the soluble ferrocyanide in the stain, to form insoluble *Prussian blue dye* (a complex hydrated ferric ferrocyanide substance) *in situ*.

458. Ans. (d) Denatured hemoglobin

Ref: Harsh Mohan, Textbook of Pathology, 7th ed. pg. 287

- The image shows a *supra vital stain* showing *Heinz bodies* seen in G6PD and are composed up of denatured hemoglobin.
- *Heinz bodies*, are clinically detectable by staining with supravital dyes such as crystal violet. Removal of these inclusions by the spleen generates pitted, rigid RBCs that have shortened life spans.
- *Causes of Heinz bodies* (not seen on Romanowsky stain)

- Glucose 6 phosphatase dehydrogenase deficiency
- Glutathione synthetase deficiency
- Drugs
- Toxins
- Unstable hemoglobins

TABLE: Summary of Inclusion in RBC's

Inclusion	Composition
Howell-Jolly body	DNA
Basophilic stippling	RNA remnants
Siderotic granules/ Pappenheimer bodies	Iron
Heinz bodies	Denatured hemoglobin

FMGE Solutions Screening Examination

459. Ans. (c) **Pernicious anemia**

Ref: *Clinical Hematology Turgeon, 4th ed. pg. 104*

- The image shows *Cabot ring* which may result in part from abnormalities in metabolism of both iron and arginine-rich histone that are known to occur in pernicious anemia.
- *Cabot rings* are usually seen in postsplenectomy and pernicious anemia patients.

460. Ans. (a) **Dohle bodies**

Ref: *Nathan and Oski Hematology of Children, 7th ed. pg. 1637*

The image shows pale blue bodies in cytoplasm of neutrophil which appears in bacterial infections. They are called Dohle bodies.

TABLE: Causes of Dohle bodies

- Infections
- Burns
- Cancer
- Massive trauma
- Prolonged use of cyclophosphamide
- May hegglin anomaly

Critical green inclusions in neutrophils are seen in severe liver disease.

461. Ans. (c) **CLL**

Ref: *Harsh Mohan, Textbook of Pathology, 7th ed. pg. 355-56*

- The image shows peripheral blood smear showing many “smudge” or “basket” cells, nuclear remnants of cells damaged by the physical shear stress of making the blood smear.
- The clinical presentation and peripheral smear favour diagnosis of CLL.

462. Ans. (a) **Hand-Foot syndrome**

Ref: *Harsh Mohan, Textbook of Pathology, 7th ed. pg. 294-96*

The X-ray spine shows *fish shaped vertebra* with peripheral smear showing sickle shaped RBC's. The presence of sickling crisis lead to *Hand-Foot syndrome* is characterized by painful infarcts of the digits and dactylitis.

463. Ans. (b) **Basophil**

Ref: *Harsh Mohan, Textbook of Pathology, 7th ed. pg. 294-96*

The image shows a white blood cell with blue granules in the cytoplasm indicative of basophil.

464. Ans. (a) **Eosinophil**

Ref: *Harsh Mohan, Textbook of Pathology, 7th ed. pg. 129*

The image shows a white blood cell with pink granules in the cytoplasm indicative of eosinophil.

465. Ans. (d) **ESR measurement**

Ref: *Wintrobe's Hematology, 12th ed. pg. 16*

This method uses Wintrobe's tube, a narrow glass tube closed at the lower end only. The Wintrobe's tube has a **length of 11 cm** and **internal diameter of 2.5 mm**. It contains 0.7–1 mL of blood. The marking is 0 at the top and 10 at the bottom for ESR. This tube can also be used for PCV. The marking is 10 at the top and 0 at the bottom for PCV.

466. Ans. (a) **EDTA**

Ref: *Wintrobe's Hematology, 12th ed. pg. 16*

**Requirements:**

- Anticoagulated blood (EDTA, double oxalate)
- Pasteur pipette
- Timer
- Wintrobe's tube
- Wintrobe's stand

467. Ans. (c) **Thalassemia**

Ref: Harsh Mohan Textbook of Pathology, 7th ed. pg. 292
and Wintrobe's Hematology, 13th ed. pg. 610

- The image shows performance of Naked eye single tube, osmotic fragility test. Notice that in control sample on right side, the fine print of newspaper can be acknowledged.

- However in the left sided sample, *osmotic fragility is reduced* leading to turbidity, leading to opacification of sample and the fine print of the newspaper cannot be read.
- This test is a *screening test for thalassemia* following which high performance liquid chromatography is done.

468. Ans. (d) **Gamma globulin**

Ref: Chapter 99, Wintrobe's Hematology, 12th ed.

469. Ans. (d) **Rouleaux formation**

Ref: Wintrobe's Haematology, 13th ed. pg. 593

Rouleaux formation is associated with *increased positively charged proteins* usually fibrinogen or gamma globulins. The positively charged proteins neutralize the negatively charged RBC allowing them to form stacks in the form of stacks of four or more cells.

470. Ans. (a) **Teratoma**

Ref: Robbins and Cotran Atlas of Pathology,
3rd ed. pg. 356

- Teratomas are made up of a variety of parenchymal cell types representing more than 1 germ layer and often all 3 germ layer.
- Cells differentiate along various germ lines, essentially recapitulating any tissue of the body. Examples include hair, teeth, fat, skin, muscle, and endocrine tissue.
- Arising from totipotent cells, these tumors typically are midline or paraxial.
- The **most common location is sacrococcygeal** (57%).
- Because they arise from totipotent cells, they are encountered commonly in the gonads (29%).
- The **most common gonadal location is the ovary**, although they also occur somewhat less frequently in the testes.

Microbiology and Parasitology

MOST RECENT QUESTION 2019

1. Which is correct about Diphtheria membrane?
- Grey membrane that bleeds on removal
 - Grey membrane that does not bleed on removal
 - Grey pseudo-membrane that bleeds on removal
 - Grey pseudo-membrane that does not bleed on removal

GENERAL MICROBIOLOGY, MEDIA, TESTING

2. DNA transfer in bacteria via phage is: *(Recent Pattern Question 2018-19)*
- Conjugation
 - Transduction
 - Transformation
 - Translation
3. Sporulation occurs in this phase of bacterial growth curve: *(Recent Pattern Question 2018-19)*
- Stationary phase
 - Lag phase
 - Log phase
 - Decline phase
4. Glutaraldehyde is used for all of the following EXCEPT: *(Recent Pattern Question 2018)*
- Bronchoscope
 - Thermometer
 - Proctoscopes
 - Endoscopic tubes
5. Most potent disinfectant: *(Recent Pattern Question 2018)*
- 70% alcohol
 - Glutaraldehyde
 - Povidone-iodine
 - Sodium hypochlorite
6. Sporulation is seen in which phase of bacterial growth phase? *(Recent Pattern Question 2017)*
- Lag phase
 - Log phase
 - Stationary phase
 - Decline phase
7. Cold sterilization is done by: *(Recent Pattern Question 2017)*
- Steam
 - Ionizing radiation
 - Infra red
 - UV
8. Metachromatic granules can be stained by *(Recent Pattern Question 2016)*
- Albert stain
 - Gram stain
 - Gram-negative stain
 - Prussian blue

9. Most important limitation/drawback of Tuberculin test is: *(Recent Pattern Question 2016)*

- False negative cases
- Can't differentiate between latent and active TB
- Does not differentiate between primary TB and miliary TB
- Can't screen the latent TB

10. Transfer of genetic material by direct physical contact is bacteria in called? *(Recent Pattern Question 2016)*

- Lysogeny
- Transduction
- Conjugation
- Transformation

11. Lysogenic conversion is *(Recent Pattern Question 2016)*

- Integration of host bacterial nucleic acid to phage
- Integration of phage nucleic acid to host bacteria genome
- Bacterial mechanism to cause antigenic shift
- Bacterial method to acquire resistance

12. Mesophilic organism grows at

(Recent Pattern Question 2016)

- 20 to 7°C
- 10 to 20°C
- 25 to 40°C
- 55 to 80°C

13. Yellow bag is destroyed by *(Recent Pattern Question 2016)*

- Incineration
- Autoclave
- Hot air oven
- Steam sterilization

14. Incineration is done for *(Recent Pattern Question 2016)*

- Human body parts
- Syringes
- Body fluids
- Gloves

15. Grease, dusting powder and paraffin are sterilized by

(Recent Pattern Question 2016)

- Gamma radiation
- Sunlight
- Dry heat sterilization
- Autoclave

16. Gram Stain is a:

- Simple stain
- Differential stain
- Negative stain
- None

17. Method of choice for sterilization of liquid paraffin:

- Flaming
- Moist heat
- Autoclave
- Hot air oven

18. Hot air oven efficiency is best checked by which bacteria:

- Stearothermophilus
- Bacillus subtilis
- Clostridium tetani
- Streptococcus

19. Prion is best destroyed by
 - a. Autoclaving at 135 degrees
 - b. Hot air oven at 160 degrees
 - c. Hydrogen peroxide
 - d. Sodium hypochlorite
20. Which of the following culture medium is made by adding Agar:
 - a. Solid medium
 - b. Liquid medium
 - c. Selective medium
 - d. Transport medium
21. Agar is added to Broth medium:
 - a. To make the medium liquid
 - b. To make the medium solid
 - c. To provide extra nutrition to grow
 - d. None
22. Which of the following bacteria is isolated with Cetrimide agar?
 - a. Clostridium Perfringens
 - b. Clostridium tetani
 - c. Pseudomonas aeruginosa
 - d. E. Coli
23. Cetrimide agar isolates which of the following bacteria:
 - a. Clostridium perfringens
 - b. Clostridium tetani
 - c. Klebsiella
 - d. Pseudomonas
24. Thayer martin agar medium is for:
 - a. N. Meningitis
 - b. Pseudomonas
 - c. Clostridium
 - d. Trypanoma pallidum
25. Culture media for corynebacterium diphtheria:
 - a. New york media
 - b. Cysteine tellurite agar
 - c. Thayer martin agar
 - d. Tellurite media
26. Which of the following is best for diagnosing genital TB?
 - a. PCR
 - b. Montoux
 - c. LJ medium
 - d. ZN staining
27. In Robertson cooked meat media, meat color will change to:
 - a. Pink
 - b. Red
 - c. Blue
 - d. No color change
28. Citrate test is done for
 - a. G6PD deficiency
 - b. For bacteria using glucose
 - c. For bacteria using citrate
 - d. For virus using citrate and glucose
29. Mac Conkey medium is an example of:
 - a. Selective media
 - b. Differential media
 - c. Enriched media
 - d. Transport media
30. All of the following are examples of Indicator media EXCEPT:
 - a. Blood agar
 - b. Eosin methylene blue (EMB)
 - c. MacConkey (MCK)
 - d. Stuart media
31. Stain used in preparation of AFB smear:
 - a. Giemsa stain
 - b. Loeffler's stain
 - c. Ziehl-Neelsen stain
 - d. India ink stain
32. Weil Felix reaction is what type of agglutination reaction:
 - a. Slide agglutination
 - b. Tube agglutination
 - c. Passive agglutination
 - d. Direct agglutination
33. Which of the following is an example of precipitation reaction:
 - a. Coomb's Test
 - b. Counter current immune-electrophoresis
 - c. Weil-Felix Test
 - d. Widal Test
34. Which of the following test is an example of tube agglutination test:
 - a. Blood grouping
 - b. Vibrio cholera serotyping
 - c. Widal test
 - d. ANA
35. In prokaryotes, which of the following is present:
 - a. Nucleolus
 - b. ER
 - c. Golgi bodies
 - d. Muramic acid
36. Lancefield classification is done on the basis of:
 - a. C -substance
 - b. Glycoprotein O
 - c. Muramic acid
 - d. Antibiotic resistance
37. Which of the following protein is attached to surface of bacteria and phagocytized?
 - a. Antigen
 - b. Antibody
 - c. C-Reactive protein
 - d. Propendin
38. All of the following methods are used for the diagnosis of HIV infection in a 2 month old child EXCEPT:
 - a. DNA PCR
 - b. Viral culture
 - c. HIV Elisa
 - d. P24 antigen assay
39. Paul Bunnel test is used for diagnosis of:
 - a. Chicken pox
 - b. Yellow fever
 - c. Genital Herpes
 - d. Infectious mononucleosis

BACTERIOLOGY

40. Bacillus Anthrax is: *(Recent Pattern Question 2018-19)*
 - a. Gram positive cocci in cluster
 - b. Gram positive rods with square ends
 - c. Gram positive bacilli with spherical ends
 - d. Gram negative cocci in cluster
41. Which of the following is the most likely cause in a case of granuloma with positive AFB? *(Recent Pattern Question 2018-19)*
 - a. Cat scratch disease
 - b. Trench fever
 - c. Leprosy
 - d. Syphilis
42. Legionnaire disease causes? *(Recent Pattern Question 2018-19)*
 - a. Respiratory disease
 - b. U.T.I
 - c. Retroperitoneal fibrosis
 - d. Acute gastroenteritis
43. When should you perform Widal test in a case of Typhoid? *(Recent Pattern Question 2018-19)*
 - a. 1st week
 - b. 2nd week
 - c. 3rd week
 - d. 4th week

FMGE Solutions Screening Examination

44. Which of the following is anaerobic non-acid fast bacilli? (Recent Pattern Question 2018)
 a. Tuberculosis b. Listeria
 c. Nocardia d. Actinomyces
45. Which of the following is a capnophilic bacteria? (Recent Pattern Question 2018)
 a. *Staphylococcus aureus* b. *Mycobacterium*
 c. *Clostridium* d. *Haemophilus influenzae*
46. Anton test is done for: (Recent Pattern Question 2017)
 a. *Klebsiella* b. *Listeria monocytogenes*
 c. *Proteus mirabilis* d. *Nisseria*
47. Diphtheria toxin acts by: (Recent Pattern Question 2017)
 a. Inhibiting glucose synthesis
 b. Inhibiting protein synthesis
 c. Promoting acetylcholine release
 d. Altering cyclic GMP levels
48. Tumbling motility is seen in: (Recent Pattern Question 2017)
 a. *Listeria monocytogenes* b. *C. Jejuni*
 c. *Trichomonas* d. *Gonococcus*
49. "Fish in stream" appearance is seen in: (Recent Pattern Question 2017)
 a. *Hemophilus ducreyi* b. *Proteus*
 c. *Mycoplasma* d. *V. Cholerae*
50. Pontiac fever is caused by? (Recent Pattern Question 2017)
 a. *Rickettsia rickettsii* b. *Brucella*
 c. *Legionella* d. *Moraxella*
51. A 30-year-old patient presented with fever, headache and vomiting. He had splenectomy few years ago. Most probable organism? (Recent Pattern Question 2017)
 a. *Meningococcus* b. *Pneumococcus*
 c. *E. Coli* d. *C. Diphtheriae*
52. Out of 20 children that went to a party, 11 developed abdominal pain, diarrhea with nausea and vomiting around 6 hours after food intake. Most likely causative agent: (Recent Pattern Question 2017)
 a. Rota virus b. *Staphylococcus*
 c. *Streptococcus* d. *Clostridium perfringens*
53. Secondary bacterial pneumonia in a post-influenza patient is most likely due to? (Recent Pattern Question 2017)
 a. *Staphylococcus aureus* b. *Moraxella*
 c. *Listeria* d. *Klebsiella*
54. *Corynebacterium diphtheriae* is (Recent Pattern Question 2016)
 a. Gram-positive cocci b. Gram-positive bacilli
 c. Gram-negative cocci d. Gram-negative bacilli
55. Which of the following is the most severe form of Diphtheria (Recent Pattern Question 2016)
 a. Nasal
 b. Cutaneous
 c. Nasopharynx
 d. Laryngopharynx
56. McFadyean reaction is seen in: (Recent Pattern Question 2016)
 a. *Yersinia pestis* b. *Clostridium perfringens*
 c. *Bacillus anthrax* d. *Staphylococcus aureus*
57. Organism causing IV biofilm? (Recent Pattern Question 2016)
 a. *Staph epidermis* b. *Acinetobacter baumannii*
 c. *Meningococci* d. *Mycobacterium*
58. *Staph. epidermis* has become important due to (Recent Pattern Question 2016)
 a. Biofilm formation
 b. Virulence
 c. Wide spectrum antibiotics
 d. Novobiocin resistance
59. During examination of skin smears in leprosy test result was 1+, 2+. How many oil fields should be surveyed (Recent Pattern Question 2016)
 a. 10 b. 25
 c. 50 d. 100
60. In an oil immersion field 1-10 tubercle bacilli were seen per 10 field. It indicates (Recent Pattern Question 2016)
 a. + b. ++
 c. +++ d. Scanty
61. Which disease occurs after eating uncooked meat (Recent Pattern Question 2016)
 a. *Bacillus anthrax* b. *Brucella*
 c. *Trichosis* d. TB
62. *Yersinia pestis* is transmitted by (Recent Pattern Question 2016)
 a. Flea b. Rodent
 c. Mite d. Sandfly
63. Gram negative anaerobic bacteria use this method of gene transfer:
 a. Transduction b. Conjugation
 c. Translation d. Transformation
64. Method of bacterial gene transfer where viruses play role:
 a. Transduction b. Conjugation
 c. Translation d. Transformation
65. During the lag phase of bacterial growth curve, there is:
 a. Increase in number b. Increase in metabolic rate
 c. Increase in size d. Decreased metabolic rate
66. CLO test is done for:
 a. HPV b. *Salmonella typhi*
 c. HIV d. *H. Pylori*
67. Tumbling motility is seen in:
 a. *Yersinia* b. *Listeria*
 c. *Proteus* d. *Pseudomonas aeruginosa*
68. Which of the following is a kidney shaped bacteria:
 a. *Campylobacter jejuni*
 b. *Corynebacterium Diphtheriae*
 c. *Meningococci*
 d. *Gonococci*

69. Granuloma in lymph nodes seen in all infections EXCEPT:
 a. TB b. Sarcoidosis
 c. Staph Aureus d. Hemophilus ducreyi
70. Which of the following organisms causes fastest food poisoning:
 a. Staph. Aureus b. Clostridium Perfringens
 c. Bacillus Cereus d. Vibrio cholerae
71. A Person ate some milk products in a party and after 6 hours started vomiting. Which organism is most likely the cause:
 a. Bacillus cereus b. Clostridium perfringens
 c. Staphylococcus d. Clostridium botulism
72. Food poisoning 2 hours after intake of food is caused by?
 a. Salmonella typhi b. Bacillus cereus
 c. Staphylococcus aureus d. Clostridium
73. How does staph aureus become resistant to methicillin:
 a. Heat shock protein b. Protein A
 c. Transpeptidase d. Protein C
74. Organism responsible for toxicity due to Chinese fried rice:
 a. Staph. Aureus b. B. Cereus
 c. Salmonella d. Shigella
75. The following are true about Bacillus Cereus induced diarrhea EXCEPT
 a. Can be transmitted by parenteral route
 b. The enterotoxins are not resistant to acidic contents of the stomach
 c. It is caused by enterotoxins
 d. It is usually associated with fried rice or chinese food which is reheated
76. Incubation period of salmonella:
 a. 7–21 days b. 2–5 days
 c. 14–21 days d. 0–60 days
77. Rice watery stool is a common indicative of which organism?
 a. Vibrio cholerae O1 b. Vibrio cholerae O139
 c. Vibrio vulnificus d. Shigella
78. Which of the following is most likely cause of a child presenting with fever and diarrhea?
 a. EPEC b. ETEC
 c. EHEC d. EIEC
79. Which organism causes haemolytic uremic syndrome?
 a. Neisseria b. Salmonella
 c. Pseudomonas d. E. Coli
80. HUS is caused by:
 a. EIEC b. EPEC
 c. ETEC d. EHEC
81. Traveller's diarrhea is caused by:
 a. EIEC b. EPEC
 c. ETEC d. EHEC
82. Anti-microbials are given with which type of diarrhea:
 a. Traveller's diarrhea b. Rotavirus
 c. Secretory diarrhea d. Osmotic diarrhea
83. Which is the staphylococcal toxin which is responsible for food poisoning?
 a. Beta Exotoxin
 b. Enterotoxin
 c. Alpha Exotoxin
 d. Toxic Shock Syndrome Toxin (TSST-1)
84. Which of the following contains single flagella?
 a. Treponema Pallidum b. Escherichia Coli
 c. Vibrio cholerae d. Helicobacter Pylori
85. Clostridium difficile can be spread through all EXCEPT-
 a. Oral - fecal route b. Direct
 c. Hand to hand contact d. Needles
86. All of the following organisms cause gas gangrene EXCEPT:
 a. Clostridium Difficile b. Clostridium Welchi
 c. Clostridium Septicum d. Clostridium Perfringens
87. Necrotizing enteritis is caused by:
 a. Clostridium tetani b. Clostridium difficile
 c. Clostridium perfringens d. Clostridium septicum
88. Gas gangrene is caused by
 a. Clostridium perfringens b. Bacillus cereus
 c. Helicobacter pylori d. Treponema pallidum
89. Fournier gangrene is caused by:
 a. Cl. Welchi b. Proteus
 c. Streptococcus d. Mixed infection
90. Anchovy Sauce pus/chocolate brown pus is the clinical feature of:
 a. Amoebic liver abscess b. Pyogenic liver abscess
 c. Peritoneal abscess d. Hydatid liver
91. A patient presents with signs of pneumonia. The bacterium obtained from sputum was a Gram positive cocci which showed alpha hemolysis on sheep agar. Which of the following test will help to confirm the diagnosis:
 a. Bile solubility b. Coagulase test
 c. Bacitracin test d. CAMP test
92. Energy store of cell is:
 a. Adenosine monophosphate
 b. Adenosine diphosphate
 c. Adenosine triphosphate
 d. Adenosine quadriphosphate
93. Most common cause of Pneumatocele:
 a. Streptococcus pneumoniae
 b. Haemophilus influenza
 c. Serratia marcescens
 d. Staphylococcus aureus
94. Child presented with cystic fibrosis and Bronchorrhea. Which group of organism is appropriate causative agent:
 a. Staph. Aureus, H. influenza, Pseudomonas
 b. Streptococcus pneumonia, Klebsiella, H. Influenza
 c. H. Influenza, Klebsiella, staph aureus
 d. Strep. Pneumoniae, H. Influenza, Klebsiella

FMGE Solutions Screening Examination

410

95. *Streptococcus pyogenes* can be checked by which drug disk
 a. Bacitracin b. Polymycin
 c. Optochin d. None of the above
96. Chronic burrowing ulcer is caused by:
 a. Peptostreptococcus
 b. *Strep.pyogenes*
 c. Anaerobic streptococci
 d. Microaerophilic streptococci
97. Which of the following is common with *Streptococcus* infection?
 a. Cellulitis b. Gangrene
 c. Pyoderma d. UTI
98. All are true about *Entamoeba Histolytica* EXCEPT:
 a. Cyst are 4 nucleated
 b. Cyst are 8 nucleated
 c. Trophozoites colonise in the colon and rectum
 d. The chromatid bodies are stained by iron hematoxylin
99. Which of the following is a non motile bacteria –
 a. *Klebsiella pneumoniae* b. *Helicobacter pylori*
 c. *Vibrio Cholerae* d. *E.Coli*
100. Miliary shadow on X-Ray is seen in all EXCEPT:
 a. TB
 b. Loeffler's pneumonia
 c. *Klebsiella*
 d. *Varicella pneumonia*
101. True about Bubonic plague:
 a. An infection of the lung
 b. An infection of blood stream
 c. An infection of lymph nodes
 d. All of the above
102. Site where *Neisseria Meningitidis* bacteria harbour normally?
 a. Skin b. Genitals
 c. Nasopharynx d. Lower GIT
103. Which of the following is gram negative diplococci:
 a. *Corynebacterium Diphtheriae*
 b. *Neisseria Meningitidis*
 c. *Streptococcus pneumoniae*
 d. *Staphylococcus*
104. *Neisseria meningitidis* possesses following virulent factors EXCEPT:
 a. Capsule
 b. Lipo-oligosaccharide(LOS)
 c. β lactamase
 d. IgA protease cation
105. Which one of the following microbe, found in ear discharge, has a high predilection for meningitis
 a. *H. influenza*
 b. *Moraxella species*
 c. *Staphylococcus aureus*
 d. *Streptococcus pneumoniae*
106. Which one of the following organisms is the most frequent cause of acute pyogenic meningitis in adults:
 a. *Streptococcus pneumoniae*
 b. *Neisseria meningitis*
 c. *Haemophilus influenza*
 d. *Listeria monocytogenes*
107. Meningococcal vaccine not used for:
 a. Serotype A b. Serotype B
 c. Serotype C d. Serotype Y
108. Air crescent sign seen in infection due to:
 a. *Staphylococcus* b. *Streptococcus*
 c. *Diphtheria* d. *Aspergillus*
109. Incubation period of diphtheria:
 a. 2-3 days b. 5-7 days
 c. 14-15 days d. 21 days
110. *Calymmatobacterium* is?
 a. Gram negative b. Gram positive
 c. Acid fast d. Non- acid fast
111. Prolonged salmonella septicemia is caused by
 a. *S. Enteritidis* b. *S. Typhimurium*
 c. *S. Typhi* d. *S. Cholerae-suis*
112. Draughtsman appearance of colonies is seen with?
 a. *Streptococcus* b. *Pneumococcus*
 c. *Staphylococcus* d. *Menngococcus*
113. A 3 yr old boy fell down and injured his leg while he was playing on ground. After a few days, there are crepitations felt from injured area, what could be the probable causative organism?
 a. *Corynebacterium Diphtheriae*
 b. *Pseudomonas Aeruginosa*
 c. *Clostridium Tetani*
 d. *Clostridium Welchii*
114. Drum stick is characteristic of:
 a. *Corynebacterium diphtheriae*
 b. *Clostridium tetani*
 c. *Neisseria meningitidis*
 d. *Strep Pneumoniae*
115. Drugs indicated in MRSA infection are all EXCEPT:
 a. Vancomycin b. Teicoplanin
 c. Linezolid d. Imipenem
116. True about Aspergillosis?
 a. Angioinvasive
 b. Oto-mycosis
 c. Occur in asthmatics
 d. All of the above
117. Not a common cause of community acquired pneumonia EXCEPT:
 a. *Staphylococci* b. *Mycoplasma*
 c. *Chlamydia pneumonia* d. *Streptococci*
118. Leptospirosis is caused by :
 a. Dog urine b. Mosquito
 c. Rat urine d. cat urine

119. Blood culture of a patient shows growth of gram positive cocci which are catalase positive and coagulase negative. The patient was on a CVP line last week. The most likely etiological agent is?

- Staphylococcus aureus
- Staphylococcus epidermidis
- Streptococcus pyogenes
- Enterococcus faecalis

120. Which of the following parasite causes myocarditis?

- Trichuris trichura
- Ancylostoma duodenale
- Taenia solium
- Trichenella spiralis

VIROLOGY

121. Rapid diagnosis of rabies is made with:

(Recent Pattern Question 2018-19)

- Rabies virus specific antibodies
- Inoculation in mouse
- Skin biopsy with fluorescent antibody testing
- Corneal impression smear

122. Most common infectious cause of haemolysis:

(Recent Pattern Question 2018-19)

- E. coli 0157
- Malaria
- Parvovirus B19
- Bartonella henselae

123. Which of the following virus is from Herpes virus family?

(Recent Pattern Question 2018-19)

- Rubella
- Measles
- Rabies
- EBV

124. Molluscum contagiosum is a _____:

(Recent Pattern Question 2018-19)

- Adenovirus
- Flavi virus
- Rubi virus
- Pox virus

125. Which of the following is an RNA virus?

(Recent Pattern Question 2017)

- Hepatitis B virus
- Hepatitis C virus
- Herpes virus
- Adenovirus

126. Hand foot mouth disease is caused by:

(Recent Pattern Question 2017)

- Enterobius
- Coxsackie
- Adenovirus
- Prion disease

127. Which is true about rota virus infection?

(Recent Pattern Question 2017)

- Vaccine preventable disease
- Can be treated by saline infusion
- Predominates in summer season
- Has high mortality rate

128. Intracytoplasmic inclusion body is seen in?

(Recent Pattern Question 2017)

- HSV
- Polio
- Rabies
- Yellow fever

129. A patient presented with fever, cervical lymphadenopathy and night sweats four weeks after unprotected sexual contact. Next investigation *(Recent Pattern Question 2016)*

- p24
- ELISA
- CD4
- HIV PCR

130. m-RNA to C-DNA is made by

- Reverse transcriptase
- DNA polymerase
- RNA polymerase
- DNA Ligase

131. Intracytoplasmic and Intranuclear inclusion body is seen in?

- Measles
- Mumps
- Rabies
- Yellow fever

132. Intra nuclear inclusion body is exclusively seen in:

- Rabies virus
- Pox virus
- Measles virus
- Herpes virus

133. Which among the following disease is transmitted by virus:

- Molluscum contagiosum
- Taenia capitis
- Rhinosporodiosis
- Impetigo

134. Molluscum contagiosum is a:

- Bacteria
- Fungus
- Virus
- Parasite

135. Which of the following disease acts by Reverse transcriptase action:

- HTLV- I
- HIV
- Both A and B
- Hepatitis C

136. Hemagglutination is caused by which organism:

- Influenza virus
- Mumps
- Adenovirus
- Parvovirus

137. Which of the following is not caused by virus:

- Rocky mountain spotted fever
- KFD
- Dengue
- Yellow fever

138. Most common cause of common cold/coryza is?

- Influenza virus
- Adenovirus
- RSV
- Rhinovirus

139. Duffy antigen is a receptor for?

- P. Falciparum
- P. Ovale
- P. Vivax
- P. Malariae

140. Human papilloma virus is a:

- RNA virus
- DNA virus
- Both
- None

141. Jarisch Herxheimer (J-H) reaction is commonly seen in

- Primary syphilis
- Secondary syphilis
- Late congenital syphilis
- Latent syphilis

142. Intermediate host for Rabies is?

- Human
- Rat
- Dogs
- Cats

143. True about chicken pox:

- Incubation period 2-3 days.
- Vesicobullous rash
- Vesicobullous rash
- Spare palm & sole

144. A patient presented with some unknown fungal infection. Microscopic examination revealed brown coloured spherical fungi with septate hyphae. Possible condition: *(Recent Pattern Question 2018-19)*

- Acute adenolymphangitis stage
- Tropical eosinophilia
- Chyluria
- Elephantiasis

170. Ova in stool are not of diagnostic significance in:

- a. Ankylostoma b. Entrobilus
- c. Strongyloides d. Trichuris

171. Example of Zoonoses are all EXCEPT:

- a. Plague b. Rabies
- c. Taeniasis d. Brucellosis

172. A 20 year old man presents with swelling of left lower limb and hydrocoele. All of the following may be the causative agent EXCEPT:

- a. Brugia malayi
- b. Brugia timoria
- c. Wuchereria bancrofti
- d. Onchocerca volvulus

IMMUNOLOGY AND MISCELLANEOUS

173. N. meningitis can be due to deficiency of this complement system: *(Recent Pattern Question 2018-19)*

- a. C1 – C4 deficiency b. C5-C9 deficiency
- c. C3 deficiency d. C2 deficiency

174. Classical complement activated by:

(Recent Pattern Question 2018-19)

- a. C1 b. C3 convertase
- c. IgA d. Ag – Ab complex

175. In normal immune system, the epithelioid cells are derived from: *(Recent Pattern Question 2018)*

- a. TH1 b. TH2
- c. Macrophages d. TH19

176. Meningococcal meningitis is seen with which of the following complement deficiency? *(Recent Pattern Question 2018)*

- a. C1q b. C2
- c. C4 d. C5

177. All of the following are true about bacteriophage EXCEPT: *(Recent Pattern Question 2017)*

- a. It is a bacteria
- b. It helps in transduction
- c. It imparts toxigenicity by lysogenic conversion
- d. It can cause drug resistance

178. IgM is:

- a. Monomer
- b. Dimer
- c. Pentamer
- d. Tetramer

179. First antibody produced by newborn?

- a. IgA
- b. IgG
- c. IgE
- d. IgM

180. Immunoglobulin found in bronchial secretion:

- a. IgA b. IgG
- c. IgM d. IgE

181. Which of the following is used as prophylaxis in case of diphtheria:

- a. Erythromycin b. Ampicillin
- c. DPT vaccine d. DAT

182. A child presents with infective skin lesion of the leg. Culture was done which showed gram positive cocci in chains with hemolytic colonies. The test to confirm the organism is?

- a. Bile solubility b. Optochin sensitivity
- c. Bacitracin sensitivity d. Catalase +ve

183. Most common site of angioedema:

- a. Hands b. Lips
- c. Skin d. Eyelid

184. Agglutination test for typhoid is performed on which of the following:

- a. 1st week b. 2nd week
- c. 3rd week d. 4th week

185. Congenital rubella is best diagnosed by:

- a. IgM Ab against Rubella at birth
- b. IgM Ab against Rubella at 4 months of age
- c. IgG Ab against Rubella at 4 months of age
- d. IgG Ab against Rubella at birth

186. Severe combined immunodeficiency is seen with:

- a. Pre B- Cell b. Pre T Cell
- c. Both d. NK Cell

BOARD REVIEW QUESTIONS

187. Stain used in electron microscopy?

- a. 2.5% glutaraldehyde b. Phosphotungstic acid
- c. Safranin d. Coomassie blue

188. Hypogammaglobulinemia causes?

- a. Chronic recurrent sinusitis
- b. Epistaxis
- c. Contractures
- d. Eczema

189. Treponema pallidum is stained during?

- a. Albert staining b. Giemsa stain
- c. Fontana stain d. ZN stain

190. Leptospirosis is caused by?

- a. Protozoa b. Bacteria
- c. Virus d. Prion

191. Nagler reaction defects?

- a. Lecithinase b. Perfringolysin
- c. Cytolysin d. Hyaluronidase

192. Citron bodies are formed by?
 - a. Clostridium welchii
 - b. Clostridium oedematiens
 - c. Clostridium septicum
 - d. Clostridium histolyticum
193. Both intranuclear and intracytoplasmic inclusion bodies are seen in?
 - a. CMV
 - b. Herpes
 - c. Measles
 - d. Adenovirus
194. Donovanosis is caused by?
 - a. Calymmatobacterium granulomatis
 - b. Legionella
 - c. chlymadia
 - d. Rickettsia
195. All are true about Antigen drift EXCEPT?
 - a. Its causes pandemic
 - b. Occurs due to mutation
 - c. Occurs frequently
 - d. Minor antigenic changes
196. Negri bodies are mainly found in?
 - a. Brain stem
 - b. Cortical neurons
 - c. Hippocampus
 - d. Spinal cord
197. Corynebacterium diphtheria is also called?
 - a. Freidlander's bacillus
 - b. Klebs loeffler's bacillus
 - c. Fischer's bacillus
 - d. Koch's bacillus
198. Whooping cough is caused by?
 - a. C.diphthera
 - b. B.pertussis
 - c. M.catarrhalis
 - d. S.pneumonea
199. Tetanus toxin acts by?
 - a. Blocking gamma motor neurons
 - b. Blocking muscle end plate receptor
 - c. Blocking Ach release
 - d. Presynaptic blocking
200. Most common initial involvement of tetanus is seen in?
 - a. Face
 - b. Limbs
 - c. Paraspinal muscles
 - d. Abdomen
201. Food poisoning that presents within 6 hours is due to?
 - a. Staphylococcus
 - b. Salmonella
 - c. Clostridium botulinum
 - d. E.coli
202. Complement synthesized by liver is?
 - a. C1
 - b. C5
 - c. C3
 - d. C4
203. Most common protozoan parasite in stool?
 - a. Hook worm
 - b. Pin worm
 - c. Giardia
 - d. Entamoeba Histolytica
204. Blood agar is
 - a. Enrichment media
 - b. Enriched media
 - c. Selective media
 - d. Transport media
205. Father of medical microbiology
 - a. Louis Pasteur
 - b. Robert Koch
 - c. Robert whitmore
 - d. Jim Morrison
206. Chinese pattern bacteria are
 - a. Diptheroids
 - b. Vibrio
 - c. Spirochete
 - d. Pleomorphic
207. Which is used for sterilization of cystoscope
 - a. Glutaraldehyde
 - b. Formaldehyde
 - c. Isopropyl alcohol
 - d. Ethylene oxide
208. First antibody to appear in intrauterine life
 - a. IgM
 - b. IgA
 - c. IgD
 - d. IgE
209. Antibody with longest half life
 - a. IgM
 - b. Ig
 - c. IgD
 - d. IgG
210. Microglia is?
 - a. B cell
 - b. T cell
 - c. Macrophage
 - d. Dendritic cell
211. Membrane attack complex is formed by all EXCEPT?
 - a. C3
 - b. C5
 - c. C7
 - d. C9
212. Colony of Streptococcus viridans resembles?
 - a. Staphylococcus
 - b. Streptococcus pneumoniae
 - c. Enterococcus
 - d. Klebsiella
213. Which organism can penetrate intact cornea?
 - a. Pneumococcus
 - b. Gonococcus
 - c. Pseudomonas
 - d. Staphylococcus
214. Medusa head colonies are seen in
 - a. Bacillus anthracis
 - b. Bacillus cereus
 - c. C. parvum
 - d. C. difficile
215. Sereny test is used for?
 - a. EHEC
 - b. ETEC
 - c. EIEC
 - d. EPEC
216. All are true about V. cholera EXCEPT?
 - a. VR media is transport media
 - b. Alkaline peptone water is enrichment media
 - c. Selective media is bile salt agar
 - d. Multi-flagellated bacteria
217. Weil felix reaction is used for diagnosis of?
 - a. Infectious mononucleosis
 - b. Chylamydia
 - c. Rickettsia
 - d. Bartonella
218. Warthin Finkeldey cells are seen in
 - a. SSSS
 - b. Measles
 - c. Rubella
 - d. Mumps
219. Most common cause of bronchiolitis in children?
 - a. RSV
 - b. Papova virus
 - c. Adenovirus
 - d. H3N1
220. Which of the following is responsible for pandemic in influenza
 - a. Antigenic shift
 - b. Antigenic drift
 - c. Antigenic rift
 - d. All of the above
221. Which is a bullet shaped virus?
 - a. Rabies virus
 - b. Cocksackie A
 - c. Cocksackie B
 - d. Polio virus

- 222. Virus not transmitted by breast milk is**
 a. Hepatitis A b. Hepatitis B
 c. Hepatitis C d. HIV
- 223. Pilot wheel appearance of multiple budding yeast cell is seen in?**
 a. Paracoccidioides b. Blastomycosis
 c. Sporothrix d. candida
- 224. Germ tube test is positive for**
 a. Candida glabrata b. Candida albicans
 c. Coccidioides immitis d. Rhinosporidium seeberi
- 225. Which is not an opportunistic infection in AIDS?**
 a. Cryptococcus b. Aspergillosis
 c. Dermatophyte d. P. Jiroveci
- 226. Sabin Feldman test is used for diagnosis of?**
 a. Toxoplasma b. Trypanosomiasis
 c. Kala azar d. Post dermal kalaazar
- 227. Non bile stained eggs are seen with all EXCEPT**
 a. Necator americanus b. Enterobius vermicularis
 c. Hymenolepis nana d. Strongyloides
- 228. All are seen with worm infestation EXCEPT**
 a. Perianal itching b. Iron deficiency
 c. Rectal prolapse d. Descending cholangitis
- 229. Most common serological type of rota virus**
 a. Group A b. Group B
 c. Group C d. Group D
- 230. Passive immunization is useful for all EXCEPT?**
 a. Measles b. Hepatitis A
 c. Hepatitis B d. Herpes simplex
- 231. EB virus is associated with all EXCEPT:**
 a. Bell's palsy
 b. Hepatitis
 c. Guillain-Barre syndrome
 d. Laennec's cirrhosis
- 232. Dawson disease is**
 a. SSPE
 b. Acute disseminated encephalomyelitis
 c. Neuromyelitoptica
 d. River blindness
- 233. Romana's sign is seen in?**
 a. Toxoplasma b. Trypanosoma cruzi
 c. Loa loa d. Wuchereria
- 234. Which of the following is not associated with Streptococcus:**
 a. Rheumatic fever b. Scarlet fever
 c. Acute GN d. Scalded skin syndrome
- 235. PCR was invented by**
 a. Carry B mullis b. Jimmi Hendrix
 c. Van den berg d. Eddie van halen
- 236. Gram negative cocci is?**
 a. Nisseria b. Helicobactor
 c. Cholera d. Campylobactor
- 237. NK Cell activator is?**
 a. IL 1 b. IL 10
 c. IL 12 d. IFN-γ
- 238. Hand foot mouth syndrome is caused by?**
 a. Parvovirus 6 b. Parvovirus 19
 c. Coxsackie virus A16 d. Coxsackie virus A19
- 239. "Yellow black" granules are seen in which fungal infection?**
 a. Mucormycosis b. Mycetoma
 c. Aspergillosis d. Rhinosporidiosis
- 240. Immunoglobulin in peyer's patch is?**
 a. IgM b. IgG
 c. IgA d. IgD
- 241. Compound used for fixation of protozoa found in stool is?**
 a. Phenol b. Hypochlorite
 c. Formalin d. Alcohol
- 242. Charcot Leyden crystal is associated with which cell?**
 a. Macrophages b. Eosinophils
 c. Basophils d. Neutrophils
- 243. Which of the following is responsible for phagocytosis?**
 a. C5a b. C3a
 c. C3b d. TNF-a
- 244. Which of the following acts as a chemoattractant?**
 a. C3a b. C3b
 c. C5a d. LTB4
- 245. Theory of web of causation was given by?**
 a. Mc Mohan and Pugh b. Pettenkoffer
 c. John snow d. Louis Pasteur
- 246. Stain used for degenerated fungi in tissue is?**
 a. PAS
 b. Gomori methenamine silver
 c. H&E
 d. Muciramine
- 247. Investigation of choice for amoebiasis is?**
 a. ELISA b. Colonoscopy
 c. Microscopy d. Microscopy + ELISA
- 248. Widal test is a type of?**
 a. Tube agglutination b. Slide agglutination
 c. Tube precipitation d. Slide precipitation
- 249. Lepra cell are?**
 a. Histiocytes b. Monocytes
 c. Lymphocytes d. N K Cells
- 250. Aschoff Body is made up of?**
 a. Fibroblast b. Histocytes
 c. Lymphocytes d. Monocytes
- 251. Sterilization of fibre optic bronchoscope is done by?**
 a. Glutaraldehyde b. Chlorine
 c. Autoclave d. Phenol
- 252. Gas gangrene is not caused by?**
 a. Clostridium welchi b. Clostridium perferenges
 c. Clostridium novyi d. Clostridium difficile

FMGE Solutions Screening Examination

416

- 253. Thickness of bacterial cell wall is?**
 a. 0–20 nm b. 20–80 nm
 c. 80–160 nm d. 160–240 nm
- 254. Glassware sterilization is done by?**
 a. Hot air oven b. Autoclaving
 c. 5% cresol d. Hotbath
- 255. Alcohol destroys bacteria by which mechanism?**
 a. Protein coagulation
 b. Produce cell membrane defect
 c. Inhibits DNA synthesis
 d. Oxidation
- 256. MHC I is recognized by?**
 a. CD 4 T cells b. CD 8 T cells
 c. Dendritic cells d. Macrophages
- 257. C3b deficiency causes?**
 a. SLE
 b. Collagen vascular disorders
 c. Recurrent pyogenic infections
 d. Hereditary angioneurotic edema
- 258. Which is not an opsonin?**
 a. C5a b. C3b
 c. IgM d. IgG
- 259. Dark field microscopy used for?**
 a. Syphilis b. Rickettsia
 c. Brucella d. T.vaginalis
- 260. Chancroid is caused by?**
 a. H. ducreyi b. T.palidum
 c. Leptospira d. None of these
- 261. Rickettsia is resistant to which antibiotics?**
 a. Tetracyclines b. Rifampin
 c. Penicillin d. Doxycycline
- 262. Clostridium perfringens toxemia is caused by which toxin?**
 a. Alpha toxin b. Beta toxin
 c. Theta toxin d. Delta toxin
- 263. Differentiating feature of Neisseria gonococcus from Neisseria meningitidis is?**
 a. Lactose fermentation b. Maltose fermentation
 c. Mennitol fermentation d. Sucrose fermentation
- 264. Hemagglutination showing viruses are?**
 a. Respiratory syncytial virus
 b. Influenza virus
 c. Paramyxo virus
 d. None of these
- 265. Most common cause of common cold is?**
 a. Virus b. Bacteria
 c. Fungus d. Allergic
- 266. Intranuclear basophilic inclusion body with halo is seen in?**
 a. Herpes zoster b. Herpes simplex
 c. CMV d. Adenovirus
- 267. The vector for chandipura virus is?**
 a. Sandfly b. Trombiculid mite
 c. House fly d. Fish
- 268. HPV does not cause?**
 a. Condyloma Lata b. Condyloma acuminatum
 c. Common warts d. None of these
- 269. Common warts are caused by?**
 a. HPV 6 and 11 b. HPV 16 and 18
 c. HPV 2 and 7 d. HPV 63
- 270. Oral hairy leukoplakia is associated with?**
 a. Cytomegalovirus
 b. Human immunodeficiency virus
 c. EBV d. HPV
- 271. Which of the following are dimorphic fungi?**
 a. Histoplasma b. Dermatophytes
 c. Aspergillus d. Cryptococcus
- 272. Dane particles are seen in?**
 a. Hepatitis A b. Hepatitis B
 c. Hepatitis C d. Hepatitis D
- 273. Pontiac fever is caused by?**
 a. Legionella b. Mycoplasma
 c. Rickettsia d. Salmonella
- 274. Scrub typhus is caused by which stage of organism?**
 a. Nymph b. Larva
 c. Pupa d. Adult
- 275. What is true regarding lag phase?**
 a. Period of active growth without increase in numbers
 b. Growth occurs exponentially
 c. The plateau in lag phase is due to cell death
 d. It is the 2nd phase in bacterial growth curve
- 276. Nakayama strain is used for which vaccine?**
 a. Typhoid b. Chicken pox
 c. Japanese encephalitis d. Yellow fever
- 277. Sulphur granules in actinomycosis consist of?**
 a. Monophils + neutrophils b. Monophils + lymphocytes
 c. Eosinophils d. Bacterial particles
- 278. Mycobacterium leprae can be grown on?**
 a. L J medium
 b. Robertson's cooked meat medium
 c. Foot pad of mice
 d. Sabraud's agar
- 279. Herring bodies are found in?**
 a. Neurohypophysis b. Adenohypophysis
 c. Cerebral cortex d. Thalamus
- 280. Owl eye intranuclear inclusion body is seen in?**
 a. Herpes zoster b. Herpes simplex
 c. CMV d. EBV
- 281. Eosinophilic pneumonia caused by Ascaris lumbricoides is known as?**
 a. Mafucci syndrome
 b. Loeffler's syndrome
 c. Primary pulmonary eosinophilia
 d. Sweet syndrome
- 282. Most common cause of UTI in young females is?**
 a. Staph saprophyticus b. E.coli
 c. Klebsiella d. Proteus

- 283. Inverted fir tree appearance on gelatin stab is characteristic of?**
 a. Mycoplasma b. Bacillus anthracis
 c. Clostridium d. Bacteriodes
- 284. Satellitism is seen in culture of?**
 a. Campylobacter jejuni
 b. H. influenzae
 c. E.coli
 d. Beta hemolytic streptococci
- 285. Which one of the following bacteria is oxidase positive?**
 a. Vibrio b. Pseudomonas
 c. Clostridium d. E.coli
- 286. Which hepatitis virus is a partially single stranded, partially double stranded DNA virus?**
 a. Hepatitis A b. Hepatitis B
 c. Hepatitis C d. Hepatitis D
- 287. Speed of rabies virus in axon is?**
 a. 1 mm per hour b. 3 mm per hour
 c. 5 mm per hour d. 7 mm per hour
- 288. Mode of transmission of brucella is?**
 a. Air b. Water
 c. Milk d. Aerosol
- 289. KOH wet mount can be prepared for?**
 a. Bacteria b. Virus
 c. Fungus d. Parasite
- 290. Elek's gel precipitation test is seen in?**
 a. Clostridium b. Corynebacterium
 c. Bacteriodes d. Campylobacter
- 291. Naegler's reaction is shown by?**
 a. Clostridium tetani
 b. Clostridium welchii
 c. Mycobacterium tuberculosis
 d. Mycobacterium leprae
- 292. Chocolate agar is an example of?**
 a. Enriched medium b. Enrichment medium
 c. Selective medium d. Transport medium
- 293. Skirrow's medium is used for?**
 a. Clostridium tetani
 b. Corynebacterium diphtheriae
 c. Campylobacter jejuni
 d. Helicobacter pylori
- 294. Transport medium most commonly used for Vibrio cholera is?**
 a. TCBS medium
 b. Venkatraman Ramakrishna medium
 c. Sodium taurocholate medium
 d. Thayer martin medium
- 295. Taxonomically chlamydia is a?**
 a. Bacteria b. Virus
 c. Fungus d. Nematode
- 296. Pyoderma gangrenosum is caused by?**
 a. Streptococcus b. Staphylococcus
 c. Pseudomonas d. E.coli
- 297. Germ theory of disease was proposed by?**
 a. Louis pasteur b. Ronald Ross
 c. Edward jenner d. Robert koch
- 298. Microscope was invented by?**
 a. Ronald ross b. Robert koch
 c. Antonie van leeuwenhoek
 d. Louis pasteur
- 299. Scarlet fever is caused due to?**
 a. Streptococci b. Staphylococci
 c. Klebsiella d. Proteus
- 300. Influenzae virus belongs to which family?**
 a. Paramyxovirus b. Orthomyxovirus
 c. Bunyaviridae d. Togaviridae
- 301. H1N1 is a type of?**
 a. SARS virus b. Influenza type A virus
 c. Influenza type B virus d. Influenza type C virus
- 302. HTLV-1 causes which of the following?**
 a. Tropical spastic paraparesis
 b. Familial mediterranean fever
 c. Cutaneous T cell lymphoma
 d. Burkitt's lymphoma
- 303. True about HACEK group of bacteria is?**
 a. Anaerobes
 b. Includes Coxiella burnetii
 c. Gram positive
 d. Require CO₂ for growth
- 304. Proteus antigen cross react with?**
 a. Klebsiella b. Rickettsia
 c. Chlamydia d. E.coli
- 305. Rapid urea breath test is positive in?**
 a. H pylori b. Klebsella
 c. Proteus d. Ureoplasma
- 306. Motility difference according to the temperature changes is shown by?**
 a. Vibrio b. Leptospira
 c. Chlamydia d. Listeria
- 307. Nasopharyngeal leishmaniasis is caused due to?**
 a. Leishmania braziliensis b. Leishmania tropica
 c. Leishmania chagasi d. Leishmania donovani
- 308. Which viral disease is transmitted by orofecal route?**
 a. Dengue b. Poliovirus
 c. Hepatitis B d. Influenza virus
- 309. Ascoli's thermoprecipitin test is done for?**
 a. Clostridium tetani b. Chlamydia
 c. Bacillus anthracis d. Corynebacterium
- 310. Most common organism which can contaminate crowded army camps is?**
 a. Klebsiella b. E coli
 c. Neisseria meningitidis d. Staphylococcus
- 311. Which antibody is most commonly produced in secondary immune response?**
 a. IgG b. IgA
 c. IgD d. IgM

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTION 2019

1. Ans. (a) Grey pseudo-membrane that bleeds on removal

Ref: Nelson 20th ed. pg. 2018

- Development of a localized or coalescing pseudo-membrane can occur in any portion of the respiratory tract in case of Diphtheria.
- The pseudomembrane is characterized by the formation of a dense, grey debris layer composed of a mixture of dead cells, fibrin, RBCs, WBCs, and organisms.
- Removal of the membrane reveals a bleeding, oedematous mucosa. The distribution of the membrane varies from local (e.g., tonsillar, pharyngeal) to widely covering the entire tracheobronchial tree.

GENERAL MICROBIOLOGY, MEDIA, TESTING

2. Ans. (b) Transduction

Ref: Textbook of Microbiology by Surinder Kumar,
P 93 Microbiology by Ananthanarayan and
Paniker, 8th ed., pg. 60

Some bacteria also transfer genetic material between cells via following ways:

- **Transduction:** Transfer of genetic material from one bacterium to another by a bacteriophage is known as transduction
 - Most widespread mechanism of gene transfer among prokaryotes
- **Transformation:** Transfer of genetic material through the agency of free DNA
- **Conjugation:** DNA is transferred through direct cell contact. Gram negative anaerobes like E. Coli, Bacteroides, Porphyromonas, and Fusobacterium use this method of gene transfer

Extra Mile

- Bacteriophages are viruses that parasitize bacteria
- Most bacteriophages carry their genetic information (the phage genome) as a length of double-stranded DNA coiled up inside a protein coat.
- **Lysogenic conversion:** Phage DNA integrated in bacterial chromosome as prophage → replicated stably as part of host cell chromosome → transferred to daughter cell.
 - **In other words:** "This process by which the prophage DNA confers genetic information to a bacterium is called **lysogenic or phage conversion.**"
 - **NOTE:** In transduction, phage acts only as a vehicle carrying bacterial genes from one cell to another but in lysogenic conversion the phage DNA itself is the new genetic element.

3. Ans. (a) Stationary phase

Ref: Microbiology by Ananthanarayan and
Paniker, 8th ed. P 24

PHASES OF BACTERIAL GROWTH CURVE

LAG PHASE

- No appreciable increase in number but there is **increase in size of the cells**
- Accumulation of enzymes and metabolic intermediates
- **Maximum cell size** is obtained at the end of lag phase

LOG PHASE

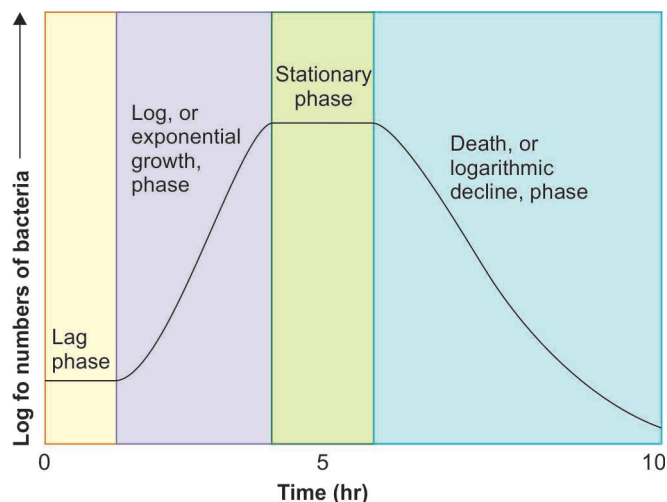

- Also called **exponential phase**
- Number of cells increase exponentially
- Cells are **small and stain uniformly**
- Increase in metabolic rate

STATIONARY PHASE

- Viable **count of cells remain stationary** as an equilibrium exists between dying cells and newly formed cells
- Cells are viable and show **irregular staining** due to intracellular storage granules
- **Sporulation occurs at this stage**
- Production of antibiotics and exotoxins

PHASE OF DECLINE

- **Population of cells decrease** due to cell death
- **Involution forms** are common

4. Ans. (b) Thermometer

Ref: Textbook of Diagnostic Microbiology, E-book, P 67

- **High level of disinfectant:** 2% glutaraldehyde for 20 minutes for all instruments coming in contact with

mucous membrane. Like bronchoscope, proctoscope, endoscopic tubes, etc.

- **Intermediate level of disinfectant:** Phenol or alcohol is used to disinfect thermometer.
- **Low level of disinfectant:** Lysol for floors and fabrics.

5. Ans. (d) Sodium hypochlorite

Ref: Textbook of Diagnostic Microbiology, E-book, P 68

- After repeated vitro studies, it is confirmed that the most potent disinfectant is hypochlorite, which disclosed the lowest minimum bactericidal concentration against various micro-organisms, when compared with iodine tincture and chlorhexidine.
- Sodium hypochlorite is proved to be efficient even at very low concentration (5% or even less) and the action is achieved very rapidly (within 30–60 minutes).

6. Ans. (c) Stationary phase

Ref: Ananthanarayan, 8th ed. pg. 24

Features of Stationary Phase

1. Viable **count of cells remain stationary** as an equilibrium exists between dying cells and newly formed cells
2. Cells are viable and show **irregular staining** due to intracellular storage granules
3. **Sporulation** occurs at this stage
4. Production of antibiotics and exotoxins is also seen at this stage.

7. Ans. (b) Ionizing radiation

Ref: Ananthanarayan's Microbiology, 8th ed. pg. 35

- Cold sterilization is a process in which sterilization is carried out at low temperature with the help of chemicals, radiations, membranes.
- Ionizing radiation such as X-rays, gamma rays and cosmic rays, cause no appreciable increase in temperature in this method, it is referred to as cold sterilization.

8. Ans. (a) Albert stain

Ref: Ananthnarayan, 9th ed. MedPub

- **Albert stain** is a type of differential stain used for staining the volutin granules also known as Metachromatic granules found in *Corynebacterium diphtheriae*.
- The name metachromatic is because of its property of changing color, i.e. *when stained with blue stain they appear red in colour. When grown in Loeffler's slopes, C. diphtheriae produces large number of granules.*

Extra Mile

• Stains used for *C. Diphtheriae*:

- Ponders stain
- Albert stain
- Neisser stain
- Loeffler methylene blue

9. Ans. (b) Can't differentiate between latent and active TB

Ref: Harrison's, 19th ed. pg. 1114; Lange Microbiology by Jawetz, Ch 8

- The skin test with tuberculin PPD (TST) is most widely used in screening for latent tuberculosis.
- It has very low sensitivity and specificity and is **unable to discriminate between latent TB and active disease.**
- **False negative reactions** are common in immunosuppressed patients and in those with overwhelming TB.
- **False-positive reactions** may be caused by infections with non-tuberculous mycobacteria and by BCG vaccination.

10. Ans. (c) Conjugation

Ref: Textbook of Microbiology, Suirnder Kumar pg. 530

- **Lysogeny** does not affect bacterial metabolism. The prophage behaves like segment of host chromosome and replicates synchronously by binary fission.
- **Bacterial conjugation** is the transfer of genetic material between bacterial cells by direct cell-to-cell contact and is a mechanism of **horizontal gene transfer**, like transformation and transduction, although these two other mechanisms do not involve cell-to-cell contact.
- **Transduction** is transfer of genetic material from bacteria to bacteria by bacteriophage. It was discovered by Zinder and Lederberg in *Salmonella typhimurium*. Clinically speaking it provides a way to study gene linkage.

Extra Mile

- **Transformation** is the genetic alteration of a cell resulting from the **direct uptake** and incorporation of exogenous genetic material (exogenous DNA) from its surroundings **through the cell membrane.**

11. Ans. (b) Integration of phage nucleic acid to host bacteria genome

Ref: PubMed

- Lysogenic conversion is characterized by **integration of the bacteriophage nucleic acid into the host bacterium's genome.**
- Once the genetic material of phage bacteria is introduced, the host bacterium continues to live and reproduce normally.
- The genetic material of the bacteriophage, called a prophage, can be transmitted to daughter cells at each subsequent cell division, and a later event (such as UV radiation or the presence of certain chemicals) can release it, causing proliferation of new phages via the lytic cycle.
- For example, a number of strains of the diphtheria bacillus acquire the capacity to form diphtheria toxin immediately after penetration of the phage into the cell and retain that capacity until the moment of the cell's dissolution (lysis).

FMGE Solutions Screening Examination

12. Ans. (c) 25 to 40°C

Ref: Ananthnarayan, 9th ed. ch-1**Organisms on the basis of their growth at different temperature:**

- **Psychrophilic:** (below 20°C)
- **Psychrotrophs:** (important cause of food spoilage)
- **Mesophilic:** (25–40°C)
- **Thermophilic:** (55–80°C)

13. Ans. (a) Incineration

Ref: PubMed

Cat.	Type of Bag/ Container used	Type of waste	Treatment/ disposal options
Yellow 	Non-chlorinated plastic bags Separate collection system leading to effluent treatment system	<ul style="list-style-type: none"> • Human anatomical waste • Animal anatomical waste • Soiled waste • Expired or discarded medicines • Chemical waste • Micro, Bio-t and other clinical lab waste • Chemical liquid waste 	Incineration of Plasma pyrolysis or deep burial*
Red 	Non-chlorinated plastic bags or containers	Contaminated waste (Recyclable) tubing, bottles, intravenous tubes and sets, catheters, urine bags, syringes (without needles) gloves	Auto/Micro/Hydro and then sent for recycling not be sent to landfill
White/ Trans-lucent 	Puncture, leak, tamper proof containers	Waste sharps including metals	Auto or Dry Heat Sterilization followed by shredding or mutilation or encapsulation
Blue 	Cardboard boxes with blue colored marking	Glassware	Disinfection or auto/Micro/hydro and then sent for recycling

14. Ans. (a) Human body parts

Ref: Please refer to above explanation

15. Ans. (c) Dry heat sterilization

Ref: Ananthnarayan, 9th ed. PubMed

- Heat sterilization is considered as the most reliable method of sterilization.
- It can be done by 2 methods
 - Dry heat
 - Moist heat

Dry heat	Moist heat
Mechanism of killing: <ul style="list-style-type: none"> • Killing effect is due to protein denaturation, oxidative damage and the toxic effect of metabolite 	Mechanism of killing: <ul style="list-style-type: none"> • Is due to protein denaturation and coagulation
Methods and its use: <ul style="list-style-type: none"> • Flaming: for loop wire, searing spatulas • Incineration: <ul style="list-style-type: none"> ■ Contaminated cloth ■ Pathological waste ■ Anatomical remains • Hot air oven <ul style="list-style-type: none"> ■ All glass syringes and glass wares ■ Liquid paraffin ■ Dusting powder ■ Swabs ■ Scalpel, forceps, scissors ■ Fat and grease 	Methods and use: <ul style="list-style-type: none"> • Pasteurization <ul style="list-style-type: none"> ■ Holder method ■ Flash method • Autoclaving (steam sterilization): 121°C x 15 min at 15 psi. Used for: <ul style="list-style-type: none"> ■ Culture media ■ Aprons, dressing ■ Surgical instruments except sharps ■ Gloves ■ Catheter ■ Sputum

TABLE: Radiation used for sterilization

Ionizing radiation (aka Cold sterilization)	Non-ionizing radiation
Methods: <ul style="list-style-type: none"> • Photon irradiation (γ): Most commonly used among radiation sterilization • Electron irradiation (β) Uses: Used for heat sensitive materials like: <ul style="list-style-type: none"> • Plastic disposables • Bone and tissue grafts • Adhesive dressings • Catgut suture 	Methods: <ul style="list-style-type: none"> • Infrared rays: used for prepacked items like catheters and syringes • UV Radiation: operation theatre, Laboratories

16. Ans. (b) Differential stain

Ref: Microbiology by Ananthnarayan and Paniker, 8th ed. pg. 15**DIFFERENTIAL STAIN**

- These are positive stain, which divide bacterial population into two different groups by imparting two different colors
 - **Gram Stain:** it is the **most common staining method of bacteriology**. It stains cell wall of bacteria.
 - ◆ **Gram positive** appears blue
 - ◆ **Gram Negative** appears pink/red
 - **Z-N stain** is used to distinguish acid fast bacteria and non-acid fast bacteria.
 - ◆ Presence of mycolic acid is responsible for the acid-fast nature of bacteria.

17. Ans. (d) Hot air oven

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 31

- **Flaming:** in this method the articles should be sterilized on the hot flame of Bunsen burner.
- **Hot air oven:** It is also called *dry heat sterilizer*.

Note: The articles should be sterilized at the temperature 160°C for 2 hours or 150–170°C for 1 hour.

- Glass ware like test tube, pipette, flask and glass syringes, fixed oil glycerin, liquid paraffin, propylene glycol and zinc oxide etc. can be sterilized by this method.
- **Autoclave:** this type of sterilization is done by steam heat under pressure.
Use: Glass ware, surgical dressing, rubber, gloves, surgical instrument are sterilized by this method.

18. Ans. (b) *Bacillus subtilis*

Ref: Textbook of Microbiology S. Kumar/14

- Hot air oven is dry heat sterilization technique used most commonly to sterilize glassware and metal items.
- *Sterility check* is done for each and every lot to enhance quality of sterilization. For this purpose the *biological indicator organism bacillus subtilis* is used.
- Non pathogenic clostridium tetani can also be used to check the efficiency (*Bacillus subtilis* > *Non-pathogenic clostridium tetani*).
- **Note:** *Stearothermophilus* is used to check efficiency of autoclave.

19. Ans. (a) Autoclaving at 135 degrees

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 32

- Prions are best destroyed by autoclave at 135 degree for one hour.

20. Ans. (a) Solid medium

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 39-40

GROWING BACTERIAL CULTURES IN LIQUID NUTRIENT BROTH

- Nutrient broth is a liquid bacterial growth medium made of powdered beef extract and short chains of amino acids that have been dissolved in water.
- Liquid medium is convenient to use for growing bacteria in test tubes, and can reveal information about the oxygen requirements of bacteria growing within.
- Bacteria that require oxygen will grow close to the water's surface, and bacteria that cannot tolerate the presence of oxygen will grow at the bottom of the test tube.

GROWING BACTERIAL CULTURES ON SOLID MEDIA

- *Broth media* can be made solid by adding agar, a gel like polysaccharide extracted from red algae.
- Broth with about 1.5% agar added will be liquid when heated, but solid at room temperature, making it easy to pour into a vessel, such as a Petri dish or test tube when hot.
- The solution then becomes solid once cooled.

21. Ans. (b) To make the medium solid

- *Broth media* can be made solid by adding agar, a gel like polysaccharide extracted from red algae.
- Broth with about 1.5% agar added will be liquid when heated, but solid at room temperature, making it easy to pour into a vessel, such as a Petri dish or test tube when hot.
- The solution then becomes solid once cooled.

22. Ans. (c) *Pseudomonas aeruginosa*

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 317

- *Pseudomonas* is isolated from feces or other samples by using selective media such as cetrimide agar.
- *E. coli* is cultured in Mac-conkey media
- *Clostridium tetani* grows on ordinary media and is improved by blood and serum.
- *Clostridium perfringens* grows on blood agar plate.

23. Ans. (d) *Pseudomonas*

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 317

- *Pseudomonas* is isolated from feces or other samples by using selective media such as cetrimide agar.

24. Ans. (a) *N. Meningitis*

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 225, 227

- Thayer martin medium is selective medium for *N. Meningitis*.

25. Ans. (d) Tellurite media

Ref: Microbiology by Ananthanarayan and Paniker, 9th ed. pg. 235-236

TABLE: Culture media used for *C. Diphtheriae*

Medium	Use	Time for growth
Tellurite medium	For best for diagnosis	Days
Loeffler's serum slope	For earliest diagnosis	Hours

26. Ans. (c) **LJ medium**Ref: Harrison, 19th ed. pg. 1110

- Harrison states: "In genitourinary TB - culture of 3 morning urinary specimen yields a definitive diagnosis in 90% cases. LJ medium is most common solid medium used for culture.
- Prevalence of GU TB= 10-15%
- **MC c/o**- Urinary frequency, dysuria, nocturia, hematuria, and flank or abdominal pain.
- **Diagnosis**- Culture of three morning urine specimens- definitive diagnosis in nearly 90% patient.
- **Other test**- IV pyelography, abdominal CT, MRI-may show deformities and obstructions
- **Suggestive findings**- calcifications and ureteral strictures-
- **Complication**-
 - **Female**- affects the fallopian tubes and the endometrium and may cause infertility, pelvic pain, and menstrual abnormalities.
 - **Diagnosis** requires biopsy or culture of specimens obtained by dilation and curettage.
 - **Male**- affects the epididymis, producing a slightly tender mass that may drain externally through a fistulous tract; orchitis and prostatitis may also develop.
- **Rx**: Genitourinary TB responds well to chemotherapy.

27. Ans. (a) **Pink**Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 47

- Color change in Robertson cooked meat media depends on clostridial organism:
 - **Clostridium perferingens** (Saccarolytic activity): color turns to **pink** (Mn: P-P)
 - If **Clostridium tetani** (Proteolytic activity): colour turns to **black**

Note: Robertson cooked meat medium is most widely used fluid medium for culture of anaerobes.

28. Ans. (c) **For bacteria using citrate**Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 674

- The **citrate test** detects the ability of an organism to use citrate as the sole source of carbon and energy.
- A positive diagnostic test rests on the generation of alkaline by-products of citrate metabolism. The subsequent increase in the pH of the medium is demonstrated by the color change of a pH indicator.
- The citrate test is often part of a battery of tests used to **identify gram-negative pathogens** and environmental isolates.

29. Ans. (b) **Differential media**Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 40**DIFFERENTIAL MEDIA (OR INDICATOR MEDIA)**

- It distinguishes one microorganism type from another growing on the same media.
- This type of media is used for the detection of microorganisms and by molecular biologists to detect recombinant strains of bacteria.
- **Examples of differential media include:**
 - Blood agar
 - Eosin methylene blue (EMB)
 - MacConkey (MCK)
 - Mannitol salt agar (MSA)

Extra Mile

- **Mac Conkey agar** is a culture medium designed to grow Gram-negative bacteria and differentiate them for lactose fermentation.
- It consists of Peptone, Lactose, Agar neutral red and taurocholate shows up lactose fermenters as PINK COLONIES
- Non lactose Fermenters are colorless.

30. Ans. (d) **Stuart media**Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 40, 43**INDICATOR MEDIA**

- It is also known as differential media which distinguishes one microorganism type from another growing on the same media.
- This type of media is used for the detection of microorganisms and by molecular biologists to detect recombinant strains of bacteria.
- Examples of differential media include:
 - Blood agar
 - Eosin methylene blue (EMB)
 - MacConkey (MCK)
 - mannitol salt agar (MSA)

TRANSPORT MEDIA**Examples of Transport Media Include**

- Thioglycolate broth for strict anaerobes
- **Stuart transport medium** - a non-nutrient soft agar gel containing a reducing agent to prevent oxidation, and charcoal to neutralize
- Certain bacterial inhibitors- for gonococci, and buffered glycerol saline for enteric bacilli.
- Venkat-Ramakrishnan (VR) medium for *V. cholerae*.

31. Ans. (c) **Ziehl-neelsen stain**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 352

- Z-N stain is used to distinguish acid fast bacteria and non-acid fast bacteria.
- Presence of mycolic acid is responsible for the acid-fast nature of bacteria.
- For the diagnosis and control of tuberculosis Sputum microscopy is the most reliable single method.
- Preparation of smear is from the thick purulent part of the sputum. They are dried, heated fixed and stained by the Ziehl-Neelsen technique.
- The smear is then covered with strong carbol fuchsin and gently heated for 5-7 minutes, without letting the stain boil and become dry.
- Wash the slide with water and decolourise it with 20% sulphuric acid, followed by 95% ethanol for two minutes.
- Smear is then counterstained with Loeffler's methylene blue, 1% picric acid or 0.2% malachite green for one minute.
- Now, under the oil immersion objective, acid fast bacilli are seen as bright red rods while the background is blue, yellow or green depending on the counterstain used.
- At least 10,000 acid fast bacilli should be present per ml of sputum for them to be readily demonstrable in direct smears.

32. Ans. (b) **Tube agglutination**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 108

TABLE: Agglutination tests and their uses

Agglutination test	Used mainly for
Direct agglutination test	Determination of blood group Bacterial agglutination test for serotyping & serogrouping. Eg: Vibrio Cholera, Salmonella Sp.
Slide agglutination test	Used for serotyping of salmonella VDRL for syphilis
Tube agglutination test	Aka standard agglutination test. Used for serological diagnosis of typhoid, brucellosis and typhus fever. Ex: Widal Test, Weil felix reaction, and Kahn test
Passive agglutination test	Rheumatoid factor ANA for SLE Antibody to Trichenella spiralis and antibody to group A strep.

33. Ans. (b) **Counter current immune-electrophoresis**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 104

TABLE: Common precipitation tests and their examples

Precipitation test	Example
Ring test	Ascoli thermoprecipitin test (anthrax) and grouping of streptococci by Lancefield technique
Slide test	VDRL test for syphilis
Tube test	Kahn test for syphilis
Immuno-diffusion tests	Elek test for toxigenicity of diphtheria bacilli
Electroimmuno diffusion	Counter current immune-electrophoresis and rocket electrophoresis

34. Ans. (c) **Widal test**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 108

AGGLUTINATION TEST

- It is a blood test used to identify unknown antigens.
- Blood with the unknown antigen is mixed with a known antibody and whether or not agglutination occurs helps to identify the antigen.
- Refer to above explanation of Q 17.

35. Ans. (d) **Muramic acid**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 10, 63, 425

- All the above options except muramic acid are membrane bound organelles which are absent in prokaryotes and only present in eukaryotes.
- Muramic Acid is one of the important components of the peptidoglycan wall present in the cell wall of prokaryotic cells.

36. Ans. (a) **C-substance**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 205, 673

- Lancefield classification is a grouping system for beta hemolytic bacteria based on the polysaccharide in their cell walls, C – substance (carbohydrate), which is antigenic. So this classification is serologic.

37. Ans. (b) **Antibody**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 102-103

- Antibody is attached to the surface of bacteria for opsonization, which further get phagocytized.

38. Ans. (c) **HIV ELISA**

Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 570, 576*

- ELISA HIV measures antibodies against the virus. These antibodies are of IgG type and can cross the placenta. Hence a baby born to HIV positive lady will test HIV positive on day 0 of life and may continue till these antibodies are cleared by the baby's immune system. The clearance may take 12-18 months and therefore Babies born to HIV lady may be false positive till the age mentioned.
- However DNA PCR or viral culture or p24 antigen positive on first few days of life is indicative of perinatal transmission rate of the virus which is 30%-

Extra Mile

- The perinatal transmission rate can be reduced by at least 50% in case single dose nevirapine given to the mother and to the baby within 72 hours. Breast feeding is indicated in baby born to HIV positive patient.

39. Ans. (d) **Infectious mononucleosis**

Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 476*

Infectious mononucleosis is diagnosed by Paul Bunnell test.

Revision of Key Points About Infectious Mononucleosis

- **Ebstein Barr virus** is causative for infectious mononucleosis.
- Infectious mononucleosis is called a **glandular fever**
- Clinical features include fever, lymphadenopathy, sore throat and presence of abnormal lymphocytes in blood.
- **Monospot test** is also used for diagnosis of infectious mononucleosis,
- Patients develop skin rash if they consume an antibiotic like **ampicillin**
- EBV is also **oncogenic** in nature because it causes **B cell clonal activation**.

BACTERIOLOGY

40. Ans. (b) **Gram positive rods with square ends**

Ref: *Textbook of Microbiology by Surinder Kumar, P 282; Lange Microbiology, Ch 12*

- The genus *bacillus* includes large aerobic, gram-positive rods occurring in chains.
- Principle pathogen of bacillus species is *Bacillus anthracis* (causes anthrax).
- Anthrax is primarily a disease of herbivores—goats, sheep, cattle, horses, etc.

- In humans anthrax is acquired by:
 - Injured skin: Cutaneous anthrax
 - Mucous membrane: Gastrointestinal anthrax
 - Inhalation of spores: Inhalational anthrax (Woolsorter's disease)

Morphology:

- The typical cells, measuring $1 \times 3-4 \mu\text{m}$, have **square ends** and are arranged in long chains; spores are located in the center of the non-motile bacilli
- **Culture:** Round colonies with "cut-glass" appearance in transmitted light

Laboratory test:

- **Specimen:** Pus, Blood or sputum
- **Smear:** shows chain of large gram positive rods
- **Blood agar plates:** shows non-hemolytic gray to white colonies with rough texture and ground glass appearance.
- **Nutrient agar:** Medusa head appearance/comma shaped outgrowth from the colonies.
 - Long chain of bacilli resembles locks of matted hair under the low power microscope.
- **Gelatin stab:** Inverted fir tree appearance.

Arrangement of bacteria: A. Cocci: 1. Streptococci 2. Pneumococci 3. Gonococci 4. Meningococci 5. Neisseria catarrhalis 6. Gaffkya tetragena 7. Sarcina 8. Staphylococci; B. Bacilli: 1. Bacilli in cluster 2. Bacilli in chains (B. anthrax) 3. Diplobacilli (K. pneumoniae)

Extra Mile

• **Bacillus anthracis**

- It is the first pathogenic bacterium to be observed under the microscope
- First communicable disease shown to be transmitted by inoculation of infected blood
- First bacterium used for the preparation of an **attenuated vaccine** by Pasteur was *B. anthracis*.

41. Ans. (c) **Leprosy**

Ref: Textbook of Microbiology by Surinder Kumar, P 328

- Choice A has a stellate granuloma while choice D has a gumma. Hence both are ruled out. Choice B is a rickettsial disease
- Choice C leprosy is a chronic granulomatous disease
- A lepromatous leprosy patient develops numerous nodular skin lesions (**lepromata**) on face, ear lobes, hands, feet and less commonly trunk.
- It shows AFB positive bacilli.
- Skin Biopsy shows: Many macrophages, seen as large foamy cells packed with AFB
- **Microscopy of lepromatous leprosy**
 - Smears are stained by Ziehl-Neelsen method using 5 percent instead of 20 percent sulphuric acid for decolorization. Acid-fast bacilli (AFB) arranged in parallel bundles within macrophages

The smears are graded, based on the number of bacilli as follows:

1-10 bacilli in 100 fields	=	1+
1-10 bacilli in 10 fields	=	2+
1-10 bacilli per field	=	3+
10-100 bacilli per field	=	4+
100-1,000 bacilli per field	=	5+
More than 1,000 bacilli, clumps and globi in every field	=	6+

42. Ans. (a) **Respiratory disease**

Ref: Page 1138: Harrison 20th edition

- The bacterium *L. pneumophila* leads to legionnaire disease.
- The most common form of transmission of *Legionella* is inhalation of contaminated aerosols produced in conjunction with water sprays, jets or mists.
- It has 2 distinct clinical syndromes: Legionnaires disease, which most often manifests as severe pneumonia accompanied by multisystemic disease, and Pontiac fever, which is an acute, febrile, self-limited, viral-like illness

43. Ans. (b) **2nd week**

Ref: page 1176: Harrison 20th edition

- Widal test should be done in *second week* of presentation of a case of typhoid. It is a serological test with patient showing H and/or O titres greater than or equal to 1:160 and typhoid-like symptoms is strongly suggestive of diagnosis of typhoid fever. *False positive widal is seen in case of malaria.*
- The criterion standard for diagnosis of typhoid fever has long been culture isolation of the organism. In the first week bone marrow culture or blood culture should be done.
- Bone marrow aspiration and blood are cultured in a selective medium (eg, 10% aqueous oxgall) or a nutritious medium (eg, tryptic soy broth) and are incubated at 37°C for at least 7 days

44. Ans. (d) **Actinomyces**

Ref: Textbook of Diagnostic Microbiology, E-book, P 505

- **Nocardia:** Aerobe, acid fast
- **Actinomyces:** Anerobe, non-acid-fast bacilli
- **Tuberculosis:** Aerobic, acid fast
- **Listeria:** Facultative anaerobe, Gram-positive, non-acid-fast

45. Ans. (d) **Haemophilus influenzae**

Ref: Textbook of Diagnostic Microbiology, E-book, P 14

- **Capnophilic bacteria:** Organisms which thrive on the high concentration of CO₂. They require ~5–10% of CO₂. For example, *Haemophilus influenzae*, *Neisseria*.
- **Facultative anaerobe:** These are capable of growing under both aerobic and anaerobic conditions. For example, *Staphylococcus aureus*.
- **Obligate anaerobe:** These organisms grow only under non-oxygen environment. Oxygen is toxic for these organisms. For example, *Clostridium*.
- **Obligate aerobe:** There is absolute requirement of oxygen for survival for this type of organism. For example, *Mycobacterium*.

FMGE Solutions Screening Examination

426

46. Ans. (b) *Listeria monocytogenes*

Ref: Ananthnarayan and Paniker's Textbook of Microbiology, 8th ed. pg. 395

- The Anton test is used in the identification of *L. monocytogenes*; instillation of a culture into the conjunctival sac of a rabbit or guinea pig causes severe keratoconjunctivitis within 24 hours.
- Experimental inoculation in rabbits causes marked monocytosis, hence the name monocytogenes. Monocytosis is a feature of human listeriosis also.

47. Ans. (b) *Inhibiting protein synthesis*

Ref: Ananthnarayan's Microbiology, 8th ed. pg. 234

- The diphtheria toxin causes damage to eukaryotic cells and tissues by inhibition of protein synthesis in the cells.
- Although the toxin is responsible for the lethal symptoms of the disease, the virulence of *C. diphtheria* cannot be attributed to toxigenicity alone, since a distinct invasive phase apparently precedes toxigenesis.

48. Ans. (a) *Listeria monocytogenes*

Ref: Handbook of Zoonoses, 2nd ed. pg. 322

- *Listeria monocytogenes* is Gram-positive, nonspore forming rod shaped bacteria with rounded ends.
- The organisms occasionally appear in a palisade arrangement, along with some V or Y forms.
- It is motile via one to six peritrichous flagella and exhibits characteristic tumbling motility.
- Tumbling motility can be seen best microscopically using cultures grown in tryptose broth incubated at 20°C. The organism is weakly motile at 37°C.

49. Ans. (d) *V. Cholerae*

Ref: Ananthnarayan and Paniker's Textbook of Microbiology, 8th ed. pg. 302

- In stained films of mucus flakes from acute cholera cases, the vibrios are seen arranged in parallel rows, described by Koch as the 'fish in stream' appearance.
- "School of Fish" appearance is seen in *H. ducreyi*.
- Vibrios are Gram-negative, rigid, curved rods that are actively motile by means of a polar flagellum. The name 'vibrio' is derived from the characteristic vibratory motility/darting motility.
- The cholera vibrio is a short, curved, cylindrical rod, about 1.5 x 0.2-0.4 µm in size, with rounded or slightly pointed ends. The cell is typically **comma shaped**.
- Aside from *V. cholera*, darting motility is also seen in *Campylobacter*.

50. Ans. (c) *Legionella*

Ref: Ananthnarayan and Paniker's Textbook of Microbiology, 8th ed. pg. 400

- Pontiac fever was named for Pontiac, Michigan, where the first case was recognized. It caused by various species of **Gram-negative bacteria in the genus *Legionella***.
- It is a milder, non-fatal, influenza like illness with fever, chills, myalgia and headache.
- Pontiac fever resolves spontaneously and often goes undiagnosed.
- Both Pontiac fever and the more severe Legionnaire's disease are caused by the same bacteria, *Legionella Pneumophila* but Pontiac fever does not include pneumonia.

Extra Mile

Legionnaire's disease:

- Can be either epidemic or sporadic.
- **Incubation period:** 2–10 days
- Presents with fever, non-productive cough and dyspnea. If untreated it rapidly progresses to pneumonia.

51. Ans. (b) *Pneumococcus*

Ref: Ananthnarayan and Paniker's Textbook of Microbiology, 8th ed. pg. 219-220

- The pathogen that most commonly causes sepsis in patients who have undergone splenectomy, as well as in children with sickle cell disease, is *S. pneumoniae* (pneumococcus).
- Asplenic patients are at risk for rapidly progressive septicemia and death. Such patients should be vaccinated against pneumococci, *H. influenzae* type b, meningococci, and influenza virus, and if fever develops, they should receive empirical antimicrobial therapy immediately.
- Mortality among patients with post-splenectomy sepsis can be as high as 50%. Most commonly caused by *Streptococcus pneumoniae*, this infection often has a sudden onset and a fulminant course.

52. Ans. (b) *Staphylococcus***Bacterial Food Poisoning**

Incubation period, organism	Symptoms	Common sources
1–6 H		
<i>Staphylococcus aureus</i>	Nausea, vomiting, diarrhea	Ham, poultry, potato or egg salad, mayonnaise, cream pastries
<i>Bacillus cereus</i>	Nausea, vomiting, diarrhea	Fried rice
8–16 H		

Incubation period, organism	Symptoms	Common sources
<i>Clostridium perfringens</i>	Abdominal cramps, diarrhea (vomiting rare)	Beef, poultry, legumes, gravies
<i>B. cereus</i>	Abdominal cramps, diarrhea (vomiting rare)	Meats, vegetables, dried beans, cereals
> 16 H		
<i>Vibrio cholerae</i>	Watery diarrhea	Shellfish
Enterotoxigenic <i>Escherichia coli</i>	Watery diarrhea	Salads, cheese, meats, water
Enterohemorrhagic <i>E. coli</i>	Bloody diarrhea	Ground beef, roast beef, salami, raw milk, raw vegetables, apple juice
<i>Salmonella spp.</i>	Inflammatory diarrhea	Beef, poultry, eggs, dairy products
<i>Campylobacter jejuni</i>	Inflammatory diarrhea	Poultry, raw milk
<i>Shigella spp</i>	Dysentery	Potato or egg salad, lettuce, raw vegetables
<i>Vibrio parahaemolyticus</i>	Dysentery	Mollusks, crustaceans

53. Ans. (a) *Staphylococcus aureus*

- *Staphylococcus aureus* is the most common cause of postinfluenza secondary bacterial pneumonia.
- It most often affects the elderly patients.

54. Ans. (b) *Gram-positive bacilli*

Ref: *Harrisons, 19th ed. pg. 978*

- *C. diphtheriae* is a **Gram-positive bacillus** that is **unencapsulated, nonmotile, and nonsporulating**.
- The bacteria have a characteristic club-shaped bacillary appearance and typically form clusters of parallel rays, or *palisades*, that are referred to as “**Chinese characters**.”

55. Ans. (d) *Laryngopharynx*

Ref: *Harrisons, 19th ed. pg. 978*

- Diphtheria is a nasopharyngeal and skin infection caused by *Corynebacterium diphtheriae*. Toxigenic strains of *C. diphtheria* produce a protein toxin that causes systemic toxicity, myocarditis, and polyneuropathy.
- The toxigenic strains cause pharyngeal diphtheria, while the non-toxigenic strains commonly cause cutaneous disease.
- **Harrisons states:** “Respiratory/pharyngeal form of diphtheria is from notifiable diseases, while cutaneous diphtheria is NOT.”
- **Most severe form of diphtheria:** Laryngeal

56. Ans. (c) *Bacillus anthrax*

Ref: *Harrisons, 19th ed. pg. 261e2*

- **McFadyean reaction** is a special staining reaction, demonstrating a pink capsule around a blue cell, after staining with methylene blue, which is used as a presumptive diagnosis for **anthrax** in a blood smear.
- Anthrax is caused by *B. anthracis*, a Gram-positive, nonmotile, spore-forming rod that is found in soil and predominantly causes disease in herbivores such as cattle, goats, and sheep.

57. Ans. (a) *Staph epidermis*

Ref: *Harrisons, 19th ed. pg. 145e-4*

- Many bacterial, fungal, and protozoal species have the ability to grow in multicellular masses called biofilms.
- These masses are biochemically and morphologically quite distinct from the free-living individual cells referred to as *planktonic cells*.
- Growth in biofilms leads to altered microbial metabolism, production of extracellular virulence factors, and decreased susceptibility to antimicrobial agents, biocides, and host defense molecules and cells.
- **Examples of bacterial organisms forming biofilm:**
 - *P. aeruginosa*, staphylococci and other pathogens growing on implanted medical devices, and dental pathogens growing on tooth surfaces to form plaque
 - *S. epidermis* – on Prosthetic valve, IV catheter
 - **Strep Mutans/sanguinis** – on Dental plaques
 - **Pseudomonas** – Cystic fibrosis, contact lens
 - **Strep. viridans** – Endocarditis
 - **Non-typable H. influenza**- Otitis. Media

58. Ans. (a) *Biofilm formation*

- *S. epidermis* is a pathogenic organism which affects interventions like catheter, canula.
- It is an organism which can form biofilm.
- It is novobiocin sensitive.

59. Ans. (d) 100

Please refer the explanation for Q. 56

60. Ans. (b) ++

Ref: *PubMed; http://www.hrsa.gov/hansensdisease/diagnosis/skinsmears.html*

- **Oil immersion** is a technique used to increase the resolving power of a microscope. This is achieved by immersing both the objective lens and the specimen in a transparent oil of high refractive index, thereby increasing the numerical aperture of the objective lens.

FMGE Solutions Screening Examination

428

Reporting the Bacterial Index

- The results are reported on a 0 to 6+ *semi-logarithmic scale* using a descriptive phrase or numerical code. This is an indicator of the total bacillary load of the patient. It falls about 1 point per year during effective treatment as dead bacilli undergo lysis and are absorbed.

Very numerous	(+6)	Over 1000 bacilli per oil immersion field
Numerous	(+5)	100 to 1000 bacilli per oil immersion field
Moderate	(+4)	10 to 100 bacilli per oil immersion field
Few	(+3)	1 to 10 bacilli per oil immersion field
Very few	(+2)	1 to 10 bacilli per 10 fields
Rare	(+1)	1 to 10 bacilli per 100 fields
None found	(NF)	No AFB seen on entire site

61. Ans. (a) **Bacillus anthrax**Ref: *Harrisons, 19th ed. pg. 261e-2*

- There are three major clinical forms of anthrax:
 - Gastrointestinal, cutaneous, and inhalational.
 - Gastrointestinal anthrax** typically results from the ingestion of contaminated meat.
 - Cutaneous anthrax** typically begins as a papule following the introduction of spores through an opening in the skin. This papule then evolves to a painless vesicle followed by the development of a coal-black, necrotic eschar.
 - Inhalational anthrax** is the form most likely to be responsible for death in the setting of a bioterrorist attack.

62. Ans. (a) **Flea**Ref: *Harrisons, 19th ed. pg. 1070*

- Plague is a systemic zoonosis caused by *Yersinia pestis*.
- It predominantly affects small rodents in rural areas of Africa, Asia, and the Americas and is usually **transmitted to humans by an arthropod vector (the flea)**.
- Sometimes, infection follows contact with animal tissues or respiratory droplets.
 - The genus *Yersinia* comprises **gram-negative bacteria** of the family Enterobacteriaceae (gamma proteobacteria).

63. Ans. (b) **Conjugation**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 60*

- Some bacteria also transfer genetic material between cells via following ways:
 - Transduction:** transfer of genetic material from one bacterium to another by a bacteriophage is known as transduction.
 - Most widespread mechanism of gene transfer among prokaryotes.
 - Transformation:** Transfer of genetic material through the agency of free DNA
 - Conjugation:** DNA is transferred through direct cell contact. Gram negative anaerobes like *E. Coli*, *Bacteroides*, *Porphyromonas*, and *Fusobacterium* use this method of gene transfer.

64. Ans. (a) **Transduction**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 61, 63*

- Transduction:** transfer of genetic material from one bacterium to another by a bacteriophage.
- Bacteriophages are viruses* that parasites bacteria and consist of a nucleic acid core and a protein coat.

65. Ans. (c) **Increase in size**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 24***PHASES OF BACTERIAL GROWTH CURVE****Lag Phase**

- No appreciable increase in number but there is **increase in size of the cells**
- Accumulation of enzymes and metabolic intermediates
- Maximum cell size** is obtained at the end of lag phase

Log Phase

- Also called as **exponential phase**
- Number of cells increase exponentially
- Cells are **small and stain uniformly**
- Increase in metabolic rate

Stationary Phase

- Viable **count of cells remain stationary** as an equilibrium exists between dying cells and newly formed cells
- Cells are viable and show **irregular staining** due to intracellular storage granules
- Sporulation** occurs at this stage
- Production of antibiotics and exotoxins

Phase of Decline

- Population** of cells **decrease** due to cell death
- Involution forms** are common

DIAGRAM: Showing bacterial curve growth curve

66. Ans. (d) **H. pylori**

Ref: Internet Source

- The rapid urease test also known as the Campylobacter like organism (CLO) test is **done for H. pylori** in which the conversion of urea to ammonia and carbon dioxide by the urease enzyme present in the H. pylori is tested.
- The Typhidot or dot ELISA is a test for the rapid diagnosis of S. typhi giving the separate identification of IgG and IgM antibodies whereas Widal test tests for specific antibody titres.
- Antigen tests which are EIA (Enzyme immunoassay) and Rapid HIV antibody test are used for detecting specific HIV antibodies and PCR (Polymerase Chain Reaction Test) is used for detecting genetic material of HIV.

67. Ans. (b) **Listeria**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 226, 395

Listeria is the bacteria that is classically associated with tumbling motility.

Swarming Motility	Proteus
Gliding Motility	P. Aeruginosa, Mycoplasma
Darting Motility	Campylobacter, Vibrio Cholera
Falling Leaf Motility	Giardia
Shooting Star Motility	Vibrio
Cork Screw Motility	T. Pallidum
Lashing motility	Borrelia

68. Ans. (d) **Gonococci**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 227

TABLE: Various Shapes of Bacteria

Shape	Associated bacteria
• Club Shape	Cornybacteria
• Lanceolate	Pneumococci
• Half Moon/Lens	Meningococci
• Kidney Shape	Gonococci
• Comma	Vibrio And Campylobacter

69. Ans. (c) **Staph Aureus**

Ref: Robbin's, 9th ed.

Diseases Characterized by Granulomas

- **Tuberculosis:** The granulomas of tuberculosis tend to contain necrosis ("caseating tubercules"), but non-necrotizing granulomas may also be present.
- **Leprosy:** In leprosy, granulomas are found in the skin and tend to involve nerves.
- **Sarcoidosis:** is a disease of unknown cause characterized by non-necrotizing ("non-caseating") granulomas in multiple organs and body sites, most commonly the lungs and lymph nodes within the chest cavity.
- **Hemophilus Ducreyi** causes chancre. It presents with painful genital ulcer with painful lymphadenopathy
- **Staph aureus** infections like pyoderma, abscess, HAP, food poisoning etc doesn't involve lymph nodes.

70. Ans. (a) **Staph. aureus**

Ref: Harriossn 18th ed./128, Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 198

Refer to above explanation of Q. 52

71. Ans. (c) **Staphylococcus**

Ref: Harrison, 18th ed. pg. 128, Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 198

- **Staphylococcus** causes food poisoning by enterotoxin A, due to intake of milk or milk products.
 - It is a preformed, heat stable enterotoxin, which stimulate the vagus nerve causing vomiting as main and first symptom.
 - I.P. < 6 hours
- Outbreaks following picnics where potato salad, mayonnaise, and cream pastries have been served offer classic examples of staphylococcal food poisoning.
- **Bacillus cereus** is an important cause of food poisoning, isolated from soil, vegetables, milk cereals, meat etc.
- It produces 2 types of food poisoning:

Diarrhea type- main symptom	Emetic type- main symptom
<ul style="list-style-type: none"> Associated with wide range of food intake including meat, puddings etc. I.P. 8-16 hrs Occurs due to heat labile enterotoxin 	<ul style="list-style-type: none"> Associated with intake of Chinese fried rice I.P. 1-5 hrs Due to pre-formed, heat stable toxin

- **Clostridium perfringens** causes gastroenteritis after intake of infected meat or meat products. I.P. - 8-16 hours.
- **Clostridium botulism** causes food poisoning due to consumption of canned food. I.P. 1 to 3 days.

72. Ans. (c) **Staphylococcus aureus**

Ref: Microbiology by Ananthanarayan and Paniker 8th ed. pg. 198, Harrison's 18th ed./Ch 128

- Among the given options staph aureus has the shortest incubation period (1-6 hrs).

Please refer to above explanation for more details

73. Ans. (c) **Transpeptidase**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 197, 201-202

Resistance develops due to alteration in transpeptidase (penicillin binding protein) on which all beta lactam antibiotics act. Hence MRSA is resistant to all β -lactam antibiotics.

74. Ans. (b) **B. Cereus**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 247, 654

As indicated in the table above, the common source of *B. cereus* is fried rice. Refer above explanation for details.

75. Ans. (a) **Can be transmitted by parenteral route**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 247, 654

Please refer to explanation of Q. 38

76. Ans. (a) **7-21 days**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 293

- I.P of salmonella is 3-21 days
- **Features of Typhoid-Step ladder pyrexia, Rash (rose spot) relative bradycardia, hepatosplenomegaly, epistaxis**
- **Complication**-Intestinal perforation and GI hemorrhage most common complication, seen during 3rd and 4th week.

77. Ans. (a) **Vibrio cholerae O1**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 302-305

- Though the various strains of cholera may present with rice watery diarrhea, the classic rice watery diarrhea is usually associated with strains O1 and strain O139.
- In these strains the more common strain to find is strain O1.

78. Ans. (a) **EPEC**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 276 & 277

ENTEROPATHOGENIC E. COLI/ENTEROADHERENT E. COLI (EPEC)

- It causes diarrhoea in infants and children usually occurring as institutional out breaks.
- In infantile enteritis, it does not produce enterotoxin, nor are they invasive,
- The bacilli are seen in to be adherent to the mucosa of the upper small intestine and cause disruption of the brush border microvilli.
- These strains can be identified by their adhesion to HEP - 2 cells.

ENTEROTOXIGENIC E. COLI (ETEC)

- It causes traveller's diarrhoea [ETEC is the most common cause of traveller's diarrhea].
- It produces enterotoxins. They can produce heat labile toxin (LT) or heat stable toxin or both.
- Toxin production alone may not lead to illness. The strain should first be able to adhere to intestinal mucosa.
- This adhesiveness is mediated by fimbriae or colonisation factor antigen (CFA).

ENTEROINVASIVE E. COLI (EIEC)

- They themselves resemble shigella and their infection resembles shigellosis (remember : shiga like toxin is elaborated by enterohemorrhagic *E. coli*).
- These strains are non motile, do not ferment lactose or ferment it late with acid without producing any gas.
- They produce mild diarrhoea to frank dysentery and occur in adult as well as in children.
- They have been termed enteroinvasive because they have the capacity to invade intestinal epithelial cells in vivo and penetrate HeLa or HEP - 2 cells in tissue culture.
- This ability of penetration is plasmid determined which codes for outer membrane antigens called the 'virulence marker antigen' (VMA). The detection of plasmid can be diagnostic.
- For laboratory diagnosis of EIEC, the *sereny test* used to be employed.

ENTERO-HEMORRHAGIC E. COLI OR VEROTOXIGENIC E. COLI

- These strains produce verocytotoxin (VT) or **shiga like toxin (SLT)**
- They can cause mild diarrhoea to fatal hemorrhagic colitis.
- This toxin also acts on vascular endothelium to promote the synthesis of coagulation factor VIII, vWF which triggers platelet aggregation.
- They can cause hemolytic uremic syndrome particularly in young children and the elderly.
- **O157 : H 7 is the most prominent serotype of EHEC, associated with HUS**, but O6, O26, O55, O91, O103, O111, O113 and OX3 have also been associated with this syndrome.
- The primary target for V.T is vascular endothelium.
- Laboratory diagnosis of VTEC diarrhea is established by demonstration of the bacilli or VT in feces directly or in culture.

ENTEROAGGREGATIVE E COLI (EACE)

- They have been associated with persistent diarrhea, especially in developing countries.
- In vitro they appear aggregated in a 'stacked brick' formation in Hep-2 cells.

79. Ans. (d) E. Coli

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 276-77

- Hemolytic uremic syndrome (HUS) is a **type 3 hypersensitivity reaction** associated with small vessel vasculitis.
- Organisms causing HUS is E.Coli (particularly EHEC) and shigella dysenteriae.

80. Ans. (d) EHEC

Ref: Ananthanaryan, 8th ed. pg. 276 & 277

Please refer to above explanation

81. Ans. (c) ETEC

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 276 & 277

Please refer to above explanation

82. Ans. (a) Traveller's diarrhea

Ref: Harrison 19th ed./727, Ananthanarayan 9/e 279

- Anti- microbials are given for Traveller's diarrhea.
- Standard regimen is a 3-day course of a quinolone taken twice daily.
- The current approach to self-treatment of travellers' diarrhea for the typical short-term traveller is to carry three once-daily doses of an antibiotic and to use as many doses as necessary to resolve the illness.

- If neither high fever nor blood in the stool accompanies the diarrhea, **loperamide** should be taken in combination with the antibiotic; studies have shown that this combination is more effective than an antibiotic alone and does not prolong illness.
- **Prophylaxis- bismuth subsalicylate**- widely used but only ~60% effective.
- For certain individuals (e.g., athletes, persons with a repeated history of travelers' diarrhea, and persons with chronic diseases), a single daily dose of a **quinolone, azithromycin, or rifaximin during travel of <1 month's duration** is 75–90% efficacious in preventing travellers' diarrhea.
- **Causes of travellers' diarrhea– Enterotoxigenic E coli is most common cause.**
- **Other causes-** Enterogaggrative E coli, Salmonella, Shigella, Vibrio, Campylobacter etc.

83. Ans. (b) Enterotoxin

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 198-199

- Enterotoxins are responsible for food poisoning and are produced when Staphylococcus Aureus grows in carbohydrate and protein foods. There are multiple types of enterotoxins (A-E, G-I, K-M) and these are usually superantigens.
- The alpha toxin is a potent hemolysin which acts on a broad spectrum of cell membranes, including RBC's.
- The beta toxin degrades spingomyelin and is also toxic for many types of cells.
- TSST-1 is the same as enterotoxin F and is therefore also a superantigen and is associated with fever, shock multisystem involvement and a desquamative skin rash.

84. Ans. (c) Vibrio cholerae

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 302-305

- Vibrio Cholerae is the organism with a single flagellum. Bacteria with a single flagellum are called monotrichous. Lophotrichous bacteria have multiple flagella located at the same end of the bacteria (or a few sites) such as Helicobacter Pylori.
- *Endoflagella are spirochetes flagella which is not external to the bacteria* but present within the cell from end to end of the cell providing rigidity to the cell and giving it the **corkscrew movement**.

Amphitrichous bacteria	A. fecalis
Peritrichous bacteria	E. Coli
Endoflagella	Spirochetes

85. Ans. (d) **Needles**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 251, 263, 634

- The organism is carried by about 3% of the general population and about 30% of the hospitalised patients in their gastrointestinal tract.
- It is usually transmitted by the feco-oral route and direct contact and hand to hand transmission are important modes of transmission in the hospitalized patients.
- *Clostridium difficile* causes pseudomembranous colitis.

86. Ans. (a) **Clostridium Difficile**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 251, 263, 634

- Gas gangrene is myonecrosis caused by bacterial infection which can further lead to toxemia and shock. It is noticed by the black sores and crepitus caused by gas (nitrogen is the predominant gas component (74.5%), followed by oxygen (16.1%).
- **Clostridium microbes which cause gas gangrene are:**
 - *Clostridium perfringens/welchi*
 - *Clostridium septicum*
 - *Clostridium Novyi*
- *Clostridium Difficile* causes acute enterocolitis.
- In a diabetic patient, the more likely pathogen of gas gangrene is *Klebsiella pneumonia*.

Extra Mile

- *Clostridium* microbe that causes tetanus: *Clostridium tetani*
- *Clostridium* microbe that causes food poisoning:
 - **Perfringens type A**- Gastroenteritis
 - **Perfringens type C**- Necrotising enteritis
 - **Botulinum**- Botulism
 - **Difficile**- Acute colitis

87. Ans. (c) **Clostridium perfringens**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 251-252

88. Ans. (a) **Clostridium perfringens**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 251-52

Please refer to above explanation.

89. Ans. (d) **Mixed infection**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 226, 270-75

- Fournier gangrene, is defined as a polymicrobial necrotizing fasciitis of the perineal, perianal, or genital area.
- In the majority of cases Fournier gangrene is a mixed infection caused by both aerobic and anaerobic bacteria.

Causal Agents

- Wound cultures from patients with Fournier gangrene reveal that it is a polymicrobial infection with an average of 4 isolates per case.
- *Escherichia coli* is the predominant aerobe, and *Bacteroides* is the predominant anaerobe that causes Fournier's gangrene
- Other common microflora include the following:
 - *Proteus*
 - *Staphylococcus*
 - *Enterococcus*
 - *Streptococcus*
 - *Pseudomonas*
 - *Clostridium*
 - *Klebsiella*

90. Ans. (a) **Amoebic liver abscess**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 595, 625

AMOEBIAC LIVER ABSCESS

- It is a liver abscess caused by *Entamoeba histolytica*
- It is common in tropical countries.
- It exists in vegetative form outside the body and is spread by the faeco-oral route.
- Presents with Pain in the right hypochondrium, fever, Profuse sweating and rigors, loss of weight etc.
- Investigation of choice: Ultrasound abdomen
- DOC: Metronidazole

91. Ans. (a) **Bile solubility**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 206,218,219

- Organism causing respiratory tract infection (pneumonia) and alpha hemolysis is pneumococci.
- Two tests are commonly employed for distinguishing pneumococci from other alpha-hemolytic streptococci :
 1. *Optochin sensitivity*
 2. *Bile solubility*

92. Ans. (c) **Adenosine triphosphate**

- ATP is a nucleotide derived from adenosine that occurs in muscle tissue.
- It is the major source of energy for cellular reactions
- Energy is stored in the cell in form of ATP (Adenosine triphosphate)

93. Ans. (d) **Staphylococcus aureus**Ref: *Harrison's's, 19th ed.*

- Pulmonary pneumatoceles are thin-walled, air-filled cysts that develop within the lung parenchyma.
- They can be single emphysematous lesions but are more often multiple, thin-walled, air-filled, cystlike cavities.
- Pneumatoceles are generally observed soon after the development of pneumonia and can be observed on the initial chest radiograph.
- They are commonly caused by *Staphylococcus Aureus*.
- Other agents also causes pneumatocele including:
 - *Streptococcus pneumonia*
 - H. Influenza,
 - E. Coli
 - Group A streptococci
 - *Serratia marcescens*
 - *Klebsiella pneumoniae*, adenovirus, and tuberculosis.
- Noninfectious etiologies include hydrocarbon ingestion, trauma, and positive pressure ventilation.

94. Ans. (a) **Staph. Aureus, H. influenza, Pseudomonas**Ref: *Harrison's, 19th ed. pg. 145e3-e5*

Most common cause of pulmonary infection in Cystic fibrosis.

Age group	MC Organism
Children	Staph Aureus
Adolescent & adult	<i>Pseudomonas aeruginosa</i>
Overall	<i>Pseudomonas aeruginosa</i>

95. Ans. (a) **Bacitracin**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 201, 206-07, 2012*

- The various species of *Streptococcus* can be checked by various drug disks which is indicated as whether it is sensitive or resistant to the drug.
- *S. pyogenes* is bacitracin sensitive.
- *S. agalactiae* is bacitracin resistant.
- *S. pneumoniae* is inhibited by optochin.
- *S. viridans* is not inhibited by optochin.

96. Ans. (c) **Anaerobic streptococci**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 635-36*

- Chronic burrowing ulcer is also known as Meleney's synergistic hospital gangrene.
- It is caused by a mixed pattern of organisms like: *anaerobic streptococci*, coliforms, *Staphylococci*, *Bacteroides* etc.

97. Ans. (a) **Cellulitis**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 205***SKIN AND SOFT TISSUE INFECTION BY STREPTOCOCCUS**

1. **Erysipelas**-diffuse infection involving the superficial lymphatics
2. **Impetigo**-superficial infection of skin (pyoderma)
3. **Cellulitis**-cellulitis is caused mainly by hemolytic streptococci. It specifically affects the dermis and subcutaneous fat.
4. **Lymphangitis**

- **Gangrene**-type of ischemic necrosis
 - **Dry gangrene**: Arterial obstruction
 - **Wet gangrene**: Venous obstruction
- **Pyoderma** is most commonly caused by *Staph Aureus*

98. Ans. (b) **Cyst are 8 nucleated**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 625, 626*

- Cyst of *E. histolytica* is **quadri-nucleate (4 nuclei)**
- Chromatid bodies are seen as refractile oblong bars with rounded ends in preparations with normal saline and as black when stained with iron-haematoxylin.
- Trophozoites colonize cecum and ascending colon, sigmoid colon, rectum and appendix in decreasing order of frequency.

99. Ans. (a) **Klebsiella pneumoniae**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 278, 707*

- All the bacteria in the list except *Klebsiella pneumoniae* have flagella (or endoflagella) which gives them the property of motility.

100. Ans. (c) **Klebsiella**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 278, 707*

101. Ans. (c) **An infection of lymph nodes**

Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 322-25*

- In human beings plague occurs in three major forms:
 - **Bubonic plague:** Infection of the lymph nodes
 - **Pneumonic plague:** Infection of the lungs
 - **Septicemic plague:** Infection of the blood
- Bubonic Plague is caused by the bacteria *Yersinia pestis* from enterobacteriaceae family.
- Rodents, such as rats, carry the disease. It is spread by their fleas.
- People can get the plague when they are bitten by a flea that carries the plague bacteria from an infected rodent.
- After an **incubation period of 2-5 days, the lymph node** draining the site of entry of bacillus become infected
- As the plague bacillus usually enters through flea bites on the legs, the inguinal nodes are involved and hence the name "bubonic" (*bubon means groin*).

102. Ans. (c) **Nasopharynx**

Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 224-25; K. Park 20th ed. pg. 150,151*

- **N. Meningococci** are capsulated **Gram negative diplococci**
- **Reservoir for N. Meningitidis**-Human nasopharynx is only reservoir of meningococcus. (N.meningitidis)
- **Most important source-** carriers are the most imp source, not clinical cases.
- They are arranged in pairs with adjacent sides flattened—*7 half moon shaped*.
- **Transport medium**—**Stuart's medium**.
- **Blood agar, chocolate agar and Muller-Hinton agar** are the media commonly used for culturing meningococci.
- **Age group**- 3 month-5 years
- **Serotype**- total 13, out of which serotype A,B,C are most important
 - **Serotype A**- Epidemics
 - **Serotype B**- Both epidemic and local out breaks
 - **Serotype C**- Local out breaks
- Chemoprophylaxis has been suggested for close contacts.
- Is DOC for prophylaxis.
- Ceftriaxone > ciprofloxacin > Rifampicin

103. Ans. (b) **Neisseria Meningitidis**

Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 224-25*

■ **MENINGOCOCCI**

- Meningococci are **Gram negative diplococci**

- Strep. Pneumoniae is a gram positive diplococci.
- Corynebacterium Diphtheriae is Gram positive bacillus. They are non-motile, non-sporing and non-acid fast.
- Staphylococcus are Gram positive cocci. They are also non-motile, non-spore forming, non-acid fast.

104. Ans. (c) **β lactamase**

Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 224-26*

- **Lipo-oligosaccharide (LOS)** is a component of the outer membrane of *N. meningitidis* which acts as an endotoxin which is responsible for septic shock and hemorrhage due to the destruction of red blood cells.
- Other virulence factors include a polysaccharide capsule which prevents host phagocytosis and aids in evasion of the host immune response; and fimbriae which mediate attachment of the bacterium to the epithelial cells of the nasopharynx.
- **Beta-lactamases** are enzymes (and not virulence factors) produced by some bacteria and are responsible for their resistance to beta-lactam antibiotics like penicillins and carbapenems

105. Ans. (d) **Streptococcus pneumoniae**

Ref: *Dhingra, 5th ed. pg. 61, 81*

- **Meningitis** is the **commonest intracranial complication** of otitis media.
- In infants and children, otogenic meningitis usually follows acute otitis media while in adults, it is due to chronic middle ear infection.
- Most common organisms in infants and children are **Streptococcus pneumoniae (30%)**, *H. influenza* (20%), and *Moraxella catarrhalis* (12%). Other organisms include *Strep. pyogenes*, *Staph aureus* and *Pseudomonas*.
- *Strep. Pneumoniae* is also the most common cause of pyogenic meningitis in adults.

106. Ans. (a) **Streptococcus pneumoniae**

Ref: *Dhingra, 5th ed. pg. 61, 81*

107. Ans. (b) **Serotype B**

Ref: *Microbiology by Ananthanarayan and Paniker, 9th ed. pg. 230*

- Effective vaccines prepared from purified group A, C, Y, W-135 meningococcal capsular polysaccharide.
- Immunity is group specific.
- Good immunity after single dose, in older children and adults but little value in age < 3yrs.
- Takes 10-14 days for immunity to develop.

- Vaccine may be monovalent (A or C) or polyvalent (A-C, A-C-Y)
- **There is no group B vaccine available at present.**

108. Ans. (d) **Aspergillus**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 659 -660

- Air crescent sign/meniscus sign appears as crescent of air in intrapulmonary cavity.
- It is formed due to angio-invasive aspergillosis. Although indolent with few or no symptoms, fatal hemoptysis can occur.

Extra Mile

- **Aspergillus fumigatus** is the most common cause of aspergillosis.
- Most common type of fungal infection of nose and paranasal sinuses is due to: **Aspergillus**.
- Most common fungus causing allergy is: **Aspergillus**.
- **Aspergillus** has septate hyphae that branch typically at 45°C (V shaped).
- Non septate hyphae with *obtuse branching*- **Rhizopus/mucor**

109. Ans. (a) **2–3 days**

Ref: Harrison's, 18th ed. Ch 138

Harrison's states: "The incubation period for respiratory diphtheria is 2–5 days; however, disease can develop as long as 10 days after exposure"

Types of Diphtheria Infections are

1. **Faucial (tonsillar pharyngeal)**- Commonest type, grey with white pseudomembrane and cervical lymphadenopathy (bull neck) + toxemia
2. **Laryngeal** - Most severe form
3. **Nasal** - Mildest form
4. **Cutaneous form** - Only non toxigenic strain, punched-out ulcer
5. **Other form** - Conjunctival, otic, genital

110. Ans. (a) **Gram negative**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 396-97

- **Calymmatobacterium Granulomatis** is known by another name: **Klebsiella Granulomatis**.
- It is non-motile bacteria containing **gram-negative**, pleomorphic rods that cause granulomatous lesions in humans, especially in the inguinal region.
- It causes **granuloma inguinale** aka Donovanosis, which is a contagious sexually transmitted disease occurring predominantly in tropical areas and characterized by deep purulent ulcers on or near the genital organs.

- Encapsulated bacilli called Donovan bodies (*macrophage*) in which these bacilli multiply.
- Bacteria stained at the ends, known as bipolar staining or *safety pin appearance* or *telephone hand appearance*.
- Granuloma inguinale is treated with streptomycin or with broad-spectrum antibiotics.

111. Ans. (d) **S. Cholerae suis**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 300

- **S. Cholerae suis** can cause septicemic disease with focal suppurative lesions, such as osteomyelitis, deep abscesses, endocarditis, pneumonia and meningitis

112. Ans. (b) **Pneumococcus**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 19, 63, 193

- Due to **alpha hemolysis**, colonies of pneumococci resemble colonies of *Str. viridans*.
- On further incubation the colonies of pneumococci become flat with raised edges and central umbonation, so that concentric rings are seen on the surface when viewed from above seems as draughtsman appearance or Carrom coin appearance.

113. Ans. (d) **Clostridium Welchii**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 643, 655, 249-54

- **Clostridium Welchii** is also known as **Clostridium perfringens**.
- It is the most common bacterial agent which causes gas gangrene.
- Gas gangrene results in tissue necrosis, putrefaction of tissues, and gas production.
- It is caused primarily by **Clostridium perfringens alpha toxin**, usually after a injury or trauma.
- These gases form bubbles in muscle and produce characteristic smell of decomposing tissue.
- The local spread of gases under tissue produces Crepitations when pressed on it.
- *Crepitations: sound of snow crushing*
- After rapid and destructive local spread (which can take hours), systemic spread of bacteria and bacterial toxins may result in death.

114. Ans. (b) **Clostridium tetani**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 249-54

- There are species of **Clostridium** that bears terminal spores which appears as drumstick shaped under microscope.

FMGE Solutions Screening Examination

- *Clostridium tetani* is a gram positive obligate anaerobe which is the causative agent of tetanus, bears spores which are spherical, terminal and twice the diameter of vegetative cells. This gives it a drumstick appearance upon viewing under microscope.

Bacteria	Appearance
• <i>Clostridium tetani</i>	Drumstick appearance
• <i>Corynebacterium diphtheria</i>	Chinese letter pattern
• <i>Neisseria meningitidis</i>	D- shaped
• <i>N. Gonorrhea</i>	Kidney shaped appearance
• <i>Strep Pneumoniae</i>	Flame shaped appearance

115. Ans. (d) **Imipenem**Ref: Harrison's 19th ed.

- Microbes which are resistant to methicillin are said to be MRSA.
- Methicillin is highly penicillinase resistant but not acid resistant.
- MRSA have emerged in many areas. These are insensitive to all penicillinase-resistant penicillins and to other β -lactams as well as to erythromycin, aminoglycosides, tetracyclines, etc.
- The drug of choice for these organisms is vancomycin, but ciprofloxacin and Rifampicin can also be used.
- Drug of choice for V.R.S.A is Daptomycin > Linezolid.
- **IMIPENEM** is an extremely potent and broad-spectrum β -lactam antibiotic whose range of activity includes gram positive cocci, Enterobacteriaceae, *Ps. Aeruginosa*, *Listeria* as well as anaerobes like *Bact. Fragilis* and *Cl. difficile*.

116. Ans. (d) **All of the above**Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 613**ASPERGILLOSIS**

- *Aspergillus fumigatus* is the most common cause of aspergillosis.
- *Aspergillus* is a mould with septate branching hyphae. Ability of *A. fumigatus* to grow at 45° C helps to distinguish it from other species.
- Mode of transmission: Inhalation of *Aspergillus* spores (Conidia).
- The commonest human disease caused by *aspergillus* is: otomycosis.
- *Aspergillus* infection in neutropenic patient is characterized by hyphae invasion of blood vessels, thrombosis, necrosis and hemorrhagic infarction.
- **Clinical manifestations**
 - Allergic bronchopulmonary aspergillosis occurs in patients with preexisting asthma or cystic fibrosis.

- Endobronchial saprophytic pulmonary aspergillosis (*Aspergilloma*) in a patient with prior chronic lung disease, such as tuberculosis, sarcoidosis, bronchiectasis or histoplasmosis
- Invasive aspergillosis develops as an acute pneumonic process with or without dissemination in the immuno-compromised patients (most common among patients with acute leukemia and recipient of tissue transplants.
 - ◆ CT finding: Halo sign and crescent sign
- Allergic sinusitis may take three forms :
 - ◆ A fungal ball may form.
 - ◆ Chronic fibrosing granulomatous inflammation
 - ◆ Allergic fungal sinusitis
- Aspergillosis in AIDS
 - ◆ Most commonly infect lung
 - ◆ CD4 +cell count is < 50/ μ L
 - ◆ Most common radiologic finding is bilateral diffuse or focal pulmonary infiltrates with a tendency to cavitate.

117. Ans. (a) **Staphylococci**Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 199-200

- *Staphylococci* causes hospital acquired pneumonia.
- **Community-acquired pneumonia (CAP)** is pneumonia acquired infectiously from normal social contact (that is, in the community).
- The most important infection in newborns is caused by *Streptococcus agalactiae*, also known as Group B Streptococcus or GBS. It causes >50% of cases of CAP in the first week of life.
- *Streptococcus pneumoniae* is the most common cause of community acquired acute pneumonia in adults. It is the most common cause of lobar pneumonia

Causes of Pneumonia

In Infants	In Adults
Group B Streptococcus	• Streptococcus pneumoniae
Streptococcus	• Hemophilus influenza
Pneumoniae	• Escherichia coli
Escherichia coli	• Klebsiella pneumoniae
Klebsiella pneumoniae	• Influenza, Parainfluenza and RSV virus

118. Ans. (c) **Rat urine**Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 381-83

- **Leptospirosis** is caused by infection with bacteria of the genus *Leptospira* and affects humans as well as other animals.

- One of the zoonotic infection, which transmits from animals to human
- Leptospirosis is transmitted by the urine of an infected animal like rat, mice or moles and is contagious as long as the urine is still moist.

Extra Mile

Doxycycline 200–250 mg once a week used as prophylaxis

119. Ans. (b) Staphylococcus epidermidis

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 655, 679

STAPHYLOCOCCUS

- Gram positive cocci, coagulase and Catalase positive: *Staphylococcus aureus*
- Gram positive cocci, *Coagulase negative*: *Staphylococcus epidermidis* and *saprophyticus*.
- Staph. Epidermis infect most commonly through artificial device like: IV canula, Prosthetic device, shunts and implants.
- *MCC of catheter associated blood stream infection: Staph. Epidermis*
- MC organism causing prosthetic valve endocarditis: Coagulase negative *Staphylococcus*.

120. Ans. (d) Trichenella spiralis

Parasitic infections associated with eosinophilic myocarditis:

PROTOZOA

- *Trypanosoma cruzi* (Chagas disease)
- *Toxoplasma gondii* (Toxoplasmosis)

METAZOA

- *Trichenella spiralis*
- *Toxocara canis*
- *Echinococcus granulosus* (Hydatid cyst)
- Schistosomiasis

VIROLOGY

121. Ans. (c) Skin biopsy with fluorescent antibody testing

Ref: Textbook of Microbiology by Surinder Kumar, P 592

Laboratory tests of rabies

IMMUNOFLUORESCENCE TEST

- Performed on samples of saliva, serum, spinal fluid, and skin biopsies of hair follicles at the nape of the neck.
- **Rabies Antigens by Immunofluorescence:**
 - MC method used for demonstration of rabies virus.

- Specimen used are corneal smears and skin biopsy (from face or neck) or saliva ante mortem, and brain post-mortem.

• **Serology**

- Rabies antibodies can be detected in the serum and CSF of the patient by ELISA

• **RT-PCR (Reverse Transcription- Polymerase Chain Reaction)**

- Can detect rabies virus in saliva and in skin biopsy samples

Extra Mile

Laboratory Diagnosis of Rabies (in animals)

Immunofluorescence Test

- Highly reliable and the best test available for the rapid diagnosis of rabies viral antigen in infected specimens.
- Can establish diagnosis within a few hours.
- Examination of salivary glands by immunofluorescence is useful
- NOTE: Fluorescent antibody titers in clinical rabies have been well in excess of 1:10,000, a feature which helps to distinguish between rabies and vaccine reaction.

HPE

- Definitive pathologic diagnosis of rabies. Demonstration of Negri bodies in hippocampus or the spinal cord is characteristic.
- MC used method if immunofluorescence is NOT available. A negative negri bodies doesn't rule out the infection

Corneal Test

- Rabies virus antigen can be detected in live animals in corneal impressions or in frozen sections of skin biopsies by the fluorescent antibody test. *A negative test doesn't rule out possibility of infection.*

122. Ans. (a) E. coli 0157

Ref: Textbook of Microbiology by Surinder Kumar, P 749

- **E. coli 0157: H7** is the infectious cause of haemolytic uremic syndrome, Haemorrhagic colitis
- **Parvovirus B19:** Is known to cause aplastic crisis in chronic haemolytic anemia
- **Bartonella henselae:** Cat – scratch disease, Bacillary angiomatosis

Extra Mile

- **Ebola virus:** Ebola hemorrhagic fever
- **Hantaan virus:** Hemorrhagic fever with renal syndrome
- **Guanarito virus:** Venezuelan hemorrhagic fever
- **Sabia virus:** Brazilian hemorrhagic fever

- Epstein barr virus is from herpes family, HHV 4.

TABLE: Classification of human herpes viruses

Subfamily	Virus	Primary target cell	Site of latency	Mode of spread
A. Alphaherpesvirinae				
Human herpesvirus 1	Herpes simplex type 1	Mucoepithelial cell	Neuron	Close contact
Human herpesvirus 2	Herpes simplex type 2	Mucoc epithelial cells	Neuron	Close contact (sexually transmitted disease)
Human herpesvirus 3	Varicella-zoster virus	Mucoc epithelial cells	Neuron	Respiratory and close contact
B. Betaherpesvirinae				
Human herpesvirus 5	Cytomegalovirus	Monocyte, lymphocyte, and epithelial cells	Monocyte, lymphocyte,	Close contact, transfusions, tissue transplant, and congenital
Human herpesvirus 6	Herpes lymphotropic virus	T cells	T cells	Respiratory and close contact
Human herpesvirus 7	Human herpesvirus 7	T cells	T cells	
Gamma herpesvirinae				
Human herpesvirus 4	Epstein-barr virus	B cells and epithelial cells	B cell	Saliva (kissing disease)
Human herpesvirus 8	Kaposi's sarcoma-related virus	Lymphocyte and other cells		Close contact (sexual)

Extra Mile

- **Rabies** virus is from the Rhabdoviridae family (*Genus: Lyssa virus; serotype 1*)
- **Rubella** is from family Togaviridae (*Genus: Rubivirus*).
- **Measles (Rubeola)** virus is a paramyxovirus, from Morbillivirus family.

124. Ans. (d) **Pox virus**

Ref: Textbook of Microbiology by Surinder Kumar, P 534

- **Molluscum contagiosum** virus is a pox virus, which causes a contagious, benign epidermal tumor that occurs in humans only.
- **Lesion:** small, pink, papular, warty, pearl-like benign tumors of the face, arm, back and buttocks.

TABLE: Poxviruses causing disease in humans

Genus	Virus	Primary host	Disease
Orthopoxvirus	Variola	Humans	Smallpox (now eliminated)
	Vaccinia	Humans	Localized lesion; used for smallpox vaccination
	Buffalopox	Water buffalo	Human infections rare; localized lesion
	Monkeypox	Rodents, monkeys	Human infections rare; generalized disease
	Cowpox	Cows	Human infections rare; localized ulcerating lesion
Parapoxvirus	Orf	Sheep	Human infections rare; localized lesion
	Pseudocowpox	Cows	
	Bovine papular stomatitis	Cows	
Mollusapoxvirus	Molluscum contagiosum	Humans	Many benign skin nodules
Yatapoxvirus	Tanapox	Monkeys	Human infections rare; localized lesion
	Yabapox	Monkeys	Human infections very rare and accidental; localized skin tumors

125. Ans. (b) **Hepatitis C virus**

Ref: Ananthnarayan and Paniker's Textbook of Microbiology, 8th ed. pg. 545

DNA and RNA virus

DNA virus	RNA virus
<ul style="list-style-type: none"> • Pox virus: <i>largest virus</i> • Parvovirus: <i>smallest virus</i> • Adenovirus • Papovavirus • Hepadna virus • Herpes virus 	<ul style="list-style-type: none"> • Rotavirus: <i>only double stranded RNA virus</i> • Orthomyxovirus • Reovirus • Bunya virus • Arena virus • Hepatitis A, C, D, E virus • Picorna, polio, coxsackie, echo and enterovirus.

126. Ans. (b) **Coxsackie**

Ref: Ananthnarayan and Paniker's Textbook of Microbiology, 8th ed. pg. 489

Coxsackie viruses produce a variety of clinical syndromes in humans ranging from trivial to fatal infections:

1. **Herpangina (vesicular pharyngitis)** is a common clinical manifestation of coxsackie Group A infection in children. It is a severe febrile pharyngitis, with headache, vomiting and pain in the abdomen.
2. **Aseptic meningitis** may be caused by most Group A and all Group B viruses. A maculopapular rash may be present. The disease may sometimes occur as epidemic.
3. **Hand, Foot and Mouth Disease (HFMD)** was identified in 1960 as an exanthematous fever affecting mainly young children, characterized by clusters of papulovesicular lesions on the skin and oral mucosa. It occurs as sporadic cases and as outbreaks.
4. Epidemic pleurodynia or **Bornholm disease** (so called because it was first described on the Danish island of Bornholm) is a febrile disease with stitch-like pain in the chest and abdomen, caused by Group B viruses.
5. Myocarditis and pericarditis in the newborn, associated with high fatality may be caused by Group B viruses.
6. Fulminant diabetes and orchitis
 - **Transplacental** and neonatal transmission has been demonstrated with **Coxsackie B viruses**.

127. Ans. (b) **Can be treated by saline infusion**

Ref: Ananthnarayan and Paniker's Textbook of Microbiology, 8th ed. pg. 557-58

- Rotaviruses are the commonest cause of diarrhea in infants and children over the world and account for about half the cases of children hospitalized for diarrhea.

- It occurs throughout the year but **predominates in winter months**, when the virus may be detected in most of the patients. It sometimes produces large epidemics of diarrhea in winter.
- Rotavirus diarrhea is usually seen in children below the age of five years, but is **most frequent between 6 and 24 months of age**.
- Mode of spread: fecal-oral route.
- Incubation period: 2–3 days.
- Vomiting and diarrhea occur with little or no fever. Stools are usually greenish yellow or pale, with no blood or mucus. The **disease is self-limited** and recovery occurs within 5–10 days. **Mortality is low. Rehydration with O.R.S. is all the treatment needed.**
- Rotavirus vaccines are given orally before the age of 6 months.

128. Ans. (c) **Rabies**

- **Inclusion bodies** are nuclear or cytoplasmic aggregates of stainable substances, usually proteins. They typically represent sites of viral multiplication in a bacterium or a eukaryotic cell and usually consist of viral capsid proteins.

Examples of viral inclusion bodies

Intracytoplasmic	Intranuclear	Intracytoplasmic + Intranuclear
<ul style="list-style-type: none"> • Negri bodies in Rabies • Guarnieri bodies in Small pox • Henderson-Peterson bodies in Molluscum contagiosum 	<ul style="list-style-type: none"> • Cowdry type A in Herpes simplex virus and Varicella zoster virus and Torres bodies in Yellow fever • Cowdry type B in Polio and adenovirus 	<ul style="list-style-type: none"> • Warthin finkeldey bodies in Measles and SSPE.

129. Ans. (a) **p24**

Ref: PubMed

- This is a possible suspicion of HIV infection.
- p24 antigen is a **viral protein** that makes up most of the viral core.
- Serum concentrations of **p24 antigen are high in the first few weeks after infection**; tests sensitive to p24 antigen are therefore useful for diagnosing very early infection when antibody levels are still low.

130. Ans. (a) **Reverse transcriptase**

Ref: Microbiology by Ananthnarayan and Paniker, 9th ed. pg. 574-75

- cDNA is created from mRNA with use of **reverse transcriptase**. First formed is single stranded DNA and then double stranded DNA.

131. Ans. (a) **Measles**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 444, 453

Refer to above explanation

132. Ans. (d) **Herpes virus**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 444, 453

Please refer to above explanation

133. Ans. (a) **Molluscum contagiosum**

- Contagiosum is a viral infection of skin which is caused by a virus, the *molluscum contagiosum virus*, from pox virus family.
- The virus is contagious through direct contact.
- The virus also can be spread by sexual contact and can occur in people with compromised immune systems.

134. Ans. (c) **Virus**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 443, 445

Please refer to above explanation

135. Ans. (c) **Both A and B**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 569-70

- **Reverse transcriptase (RNA-directed DNA polymerase):** catalyzes the transcription of retrovirus RNA into DNA.
- Reverse transcriptase is central to the infectious nature, which causes HIV infection in humans which leads to AIDS, and
- Human T-cell lymphotropic virus I (HTLV-I), which causes adult T-cell leukemia and tropical spastic paraparesis.

136. Ans. (a) **Influenza virus**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 429

- A large number of viruses agglutinate erythrocytes from different species by the process known as Hemagglutination.
- Hemagglutination of influenza virus is due to presence of hemagglutinin spikes on the surface of virus.
- Viruses causing Hemagglutination are:

■ Influenza Virus	■ Measles
■ Rubella	■ Coxsackie Virus
■ RhinoVirus	■ Rabies
■ Parainfluenza Virus	■ Toga Virus
■ Enterovirus	■ Echo Virus
■ Reo Virus	

137. Ans. (a) **Rocky mountain spotted fever**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 406, 408, 413

Disease	Causative agent
RMSF (Rocky Mountain Spotted Fever)	<i>R. Rickettsii</i>
Kyasanur forest disease	<i>Group B togavirus (Flavivirus)</i>
Dengue	<i>Arbovirus 4 serotypes (Den- 1,2,3,4)</i>
Yellow fever	<i>Flavivirus fibricus</i>

138. Ans. (d) **Rhinovirus**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 490

- Common cold is a viral infection of the upper respiratory tract. The most commonly implicated viruses are:
 1. Rhinovirus: most common cause (30–80%), a type of Picornavirus
 2. Human coronavirus ~15%
 3. Influenza viruses 10–15%
 4. Adenoviruses 5%
 5. Other viruses include: human parainfluenza virus, human respiratory syncytial virus, and enteroviruses.

139. Ans. (c) **P. vivax**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 694

- **Duffy antigen/chemokine receptor (DARC)** also known as **CD234**, is a protein that in humans is encoded by *DARC* gene.
- The Duffy antigen is located on the surface of red blood cells.

- The Duffy antigen protein is also the *receptor for the human malarial parasites Plasmodium vivax*.
- Polymorphisms in this gene are the basis of the Duffy blood group system.

Clinical Significance of Duffy Antigen

- **Asthma:** There appears to be a correlation with both total IgE levels and asthma and mutations in the Duffy antigen.
- **Malaria:** On erythrocytes the Duffy antigen acts as a receptor for invasion by the human malarial parasites *P. vivax* and *P. knowles*.
- *Duffy negative individuals whose erythrocytes do not express the receptor are believed to be resistant to merozoite invasion.*
- **HIV infection:** The absence of the DARC receptor appears to increase the susceptibility to infection by HIV. HIV-1 appears to be able to attach to erythrocytes via DARC
- **Lung transplantation:** The Duffy antigen has been implicated in lung transplantation rejection.
- **Multiple myeloma:** An increased incidence of Duffy antigen has been reported in patients with multiple myeloma compared with healthy controls
- **Pneumonia:** The Duffy antigen is present in the normal pulmonary vascular bed. Its expression is increased in the vascular beds and alveolar septa of the lung parenchyma during suppurative pneumonia.
- **Prostate cancer:** Experimental work has suggested that DARC expression inhibits prostate tumor growth. The reasons for this increased risk are not known.
- **Sickle cell anemia:** Duffy antigen-negative individuals with sickle cell anaemia tend to suffer from more severe organ damage than do those with the Duffy antigen.

140. Ans. (b) DNA virus

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 549

- **Human papillomavirus (HPV)** is a DNA virus from the papovavirus family that is capable of infecting humans.
- Usually it causes no symptoms in most people, but some types can cause warts (verrucae), while others can in a minority of cases lead to cancers of the cervix, vulva, vagina, penis, oropharynx and anus.
- HPV has been linked with an increased risk of cardiovascular disease.
- In addition, HPV 16 and 18 infections are a cause of a unique type of oropharyngeal (throat) and cervix cancer.

DNA and RNA virus

DNA virus	RNA virus
<ul style="list-style-type: none"> • Pox virus: <i>largest virus</i> • Parvovirus: <i>smallest virus</i> • Adenovirus • Papovavirus • Hepadna virus • Herpes virus 	<ul style="list-style-type: none"> • Rotavirus: <i>only double stranded RNA virus</i> • Orthomyxovirus • Reovirus • Buniya virus • Arena virus • Hepatitis A, C, D, E virus • Picorna, polio, cocksackie, echo and enterovirus.

141. Ans. (b) Secondary syphilis

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 378

- The Jarisch-Herxheimer reaction is classically associated with penicillin treatment of syphilis.
- It is believed to be caused by the release of endotoxin-like substances when large numbers of *Treponema pallidum* are killed by antibiotics.
- It has also been documented in tick-borne rickettsial diseases like Lyme disease and relapsing fever where the infecting organism is also a spirochete.
- The reaction can be expected in **50% of primary syphilis, 90% of secondary syphilis, and in 25% of early latent infection**, but is very rare in late syphilis.
- It has been suggested that it is more severe in patients with HIV

142. Ans. (c) Dogs

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 112, 174, 427

143. Ans. (d) Spare palm sole

- **IP of chicken pox-10-21 days**
- Infectious period is 2 days before to 5 days after the onset of rash. The rash is maculo-papulo-vesicular rash.
- **Rash is symmetrical and centripetal**, mainly on trunk, pleomorphic, **spare palm and sole**
- *Portal of entry of virus-respiratory tract or conjunctiva*
- Rash appear on the day the fever starts

MYCOLOGY AND PARASITOLOGY

144. Ans. (b) Chromoblastomycosis

Ref: Textbook of Microbiology by Surinder Kumar, P 659

- The fungal hyphae are broken down into smaller sections/compartment by septa → septate hyphae
 - Example: *Apergillus*
- If there is no septation/compartment → Non-septate (Coenocytic)
 - *Mucor, Zygomycetes*

FMGE Solutions Screening Examination

**Chromoblastomycosis**

- It is one of the subcutaneous mycosis.
- Characterized by: crusted, warty lesions in limbs
- **Cause:** soil inhabiting fungi of the family Dematiaceae.

**Laboratory Diagnosis**

- Microscopically dark fungal elements on skin scraping or pus
- Histologically, it shows fungus having round or irregular, dark brown, yeast-like bodies with septae, called *sclerotic cells* (seen on KOH mount).

Extra Mile**Microscopic examination of some fungi**

- **Tinea versicolor:** cluster of round yeast cell with short, stout hyphae which is branched or curved
- **Mycetoma:** presence of pus in draining sinus
- **Tinea Nigra:** Localized infection of the stratum corneum, particularly of the palms. It is caused by the dematiaceous fungus *Hortaea (Exophiala) werneckii*.
 - **Microscopy:** Brownish, branched, septate hyphae and budding cells
- **Histoplasmosis:** white to tan fluffy colony with septate branching hyphae
- **Aspergillus:** On direct examination of sputum with KOH or calcofluor white or in histologic sections → non-pigmented septate mycelium, with dichotomous branching.
- **Coccidioidomycosis:** large number of barrel shaped anthropores, characteristically alternate with smaller intervening empty cells.
- **Candida albicans:** Culture colonies are creamy white, smooth and with yeast odour. Identified by production of germ tube test.

145. Ans. (b) Cysticercosis cellulose

Ref: Lange Microbiology, Ch 46

- The larval stage of taenia solium is Cysticercus cellulose, which lives in pig or in human tissues causing human cysticercosis.

Must know questions about Tenia solium:

- **Life span:** > 25 years; Cysticercus survives 5 – 6 years in human body
- **Final host:** Man
- **Intermediate host:** Pig/Man
- **Infective stage:** Cysticercus and Egg
- **Source of infection:** Consuming raw/undercooked pork
- **Inhabitation site:**
 - Adult org: In human intestine
 - Cysticercus: In tissues

146. Ans. (b) Candida albicans

Ref: Textbook of Diagnostic Microbiology, E-book, P 634

- A germ tube test is a diagnostic test in which a sample of fungal spores are suspended in serum and examined by microscopy. It is particularly indicated for colonies of white or cream color on fungal culture.
- A positive germ tube test is strongly indicative of *Candida albicans*. This test also helps to differentiate between *Candida albicans* and non-albicans *Candida* (germ tube test negative).

147. Ans. (b) Skin and hair

Ref: Textbook of Diagnostic Microbiology, E-book, P 607

- **Trichophyton:** Skin, hair, nail
- **Epidermophyton:** Skin, nail
- **Microsporum:** Skin, hair

148. Ans. (c) FilariaRef: Harrison 19th ed. P 1420

- Tropical or pulmonary eosinophilia is due to microfilaria in lung. There is no microfilaria in blood.
- It is characterized by coughing, asthmatic attacks and enlarged spleen.
- **DOC:** Diethylcarbamazine

149. Ans. (a) SchistosomaRef: Harrison 19th ed. P 605**Schistosoma has 3 species mainly and resides in:**

- *S. mansoni*: resides in mesenteric veins draining sigmoido-rectal region
- *S. japonicum*: resides in mesenteric veins draining the ileocecal region

- *S. haematobium*: Bladder plexus
- *Fasciola*: Liver fluke (*Fasciola hepatica*)
- *Paragonimus westermani*: Lung fluke

150. Ans. (b) Accidental intermediate host in humans

Ref: Textbook of surgical gastroenterology pg. 767, PK mission ed 2016

Human echinococcosis is a zoonotic disease that is caused by parasites, namely tapeworms of the genus *Echinococcus*.

Transmission

- *E. granulosus* requires two host types, a definitive host and an intermediate host.
- The definitive host of this parasite are dogs
- Intermediate host are most commonly sheep, however, cattle, horses, pigs, goats, and camels are also potential intermediate hosts.
- Humans can also be an *intermediate host* for *E. granulosus*, however this is uncommon and therefore humans are considered an *accidental intermediate host*.

151. Ans. (c) Plasmodium malariae

Ref: Harrison's, 19th ed. pg. 1371

- *P. vivax*, *P. ovale*, show a marked predilection for young RBCs
- *P. malariae* has predilection for old RBCs
- *P. falciparum* can invade erythrocytes of all ages and may be associated with very high levels of parasitemia.

TABLE: Characteristics of plasmodium species infecting humans

Characteristic	Finding of indicated species			
	<i>P. falciparum</i>	<i>P. vivax</i>	<i>P. ovale</i>	<i>P. malariae</i>
Duration of intrahepatic phase (days)	5.5	8	9	15
Number of merozoites released per infected hepatocyte	30,000	10,000	15,000	15,000
Duration of erythrocytic cycle (hours)	48	48	50	72
Red cell preference	Younger cell (but can invade cells of all ages)	Reticulocytes and cells up to 2 weeks old	Reticulocytes	Older cells
Morphology of RBC and parasites	Usually only ring forms; banana-shaped gametocytes, (Maurer dots)	Irregularly shaped large rings and trophozoites; enlarged erythrocytes; (Schuffner's dots)	Infected erythrocytes, enlarged and oval with tufted end; (James dots)	Band or rectangular forms of trophozoites common (Ziemann's dot)
Ability to cause relapses	No	Yes	Yes	No

152. Ans. (c) Coccidioidomycosis

Ref: Atlas of Infectious diseases: Fungal Infection, pg. 33

- Mature spherule in sputum sample is seen in coccidioidomycosis.
- Coccidioidomycosis may present with a syndrome of erythema nodosum, fever, and conjunctivitis. Serious complications include cavitating lung lesions or meningitis.
- *Coccidioides immitis* grows readily on routine culture media. Unlike other dimorphic fungi, colonies usually are visually apparent within 3 to 5 days. On solid media, the fungus appears as a nonpigmented mold. Unlike specimens obtained from patients, *C. limitis* growing in culture is highly infectious and represents an extreme laboratory hazard.

FIGURE: Potassium hydroxide (KOH) preparation of sputum. The chitin in the spherule cell wall is resistant to digestion by KOH, whereas host cells in sputum are not. Two mature spherules are evident in the figure, one of which has ruptured and is releasing endospores. Although KOH is not a sensitive test, the finding of spherules in a sputum specimen is diagnostic of coccidioidomycosis.

153. Ans. (a) **Giardiasis**Ref: *Harrisons, 19th ed. pg. 1946***Giardiasis**

- **Mode of transmission:** Fecal-oral
- **Incubation period:** 7–10 days
- **Signs/symptom:**
 - Chronic diarrhea, abdominal pain, bloating, nausea, flatus due to postinfectious irritable bowel syndrome or **protein losing enteropathy**; postinfection fatigue
- **Diagnosis:** Fecal, **string test**, or duodenal aspirate microscopy; stool antigen assay
- **Treatment:** Metronidazole for ongoing infection; no specific antiparasitic therapy for postinfectious syndromes.
- **NOTE:** Hookworm infection can cause iron deficiency anemia

Important causes of Malabsorption Syndrome (Table from *Harrison's 19th ed*)

Impaired mucosal absorption/mucosal loss or defect

- | | |
|--------------------------|---|
| ■ Crohn's disease | ■ Celiac disease |
| ■ Amyloidosis | ■ Collagenous sprue |
| ■ Scleroderma | ■ Whipple's disease |
| ■ Lymphoma | ■ Folate and vitamin B ₁₂ deficiency |
| ■ Eosinophilic enteritis | ■ Infections—giardiasis |
| ■ Mastocytosis | |
| ■ Tropical sprue | |

154. Ans. (b) **Man**Ref: *Harrisons, 19th ed. pg. 1413*

- *Ascaris lumbricoides* the largest intestinal nematode **parasite of humans**, reaching up to **40 cm** in length.
- **Humans are definitive host** of ascaris
- **Clinical disease arises from larval migration in the lungs** or effects of the adult worms in the intestines.
- **Clinical Features:**
 - Around, ~9–12 days after egg ingestion, patients may develop an irritating non-productive cough and burning substernal discomfort that is aggravated by coughing or deep inspiration.
 - Eosinophilia develops during this symptomatic phase and subsides slowly over weeks.
 - Chest x-rays may reveal evidence of eosinophilic pneumonitis (**Löffler's syndrome**), with rounded infiltrates a few millimeters to several centimeters in size.
- **Treatment:** Mebendazole (DOC)

155. Ans. (a) **Treponema pallidum**Ref: *Harrisons, 19th ed. pg. 1146; table 245e1*

- Cestodes are helminthes. **Example of cestodes:**

Cestodes	Intermediate host	Definitive host
<i>Taenia solium</i>	Pig	Man
<i>Taenia saginata</i>	Beef	Man
<i>Echinococcus granulosus</i>	Man, camels and sheep	Dog
<i>Echinococcus multilocularis</i>	Rodents and humans	Foxes, dogs and cats
<i>H. nana</i>	Man	Man
<i>D. latum</i>	Cyclops, fresh water fish	Man

Note: *Treponema pallidum* is a spirochete156. Ans. (d) **Fungus**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 605*

- **Kerion** is the result of the host's response to a **fungal** ringworm infection of the hair follicles of the scalp and beard accompanied by secondary bacterial infection.
- It is usually caused by Zoophilic dermatophytes like *Trichophyton verrucosum* and *T. mentagrophytes*.
- **Treatment:** Oral Griseofulvin is the treatment of choice.

157. Ans. (b) **Germ tube method**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 607-608*

- A **germ tube test** is a diagnostic test in which a sample of fungal spores are suspended in serum and examined by microscopy for the detection of any germ.
- It is particularly indicated for colonies of white or cream color on fungal culture, where a **positive germ tube test** is strongly indicative of *Candida albicans*

158. Ans. (b) **Candida**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 601; Greenwood, 16 ed. pg. 570*

- For direct microscopy of tissue infected with fungus, 10% KOH is used. KOH digests cells and other tissue material, enabling fungus elements to be seen clearly.
- **Special stains for fungus-** PAS, methanamine silver
- **Culture media for fungus-**
 - Sabouraud's glucose agar (MC)
 - Corn meal agar
 - Czapek-dox medium
 - Culture medium are supplemented with chloramphenicol- to suppress bacterial contamination.
 - **Temp-** 22 to 30°C

159. Ans. (b) **Borrelia burgdorferi**Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 377, 379, 381*

- Causal agent of lyme disease: *Borrelia Burgdorferi* (I.P. 3 to 30 days)
 - Vector: Ticks
- **Lyme disease occurs in 3 stages:**
 - **Stage 1:** Localized infection, appears an annular skin lesion (Erythema Migrans)
 - **Stage 2:** Disseminated infection, now with headache, fever, arthralgia, myalgia and lymphadenopathy.
 - **Stage 3:** Persistent infection, presents with chronic arthritis, encephalopathy, and acrodermatitis.

Extra Mile

- **Borrelia vincenti:** ulcerative gingivostomatitis or oropharyngitis (*Vincent's Angina*)
- **Borrelia Recurrentis:** Louse borne relapsing fever
- **Treponema carateum:** Causes Pinta
- **Treponema Pertenuae:** Causes Yaws
- **Treponema Pallidum:** Syphilis

160. Ans (d) **LGV**

Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 417, 420*

GROOVE SIGN

- Large, hard, fixed, and extremely tender lymph nodes in the groin above and below the inguinal ligament, with a groove along the ligament characteristic of lymphogranuloma venereum.
- LGV caused by *Chlamydia trachomatis*
- **DOC-** Doxycycline.
- **DOC in pregnancy-** Erythromycin

**Classification of Chlamydia Trachomatis**

- **A, B, Ba, C-** Trachoma conjunctivitis
- **D to K-** Inclusion conjunctivitis
- **L1, L2, L3-** LGV

Extra Mile

- Chlamydia are obligate intracellular parasites, therefore cannot be cultured on non-living artificial media. Isolation of chlamydia can be done by inoculation into:
 - Tissue culture (cell culture, Mc coy cells)- **Most preferred.**
 - Embryonated eggs particularly in yolk

161. Ans. (b) **Aspergillus**

Ref: *Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 613, 659-60*

- Fungal infections of the cornea are secondary to injury, bacterial infection and treatment with antibacterial agents and steroids. LASIK and agricultural occupation predispose too.
- Occur most often in hot climates.
- *Aspergillus* and *Fusarium* are the most common isolates in fungal keratitis worldwide.

162. Ans. (c) **Appendix and cecum**

Ref: *Manson's tropical Diseases, 22nd ed. pg. 1516*

- The life cycle of *Enterobius vermicularis* begins with eggs being ingested. The eggs hatch in the duodenum.
- The emerging pinworm larvae grow rapidly and migrate through the small intestine towards the colon
- The male and female pinworms mate in the ileum.
- The gravid female pinworms settle in the *ileum, caecum, appendix, and ascending colon*, where they attach themselves to the mucosa and ingest colonic contents.

163. Ans. (c) **Round worm**

Ref: *Manson's Tropical Diseases, 22nd ed. pg. 1516*

- Older literature indicates that the pin worm is the parasite which multiplies in the appendix and blocks the lumen causing appendicitis. Although new data indicates that the most common parasite in the appendix is the round worm or *Ascaris lumbricoides*.

164. Ans. (c) **Causes cutaneous larva migrans**

Ref: *Manual of Family Practice, pg. 622*

- *Toxocara canis* can cause visceral larva migrans leading to hepatitis and pneumonitis. It can also lead to vision loss due to ocular larva migrans.
- The life cycle of *Toxocara canis* occurs in dogs and humans acquire the infection as accidental hosts.

165. Ans. (b) **Ancylostoma braziliense**

Ref: *Atlas of Clinical Microbiology Vol. II/Ch. 19*

- Cutaneous larva migrans caused by *Ancylostoma braziliense* is the most common tropically acquired dermatosis. Using their proteases, larvae/penetrate through follicles, fissures or intact skin.

446

166. Ans. (c) **Man is an intermediate host**Ref: *Manson's Tropical Diseases*, 22nd ed. pg. 1477

For filarial parasite	For malarial parasite
<ul style="list-style-type: none"> Man: Definitive host Mosquito: Intermediate host 	<ul style="list-style-type: none"> Man: Intermediate host Mosquito: Definitive host

LYMPHATIC FILARIASIS

- Lymphatic filariasis is caused by *W. Bancrofti*, *B. Malayi* and *B. Timori*.
- Man is definitive host and mosquito acts as intermediate host.
- Microfilariae* resides in the blood and adult worm in the lymphatics.
- The principal pathologic changes result from inflammatory damage to the lymphatics, which is caused by adult worms and not by *microfilariae*.

Clinical Manifestations

- Asymptomatic or subclinical microfilaremia
- Acute adenolymphangitis
- Hydrocele
- Chronic lymphatic disease

Diagnosis

- A definitive diagnosis can be made only by detection of parasite.
- Assays for circulating antigens of *W. bancrofti* permit the diagnosis of microfilaremic and nonmicrofilaremic infection. Tests are:
 - ELISA
 - Rapid-format immunochromatographic card test.
 - Ultrasound in conjunction with Doppler techniques may result in the identification of motile adult worms: **Filarial dance sign**.
- Treatment: Diethylcarbamazine: Drug of choice.**

167. Ans. (b) **Epidemic typhus**Ref: *Microbiology by Ananthanarayan and Paniker*, 8th ed. pg. 410**Rickettsial Diseases**

Disease	Cause	Vector
Epidemic typhus	<i>R. Prowazeki</i>	Louse
Endemic typhus	<i>R. Typhi</i>	Rat flea
Scrub Typhus	<i>R. Tsutsugamushi</i>	Trombiculid mite
Indian tick typhus	<i>R. conori</i>	Tick
RMSF	<i>R. Rickettsii</i>	Tick
Trench fever	<i>Rochalimaea Quintana</i>	Louse
Q fever	<i>Coxiella burnetii</i>	None but rarely soft tick

168. Ans. (d) **Ileum & jejunum**Ref: *Chatterjee*, 12th ed. pg. 116

- Tapeworm infection can also be caused by eating raw or undercooked meat from an animal or a fish that has the larval form of the tapeworm cysts in its muscle tissue.
- Once ingested, the larvae then develop into adult tapeworms in the small intestine (jejunum and ileum).

TAPEWORMS

- Taenia saginata*: The beef tape worm
- Taenia solium*: The pork tape worm
- Habitat of tapeworms: Small intestine (upper jejunum)**
- Definitive host: Man
- Intermediate host:** Cattle (cow or buffalo) for *T. Saginata*
Pig for *T. Solium*.

169. Ans. (a) **Acute adenolymphangitis stage**

- Filaria** is caused by thread-like nematodes, which are transmitted by black flies and mosquitoes.
- The adult worms, which usually stay in lymphatics, release early larval forms known as *microfilariae* into the host's bloodstream. Person is infective once *microfilaria* presents in the peripheral blood.
- This inflammatory phase is characterised by Lymphangitis, lymphadenitis and adenolymphangitis.
- It lasts for a few days, then subsides spontaneously & recurs at irregular intervals for a period of weeks to months.
- These circulating *microfilariae* can be taken up with a blood meal by the arthropod vector; in the vector, they develop into infective larvae that can be transmitted to a new host.
- Filaria is diagnosed in microfilaremic cases primarily through direct observation of *microfilariae* in the peripheral blood.
- Remember:** *W. bancrofti* is nocturnally periodic i.e. *microfilariae* are scarce in peripheral blood by day and increase at night.

170. Ans. (c) **Strongyloides**Ref: *Jawetz, Melnick, & Adelberg's Medical Microbiology*, 24th ed.

- Ova/egg in stool is not required for diagnosis of *Strongyloides*.
- In the other given cases like *ankylostoma*, *Enterobius*, and *trichuris* if ova/egg is seen, it indicates infestation of that parasite.

- Shape of *Trichuris trichura* egg: Barrel shaped**

FMGE Solutions Screening Examination

- The classical pathway is so called because it was the first one identified. Steps involved are as follows:
 - Antigen-Antibody binding: first step is the binding of C1 to the antigen-antibody complex → activation of C1s
 - Production of C3 convertase
 - Production of C5 convertase
 - Formation of membrane attack complex (MAC).

175. Ans. (c) **Macrophages**

Ref: Robbins Basic Pathology, E-book, P 85

- Epithelioid cells are defined as cells that resemble epithelial cells (keratinocytes). They have large oval, pale, vesicular nuclei and abundant eosinophilic cytoplasm.
- The best-known epithelioid cells are those *derived from macrophages* within granulomas, but tumor cells can also be described as epithelioid. Immunostaining may be needed to identify the type of epithelioid cell.

MOST COMMON LESIONS WITH EPITHELIOID CELLS

- Granulomas
- Squamous cell carcinoma
- Spitz nevus (spindle and epithelioid cell nevus)
- Melanoma

176. Ans. (d) **C5**

Ref: Harrison 19th ed. P 997

- Meningococcal disease is associated with terminal complement deficiency (C5-C9) which forms the membrane attack complex. Hence the bactericidal activity is reduced in this condition and increases susceptibility to invasive meningococcal infection *up to 600 times*.

177. Ans. (a) **It is a bacteria**

- Bacteriophages are viruses that infect bacteria.** It helps in transduction and not transformation.
- It imparts toxigenicity by lysogenic conversion** e.g. toxin production by diphtheria bacillus due to presence of prophage beta.
- Penicillinase resistance in Staphylococcus is a **classical example of plasmid mediated drug resistance transmitted by transduction or bacteriophage**.

Extra Mile

- Transformation is bacterial gene transfer through the agency of free DNA as shown by Griffith in the experiments of **Pneumococci with mice**. Transformation plays no role in transfer of drug resistance.

178. Ans. (c) **Pentamer**

Ref: Anantnayayan, 9th ed. pg. 98

Antibody	Effective valency
IgM	5
IgG	2
IgD	2
IgE	2
IgA	2,4

Extra Mile

- Ig having maximum molecular weight: **IgM**
- First antibody produced by newborn: IgM**
- All immunoglobulin are heat stable EXCEPT: **IgE**
- Ig present in **breast milk: IgA**
- Ig with **maximum half life: IgG**
- Ig with **minimum half life: IgE**
- Ig having **maxilum serum concentration: IgG**
- Ig having **least serum concentration: IgE**

179. Ans. (d) **IgM**

Ref: Microbiology by Ananthanarayan 9th ed./98-99

- First antibody produced by newborn is IgM at 20 weeks age of gestation.
- Immunoglobulin that can cross placenta: **IgG₁**
- Immunoglobulin that is present in breast milk: **IgA**

180. Ans. (a) **IgA**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 100

TABLE: Immunoglobulins and their salient features

Immuno-globulins	Salient features
IgG	Most abundant Ig , consists of about 80% Marker of chronic infection Only Ig that Can cross placenta (IgG ₁ subtype)
IgA	2 nd most abundant, 10-13% Found in glandular secretion like saliva, tear, ileum, and mucosal secretion like bronchial secretion
IgM	5-8% of total Ig; aka pentameric Ig. First Ig to be synthesized by fetus (20 weeks AOG) Marker of acute infection
IgD	Present mostly intravascular Serve as recognition receptor for antigens
IgE	Mostly extravascular in distribution Highly elevated levels in case of type-I HPS reaction <i>Produced chiefly in the linings of respiratory and intestinal tracts</i>

181. Ans. (c) **DPT vaccine**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 139, 143, 237-38

- DPT vaccine is most effectively used for prophylaxis and prevention of diphtheria.
- Diphtheria is caused by the bacterium *Corynebacterium diphtheriae*. It produces a toxin that can cause death by myocarditis.
- One type of diphtheria affects the throat and sometimes the tonsils. Another type, more common in the tropics, causes ulcers on the skin.
- Diphtheria affects people of all ages, but most often it strikes unimmunized children.
- It is transmitted from person to person through close physical and respiratory contact.
- **DOC for Diphtheria infection: Erythromycin**

182. Ans. (c) **Bacitracin sensitivity**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 211-212

- Infective skin lesion with gram positive cocci in chains and hemolytic colonies suggest infection of streptococcus pyogenes.
- A convenient method for the identification of *Str. pyogenes* is their sensitivity to bacitracin which is better known as: *Maxted's observation*.

183. Ans. (b) **Lips**

Ref: Clinical oral Medicine and Pathology, 2nd ed. pg. 58

- Angioedema is the swelling of deep dermis, subcutaneous, or submucosal tissue due to vascular leakage.
- Acute episodes often involve the lip, eyes, and face; however, angioedema may affect other parts of body, including respiratory and gastrointestinal (GI) mucosa.
- Most common site of angioedema: LIPS > Tongue
- Laryngeal swelling can be life-threatening.

184. Ans. (b) **2nd week**

Ref: Microbiology by Ananthanarayan and Paniker, 8th ed. pg. 654-55

- The **Widal test** is a presumptive serological test for enteric fever or undulant fever whereby bacteria causing typhoid fever are mixed with serum containing specific antibodies obtained from an infected individual.

- Typhidot is the other test used to ascertain the diagnosis of typhoid fever.
- As with all serological tests, the rise in antibody levels needed to perform the diagnosis takes **7-14 days**, which limits its applicability in early diagnosis.
- Other means of diagnosing *Salmonella typhi* (and *paratyphi*) include cultures of blood, urine and faeces.

185. Ans. (a) **IgM Ab against rubella at birth**

Ref: Harrison, 18th ed. pg. 1606

CONGENITAL RUBELLA DIAGNOSED BY:

- Presence of IgM against rubella
- PCR for rubella RNA
- Presence of persistent IgG beyond 1 year in unvaccinated child.

Note: IgG antibodies is transferred from mother to baby, in last over period of 6 months. Hence their presence is not diagnostic during this period.

Extra Mile

Triad of congenital rubella syndrome:

- Sensorineural hearing loss
- Cataract
- Congenital heart disease (**MC- Patent Ductus Arteriosus**)

186. Ans. (c) **Both**

Ref: Microbiology by Ananthanarayan and Paniker, 9th ed. pg. 174

- Severe combined immunodeficiency (SCID) syndrome has impairment of both humoral and cell mediated immunity (**B and T cell defect**).
- Inheritance pattern of SCID is **X-linked recessive** > **Autosomal recessive**.

Clinical Manifestation of SCID

1. Oral candidiasis in infants
2. Recurrent infection with candida albicans, P.Carinii, CMV, varicella.
3. Organs like lymph nodes, tonsils, peyer's patches are absent.
4. Very small thymus gland
5. Poor survival rate.

ANSWERS TO BOARD REVIEW QUESTIONS

187. Ans. (b) **Phosphotungstic acid**

Ref: Electron Microscopy: Principles and Techniques for Biologists By John J. Bozzola, Lonnie Dee Russell pg. 139

188. Ans. (a) **Chronic recurrent sinusitis**

Ref: Harrison, 18th ed. ch-316

189. Ans. (c) **Fontana stain**

Ref: Ananthanarayan 8th ed p.374, Jawetz 24th ed. ch-25, lever's histopathology of skin 9th ed. ch-22

190. Ans. (b) **Bacteria**

Ref: Harrison's, 18th ed. ch-171

191. Ans. (a) **Lecithinase**

Ref: Ananthnaraan, 7th ed. pg. 238

192. Ans. (c) **Clostridium septicum**

Ref: Ananthnaraan, 8th ed. pg. 256

193. Ans. (c) **Measles**

Ref: Medical Virology By David O. White, Frank J. Fenner p/78

194. Ans. (a) **Calymmatobacterium granulomatosis**

Ref: Harrison's, 17th ed. ch-154

195. Ans. (a) **Its causes pandemic**

Ref: Jaweyz, 24th ed. ch-39

196. Ans. (c) **Hippocampus**

Ref: Harrison's 17th ed ch-188, Anantnarayan 7th ed p 539, Rabies: Scientific Basis of the Disease and Its Management by William H. Wunner, Alan C. Jackson p390.

197. Ans. (b) **Klebs loeffler's bacillus**

Ref: Microbiology by Ananthanarayan and Paniker 7th ed p. 231

198. Ans. (b) **B. pertusis**

Ref: Harrison's 18th ed ch-148

199. Ans. (d) **Presynaptic blocking**

Ref: Jawett 24th ed ch-14

200. Ans. (a) **Face**

Ref: Harrison's 18th ed ch-140

- Lock jaw is an early manifestation of tetanus.

201. Ans. (a) **Staphylococcus**

Ref: Harrison's 18th ed ch-141

202. Ans. (c) **C3**

Ref: Jawetz 24th ed ch-8

203. Ans. (d) **Entamoeba Histolytica**

204. Ans. (b) **Enriched media**

205. Ans. (b) **Robert Koch**

206. Ans. (a) **Diphtheroids**

207. Ans. (a) **Glutaraldehyde**

208. Ans. (a) **IgM**

209. Ans. (d) **IgG**

210. Ans. (c) **Macrophage**

211. Ans. (a) **C3**

212. Ans. (b) **Streptococcus pneumoniae**

MOST RECENT QUESTIONS 2019

1. **Grounds of divorce:**
 - a. Sterility
 - b. Frigidity
 - c. Impotence
 - d. Poverty
2. **IPC for causing abortion without women's consent:**
 - a. 312
 - b. 313
 - c. 314
 - d. 315
3. **Autopsy of stomach, incision of choice along:**
 - a. Lesser curvature
 - b. Greater curvature
 - c. Vertical
 - d. Pylorus
4. **Organ injured commonly in seat belt injury:**
 - a. Mesentery
 - b. Spleen
 - c. Liver
 - d. Lungs
5. **Before dying declaration, the role of a doctor is:**
 - a. To assess compos mentis
 - b. To record statement even in presence of magistrate
 - c. Cross examines the person
 - d. Put person under oath before declaration

IDENTIFICATION

6. **Study of birth defects is called:**
(Recent Pattern Question 2018-19)
 - a. Teratology
 - b. Tetralogy
 - c. Anthropology
 - d. Parturitology
7. **Confirmatory test of blood stain:**
(Recent Pattern Question 2018-19)
 - a. Kastle meyer test
 - b. Haemin crystal test
 - c. Spectroscopic test
 - d. Orthotoluidine test
8. **Gustafson method of age estimation by teeth utilizes:**
(Recent Pattern Question 2018-19)
 - a. Number of tooth
 - b. Transparency of root
 - c. Height and weight of teeth
 - d. Structural feature of enamel

9. **Which of the following is used for biometric evaluation?**
(Recent Pattern Question 2018)

- a. Iris
- b. Pupil
- c. Lens
- d. Cornea

10. **21st tooth erupts at:** (Recent Pattern Question 2018)

- a. 5 years
- b. 8 years
- c. 10 years
- d. 12 years

11. **Cephalic index 75-80 is seen in:**

(Recent Pattern Question 2018)

- a. Mongols
- b. Aryans
- c. Negros
- d. Chinese

12. **Stack's formula for age determination from teeth is used in:**
(Recent Pattern Question 2017)

- a. Infants
- b. Adults
- c. Between 25 and 50 years of age
- d. > 50 years of age

13. **Boyde's method is useful for age estimation of:**

(Recent Pattern Question 2017)

- a. Dead infant
- b. Adult
- c. Toddler
- d. School going child

14. **The antero-posterior diameter of the skull is minimum in:**

- a. Brachycephaly.
- b. Dolicocephaly
- c. Plagicephaly
- d. Trigonocephaly

15. **Mongols are:**

- a. Dolicocephalic
- b. Mesaticephalic
- c. Brachycephalic
- d. Anglocephalic

16. **Palatoprints used for identification of human beings are usually taken from:**

- a. Anterior part of palate
- b. Posterior part of palate
- c. Lateral part of palate
- d. Middle part of palate

17. **Breslau's second life test detects changes in which of the following organs:**

- a. Brain
- b. Lung
- c. Heart
- d. Stomach and small intestine

**18. Raygat's test is used for testing function maturity of:**

- a. Small intestine b. Kidney
- c. Lungs d. Heart

COURT OF LAW AND IPCs

19. McNaughton rule is for:*(Recent Pattern Question 2018-19)*

- a. Civil responsibility of insane
- b. Criminal responsibility of insane
- c. Capacity of witness
- d. Testamentary capacity

20. Which of the following is related to legal responsibility of insane person:*(Recent Pattern Question 2018-19)*

- a. Hasse's rule b. Curren's rule
- c. Morrison rule d. Rule of nine

21. True about summon to medical examiner for criminal case:*(Recent Pattern Question 2018-19)*

- a. Under penalty document
- b. Issued by magistrate
- c. Conduct money paid along with summon
- d. Punishable under IPC Sec 87

22. First class magistrate is selected by*(Recent Pattern Question 2017)*

- a. State government
- b. Chief justice of supreme court
- c. Chief justice of high court
- d. Governor

23. Investigation of custody death is done by:*(Recent Pattern Question 2017)*

- a. Medical officer b. Magistrate
- c. Constable d. Sub-inspector

24. Which of these following is an example of a leading question?*(Recent Pattern Question 2016)*

- a. How did you get cuts on T-shirt
- b. Cause of injury
- c. Whether it is caused by knife
- d. Size of incised wound

25. Inquest of dowry death is done by:

- a. Magistrate b. Police
- c. Medical officer d. Sub-inspector

26. Dowry death investigation is done by:

- a. Magistrate b. Sub-inspector
- c. Police d. Medical officer

27. IPC 321:

- a. Grievous hurt b. Hurt
- c. Punishment of hurt d. Voluntarily causing hurt

28. Punishment for Rape is

- a. 5 years b. 7 years
- c. 10 years d. 20 years

29. Hurt is defined by IPC:

- a. 317 b. 319
- c. 320 d. 321

30. Greivous hurt is defined under IPC

- a. 320 b. 302
- c. 300 d. 376

31. Criteria for grievous hurt are all EXCEPT:

- a. Endanger to life
- b. Privation to eye/sight
- c. Permanent disfiguration of face
- d. Injured person admitted in hospital for 21 days

32. Adultery comes under IPC section

- a. 497 b. 498
- c. 375 d. 376

33. Infanticide comes under which section

- a. 83 b. 315
- c. 299 d. 317

34. Death due to bodily injury caused by husband or his relative after marriage is punished under IPC:

- a. 304 b. 304 A
- c. 304 B d. 498 A

35. Cruel behavior towards wife by husband, family members or his relatives comes under which IPC section:

- a. 498 A b. 304
- c. 304 A d. 304 B

36. Extending the hanging for pregnant women comes under which Crpc:

- a. Section 413 b. Section 414
- c. Section 419 d. Section 416

37. Which of the following is not illegal in India:

- a. Bestiality
- b. Masturbation
- c. Buccal coitus
- d. Indecent assault

TOXICOLOGY

38. Gastric lavage is contraindicated in:*(Recent Pattern Question 2018-19)*

- a. Organo-phosphosphate poisoning
- b. Hydrocarbons
- c. Bicarbonate
- d. PCM toxicity

39. Wall scraping is used in treatment of which poisoning:*(Recent Pattern Question 2018-19)*

- a. Oxalic acid
- b. Sulphuric acid
- c. Carbolic acid
- d. Phenol

40. Aconite poisoning is mainly caused by:

(Recent Pattern Question 2017)

- a. Fruit
- b. Leaf
- c. Root
- d. Bark

41. Heroin is which type of derivative of opium?

(Recent Pattern Question 2017)

- a. Natural
- b. Semi-natural
- c. Synthetic
- d. Semi-synthetic

42. Binocellate mark is seen in which snake?

(Recent Pattern Question 2017)

- a. Cobra
- b. Viper
- c. Sea scale viper
- d. Krait

43. Cherry red discoloration is seen in which poisoning?

(Recent Pattern Question 2017)

- a. Nickel
- b. Carbon monoxide
- c. Phosphorus
- d. Cyanide

44. Which of the following is a cyanide poisoning antidote

(Recent Pattern Question 2017)

- a. Sodium dantrolene
- b. Sodium thiosulfate
- c. Sodium valproate
- d. Sodium formaldehyde

45. Cyanide poisoning antidote

(Recent Pattern Question 2017)

- a. Hydroxocobalamin
- b. Sodium chloride
- c. Sodium bicarbonate
- d. Sodium gluconate

46. Acrodynia is associated with:

- a. Lead
- b. Mercury
- c. Zinc
- d. Arsenic

47. Maximum damage to the esophagus is caused by:

- a. Acid
- b. Alkali
- c. Organophosphate
- d. Kerosene

48. In which of the following poisoning C.S.F. is required to be preserved:

- a. Alcoholic poisoning
- b. Arsenic poisoning
- c. Copper poisoning
- d. Organophosphorous poisoning

49. Which of the following is NOT used in organophosphate poisoning?

- a. Charcoal
- b. Atropine
- c. Oximes
- d. PAM

50. Gastric lavage is contraindicated in which poisoning:

- a. Kerosene
- b. Alcohol
- c. Organophosphate
- d. Lead

51. To which of following a person gets easily tolerated and addicted?

- a. Tobacco
- b. Caffeine
- c. Cannabis
- d. Alcohol

52. Antidote for phosphorus poisoning:

- a. Atropine
- b. Calcium gluconate
- c. Copper sulphate
- d. Physostigmine

53. All are true about arsenic poisoning EXCEPT:

- a. Aldrich mees line on nails
- b. Mimics tetanus
- c. Rain drop pigmentation on body
- d. Hyperkeratosis of palms and soles

54. Rain drop appearance is seen in which poisoning:

- a. Arsenic
- b. Lead
- c. Mg
- d. Tin

55. Miosis is caused by all EXCEPT:

- a. Opiates
- b. Organophosphates
- c. Pontine hemorrhage
- d. Cyanide

56. Treatment of choice in cyanide poisoning is:

- a. Sodium chloride
- b. Sodium carbonate
- c. Sodium thiosulfate
- d. Atropine

57. Sea snake venom is mostly:

- a. Hepatotoxic
- b. Neurotoxic
- c. Haemolytic
- d. Myotoxic

58. Bitten by krait. Manifestation would be:

- a. Neurotoxic
- b. Myotoxic
- c. Vasculotoxic
- d. Cardiotoxic

59. Blood alcohol level while driving mg%:

- a. 10
- b. 20
- c. 30
- d. 40

60. Hooch' tragedy is due to:

- a. Ethyl alcohol
- b. Methyl alcohol
- c. Ethylene glycol
- d. Cannabis

61. Which of the following is NOT a form of cannabis:

- a. Bhang
- b. Charas
- c. Cocaine
- d. Ganja

62. A narcotic abuse case presents with jet black tongue. The most likely cause is:

- a. Cannabis toxicity
- b. Alcohol poisoning
- c. LSD poisoning
- d. Cocaine poisoning

63. Vitriolage can be done by which of the plant:

- a. Croton tiglium
- b. Arbus precagtorius
- c. Bhilawanol
- d. Calotropes

BURNS AND DROWNING

64. In the investigation of severe burn body, which of the following sample is taken for identification:

(Recent Pattern Question 2019)

- a. Blood
- b. Hair
- c. Teeth
- d. Bone

65. Gettler test is done in? (Recent Pattern Question 2017)

- a. Burn
- b. Drowning
- c. Hanging
- d. Strangulation

66. Mesohalophilic diatoms live in:

(Recent Pattern Question 2017)

- a. Brackish water
- b. Sea water
- c. Fresh water
- d. Sewer water

67. Most conclusive sign of ante-mortem death due to burns

(Recent Pattern Question 2016)

- a. Heat hyperemia
- b. Heat fracture
- c. Presence of carboxyhemoglobin
- d. Absence of line of redness

68. Most common cause of death in drowning:

- a. Electrolyte imbalance
- b. Pneumonia
- c. Cardiac arrest
- d. Vasovagal shock

69. In case of cold water drowning death is due to

- a. Vagal stimulation
- b. Vagal inhibition
- c. Hypervolemia
- d. Ventricular fibrillation

70. Most common feature indicative of Antemortem drowning:

- a. Washerwomen feet
- b. Pugilistic attitude
- c. Clenched fist
- d. Cyanosis

71. Paltauf haemorrhage is seen in:

- a. Drowning
- b. Suffocation
- c. Throttling
- d. Burns

72. Presence of diatoms in bone marrow are characteristic of which of the following?

- a. Putrefaction
- b. Drowning
- c. Strangulation
- d. Throttling

73. Pugilistic attitude is seen in:

- a. Drowning
- b. Burns
- c. Lightning
- d. Hanging

74. Degloving injury involve:

- a. Avulsion of subcutaneous layer with fat
- b. Erosion of skin with muscle
- c. Peeling of the skin
- d. Necrosis of muscle

75. Crocodile skin is seen in:

- a. Drowning
- b. High voltage Electric burns
- c. Neck ligature
- d. High temperature water burns

76. Lichenburg flower is a classical finding in which of the following:

- a. Lightning stroke
- b. Electrical injuries
- c. Joule burn
- d. Scald burn

77. Scald burns can be caused by:

- a. Molten metal
- b. Electric burns
- c. High temperature liquids
- d. Lightning stroke

78. Which of the following is seen in antemortem burns:

- a. Decreased alkaline phosphatase
- b. Cl^- increased & albumin decreased in vesicles
- c. Presence of carbonaceous deposits in respiratory tract
- d. Dull base of blister

79. In case of burning fire in a closed room, death occurs due to:

- a. CO_2 poisoning
- b. CO poisoning
- c. Cardiac failure
- d. Respiratory failure

IMPOTENCY, SEXUAL PERVERSION AND SEXUAL OFFENCES

80. Lesbianism is also known as:

(Recent Pattern Question 2018)

- a. Machoism
- b. Tribadism
- c. Nymphomania
- d. Transsexualism

81. In an eligible couple, the age of woman is:

(Recent Pattern Question 2017)

- a. 18–45 years
- b. 18–49 years
- c. 21–45 years
- d. 15–49 years

82. Frotteurism is

(Recent Pattern Question 2016)

- a. Sexual satisfaction by contact with articles of opposite sex like hanky, sandals, clothes
- b. Sexual satisfaction by rubbing the genitalia with the body of the person of opposite sex
- c. Sexual gratification by exposing one's genitalia
- d. Sexual satisfaction by watching the sexual act

83. Statutory rape is considered below the age

(Recent Pattern Question 2016)

- a. 16 years
- b. 18 years
- c. 20 years
- d. 22 years

84. Impotent quoad is seen in:

- a. Inability of the male to beget children and in the female, the inability to conceive children
- b. An individual who may be impotent with any particular woman but not with others
- c. Inability of a person to perform sexual intercourse
- d. Inability to start or maintain the sexual arousal pattern in the female

85. A posthumous child is:

- a. Still born
- b. Child born after father's death
- c. Child born after mother's death
- d. Fictitious child claimed by a woman as her own

86. A female forges to have a child, whereas she doesn't have. It is:

- a. Cheating
- b. Posthumous child
- c. Suppositious child
- d. Superstitious child

87. A child who is born to an unmarried women:
a. Posthumous child b. Illegitimate child
c. Suppositious child d. Fictitious child
88. Most important cause of impotence:
a. Male factor b. Female factor
c. Psychogenic d. Anatomical
89. Which of the following is not a crime:
a. Rape b. Sodomy
c. Incest d. Indecent Assault
90. Hymen in false virgin is:
a. Annular b. Elastic
c. Imperforate d. Semilunar
91. All of the following are paraphilias EXCEPT:
a. Bestiality b. Frotteurism
c. Sadomasochism d. Bisexuality
92. Frotteurism is:
a. Sexual satisfaction by contact with articles of opposite sex like hanky, sandals, clothes
b. Sexual satisfaction by rubbing the genitalia with the body of the person of other sex
c. Sexual gratification by exposing one's genitalia.
d. Sexual satisfaction by watching the sexual act.
93. Frotteurism:
a. Pleasure in watching intercourse
b. Pleasure in using article of opposite sex
c. Pleasure in touching opposite sex
d. Pleasure in wearing opposite sex clothes
94. A person who gets satisfaction by watching others indulged in sexual activity:
a. Voyeurism b. Frotteurism
c. Fetishism d. Exhibitionism
95. A 24-year-old male is convinced to be a female, is diagnosed as:
a. Transvestism b. Transsexualism
c. Homosexuality d. Undinism
96. Incessant sexual desire in males:
a. Satyriasis b. Nymphomania
c. Vaginismus d. Quoad hoc
97. Florence test is used for
a. Blood b. Semen
c. Urine d. Albumin
98. The seminal stains shows fluorescence when examined under the filtered ultraviolet light, this property of seminal stains is due to presence of:
a. Choline b. Spermine
c. Sperm d. Enzymes
99. Identification of semen is done by:
a. Haemochromogen Test b. Barberis Test
c. Guaiacum Test d. Leuco malachite green test
100. Saliva is tested by:
a. Amylase b. Ortho-toluidine
c. Acid phosphatase d. Tetra-methyl-Benzidine

INJURY/GUNSHOT INJURY/FIREARM INJURY/STAB WOUND

101. Gun powder in hand during gun-shot residue testing is collected using: *(Recent Pattern Question 2018)*
a. Paraffin wax b. Benzidine
c. Acid phosphatase d. Sulfur
102. Lacerated looking incised wounds are seen at: *(Recent Pattern Question 2017)*
a. Cheek prominence b. Scrotum
c. Shin d. Forehead
103. Yellow color of bruise is seen due to: *(Recent Pattern Question 2017)*
a. Biliverdin in one day b. Biliverdin in 14 day
c. Bilirubin on 4th day d. Bilirubin on 9th day
104. In a large bruise, color changes begins from: *(Recent Pattern Question 2017)*
a. From the center
b. From the periphery
c. All at same time
d. Little lateral from the main site of bruise
105. Oblique bullet injury causes which type of wound *(Recent Pattern Question 2016)*
a. Oval b. Round
c. Stellate d. Keyhole
106. Teeth bite marks are which type of abrasion:
a. Pressure Abrasion b. Contusions
c. Graze abrasion d. Linear abrasion
107. Brush burn is a:
a. Linear abrasion b. Pressure abrasion
c. Graze abrasion d. Contusion
108. Whiplash injury is damage to
a. Skull b. Spine
c. Rib cage d. Long bones
109. Bruise is bluish-black in color after:
a. 24 hour b. 2 day
c. Few days d. Few months
110. True about Countre-coup injury:
a. Injury located towards the impact
b. Injury common in stationary head
c. Injury common in moving head
d. All of the above
111. Which of the following is not seen in black gun powder of Bullet:
a. Sulphur b. Charcoal
c. Potassium d. Nitrocellulose
112. True statement about Tandem bullet:
a. Bullet that rotates in end on end during its motion
b. Bullet which travel in irregular fashion
c. Bullet that first hits some other object along the way
d. Two bullets are ejected one after the other

113. Tailing of wound suggests:
 a. Direction of injury b. Weapon used
 c. Type of wound d. Surface of weapon
114. Which of the following is NOT associated with stabbing injury:
 a. Point wound b. Puncture wound
 c. Perforation d. Chopping
115. Tentative cuts are seen in?
 a. Suicide b. Homicide
 c. Accidental cut d. Traumatic cut
116. 'Flaying' is seen in which type of laceration?
 a. Split b. Stretch
 c. Avulsion d. Tears

ABORTION, THANATOLOGY AND HANGING

117. Rule which describes the cadaveric rigidity and sequential onset of rigor mortis: (Recent Pattern Question 2018-19)
 a. Curren's rule b. Nysten's rule
 c. Hasse's rule d. Durham rule
118. Which cavity should be opened first in the suspicion of hanging? (Recent Pattern Question 2018)
 a. Thorax b. Head
 c. Abdomen d. Neck
119. Specific gravity of unrespired lung: (Recent Pattern Question 2018)
 a. 0.94 b. 1.2
 c. 0.75 d. 1.04
120. Respired lung weight as compared to body weight is: (Recent Pattern Question 2018)
 a. 1/10 b. 1/20
 c. 1/35 d. 1/70
121. Person identification can be done by: (Recent Pattern Question 2017)
 a. Proctoscopy b. Colposcopy
 c. Chelioscopy d. Endoscopy
122. A diabetic patient develops DVT and PE. Leading cause of death I(a) in medical certificate is? (Recent Pattern Question 2017)
 a. Pulmonary embolism b. DVT
 c. DM d. Renal failure
123. Which of the following is more dangerous in causing spinal damage? (Recent Pattern Question 2017)
 a. Hyperextension of the neck
 b. Hyperflexion of the neck
 c. Both hyperflexion and hyperextension of the neck
 d. None can cause spinal damage
124. Wilful MTP is allowed upto how many weeks in India (Recent Pattern Question 2016)
 a. 12 weeks b. 20 weeks
 c. 28 weeks d. 32 weeks
125. Which of the following points towards female skull differentiating from male (Recent Pattern Question 2016)
 a. Mastoid bigger
 b. Prominent frontal eminence
 c. Orbit square with round edges
 d. Prominent jaw
126. All are correct about MTP EXCEPT:
 a. Only qualified medical practitioner is allowed to perform it
 b. Medical assistant can perform in absence of gynecologist
 c. Husband's consent is not required.
 d. Can be done upto 20 weeks
127. Which of the following statement is true about MTP:
 a. Consent of one doctor is enough upto 14 weeks
 b. Husband's consent for MTP is must
 c. Make sure to lodge a police complaint in case of MTP due to rape
 d. Age proof is generally not required
128. A doctor can do MTP after practicing or assisting how many MTPs:
 a. 22 b. 20
 c. 12 d. 25
129. In case of typical hanging, position of knot is at:
 a. Occiput b. Angle of mandible
 c. Below the chin d. Side of neck
130. On examination a dead guy was found a ligature mark on neck. According to police, the person's leg were touching the ground while hanging. You suspected death due to partial hanging. This death is due to weight of around:
 a. 1.15 kg b. 2.20 kg
 c. 3.10 kg d. 4.50 kg
131. A 28 year female committed suicide. On the site it was noticed that her feet was not touching the ground. Which of the following shows its suicidal and not homicidal:
 a. Ligature mark continuous around the neck
 b. The position of the knot at the angle of mandible
 c. Saliva dribbling to the opposite side of the knot
 d. Red congested face
132. Le-facies expression is due to
 a. Hanging b. Strangulation
 c. Throttling d. Café coronary
133. All are strangulation EXCEPT:
 a. Burking b. Throttling
 c. Garroting d. Mugging
134. Burking is a method of:
 a. Homicidal smothering and traumatic asphyxia
 b. Suicidal smothering and traumatic asphyxia
 c. Accidental smothering and choking
 d. Choking and traumatic asphyxia
135. Overlying leads to death due to
 a. Strangulation b. Suffocation
 c. Mugging d. Choking

136. Postmortem rigidity disappears first in:
a. Upper limbs b. Neck
c. Lower limbs d. Eyelids
137. On postmortem examination, stiffening of muscles is observed in a burn deceased. This indicates that the person is exposed to intense heat above what temperature?
a. 30°C b. 40°C
c. 50°C d. 60°C
138. In asphyxia, the organ to be dissected last is:
a. Neck b. Head
c. Thorax d. Abdomen

FORENSIC PSYCHIATRY

139. Fodere test is done for: *(Recent Pattern Question 2017)*
a. Bone maturity b. Lung maturity
c. Heart maturity d. Intestinal maturity
140. Phytobezoar is:
a. Intake of indigestible plant materials
b. Vegetable balls
c. Hair ball
d. Drugs ball

BOARD REVIEW QUESTIONS

141. Cephalic index is used for determination of?
a. Sex b. Race
c. Height d. Stature
142. Falanga is a type of?
a. Physical torture b. Sexual torture
c. Mental torture d. Method of homicide
143. Telefona refers to?
a. Pulling of hairs b. Beating of soles
c. Beating on both ears d. Beating on head
144. Tactile hallucination is seen with?
a. Dhatura b. Cocaine
c. Cerebra thevetia d. None of these
145. Delirium is caused by which poison?
a. Aconite b. Dhatura
c. Morphine d. Kerosene
146. Fomepizole is used in which poisoning?
a. Methyl alcohol b. Benzodiazepine
c. Cyanide d. Phenobarbitone
147. Ordeal poison is?
a. Physostigmine b. Digoxin
c. Cocaine d. Atropine
148. Which is not a derivative of cannabis?
a. Heroin b. Charas
c. Ganza d. Bhang
149. In which poisoning dialysis is not indicated?
a. Benzodiazepine b. Barbiturates
c. Aspirin d. Acetaminophen
150. Fusion of xiphoid process occurs at?
a. 30 years b. 10 years
c. 40 years d. 70 years
151. MTP act was last modified in?
a. 2000 b. 2003
c. 2005 d. 2007
152. The shape of a stab wound is due to?
a. Edge of blade b. Length of blade
c. Width of blade d. Strength of force
153. Tissue bridging is seen in?
a. Stab wound b. Incised wound
c. Lacerations d. Abrasion
154. Minimum age required for consent to donate organs as per "Transplantation of human organ act 1994" is?
a. 16 years b. 18 years
c. 21 years d. No age limit
155. Dicobalt EDTA is used to treat poisoning by?
a. Cyanide b. Sulfuric acid
c. Nitric acid d. H₂S
156. Phosphorous is preserved in?
a. Alcohol b. Formalin
c. Kerosene d. Water
157. Stability of a bullet is increased by?
a. Jacketing b. Rifling
c. Choke d. Highmass bullets
158. Fatal dose of potassium cyanide is?
a. 30–50 mg b. 50–60 mg
c. 200 mg d. 300 mg
159. Hatter shake is seen in which poisoning?
a. Aluminum b. Mercury
c. Lead d. Arsenic
160. Dialysis dementia syndrome is seen in which poisoning?
a. Aluminium b. Mercury
c. Lead d. Arsenic
161. Magnan's phenomenon occurs in addiction of?
a. Alcohol b. Cocaine
c. LSD d. Opiates
162. Saturnism is a feature of?
a. Mercury poisoning
b. Lead poisoning
c. Arsenic poisoning
d. Thallium poisoning
163. Last organ to putrefy in females is?
a. Lung b. Uterus
c. Bain d. Heart

- 164. Most common site of diatoms test done in drowning is?**
 a. Lungs b. Bone marrow
 c. Heart d. Stomach
- 165. Statutory rape is considered below the age of?**
 a. 15 years
 b. 16 years
 c. 18 years
 d. 21 years
- 166. Section 509 IPC deals with?**
 a. Rape
 b. Outrage of modesty of a woman
 c. Insult of modesty of a woman
 d. Criminal conspiracy
- 167. Dangerous weapon is related to which section of IPC?**
 a. 300 b. 302
 c. 320 d. 324
- 168. Declaration of Tokyo is related to?**
 a. Human experimentation
 b. Torture
 c. Euthanasia
 d. Organ transplantation
- 169. Maximum tissue damage is done by?**
 a. Tandem bullet b. Ricochet bullet
 c. Dum dum bullet d. Wad cutter bullet
- 170. Dying declaration comes under?**
 a. Section 32 IPC b. Section 32 IEA
 c. Section 60 IEA d. 291 CrPC
- 171. Permissible alcohol level in blood as per motor vehicle act 1988 is below?**
 a. 30% b. 40%
 c. 50% d. 60%
- 172. Corpoporphyrin in urine is seen in which of the poisoning?**
 a. Copper b. Lead
 c. Arsenic d. Mercury
- 173. Smoky stool is seen in which poisoning?**
 a. Mercury b. Phosphorous
 c. Iodine d. Lead
- 174. Antidote for magnesium sulfate toxicity is?**
 a. Calcium gluconate b. Penicillamine
 c. Hydrated ferric oxide d. Exchange resins
- 175. Vineyard sprayer's lung is due to?**
 a. Thallium toxicity
 b. Chronic CuSO_4 poisoning
 c. Chronic arsenic poisoning
 d. Potassium permanganate toxicity
- 176. Concealment of birth comes under which IPC?**
 a. 317 b. 318
 c. 319 d. 320
- 177. Postponement of death sentence of a pregnant women comes under?**
 a. Section 433 A Cr.PC b. Section 416 CrPC
 c. Section 54 IPC d. Section 55 IPC
- 178. Virchow method of autopsy includes?**
 a. Organs are removed en masse
 b. Organs are removed en block
 c. Organs are removed one by one
 d. In situ dissection combined with en block removal
- 179. Duret's hemorrhages are seen in?**
 a. Lungs b. Spleen
 c. Liver d. Brain
- 180. Taches noires refers to?**
 a. Postmortem staining
 b. Flaccidity of eyeball
 c. Wrinkled dusty sclera
 d. Maggot growth
- 181. Tache noir is seen in the eye how many hours after death?**
 a. 3 to 5 hours
 b. 6 to 8 hours
 c. 12 to 14 hours
 d. 16 to 18 hours
- 182. Hasse's formula is used in pregnancy to?**
 a. Estimate fetal age
 b. Identify fetal blood group
 c. Identify fetal sex
 d. Identify fetal congenital malformations
- 183. Cross examination in the court of law is for?**
 a. Confusing witness
 b. To make judge understand better
 c. To protect the accused
 d. To obtain more evidence
- 184. Specimen containing viral particle is preserved in?**
 a. NaCl solution b. Formaldehyde
 c. 50% glycerine d. Liquid nitrogen
- 185. Most common type of finger print:** (2018)
 a. Loops b. Whorls
 c. Composite d. Arches
- 186. Gustafson method of identification includes all EXCEPT:** (2018)
 a. Attrition
 b. Root transparency
 c. Loss of periodontal attachment
 d. Root resorption at the base

IMAGE-BASED QUESTION

187. The following picture shows?

- a. Lead poisoning
- b. Arsenic poisoning
- c. Copper poisoning
- d. Iron poisoning

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTIONS 2019

1. Ans. (c) Impotence

*Ref: Forensic Medicine and Toxicology by
RN Karmakar P 370*

- **Impotence** can be ground for divorce. A wife can sue for marriage dissolution on grounds of husband's impotency, given that the 2 facts are proved:
 - Husband was impotent at the time of marriage
 - Husband continues to be impotent till the filing of suit

Grounds for divorce:

- Adultery
- Cruelty
- Desertion
- Impotency
- Forced conversion of religion
- Communicable venereal diseases, incurable disease like leprosy, incurable mental disorder and insanity
- Either of spouse not alive or not seen for more than 7 years

2. Ans. (a) 312

*Ref: Forensic medicine and toxicology by
RN Karmakar P 532*

- **IPC Section 312:** Anyone voluntarily causing miscarriage to a woman with child, other than in good faith for the purpose of saving her life is punishable by imprisonment or fine or both.
- **IPC section 313–316:** Punishment (If death during the procedure) for up to 10 years imprisonment, extending up to life and fine, where abortion was conducted without consent.

3. Ans. (b) Greater curvature

*Ref: Forensic medicine and toxicology by
RN Karmakar P 327-28*

- Stomach autopsy is done to examine any food particle, its state of digestion, smell, color, character or presence of any foreign/suspicious body. This is very important if determining time of death is a major factor.
- For doing autopsy of stomach, double ligature is applied and the stomach is opened along greater curvature (from cardiac to pylorus).

4. Ans. (a) Mesentery

*Ref: Forensic medicine and toxicology by RN Karmakar
P 204*

- Seat belt is usually worn diagonally across the chest, and fastened on across the opposite side, lower lateral abdominal region.
- Seat belt injury occur when there is sudden halt of a moving car. It results into following injury:
 - Abrasion, contusion and hematoma of lower abdomen
 - More commonly, laceration, avulsions or perforation of mesentery or gas filled intestine and also injury to the vertebral column, particularly lumbar vertebra
 - Rupture of abdominal organs (like liver, spleen, pancreas and cecum) due to compression.
- These injuries are collectively known as seat belt syndrome.

5. Ans. (a) To assess compos mentis

Ref: Forensic medicine and toxicology by RN Karmakar, P 259

- Dying declaration (Sec 32 IEA) is written or oral statement of a person (who is dying due to some unlawful act), relating to the cause of his death.
- The statement is recorded by magistrate, or if the condition is serious, the doctor or any other person can record the statement in absence of magistrate.
- If the person survives, he is called to give oral evidence and the dying declaration becomes useless.
- **Role of a doctor in dying declaration:**
 - Assess the condition of the patient
 - Arrange for dying declaration and send call for magistrate
 - Certify the compos mentis (mental soundness of person)- major role
 - Record dying declaration in absence of magistrate

Extra Mile

Differences between dying declaration and dying deposition

Dying declaration	Dying deposition (more superior than dying declaration)
<ul style="list-style-type: none"> • Recorded by magistrate, doctor or even a common person • Person NOT put under oath (it is believed that a dying person does not lie) • Person is NOT cross examined • Accepted in India under sec 32 IEA (Indian Evidence Act) 	<ul style="list-style-type: none"> • Recorded only by magistrate • Person is put under oath • The person is cross examined • Not accepted in India

FMGE Solutions Screening Examination

464

IDENTIFICATION

6. Ans. (a) Teratology

Ref: PubMed

- Teratology is the science that studies the causes of structural, functional, behavioral and metabolic disorders present at birth (congenital malformation). It includes:

- Size
- Arrangement
- Composition of any organ or part of the body

- **Classification of anomalies:**

- **Genetic/Chromosomal:** AR, X-linked, Down syndrome, Turner syndrome
- Teratogenic agent or environmental (~10% of congenital anomalies)
 - ♦ **Physical:** External traumatic injuries
 - ♦ Radiation/atomic explosion
 - ♦ Chemical agent like thalidomide, anticonvulsants, alcohol, smoking
 - ♦ **Infectious agents:** German measles, CMV, HSV, Syphilis
 - ♦ **Antigens:** Rh factor

7. Ans. (c) Spectroscopic test

Ref: *The Essentials of FSM by KS Narayan Reddy, 31st ed. pg. 405-407*

TESTS OF BLOOD STAIN

- **Spectroscopic test:** Most specific/confirmatory method for blood stain test
- **Kastle-Meyer/Phenolphthalein test:** Color produced is Pink Purple.
- **Microchemical test:** Based on RBC content of blood.
- **Takayama's test:** Hb converted to Haemochromogen crystal. Salmon pink feathery haemochromogen crystals are obtained.
- **Teichmann's Haemin crystal test:** Hb converted into Hemin/Hematin crystals. Brown rhombic haemic crystal are seen
- **Benzidine test**
 - Best preliminary test as it detects blood present in dilution of 1 in 3 lakhs.
 - **Color produced:** Deep Blue
 - *Not used because it is a potential carcinogen.*

8. Ans. (b) Transparency of root

Ref: *Forensic Medicine and Toxicology by Rabindra Nath Karmakar, P 11*

GUSTAFSON METHOD

- Used for age determination, when teeth eruption is complete (after age 17–25 years)

It has 6 criteria:

- **Degree of attrition:** Wear and tear due to mastication. Not very reliable
- **Degree of periodontitis:** With age → regression of gum and periodontal tissue. It can be due to disease of gum or lack of oral hygiene. So not reliable also
- Degree of secondary dentine formation
- Degree of cementum apposition (gradual thickening of cementum following changes in position of teeth at the end of root).
- Degree of root resorption
- **Degree of root transparency/translucency** (due to mineral deposition in dentine canal → gradually becomes translucent but the dentine tissue become transparent due to osteoporosis). **It is most dependable criteria.**

Extra Mile

- Modified Gustafson's is Daliz's formula
- **Stack's formula:** For age estimation of infant and children from the height and weight of teeth.
- **Boyde's method:** Age estimation from the structural feature of enamel
- **Lamendin method:** Uses 2 criteria gingival and root transparency for age estimation. Gives better result than Gustafson's method.

9. Ans. (a) Iris

Ref: *Guide to Biometric Reference Systems and Performance Evaluation, P 25*

- Iris is the only internal organ available for acquisition. Its information, richness and stability make it a very suitable and efficient biometric modality.
- Iris recognition is reported as the most reliable biometrics for human recognition and it is suitable for large scale identification purposes.
- It is already being used in government programs, border or restricted areas access control.

10. Ans. (b) 8 years

Ref: *Pediatric Otolaryngology, Volume 2, P 1170*

- A child has a total of 20 primary teeth by age of 3 years:
 - 10 in the maxillary arch
 - 10 in the mandibular arch
- Subsequently permanent dentition starts at 6 yrs (21st Tooth). Hence choice A cannot be the answer. The correct answer is 8 yrs.

- As the permanent teeth erupt, a mixed dentition results, giving rise to mixed dentition (*combination of primary and permanent teeth*) between ages of 6 years and 12 years.
- The early mixed dentition is characterized by the eruption of the permanent maxillary and mandibular incisors and first molar teeth, with concurrent exfoliation of their primary counterparts.
- After these teeth have erupted, dental development becomes quiescent during what is known as the intertransitional period, from age 9 to 11. During this time, no further permanent teeth erupt.
- By the age of 13 years, adolescents have 28 permanent teeth.

TABLE: Initiation and eruption timing of the permanent dentition

Tooth	Initiation (Month)	Eruption (Year)
Maxilla		
Central incisor	5–5.25 <i>in utero</i>	7–8
Lateral incisor	5–5.25 <i>in utero</i>	8–9
Canine	5.5–6 <i>in utero</i>	11–12
First premolar	Birth	10–11
Second premolar	7.5–8	10–12
First molar	3.5–4 <i>in utero</i>	10–12
Second molar	8.5–9	12–13
Third molar	3.5–4 (years)	17–25
Mandible		
Central incisor	5–5.25 <i>in utero</i>	6–7
Lateral incisor	5.25 <i>in utero</i>	7–8
Canine	5.5–6 <i>in utero</i>	9–11
First premolar	Birth	10–12
Second premolar	7.5–8	11–12
First molar	3.5–4 <i>in utero</i>	6–7
Second molar	8.5–9	11–13
Third molar	3.5–4 (years)	17–25

11. Ans. (d) Chinese

Ref: Principles of Forensic Medicine & Toxicology, 2017 ed. Bardale, P 92

Cephalic index: A number expressing the ratio of the maximum breadth of a skull to its maximum length. Range of cephalic index are as follows:

- **Dolichocephalic:** 70–75. For example, Pure Aryans, Negroes, aborigines
- **Mesaticephalic:** 75–80. For example, Europeans and Chinese
- **Brachycephalic:** 80–85. For example, Mongols
- **Hyperbrachycephalic:** >85.

12. Ans. (a) Infants

Ref: KS Narayana Reddy's 'The Essentials of Forensic Medicine and Toxicology'; 29/e, p-64-65

Stack's Method

- Stack evolved a method to know the age of infants from the weight and height of the erupting teeth of the child.
- This method can be based on both the deciduous and permanent teeth during their eruptive phase.

13. Ans. (a) Dead infant

Ref: KS Narayana Reddy's 'The Essentials of Forensic Medicine and Toxicology'; 29/e, p-64-65

Boyde's Method

- Cross-striations develop in the enamel of the teeth, till the complete formation of the enamel.
- They represent daily incremental lines.
- The age of an individual can be calculated in terms of days by counting the number of lines from the neonatal line onwards.
- Neonatal line is formed very soon after birth and can be seen in about 2–3 weeks or by electron microscopy within 1–2 days after birth.
- **It is useful** to estimate the age of a dead infant.

14. Ans. (a) Brachycephaly

Ref: KS Narayana Reddy's 'The Essentials of Forensic Medicine and Toxicology'; 29/e, p-54

Types of skull (Mn: DuMB)	Cephalic index	Race
Dolichocephalic (long headed)	70–75	Pure Aryans, Aborigines, Negroes
Mesaticephalic (medium headed)	75–80	Europeans and Chinese
Brachycephalic (short headed)	80–85	Mongols

Note: Cephalic index = $\frac{\text{Maximum breadth of skull}}{\text{Maximum length of skull}} \times 100$

Note: Anteroposterior diameter of the skull is maximum in dolichocephalic and minimum in brachycephalic

15. Ans. (c) Brachycephalic

Ref: KS Narayana Reddy's 'The Essentials of Forensic Medicine and Toxicology'; 29/e, p-54

FMGE Solutions Screening Examination

466

16. Ans. (a) **Anterior part of palate**

Ref: KS Narayana Reddy's *The Essentials of Forensic Medicine and Toxicology*; 29/e, p-80

Palatoprints

- Harrison Allis suggested study of palate prints for identification.
- The structural details like the rugae are individual-specific and permanent **In the anterior part of the palate**
- The palatoprints can be used in the same way as fingerprints.
- **Thomas and Kurtze** have classified Palatoprints based on characteristics of rugae:
 - ♦ Primary rugae: 5 to 10 mm or >10 mm
 - ♦ Secondary rugae: 3 to 5 mm
 - ♦ Tertiary rugae-less than 3 mm

17. Ans. (d) **Stomach and small intestine**

Ref: KS Narayan Reddy's *The Essentials of Forensic Medicine and Toxicology*; 26/e, p-381

Breslau's Second Life Test

- Air is swallowed into the stomach during respiration.
- The stomach and intestines are removed after tying double ligature at each end.
- They float in water if respiration has taken place, otherwise they sink.
- This is known as Breslau's second life test.
- This test is not of much value as air may be swallowed by child in attempting to free the air-passages of fluid obstruction in cases of stillbirth.
- It is useless when there is decomposition.

18. Ans. (c) **Lungs****Tests for lung functional maturity/Lung chances in fetus after respiration**

- **Hydrostatic test (Raygat's test):** Respired air remains in the lunge as residual air which cannot be removed after death. Hence lungs floats in water.
- **Static test or Fodere's test**—Weight of lung before (30–40 g) and after respiration (60–66 gm) is measured. The increase in weight of lung is due to increased blood flow.
- **Ploucquet's test**—weight of lung **is doubled after respiration**.

Before respiration – 1/70 of body wt.

After respiration – 1/35 of body wt.

COURT OF LAW AND IPCS19. Ans. (b) **Criminal responsibility of insane**

Ref: *Forensic Medicine and Toxicology by Rabindra Nath Karmakar, P 566*

- McNaughton rule explains the criminal responsibility of insane, which says if a person commits crime, the person will be held guilty but considering the unsoundness of mind he/she not punished as per the verdict given by the jury of England. This theory is NOT acceptable in India.
- The Indian counterpart of McNaughton's rule is IPC Sec 84.
- According to this: "Nothing is offence which is done by a person, who at the time of doing it, is, by reason of unsoundness of mind, incapable of knowing the nature of act or that he was doing what is either wrong or contrary to law"

20. Ans. (b) **Curren's rule**

Ref: *Forensic Medicine and Toxicology by Rabindra Nath Karmakar, P 566*

Other Rules Regarding Fixing up Criminal Responsibility

- **Durham's rule (1954):** A person is not criminally held responsible if his unlawful act was the product of mental disease or defect.
- **Current rule (1961):** An accused person will not be criminally responsible if at the time of committing the act, he did not have the capacity to regulate his conduct to the requirement of law, as a result of mental disease or defect.
- **American law institute rest (1970):** A person is not held responsible for his criminal conduct if at the time of commission of such criminal conduct he lacks substantial capacity to appreciate the wrongfulness of his conduct to the requirement of law, resulting from mental disease or defect.
However, repeated criminal conduct does not alone prove such abnormality
- **Irresistible impulse test (New Hampshire Doctrine):** An accused person will not be held criminally responsible, even when he knows the nature and quality of his act and that it is wrong, but he is incapable of restraining himself from committing it due to destruction of his free will to control him as a result of the mental disease.

Extra Mile

- **Hasse's rule:** to calculate the fetal age. As per this rule up to 5th month IUL, square root of the length of fetus is the age in months.
- **Morrison rule:** to know the fetal length. As per this rule, after 5th month, age in lunar month multiplied by 5 is the length of fetus.

21. Ans. (a) Under penalty document

Ref: Forensic Medicine and Toxicology by Rabindra Nath Karmakar, P 314

Summon/Subpoena (Sub = under; Poena = Penalty)

- A written document issued by court, compelling the attendance of witness for giving evidence in relation to a particular case, with a warning NOT to be absent without proper ground and after attendance not to leave the court without proper permission under penalty.
- **Two types of summons:**
 - **Subpoena Ad testificandum:** To give evidence in court
 - **Subpoena Duces Tecum:** To produce some document in the court (CrPC Sec 91)
- **Punishment for non-compliance**
 - **Civil case:** Liable to pay damages
 - **Criminal case:** Arrest warrant issued compelling attendance (CrPC 87). Later on may be ordered for punishment either in form of fine or even imprisonment (IPC Sec 174)
- **Conduct money:** Money paid to witness as expense of attending the court
 - **Civil case:** Paid along with summon
 - **Criminal case:** Not paid to witness, but court will pay the expenses as per Govt. rule
 - ♦ For government employees, paid by employer

22. Ans. (a) State Government

- **Courts of Judicial Magistrate of First Class** are at the second lowest level of the Criminal Court structure in India. According to the Section 11 of the Criminal Procedure Code, 1973 (CrPc), a Court of Judicial Magistrate of First Class may be **established by the State Government** in consultation with the High Court of the respective state at such places in the district and in any number by a notification.
- According to Section 29 of the CrPc, a Judicial Magistrate of First Class may pass a sentence of imprisonment for a term not exceeding three years, or of fine not exceeding ten thousand rupees or of both.

23. Ans. (b) Magistrate

Magistrate Inquest: Court of Trail

- Usually conducted by DM, SDM or Executive Magistrate (i.e. collector, Deputy Collector or Tahsildar)
- Magistrate inquests are usually done in following circumstances:
 - **Dowry death**, i.e. unnatural death within 7 years of marriage

- Death in prison
- Death in police custody or interrogation or during police firing
- Death in any psychiatric hospital
- Exhumation, i.e. digging out of an already buried body is also done upon order of magistrate.

24. Ans. (c) Whether it is caused by knife

Ref: Review of Forensic medicine by Sumit Seth pg. 248-49

- During a court trial, questions are put to the witness by the public prosecutor or the defence lawyer.
- A leading question is one the answer of which is desired in only YES or NO. **Examples of leading question:**
 - Whether you were present at the crime site?
 - Did you see this person at crime site?
 - Is this the knife you saw at crime site?
 - Whether the accused was holding knife or gun?
- The other options like "how did you get cuts on T-Shirt; cause of injury, size of incised wound" needs explanatory answer and cannot be answered in yes or no.
- Leading question can only be asked by **defence lawyer in cross examination. (Recent exam 2018)**
- A leading question is NOT allowed in chief examination by public prosecutor (*EXCEPT when the witness is hostile*)
- **NOTE:** Leading question has been classified under 141 IEA (Indian Evidence Act)

25. Ans. (a) Magistrate

Ref: The Essentials of FSM by K.S. Narayan Reddy 31st ed. pg. 5, 272

Inquest: inquiry into the cause of death

- **Police Inquest**
 - Most common type of inquest in India
 - Investigating officer usually is sub inspector or officer not below the rank of (senior) head constable.

Magistrate Inquest: Court of Trail

- Usually conducted by DM, SDM or Executive Magistrate (i.e. collector, Deputy Collector or Tahsildar)
- Magistrate inquests are usually done in following circumstances:
 - **Dowry deaths** i.e. unnatural deaths within 7 years of marriage
 - Death in prison
 - Death in police custody or interrogation or during police firing
 - Death in any psychiatric hospital
- Exhumation i.e. digging out of an already buried body also done upon order of magistrate.

**Coroner's Inquest: Court of inquiry**

- Coroner is an advocate, attorney, pleader, or first class magistrate with 5 years experience or metropolitan magistrate
- Coroner court is a court of inquiry & accused need not be present.
- Coroner court can't impose fine or punishment; but it can punish those guilty of contempt of his court when the offence is committed in the premises of his court (i.e. city limit only)
- *In India it was practiced in Mumbai, Kolkata. But now abolished.*

26. Ans. (a) Magistrate

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 5, 272

Please refer to above explanation.

27. Ans. (d) Voluntarily causing hurt

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 270-71

TABLE: Some Important IPC sections and their definitions

INDIAN PENAL CODE (IPC):

CRIMINAL PROCEDURE CODE (CrPC):

IPC Section	Definition
Sec 82	A child under 7 years is incapable of committing an offence. Not applicable to railway act.
Sec 83	A child >7 & < 12 is presumed to be mature enough to be capable of committing an offence.
Sec 84	Act of a person of unsound mind is not liable (McNaughten's rule)
Sec 85	Act of a person who's intoxicated against will.
Sec 87	A person less than 18 years cannot give valid consent to suffer any harm which may result from an act not intended or not known to cause death or grievous hurt. E.g. consent for wrestling contest
Sec 88 to 93	Legal protection to medical doctors. Sec 89 – a child < 12 years cannot give valid consent to suffer any harm which can occur by an act done in good faith or for its benefit e.g. consent for operation
Cr PC 174	Police inquest
Cr PC 176	Magistrate's inquest
Sec 179	Punishment for refusal to answer question by the police
Sec 191	Definition of perjury
Sec 193	Punishment for perjury

Contd...

IPC Section	Definition
Sec 197	Issuing false certificate (3-7 years of punishment)
Sec 201	Disappearance of evidence (2 years of punishment)
Sec 297	Trespassing of burial place, Necrophilia, Necrophobia
Sec 299	Definition of Culpable homicide
Sec 300	Murder
Sec 302	Punishment for murder/infanticide
Sec 304	Culpable homicide not amounting to murder
Sec 304 A	Causing death by negligence
Sec 304 B	Dowry death
307	Attempt to murder
308	Attempt to culpable homicide
309	Attempt to suicide
Sec 317	Exposure and Abandonment of child <12 years
Sec 318	Concealment of birth by secret disposal of dead body
Sec 319	Hurt
Sec 320	Grievous hurt
Sec 321	Voluntarily causing hurt
Sec 322	Voluntarily causing grievous hurt
Sec 323	Punishment for voluntary causing hurt
Sec 324	Voluntary causing hurt by dangerous weapon/ means
Sec 325	Punishment for voluntarily causing grievous hurt
Sec 326	Punishment for voluntarily causing grievous hurt by a dangerous weapon/means
Sec 351	Assault
Sec 354	Assault to outrage the modesty of a woman.
Sec 375	Definition of rape
Sec 376	Punishment of rape
Sec 377	Unnatural sexual offence
Sec 497	Adultery

28. Ans. (b) 7 years

Ref: The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 384-85

- **IPC for rape:** 375
- **IPC punishment of rape:** 376. This IPC states that whoever commits rape shall be punished with imprisonment for a term of not less than 7 years, but which may be for life or ten years plus fine.

29. Ans. (b) 319

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 384-85*

Please refer to above table.

30. Ans. (a) 320

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 384-85*

Please refer to above table.

31. Ans. (d) Injured person admitted in hospital for 21 days

Ref: *Legal Aptitude And Legal Reasoning For The Clat By Bhardwaj A. pg. 36*

Section for grievous hurt: IPC 320

The book states: "the mere fact that the injured remained in hospital for 20 days would not be enough to conclude that he was unable to follow his ordinary pursuits during that. Continuance of severe body pain for 20 days or disability to follow one's avocation for 20 days constitutes grievous hurt"

Criteria

- Emasculation
- Permanent privation of the sight of either eye
- Permanent privation of hearing of either ear
- Privation of any joint or permanent impairment of the power of any member of joint
- Permanent disfiguration of head or face
- Fracture or dislocation of bone or tooth
- Any hurt which endangers life or which causes the sufferer to be admitted during the span of 20 days in severe body pain or unable to follow his ordinary pursuits.

32. Ans. (a) 497

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 24*

Please refer to above table.

33. Ans. (b) 315

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 408*

- IPC Section 315 and 316 discusses the offence of foeticide and infanticide.
- If a person commits an act with the intention of preventing the child from being born alive or an act that results in the death of the child after birth, that person is committing foeticide/infanticide as long as they do not do it in the interest of the mother's health or life.

- Section 317 states that it is a crime against children, if their mother or father expose or leave a child in a place with the intention of abandonment.
- Sections 82 and 83 of the IPC states: a child who commits a crime and is below the age of seven is not considered to have committed a crime.
- Section 299: Culpable homicide

34. Ans. (c) 304-B

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 272*

Dowry Death

- Bodily injury caused by husband or relative, which lead to death comes under Dowry death and punished under IPC 304 B.
- IPC section 304 B states: Whenever any death of a woman is caused by any burns or bodily injury or occurs otherwise than under normal circumstances within seven years of her marriage and it is shown that soon before her death she was subjected to cruelty or harassment by her husband or any relative of her husband for, or in connection with, any demand for dowry, such death shall be called "dowry death" and such husband or relative shall be deemed to have caused her death.
- Whoever commits dowry death shall be punished with imprisonment for a term which shall not be less than seven years and it may extend to life time imprisonment.

35. Ans. (a) 498 A

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 272-73*

- Cruel behavior towards wife by husband or his relatives punished by IPC 498 A.
- IPC section 498 A states that whosoever being husband or relative subject women to cruelty shall be punished with imprisonment of upto 3 years with or without fine.

36. Ans. (d) Section 416

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 5-6, 314-15*

Section 416: If a woman sentenced to death is found to be pregnant, the High Court shall order the execution of the sentence to be postponed, and may, if it thinks fit, commute the sentence to imprisonment for life.

Section 413. Execution of order passed under Section 368: When a case submitted to the High Court for the confirmation of a sentence of death, the Court of Session receives the order of confirmation or other order of the

FMGE Solutions Screening Examination

470

High Court thereon, it shall cause such order to be carried into effect by issuing a warrant or taking such other steps as may be necessary.

Section 414. Execution of sentence of death passed by High Court: When a sentence of death is passed by the High Court in appeal or in revision, the Court of Session shall, on receiving the order of the High Court, cause the sentence to be carried into effect by issuing a warrant.

Section 419. Direction of warrant for execution: Every warrant for the execution of a sentence of imprisonment shall be directed to the officer in charge of the jail or other place in which the prisoner is, or is to be, confined.

37. Ans. (b) **Masturbation**

Ref: The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 404

- Masturbation is an offence only when practiced openly; Ex: in telephone booth, lavatories.

TOXICOLOGY

38. Ans. (b) **Hydrocarbons**

Ref: Harrison's 20th ed. P 3306

■ CONTRAINDICATION OF GASTRIC LAVAGE

- Hydrocarbon and petroleum distillate
- Caustic or corrosive poisoning—due to increased risk of gastric perforation and aspiration pneumonitis.
- Uncontrolled convulsion—due to increased risk of aspiration
- Comatose patients—compromised/unprotected airway
- Cardiac arrhythmias
- Recent upper GI surgery
- Combative patients or those who refuse—absolutely contraindicated

Extra Mile

TABLE: Contraindications of gastric lavage

Absolute contraindications	Relative contraindications
• Alkali	• Kerosene or volatile poisoning
• Mineral acid	• Strychnine
• Vegetable acids	• Hypothermia
• Organic acids except carbolic acid	• Bleeding disorder

39. Ans. (a) **Oxalic acid**

Ref: Forensic Medicine and Toxicology by Rabindra Nath Karmakar, P 79

- Oxalic acid is a colorless organic compound with a wide-range of use in cleaning and bleaching applications

- Oxalic Acid Poisoning is the accidental or intentional intake of oxalic acid or oxalic acid compound

■ SIGNS AND SYMPTOMS

- Vomiting
- Burning pain in throat, mouth
- Swelling of mouth and tongue— inability to speak clearly
- Skin burns/blister formation
- Red, watery eyes

■ TREATMENT

- The immediate administration of an antidote: Lime and chalk (precipitated chalk or saccharate solution of lime).
- They can be scraped off the wall, whitewashed fences, or ceilings, crushed egg shells, mixed with milk/water and given.
- Emesis to remove unabsorbed poison
- Demulcent drink to protect gastric mucosa
- IV 10% Calcium gluconate—to treat hypocalcemia

40. Ans. (c) **Root**

- Although entire plant is poisonous, the **root is most potent**.
- *Dry root* is conical or tapering, shows bases of the broken rootlets and shriveled with longitudinal wrinkles.
- **NO odor, Sweet taste** (mitha bish)

Mechanism of Action

- Aconitine binds with the voltage-dependent sodium-ion channels.
- Aconitine first stimulates and then paralyzes the peripheral terminations of sensory, secretory and motor nerves

41. Ans. (c) **Synthetic**

■ OPIUM/AFIM

- Heroin (brown Sugar/Junk): **Synthetic derivative of opium**
- Juice from **unripe capsule** of *Papaver Somniferum* (poppy) contains opioid alkaloids
- Poppy seeds are used for cooking and are non-toxic
- **Poison of choice for suicide:** As it produces painless death.
- **Pinpoint pupil**, respiratory depression.
- Marquis test: to detect opium
- **Antidote:** *Naloxone sodium*
- Treatment for morphine withdrawal: Methadone
- Along with routine viscera, Brain, blood and bile to be preserved.
- **Speedball** is the use of *cocaine with morphine or heroin*

42. Ans. (a) **Cobra**

Appearance	Poisonous snakes	Nonpoisonous snakes
Habit	Nocturnal	Not specific
Head scales	Usually small 3 exceptions (Poisonous snakes with large head scales) Pit Vipers Cobra Krait Pit viper pit below the eye Cobra 3 rd labial touches eye and nasal shields Krait : 4 infralabials scales below mouth and 4 th being largest	Usually large
Belly scales	Large and cover the entire breadth of belly	Small, not covering the entire belly
Distal scales	Single row	Double row
Tail	Compressed	Noncompressed
Fangs	Long and canalized, like hypodermic needle	Short or small grooved
Bite mark	Two fang marks	Small teeth marks

43. Ans. (b) **Carbon monoxide**

- The color of livor mortis depends on the type of hemoglobin
- Normally, the lividity is bluish or purple due to the presence of deoxyhemoglobin.

Conditions	Color of lividity	Type of hemoglobin
Normal	Blue purplish	Reduced Hemoglobin
Carbon monoxide Burns	Cherry red Bright red	Carboxyhemoglobin and increased oxygen content in blood (Anemic anoxia)
Cyanide	Bright red	Cyanide inhibits cytochrome oxidase and decreased O ₂ utilization by tissues. (Histotoxic anoxia) Increased oxygen content in blood

Contd...

Conditions	Color of lividity	Type of hemoglobin
Hypothermia/Refrigeration	Pink	Oxygen retention in cutaneous blood by cold air
NaCl/Nitrite/Nitrate/aniline Potassium chlorate	Chocolate Brown	Methemoglobin (meth Hb)
Septic abortion	Bronze	Due to Cl. Perfringens
Hydrogen sulphide	Green	Sulfhemoglobin

44. Ans. (b) **Sodium thiosulfate**

TABLE: Poisoning and their Antidote

Poisoning	Antidote/treatment
Oxalic acid (ink remover)	Calcium gluconate
Phosphorus	Copper sulphate
Organophosphorus	Atropine
Datura	Physostigmine
Arsenic	BAL, DMSA
Mercury	BAL, DMSA
Lead (Plumbism)	EDTA, DMSA
Alcohol	Ethyl alcohol
Opium (Afeem)	Naloxone
Heroin/Brown sugar/Junk/Smack	Amyl nitrite
Bhang/Ganja/Charas	Diazepam
Strychnine	Diazepam
Copper	EDTA, penicillamine desferrioxamine
Cyanide	<ul style="list-style-type: none"> Hydroxocobalamin. If not available then Na⁺ thiosulphate/Na⁺ nitrite can be used GASTRIC LAVAGE: 5% of sodium thiosulphate, sodium nitrite.

45. Ans. (a) **Hydroxocobalamin****Hydrocyanic acid (Cyanide poisoning)**

- CYANOGEN/PRUSSIC ACID is colorless, **odor resembling bitter almond**.
- Cause of death in cyanide poisoning**:
 - Cytotoxic and histo-toxic anoxia.
 - Corrosive effect on the mucous membrane, when inhaled instantaneous death is the result.

Treatment

- ANTIDOTE**: Hydroxocobalamin
- GASTRIC LAVAGE**: 5% of sodium thiosulphate, sodium nitrite.

46. Ans. (b) **Mercury**

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 505

FMGE Solutions Screening Examination

472

MERCURY POISONING (HYDRAGYRISM)

- Vapours of mercuric compounds are poisonous because it will be absorbed in the systemic circulation.
- Mercuric compounds being soluble are more poisonous than mercurous (less soluble) compounds.

Clinical Presentation of Mercury Poisoning (Remembered as MEATS)

- **Mercuria lentis:** Brownish deposition of mercury on anterior lens.
- **Membranous colitis**
- **Erethism:** Characterized by shyness, irritability, tremors, loss of memory & insomnia.
- **Acrodynia (Pink disease):** Generalized pinkish body rash starting from tips of fingers & toes
 - **Characterized by 5 P's:** Pinkish, Puffy, Painful, Paresthetic hands and feet with Peeling of skin.
- **Tremors:** Also known as *Danbury tremors*, *hatter's or glass-blower's shake*
- **Salivation & gingivitis:** excessive salivation associated with metallic taste, gingivitis, loosening of teeth and **blue-black line on gums**.

Extra Mile**TABLE:** Different metallic poisoning and their effect on hair and skin

Poisoning	Color of Hair & Skin
Arsenic (As)	<ul style="list-style-type: none"> • Yellow color of skin, hair & mucous membrane • Milk rose (Brownish pigmentation)/Rain drop pigmentation • BLACK FOOT DISEASE
Copper (Cu)	<ul style="list-style-type: none"> • Jaundiced skin • Green-blue skin, hair & perspiration • Green – purple line on gums
Mercury (Hg)	<ul style="list-style-type: none"> • Blue-black line on gums with jaw necrosis and loosening of tooth • Brown deposits on anterior lens capsule (mercuria lentis) • Acrodynia (pink disease)
Lead (Pb)	<ul style="list-style-type: none"> • Blue stippled burtonian line on gums, especially on upper jaw.

Other Features of Mercury Poisoning

- Proximal Convoluted Tubule necrosis
- Prevalence of abortions are common
- **Minimata disease** is an organic mercury poisoning due to consumption of fish poisoned by mercury.

47. Ans. (b) Alkali

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 499

- Maximum damage to the esophagus is caused by ingestion of alkali as compared to acid.

- Alkali causes Liquefactive necrosis which is more damaging than coagulative necrosis caused by acid.
- Liquefactive necrosis is caused by hydrolytic enzymes. It attracts WBC which leads to bacterial infection and Pus formation. It can cause CNS ischemia also.
- Acid causes coagulative necrosis due to coagulation of proteins. Coagulative necrosis is seen in all organs of body except brain.
- MCC of coagulative necrosis is hypoxia.

48. Ans. (a) Alcoholic poisoning

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 540-41

- In case of alcohol poisoning, CSF as much as can be withdrawn is required to be preserved.
- Preservative used is Na/K- Fluoride and K-Oxalate.
 - Fluoride is added to CSF for alcohol estimation.
 - It can be also be used for vitreous humor and urine if alcohol estimation is required.

Extra Mile**TABLE:** Poisoning and Organ preserved

Poisoning	Organ preserved
Strychnine poisoning	Spinal cord (entire length)
Pesticides and Insecticides poisoning	Fat
CO, Cyanide, Organophosphates, Opiates, Barbiturates, Alkaloids and Strychnine poisoning (<i>Mn: COOBAS</i>)	Brain
Arsenic, Radium and Thallium poisoning (<i>Mn: ART</i>)	Bone

49. Ans. (a) Charcoal

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 485-86

ORGANOPHOSPHORUS

- **Alkyl phosphate:** Malathion (bug killer)
- **Aryl phosphate:** Parathion; Diazinon (Tik 20)
- Absorbed by inhalation, through skin, mucous membrane & gastro intestinal tract.
- **MOA:** It irreversibly inhibits acetylcholine esterase enzyme, which subsequently leads to increase in acetylcholine in body and patient presents with cholinergic symptoms.

Clinical Features

- Increases all secretions of body (eg: increased sweating, salivation, urination, diarrhea, emesis).
- Stimulate bronchial asthma
- Miosis
- Bradycardia
- Irritability, confusion and fine tremors.

Investigation

- **RBC cholinesterase:** Most popular and most commonly used.
- Plasma cholinesterase

Treatment

- **Antidote:** Atropine, Pralidoxime
- Atropine (antidote) is highly effective in counteracting peripheral muscarinic effects, and higher doses are required to antagonize CNS effects.
- It is not effective against nicotinic actions.
- Cholinesterase reactivators like DAM (Di Acetyl Monoxime), PAM (Pralidoxime iodide) action is most marked at nicotinic site.
- Oximes should be started as early as possible preferably withing 24 hours before phosphorylated enzyme has undergone aging & become resistant to hydrolysis
- Oximes do not cross BBB. It directly detoxify OPC.
- **Note:** Activated charcoal is used in case of cyanide poisoning.

50. Ans. (a) Kerosene

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 551

TABLE: Contraindications of Gastric Lavage

Absolute contraindications	Relative contraindications
<ul style="list-style-type: none"> • Alkali • Mineral acid • Vegetable acids • Organic acids except carbolic acid 	<ul style="list-style-type: none"> • Kerosene or volatile poisoning • Strychnine • Hypothermia • Bleeding disorder

51. Ans. (a) Tobacco

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 577

- Among the given options, tobacco is the substance which is most commonly used in India and also persons can easily get addicted and can tolerate this agent.

52. Ans. (c) Copper sulphate

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 512-13

- White phosphorus is toxic while Red phosphorus is non-toxic
- Phosphorus poisoning presents with Phossy jaw, Garlicky mucosa.
- Garlicky mucosal odor is also seen in Celphos and Arsenic poisoning.
- **Antidote:** Copper sulphate

53. Ans. (b) Mimics tetanus

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 501-502

Arsenic Poisoning Features

- It is the most commonly used homicidal poison.
- Presents with Haemorrhagic gastroenteritis and necrosis of intestinal mucosa.
- **It mimics Cholera** NOT tetanus (*Strychnine mimics tetanus*).
- Diarrhea accompanied by tenesmus and anal irritation.
- **Arsenic poisoning is also characterized by:**
 - Black foot disease
 - Red velvety mucosa upon PM
 - Rain drop pigmentation on body
 - Reinsch test or maRsh test- used to test the arsenic
- They deposited on skin, hair and nail because they contain keratin, hence it is preserved.
- Hyperkeratosis on palms and soles.
- **Fatal dose:** 0.1-0.2 gm.
- On nails specific lines seen known as: **Aldrich Mees Line**
- **Upon chronic poisoning**
 - Sensory motor polyneuropathy causing tingling, numbness and paresis
 - Encephalopathy
- **Antidote:** BAL, Succimer.

54. Ans. (a) Arsenic

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 501-502

Please refer to above explanation.

55. Ans. (d) Cyanide

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 588-89

HYDROCYANIC ACID (CYANIDE POISONING)

- CYANOGEN/PRUSSIC ACID is colorless, with an odor resembling bitter almond.
- Hydrocyanic acid, a colorless volatile liquid found in fruits like peach, plum, bitter almond.
- Cyanides (white powder) used in photography, electroplating, fumigation of ship.
- It is Cytochrome oxidase and Carbonic anhydrase inhibitor.
- **Cause of death:**
 - Cytotoxic and histo-toxic anoxia.
 - Corrosive effect on the mucous membrane, when inhaled leads to instantaneous death.

Signs and Symptoms

- Headache, giddiness, convulsion, seizure
- **Dilated & fixed pupil**
- Smell of bitter almond and froth at the mouth
- Cyanosed face, clenched jaw
- Respiratory failure leads to death

Fatal dose: 60 mg of pure acid or 60 drops of crude oil of bitter almond or 200 mg of KCN

FMGE Solutions Screening Examination

Treatment

- **ANTIDOTE:** Hydroxocobalamin.
- **GASTRIC LAVAGE:** 5% of sodium thiosulphate, sodium nitrite.

PM: BRICK RED blood due to cyano-meth Hb.
(Brain, Lung, Blood, Urine, Vomitus are preserved.)

56. Ans. (c) **Sodium thiosulfate**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 588-89*

57. Ans. (d) **Myotoxic**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 524*

TABLE: Snakes and their respective poisoning

Snake	Type of poisoning
Vipers	Vasculotoxic, Hemotoxic
Sea snakes	Myotoxic
Cobra, Krait	Neurotoxic

58. Ans. (a) **Neurotoxic**

Ref: *The Essentials of FSM by K.S. Narayan Reddy 31st ed. / 523*

Please refer to above explanation.

59. Ans. (c) **30**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 530-40*

- 30 mg%- Normal limit for drink and drive
- 80 mg%- Nystagmus
- 150 mg%- Muscle incoordination
- 400 mg%- Coma

60. Ans. (b) **Methyl alcohol**

Ref: *Internet Source*

- Methyl alcohol poisoning is referred to as HOOCH tragedy. It is converted in the body to formaldehyde which is toxic to retina, leading to blindness. Concomitant high anion gap metabolic acidosis results in mortality.
- The latest hooch tragedy was in Mumbai in June, 2015 and in Cuttack, Odisha in 2012.

61. Ans. (c) **Cocaine**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 562-63*

- Cannabis and its products contain (–) D-9 TetraHydroCoannabinol (Δ^9 -THC).

- It is obtained from Indian hemp plant known as cannabis Sativa.
- Different parts of this plants give different products:
 - Dried leaves: **Bhang**
 - Dried female inflorescence: **Ganja**
 - Resinous extract of stem: **Charas/Hashish**
 - Marijuana/Marihuana: Other name for cannabis
- In case of cannabis abuse there is an episode of acute violent behavior for which the person claims amnesia. This is known as **Run Amok**.

Extra Mile

TABLE: Commonly abused substances and their characteristic clinical feature

Substance	Characteristic clinical feature
Cocaine	Magnus symptoms (<i>cocaine bugs</i> or <i>Tactile hallucination</i>) Black tongue and teeth
Cannabis	<ul style="list-style-type: none"> • Run Amok • Amotivation syndrome • Flash backs
Alcohol	<ul style="list-style-type: none"> • Mc-Evan's sign • Morbid jealousy
LSD	<ul style="list-style-type: none"> • Bad Trips • Flash backs
Amphetamine	Paranoid hallucinatory syndrome (like paranoid schizophrenia)
Phencyclidine (Angel dust)	Dissociative anesthesia

62. Ans. (d) **Cocaine poisoning**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 564-65*

63. Ans. (c) **Bhilawanol**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 517*

Semi carpus anacardium (bhilawanol or marking nut): Juice applied to the skin produces irritation, painful blisters, followed by itching and eczematous eruption. Lesions formed resemble bruise which ulcerate and slough.

Active principles: *bilawanol* and *semicarpol*

- Used by washermen as marking ink on clothes
- Used to produce artificial bruise
- Used as abortifacient by an abortion stick

BURNS AND DROWNING

64. Ans. (c) **Teeth**

Ref: *PubMed*

- In severely burnt body, dental data is most helpful in identification.

65. Ans. (b) **Drowning**

- Gettler test is done to distinguish between freshwater drowning and salt water drowning.
- It is done by measuring the chloride difference of right and left side of heart. A difference of >25% is considered as significant.

66. Ans. (a) **Brackish water**

- Oligohalophilic diatoms live in fresh water.
- Polyhalophilic diatoms live in sea water.
- **Mesohalophilic diatoms** live in brackish water (water midway in salinity between freshwater and seawater)

67. Ans. (c) **Presence of carboxyhemoglobin**

Ref: Textbook of Forensic Medicine And Toxicology: Principles And Practice by Vij, pg. 221

TABLE: Difference between antemortem burns vs postmortem burns

Features	Antemortem Burns	Postmortem Burns
Line of redness	Present around the injured burn area	Not so
Vesicles	Contain serous fluid with high proportion of albumin and chloride	Contain air mostly. If fluid present it comprises of very little albumin and no chlorides
Base of blister	Red and inflamed	<i>Dull, dry, hard and yellow</i>
Inflammation evidence	Inflammatory edema and repair processes; (+) Leucocyte Infiltration	No such changes noticed
Presence of carbonaceous deposits/soot in the respiratory tract	PRESENT. <i>Indicates death from suffocation following antemortem burn</i>	Not present
Presence of Carboxyhemoglobin	Present (<i>its highly suggestive and diagnostic</i>)	Absent
Enzymatic activity	Time related increase in enzymatic activity: <ul style="list-style-type: none"> • Immediate: Tissue Cathepsin • At 2 hours: Leucine Aminopeptidase • At 3 hours: Acid Phosphatase • At 4 hours: Alkaline Phosphatase 	Never noticed

68. Ans. (c) **Cardiac arrest**

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 339-40

DROWNING

- In most of the cases it is accidental.

Types of Drowning

- **Wet drowning**
 - Most common form of drowning.
 - In this type water is withheld in lungs.
 - **Cause of death in wet drowning: Cardiac Arrest**
 - In fresh water death is earlier compared to sea water. Fresh water causes hemodilution and due to hemodilution there is hyperkalemia which causes ventricular fibrillation.
 - In case of sea water, death is little later, because sea water causes hemoconcentration in body, which leads to Hypernatremia and as a result death due to bradycardia.
- **Dry drowning**
 - In this type of drowning, water is not inside the lung.
 - Death is due to Reflex Laryngospasm.
- **Delayed drowning/Near Drowning**
 - This is also known as post immersion syndrome.
 - Resuscitation after drowning and death after 24 hours.
 - **Cause of death:**
 - ◆ Metabolic acidosis
 - ◆ Pneumonia
 - ◆ Electrolyte imbalance.
- **Hydrocution/Immersion syndrome**
 - Drowning in extreme cold water.
 - **Cause of death:** Vaso-vagal shock (VVS).

69. Ans. (b) **Vagal inhibition**

Ref: The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 342

- **Cause of death in drowning:**
 - **Asphyxia:** cause of death in sea water drowning. Inhalation of fluid causes obstruction to the air passages which leads to respiratory and circulatory failure due to anoxia.
 - **Ventricular fibrillation: MCC of death in fresh water drowning.** Death may occur in 3-5 minutes from a combination of anoxia and electrolyte imbalance which might lead to ventricular tachycardia and fibrillation.
 - **Vagal Inhibition:** MCC of death in icy cold water, drunkenness, high emotion or excitement.
 - **Exhaustion**
 - **Injuries**

FMGE Solutions Screening Examination

476

Extra Mile

- Fatal period:
 - Death in fresh water: 4–5 minutes
 - Death in salt water: 8–10 minutes

70. Ans. (c) **Clenched fist**

Ref: *The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 344*

- Presence of gravel, grass, etc firmly grasped in hand due to cadaveric spasm strongly suggest that person was alive when drowned as it indicates the struggle of person for life.

TABLE: Postmortem signs of drowning

Pathognomic Signs: indicates antemortem drowning	Non Specific signs
External <ul style="list-style-type: none"> Fine copious white leathery froth from mouth, nose and air passage which increases on chest pressure. Weeds, grass, mud etc in tightly clenched hand: a very definite sign. Internal <ul style="list-style-type: none"> Water in stomach and intestine and middle ear Diatoms in brain and bone marrow of long bones. 	<ul style="list-style-type: none"> Cutis anserine or goose skin Washer woman hand and feet Paltauf (subpleural, pectechial) haemorrhage Emphysema aqousum

71. Ans. (a) **Drowning**

Ref: *The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 344*

- Paltauf haemorrhage is subpleural, pectechial haemorrhage. It is shiny, pale pink or bluish red and may be minute or 3-5 cm in diameter, seen in case of drowning.
- During drowning there is more powerful inspiratory efforts which causes air entry to lungs with water and foam which makes the lungs heavy and increased pressure inside. This causes forced expiration which causes rupture of alveolar walls that may present subpleurally and is referred as paltauf haemorrhage.
- Paltauf haemorrhage most commonly occur in lower lobes of lung.**

Extra Mile

- Other important findings of drowning:
 - Emphysema aqousum
 - Oedema aqousum
 - Diatoms (microscopic unicellular or colonial algae)
 - Washerwomen hand/feet
 - Cutis anserine or goose skin

72. Ans. (b) **Drowning**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 346*

73. Ans. (b) **Burns**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 299*

- Pugilistic attitude is seen in case of burns.
- It is also known as Boxing or fencing attitude.
- Pugilistic attitude is due to coagulation of proteins other than those affected by rigor mortis.
- It is seen in both antemortem as well as postmortem burns.

Extra Mile

- Most common finding of antemortem drowning:** Clenched Fist.
- In case of Lightning: Branching tree pattern seen.

74. Ans. (c) **Peeling of the skin**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 296-98; Internet source*

An injury most commonly to an extremity or digit in which the skin and subcutaneous tissue are separated from the deeper tissue layers thereby depleting its blood supply and increasing the risk of tissue necrosis.

75. Ans. (b) **High voltage Electric burns**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 308-309*

ELECTRICAL INJURIES

- JOULE BURN:** contact electrical and endogenous burn.
- CROCODILE FLASH BURN:** high voltage burn.
- Multiple lesions due to 'ARC EFFECT'.
- Cause of Death-** ventricular fibrillation.
- Current pearls and wax drops seen on autopsy.

76. Ans. (a) **Lightening stroke**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 310-311*

- Lightening stroke:** It is an electrical discharge from the cloud to the earth.
- Classical finding:** FILLIGREE BURN/ LITCHENBURG'S FLOWERS: superficial, irregular, thin resembling the branches of a tree also known as arborescent burn.

- Most common site is shoulder flanks. (Cause is staining of tissues with Hb along the path of current.)

77. Ans. (c) High temperature liquids

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 305*

Scalds: Caused by application of liquid above 60°C or steam. Skin becomes sodden and bleached. Clothes are wet but do not burn.

78. Ans. (c) Presence of carbonaceous deposits in respiratory tract

Ref: *Textbook of Forensic Medicine And Toxicology: Principles And Practice by Vij pg. 221*

TABLE: Difference between Antemortem burns vs Postmortem burns

Features	Antemortem Burns	Postmortem Burns
Line of redness	Present around the injured burn area	Not so
Vesicles	Contain serous fluid with high proportion of albumin and chloride	Contain air mostly. If fluid present it comprises of very little albumin and no chlorides
Base of blister	Red and inflamed	Dull, dry, hard and yellow
Inflammation evidence	Inflammatory edema and repair processes; (+) Leucocyte Infiltration	No such changes noticed
Presence of carbonaceous deposits/soot in the respiratory tract	PRESENT. <i>Indicates death from suffocation following antemortem burn</i>	Not present
Presence of Carboxyhemoglobin	Present (its highly suggestive and diagnostic)	Absent
Enzymatic activity	Time related increase in enzymatic activity: Immediate: Tissue Cathepsin At 2 hrs: Leucine Aminopeptidase At 3 hrs: Acid Phosphatase At 4 hrs: Alkaline Phosphatase	Never noticed

79. Ans. (b) CO poisoning

Ref: *The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 582*

IMPOTENCY, SEXUAL PERVERSION AND SEXUAL OFFENCES

80. Ans. (b) Tribadism

Ref: *Principles of Forensic Medicine & Toxicology, 2017 ed. Bardale, P 316*

- **Lesbianism/tribadism:** Gratification of sexual desire of a woman by a woman.
- **Masochism:** Pleasure on receiving painful stimulus from sexual partner.
- **Nymphomania:** Excess sexual desire in female.
- **Transsexualism:** A gender identity that is inconsistent with or not culturally associated with their assigned sex and desire to permanently transition to the gender with which they identify.

81. Ans. (d) 15–49 years

Eligible Couples

For the purpose of family welfare, an eligible couple is the one who is currently married and the wife is in the reproductive phase, i.e. of age 15–49 years. There are nearly 180 such couples per 1000 population on average in India. All these are targeted for family welfare activities. Those with two or more children are targeted for sterilization and with fewer children for spacing methods such as condom, pills and IUDs.

82. Ans. (b) Sexual satisfaction by rubbing the genitalia with the body of the person of opposite sex

Frotteurism: Rubbing the genitalia with the body of the person of other sex for sexual satisfaction.

Sexual perversion	Mode of sexual pleasure
Sadism	Pleasure in giving pain to sexual partner
Masochism	Pleasure on receiving painful stimulus from sexual partner
Bondage	Sadism + masochism are found together
Fetichism	Sexual gratification by article of opposite sex
Frotteurism	Sexual gratification by contact. Ex: rubbing genitalia on another person
Exhibitionism	Satisfaction in exhibition of genitals with or without masturbation
Transvestism/Eonism	Pleasure in wearing clothes of opposite sex

Contd...

Sexual perversion	Mode of sexual pleasure
Buccal coitus or Sin of Gomorrah	Fellatio is oral stimulation of penis by male or female Cunnilingus is oral stimulation of female genitals
Voyeurism/ Scotophilia	Also known as Peeping tom Desire to watch sexual intercourse or to observe genitals of others
Trolism	Extreme degree of voyeurism. Ex: A perverted husband enjoy watching his wife having sexual intercourse with another man.
Urolangia	Sexual excitement by sight or odor of urine or faeces.
Tribadism/ Lesbianism	Gratification of sexual desire of a women by another women
Sodomy or Buggery of Greek Love	<ul style="list-style-type: none">• Anal sex• Gerantophilia –when passive agent is adult• Paederasty – when the passive agent is young boy (catamite)
Incest	Sexual intercourse with close relative
Bestiality	Sexual intercourse by a human being with a lower animal

83. Ans. (b) 18 years

Ref: <https://www.ageofconsent.net/world/India>

The Age of Consent in India is **18 years old**. The age of consent is the minimum age at which an individual is considered legally old enough to consent to participation in sexual activity. Individuals aged 17 or younger in India are not legally able to consent to sexual activity, and such activity may result in prosecution for **statutory rape** or the equivalent local law.

84. Ans. (b) An individual who may be impotent with any particular woman but not with others.

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 357-58*

- **IMPOTENCE**: inability of a person to perform sexual intercourse. *It cannot be placed as a defense for rape.*
- **STERILITY**: inability of the male to beget children and in the female, the inability to conceive children.
- **FRIGIDITY**: inability to start or maintain the sexual arousal pattern in the female.
- **QUOAD**: an individual who may be impotent with any particular woman but not with others.

85. Ans. (b) Child born after father's death

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 369*

- **Posthumous child**: Child born after father's death, the mother being conceived by the said father.

- **Suppositious child**: Fictitious child claimed by a women as her own, a women may pretend pregnancy & deliver and later produce a living child as her own or substitute a living male child for a dead child or for a living female child born for her.
- **Spurious or phantom child (pseudocyesis)**: Usually seen in women nearing menopause or younger women with an intense desire for children.

86. Ans. (c) Suppositious child

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 370; Forensic Medicine By P.V. Guhara, pg. 230*

- A **suppositious child** is one produced by a women whom claims it as her own whereas in actual fact it is not her child. A women may substitute a living male child for a dead or living female child born of her or may feign pregnancy and delivery and later produce a living child.
 - *Suppositious child also known as fraudulent offspring*
- **Posthumous child** is a child born after the death of the father in a legally married couple.

87. Ans. (b) Illegitimate child

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 369-70; Principles of Forensic Medicine and Toxicology By Rajesh Bardale / 364*

- A child is born to a couple who are not married legally is considered to be **illegitimate or a bastard**.

Conditions for being illegitimate or bastard if:

- The child is born out of wedlock OR
- Birth of child is not within a competent period after the cessation of the relationship of a man and wife OR
- Born within wedlock when procreation by the husband is not possible because of congenital or acquired malformation or disease.

88. Ans. (c) Psychogenic

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 356-58*

- Impotence is inability to perform sexual activity.
- It is applied to male only
- Most important cause of impotence is: **Psychogenic**
- *If psychogenic cause is ruled out then male factor should be tested next*
- **NOTE**: **FRIGIDITY**: impotency which is seen in females

89. Ans. (c) Incest

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 398*

- Incest is Sexual intercourse with close relative. It is not considered as crime in India.

- Other acts like rape, sodomy and indecent actions are considered as crime in India and are punished as and according to law.
 - **Rape:** punished under IPC 376
 - **Adultery:** under IPC 497
 - **Sodomy or any other un-natural sexual activity:** punished under IPC 377
 - **Grievous hurt or Indecent assault:** punished under IPC 320.

- The presence of unruptured hymen is a presumption, BUT IS NOT AN ABSOLUTE PROOF OF VIRGINITY.
- This makes the diagnosis of virginity difficult. With an intact hymen there are: TRUE VIRGINS and FALSE VIRGIN.
- **References states:** "Hymen may not be ruptured even after repeated acts of coitus if it is loose, lax, folded and **elastic** or thick, tough and fleshy which permits displacement, distortion and stretching without rupture"

90. Ans. (b) **Elastic**

Ref: *The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 365-66*

- **MC type of hymen:** Semilunar/Crescentic.

91. Ans. (d) **Bisexuality**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 402-403*

- **Paraphilias:** Abnormal & unorthodox sex play by using unusual objects or parts are known as paraphilia eg. Sadomasochism, Transvestism, Bestiality, Frotteurism, Homosexuality etc.
- **Bisexuality** means hermaphrodite; an individual with both ovary & testis & external genitals of both sexes.

TABLE: Different Paraphilias/Perversion

Sexual perversion	Mode of sexual pleasure
Sadism	Pleasure in giving pain to sexual partner
Masochism	Pleasure on receiving painful stimulus from sexual partner
Bondage	Sadism + masochism are found together
Fetischism	Sexual gratification by article of opposite sex
Frotteurism	Sexual gratification by contact. Ex: rubbing genitalia on another person
Exhibitionism	Satisfaction in exhibition of genitals with or without masturbation
Transvestism/Eonism	Pleasure in wearing clothes of opposite sex
Uranism	Sexual gratification by fingering, fellatio, cunnilingus etc.
Buccal coitus or Sin of Gomorrah	Fellatio is oral stimulation of penis by male or female Cunnilingus is oral stimulation of female genitals
Voyeurism/Scotophilia	Also known as Peeping tom Desire to watch sexual intercourse or to observe genitals of others
Trolism	Extreme degree of voyeurism. Ex: A perverted husband enjoy watching his wife having sexual intercourse with another man.
Urolangia/Coprophilia	Sexual excitement by sight or odor of urine or faeces.
Tribadism/Lesbianism	Gratification of sexual desire of a woman by another woman
Sodomy or Buggery of Greek Love	<ul style="list-style-type: none"> • Anal sex • Gerantophilia –when passive agent is adult • Paederasty – when the passive agent is young boy (catamite)
Incest	Sexual intercourse with close relative
Bestiality	Sexual intercourse by a human being with a lower animal

FMGE Solutions Screening Examination

92. Ans. (b) Sexual satisfaction by rubbing the genitalia with the body of the person of other sex

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 404

- **FROTTEURISM:** rubbing the genitalia with the body of the person of other sex for sexual satisfaction.
- *Refer to above explanation.*

93. Ans. (c) Pleasure in touching opposite sex

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 404

Please refer to above explanation.

94. Ans. (a) Voyeurism

Ref: The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 403-404

95. Ans. (a) Transvestism

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 403

TRANSVESTISM/ EONISM (trans= opposite; vista = clothing): whole personality is dominated by the desire of being identified with the opposite sex.

96. Ans. (a) Satyriasis

Ref: The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 357

- **SATYRIASIS:** Excessive sexual desire in males
- **Nymphomania:** Excessive sexual desire in females
- **Vaginismus** is one of the causes of female sterilization. It is spasmodic contraction of vagina due to hyperaesthesia.
- **Quoad hoc:** Individual impotent with one particular women, but NOT with others.

97. Ans. (b) Semen

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 405

Tests for Detection of

Seminal Stain (Mnemonic- "Creat Acid Fast Bacilli")

- **Acid phosphatase test:** to detect Aspermia cases
- **BarberioS test:** to detect Spermine (yellow needle shaped spermine picrate)
- **Creatine phosphokinase test:** for old seminal stain
- **Florence test:** choline crystals of semen shows fluorescence when examined (*Rhombotic crystals of choline iodide*)
- **Most specific test for seminal stain:** Isoenzyme LDH assay
- **For dry seminal stain:** UV rays used

Blood Benzidine test

- Best preliminary test as it detects blood present in dilution of 1 in 3 lakhs.
- Color produced: Deep Blue
- Not used because it is a potential carcinogen.

Kastle-Mayer/Phenolphthalein test- color produced is Pink Purple.

Microchemical test: Based on RBC content of blood.

- **Takayama's test:** Hb converted to Haemochromogen crystal.
 - Salmon pink feathery haemochromogen crystals are obtained.
- **Teichmann's Haemin crystal test:** Hb converted into Hemin/Hematin crystals.
 - Brown rhombic haemic crystal are seen
- **Spectroscopic test:** Most specific/confirmatory method for blood stain test
- Thin layer chromatography (TLC)
- Electrophoresis

Note: Test to distinguish human vs. animal blood- **Precipitin Test.**

98. Ans. (a) Choline

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 405-406

Please refer to above explanation.

99. Ans. (b) Barberios Test

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 405

Please refer to above explanation.

100. Ans. (a) Amylase

• Amylase	Saliva
• Ortho-toluidine	Blood
• Acid phosphatase	Semen
• Tetra-methyl-Benzidine	Blood

INJURY/ GUNSHOT INJURY/FIREARM INJURY/ STAB WOUND**101. Ans. (a) Paraffin wax**

Ref: Principle of Forensic Medicine & Toxicology, 2017 ed. Bardale, P 217,

- **The basic formula for black powder:**
 - A mixture of saltpeter (potassium nitrate), charcoal and sulfur.

- Later versions of gunpowder contain these same basic ingredients, but the overall chemistry evolved to include modifications that produced “smokeless gunpowder,” **Cordite**, which eliminated the sulfur.
- Other advances added materials such as nitrocellulose (guncotton) and glycerol trinitrate (nitroglycerin).
- Gunshot residue, or simply GSR, is a means of testing for the presence of certain materials on the hands and clothing of a subject in hopes of determining that this individual may have discharged a firearm.
- Gunshot residue contains burned particles (potassium nitrite) and some unburned particles (potassium nitrate), and criminal investigators collected these particles by **applying melted paraffin wax to a subject's hands**. Upon removal of the wax cast, a reagent containing diphenylamine and sulfuric acid was applied to the cast. The development of blue specks was indicative of the presence of nitrates.

102. Ans. (b) Scrotum

- *Lacerated looking incised wound* is seen at area where there is loose skin. For example scrotum and axilla.
- *Incised looking lacerated wounds* are seen at area where there is bony prominences. For example forehead, shin, etc.

103. Ans. (d) Bilirubin on 9th day

Ageing or Dating of Bruise

- As bruises heal, there is a gradual destruction and removal of the extravasated blood. Color change *starts at the periphery and extends inwards to the center*.
- *It follows this order:*

104. Ans. (b) From the periphery

- A large bruise takes longer time to heal than a smaller bruise. The color changes begin at the periphery first.
- A large old bruise may contain all possible colors seen in a bruise – from purple in the center to yellow at the edges.

105. Ans. (d) Keyhole

Ref: Forensic medicine, Clinical and Pathological aspect by Jason, Anthony and Williams. pg. 161

- If a bullet strikes the skull at an oblique, shallow angle, a characteristic defect may occur. This defect is often referred to as “keyhole defect” based on its resemblance to an old fashioned wooden door keyhole.
- **Graze wound** occurs when a bullet strikes the skin at a shallow angle and passess across the skin almost parallel to the skin surface, abrading the skin without penetrating the body. Abrasion produced is elongated, ovoid to elliptical in shape.
- **In tangential gunshot wound** bullet strikes the skin at a shallow angle, but penetrates into subcutaneous tissue, lacerating the tissue before exiting at a point separate from entry. The entry and exit wound appear as crescent shaped abrasion.

Extra Mile

TABLE: Wounds from shot gun suggesting range

Shape of wound	Distance
Cruciate or stellate shaped	Contact over bone
Oval shaped	Up to 30 cm
Rat hole wound	30–100 cm
Satellite wound	More than 2 meters
Individual pellets	Over 4 meters

106. Ans. (a) Pressure Abrasion

Ref: The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 166-67

- **Abrasion:** An injury involving superficial layers of skin & is caused by friction between skin & some rough object. It is of 3 types:

FMGE Solutions Screening Examination

Scratch	Graze	Imprint/Pressure/ Contact abrasion
<ul style="list-style-type: none"> Produced by sharp object as pin Direction of injury is indicated by sharp edge initially & heaped up epithelium at end 	<ul style="list-style-type: none"> Also known as Friction or brush burn Produced when broad surface of skin slides against rough surface 	<ul style="list-style-type: none"> Also known as Patterned abrasion Produced as a result of direct impact or pressure with some object. Example: ligature mark in hanging & strangulation; nail & thumb mark in throttling; teeth mark in biting; tire marks in accident etc.

107. Ans. (c) **Graze abrasion**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 166-67*

- Brush burn or friction burn is seen in graze abrasion.
- Produced when broad surface of skin slides against rough surface.

108. Ans. (b) **Spine**

Ref: *The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 246*

- Fracture of spine need not injure the cord, but the cord is rarely injured without associated fractures of the vertebral column. “**Whiplash injury**” is an exception to this rule. This injury sustained commonly by the occupants of the front seat. When the vehicle comes to a sudden stop, there is forward thrust which produces acute hyperflexion but this converted into acute hyperextension as the forehead strikes the windscreen which causes injury to the cervical column.

109. Ans. (b) **2 day**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 169-70*

TABLE: Color Changes of Bruise according to duration and systemic causes

Color	Duration	Due to
Red	Day 0	Hemoglobin (fresh blood)
Blue	1 day	Deoxygenated hemoglobin
Bluish Black/ Dark Blue to Brown	2-4 days	Hemosiderin
Green	5-7 days	Biliverdin/Haematoidin
Yellow	7-10 days	Bilirubin
Normal color	14-15 days	Pigment removed by phagocytes

Note: These color changes are not seen in subconjunctival hemorrhage which is being kept oxygenated by air. It is red at first then becomes yellow and finally disappears.

110. Ans. (c) **Injury common in moving head**

Ref: *The Essentials of FSM by K.S. Narayan Reddy 31st ed. pg. 233; Reddy's Essentials of forensic medicine & toxicology 23 ed. pg. 205*

- Coup & Countre coup lesions are most commonly seen in brain.
- Remember countre coup injury this way:
 - When a body is in motion, brain is also in motion in same direction.
 - A sudden stop, puts the body in static condition, but the brain is still in motion, and hits the skull leading to injury known as coup injury, brain then again hits on the opposite side causing countrecoup injury.

TABLE: Differences between coup and countre coup injury

Coup	Countre-coup
<ul style="list-style-type: none"> Means that the injury is located towards the side of impact/injury. It results directly by the impacting force Seen MC in stationary condition 	<ul style="list-style-type: none"> Means that the lesion is present in an area opposite the side of impact/injury. It results due to sudden hitch of a moving head. Seen MC in moving head

111. Ans. (d) **Nitrocellulose**

Ref: *The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 197-98*

Gun powders can be of two types and is made of:

Black gun powder	Smokeless powder
Consists of: <ul style="list-style-type: none"> Potassium nitrate 75% Sulphur 10% Charcoal 15% 	Consists of: <ul style="list-style-type: none"> Nitrocellulose (single base; gun cotton) Nitroglycerine + Nitrocellulose Nitroglycerine + Nitrocellulose + Nitroguanidine (triple base)

112. Ans. (d) **Two bullets are ejected one after the other**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 213*

- Tandem or Piggyback bullet** are the bullets ejected one after the other, when the first bullet having been stuck in the barrel, fails to leave the barrel & is ejected when the next bullet is fired.

Extra Mile

TABLE: Different types of bullet movements

Term	Feature
Yawning Bullet	Bullet which travel in an irregular fashion instead of travelling straight and cause a key hole entry wound.
Ricochet bullet	Bullet strikes some intervening object first, and then after ricocheting & rebounding from this hits the object.
Dum dum Bullet	A jacketed bullet with its nose cut off to expose the core and it expands on impact
Tumbling B.	One that rotates in end on end during its motion.
Souvenir Bullet	A bullet left in body for long time & it gets surrounded by dense fibrous tissue
Gutter wound	Bullet strikes the skull but does not enter and travel in soft tissue and form an elongated gutter like depression
Bullet gaze/slap	Bullet that does not perforate the skin, but produces only friction wound

113. Ans. (a) **Direction of injury**

Ref: *The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 178*

- Tailing of wound is one of the characteristics of the incised wound which indicates the direction in which the cut was made.
- Incised wounds are deeper at the beginning as more pressure is exerted at this point (head of wound). Towards the end of the cut the wound becomes increasingly shallow, till finally as the knife leaves the tissues, the skin alone is cut. This is known as tailing of wound.

114. Ans. (d) **Chopping**

Ref: *The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 182-83*

- Stab wound is produced when force is delivered along long axis of narrow or a pointed object, such as knife, dagger, sword, chisel, screw driver etc into the depth of the body.
- It can present as point wound, puncture wound or perforation.
- **Chop wound/slash wound** are deep gaping wound caused by a blow with the sharp cutting edge with a heavy weapon like axe, sword, chopper or meat cleaver.

115. Ans. (a) **Suicide**

Ref: *The essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 180*

- Tentative cuts/Hesitation marks are multiple small superficial cuts seen in cases where there is a trial of suicide.
- MC site for tentative cuts are: **Forearm**

116. Ans. (c) **Avulsion**

Ref: *KS Narayana Reddy's 'The Essentials of Forensic Medicine and Toxicology'; 29/e, p-171*

Avulsion (Shearing Laceration)

- The shearing and grinding force by a weight, such as heavy vehicle wheel passing over a limb may produce separation of the skin from the underlying tissues over a relatively large area. This is called 'flaying'.
- The underlying muscles are crushed and the bones may be fractured.
- The separated skin may show abrasions from the rotating frictional effect of the tyre, but one portion is still in continuity with the adjacent skin.

ABORTION, THANATOLOGY AND HANGING117. (b) **Nysten's rule**

Ref: *Forensic Medicine: Clinical and Pathological Aspects, P 101*

- Nysten's rule describes that rigor mortis doesn't start in all muscles simultaneously. It can be used for rough estimation of time since death.
- The law states: "the rigidity in humans begins in mandibular joint then in trunk and neck, followed by upper extremities and then lower extremities. It follows the same order during resolution".
- The development of rigor mortis is thus descending.

118. Ans. (b) **Head**

Ref: *APC Essentials of Forensic Medicine By Anil Aggarwal P. 143*

- In suspected cranial injury, neck and chest should be opened first. It decompresses the CVS draining the blood in chest cavity.
- While in suspected neck trauma/hanging, **cranial cavity is opened first** to drain out blood from head. A bloodless field is thus created in the neck which prevents artifactual hemorrhages occurring in the neck.
- The **neck should be opened or dissected last** in case of death due to asphyxia/hanging.
- This is because the neck structure show marked congestion and suffusion of blood along with petechial hemorrhage in cases of asphyxia, therefore in an already congested neck it becomes sometimes difficult to distinguish a bruise on neck from congestion.
- Therefore, the neck needs to be drained of blood by opening the other structures like head, thorax, abdomen first to have a clear field devoid of artifacts.

119. Ans. (d) 1.04

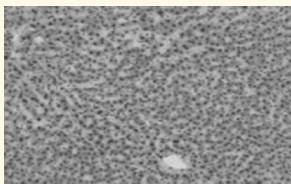

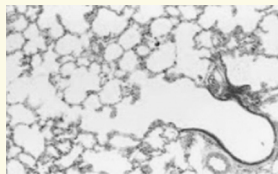

Ref: Guide to Forensic Medicine & Toxicology, P 157

TABLE: Difference between respired and unrespired lung

Character	Unrespired lung	Respired lung
Weight in relation to body weight	1/70	1/35
Specific gravity	1.04	0.94
Color	Uniform, reddish	Mottled/marbled appearance

120. Ans. (c) 1/35

Ref: Textbook and Principles of Forensic Medicine by Bardale, P 357:

Character	Unrespired lungs	Respired lungs
Weight in relation to body weight	1/70	1/35
Volume	Small	Large and covers the heart
Consistency	Liver like: Dense firm noncrepitant	Soft, spongy, elastic, crepitant
Extension	Up to the level of 4th and 5th rib	Up to the level of 6th and 7th rib
Specific gravity	1.04	0.94
Margin	Sharp	Rounded
Color	Uniform reddish	Mottled/marbled appearance
Air vesicle	Not inflated	Inflated
Section	Little froth less blood exudates on pressure	Abundant frothy blood exudates
Breslow life test	Whole or part sinks	Expanded
Microscopy	Cuboidal lining 	Squamous epithelium 
Blood vessel	Less patent	More patent

121. Ans. (c) Chelioscopy

Ref: Textbook of forensic medicine and toxicology by R N Karmakar pg. 358

Chelioscopy is the study of furrows or grooves present on the lips.

Le Moyne Snyder (1950) pointed out that the pattern of the furrows on the lips like finger prints are also individualistic and the prints left over glass, wine bottles, cup, saucer, fruit, cloth, paper, love letters may help in identification. Later on Santosh classified the furrows or the grooves of the lips into simple and compound types and further subdivided into 6 types.

Kazuo Suzuki and Yasuo Tsuchihashi (1970) classified lip prints as follows (Figs)

**FIGURES:** Types of lip-prints

- Type-I (Long vertical type)—Grooves running vertically for whole length

- Type-II (Short vertical type)—Grooves running vertically for partial length
- Type-III (Branching type)—Grooves are branched.
- Type-IV (Diamond type)—Grooves are intersected
- Type-V (Reticular type)—Grooves are reticulated
- Type-VI (Non-specific type)—Irregular having no specific pattern

122. Ans. (a) Pulmonary embolism

- In death certificate, 1A is the immediate cause of death. Like in this example, diabetic patient developed DVT, which leads to pulmonary embolism. The pulmonary embolism is the immediate cause of death.
- Line 1c is known as essence of death certificate.
- Given below is an example of death certificate:

Cause of death the disease or condition thought to be the underlying cause should appear in the lowest completed line of part I

I	(a) Disease or condition leading directly to death	Intraperitoneal hemorrhage
	(b) Other disease or condition, if any, leading to I(a)	Ruptured metastatic deposit in liver
	(c) Other disease or condition, if any, leading to I(b)	Primary adenocarcinoma of ascending colon
II	Other significant conditions Contributing to death but not Related to the disease or Condition causing it	Non-insulin dependent diabetes mellitus

The colon cancer on line I (c) led directly to the liver metastases on line I (b), which ruptured, causing the fatal hemorrhage on I (a). Adenocarcinoma of the colon is the underlying cause of death

123. Ans. (a) Hyperextension of the neck

Hyperextension is more dangerous because flexion is protected by the contraction of strong posterior neck muscles.

124. Ans. (b) 20 weeks

Medical Termination is permitted up to 20th week.

- Indications of MTP:
 - **Social:** Failure of contraceptives in a married woman.
 - **Eugenic:** Child born with serious physical or mental abnormalities
 - **Therapeutic:** If continuation of pregnancy endangers life.
 - **Humanitarian:** If pregnancy is the outcome of rape.

Important points about MTP act 1971:

- Only a qualified registered practitioner can perform it. Chief Medical Officer of district is empowered to certify that a doctor can perform it.

- A medical practitioner should have performed **25 cases of MTP** in a recognized hospital
- The operation should be performed either in a Government hospital or a place recognized by government.
- Non government institutions authorized by chief medical officer can also perform MTP.
- Consent of husband is **not** required, however written consent of the women or her guardian (if she is minor or mentally ill) is required
- Abortion can't be performed at the husband's request, if the woman is not willing.
- **No age proof is required**
- If the woman was raped, it's not necessary to lodge a police complaint
- Professional secrecy should be maintained
- If the duration of pregnancy is <12 weeks, opinion of single doctor is required
- Between 12 and 20 weeks, two doctors should consent that there is an indication.
- Termination can be performed by any of the doctor

125. Ans. (b) Prominent frontal emience

Ref: Review of Forensic medicine by Sumit Seth pg. 5–6

TABLE: Important identification differences between male and female

		Male	Female
Skull	General appearance	Larger, heavier	Smaller, lighter, smooth
	Capacity:	1500–1550 cc	Capacity: 1350–1400 cc
	Forehead:	Steeper, less rounded	Vertical, round
	Orbits	Square, relatively smaller	Rounded, relatively larger
	Frontal eminence	Small	Large
	Mastoid	Large, round, blunt	Small, smooth, pointed
Mandible	Rest all structure	Larger, broader	Relatively small, less prominent
	General	Larger and thicker	Smaller and thinner
	Chin	Square	Rounded
	Angle of body and ramus	Less obtuse (125°), prominent, everted	More obtuse, not prominent, inverted

Contd...

		Male	Female
Pelvis	General	Deep funnel	Flat bowl
	Framework	Massive, tougher, narrow, tough	Less massive, smooth
	Preauricular sulcus	Not frequent, shallow, narrow	Frequent, deep, broad
	Obturator foramen	Large, OVAL with base upwards	Small, triangular with apex forward
	Greater sciatic notch	Smaller, narrower, deeper	Larger, Wider, shallower
	Subpubic angle	V shaped, 70–75°	U-shaped, 75–90°
	Corpobasal index of sacrum	More in males	Less in female

FIGURES: Comparison of male and female pelvis

FIGURES: Comparison of male and female skulls

126. Ans. (b) **Medical assistant can perform in absence of gynecologist**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 374-75*

• **Indications of MTP:**

- **Social:** failure of contraceptives in a married woman.
- **Eugenic:** child borne with serious physical or mental abnormalities
- **Therapeutic:** if continuation of pregnancy endangers life.
- **Humanitarian:** if pregnancy is the outcome of rape.

Important Points about MTP act 1971

- Only a qualified registered practitioner can perform it, Chief medical officer of district is empowered to certify that a doctor can perform it.
- A medical practitioner should have performed **25 cases of MTP in a recognised hospital**
- The operation should be performed either in a Government hospital or a recognised place by government.
- Non government institutions authorised by chief medical officer can also perform MTP.
- *Consent of husband not required, however written consent of the woman or her guardian (If she is minor or mentally ill)*
- Abortion can't be performed at her husband's request, if the woman is not willing.
- **No age proof is required**
- If the woman was raped, it's not necessary to lodge a police complaint
- Professional secrecy should be maintained
- If the duration of pregnancy is < 12 weeks opinion of single doctor is required
- Between 12-20 weeks two doctors should consent that there is an indication.
- Termination can be performed by any of the doctor
- Termination permitted upto 20th week.

127. Ans. (d) **Age proof is generally not required**

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 374-75*

- Please read the question carefully. After reading the options of this question, we generally get a tendency to mark among option A to C.
- Please read the last option carefully, it's given as if it has no significance. But actually that's the correct answer.
- In case of MTP, age proof is not required.
- Please refer to the previous answer for detailed explanation.

128. Ans. (d) 25

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 374-375*

Please refer to above explanation.

129. Ans. (a) Occiput

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 314-15*

HANGING

- A form of violent asphyxia as a result of suspension of the body by a ligature round the neck the constricting force being the weight of body.

TABLE: Type of Hanging according to position of Knot

Typical Hanging	Atypical Hanging
<ul style="list-style-type: none"> Knot of ligature should be at the nape of neck on the back (Occiput). 'V' shape above thyroid cartilage Eg: suicide hanging 	<ul style="list-style-type: none"> At any site other than the nape of neck Most common site is near on angle of mandible No V- shape Eg: Judicial hanging

130. Ans. (d) 4.50 kg

Ref: *The Essentials of FSM by K.S. Narayan Reddy, 31st ed. pg. 314-18*

- Upon hanging the death can either be cervical bone fracture or can be secondary to vascular occlusion.
- In case of partial hanging some part of body touching the ground. Therefore weight responsible for death is weight of head, which is nearly equal to 4-5 kg.**
- There are 4 important vascular structures in neck which can bear weight of upto:
 - Jugular vein: 2 kg**
 - Carotid artery: 5 kg
 - Tracheal artery: 15 kg
 - Vertebral artery: 20-30 kg.

TABLE: Type of Hanging according to degree of suspension

Complete hanging	Incomplete (partial) hanging
<ul style="list-style-type: none"> Body is fully suspended & no part of body touches the ground Constricting force is weight of body 	<ul style="list-style-type: none"> The lower part of body is in touch with ground Weight of head acts as constricting force

131. Ans. (c) Saliva dribbling to the opposite side of the knot

Ref: *Textbook of Forensic Medicine and Toxicology: Principles and Practice by Vij/162*

TABLE: Difference between Hanging and Strangulation by ligature

Trait	Hanging	Strangulation by ligature
Manner of death	Mostly suicidal	Homicidal
Face	Pale, No petechiae	Red congested, marked petechiae
Bleeding	Bleeding from nose, mouth and ears not common	Common
Saliva	Often dribbles out of mouth	Very rare
Ligature	Oblique, Non-continuous, placed high up in the neck between chin and larynx	Horizontal or transverse, continuous round the neck, low down in the neck below or across the thyroid
Abrasion and Echymosis around the edge of ligature	Rare	Common
Larynx and trachea fracture	Rare That too in Judicial hanging	Comparatively more common

Note: Position of knot in suicidal hanging is at the nape of neck. In Judicial hanging position of knot mostly is at the angle of mandible.

132. Ans. (a) Hanging

Ref: *The Essentials of FSM by KS Narayan Reddy, 31st ed. pg. 319*

- Le facies sympathique is an expression which is seen in cases of antemortem hanging.
- When the ligature knot presses on cervical sympathetic, the eyes on the same side may remain open and its pupil dilated. This particular finding is known as le facies sympathique.

133. Ans. (a) Burking

Ref: *The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 335*

- Strangulation** is a form of asphyxia which is caused by constriction of the neck by a ligature without suspending the body. It can be several types:
 - Bandsola:** One bamboo stick at back of neck and other at the front of neck. Both ends tied with rope which causes death of the victim.
 - Garotting:** Victim is attacked from behind with a rope over the neck.
 - Mugging:** Strangulation caused by holding the neck of the victim in the bend of the elbow.

- **Suffocation** is a form of asphyxia, which is caused by deprivation of oxygen, either due to lack of oxygen in environment or from obstruction of air passages at the level of nose and mouth.
- **Forms of suffocation asphyxia:**
 - **Burking** is a method of homicidal **smothering and traumatic asphyxia**.
 - **Smothering:** form of asphyxia caused by closing the external respiratory orifices either by hand or other means
 - **Gagging:** Asphyxia by forcing cloth into the mouth.
 - **Overlaying:** Asphyxia due to compression of chest. Ex: Mother overlaid on infant.
 - **Choking:** Asphyxia by obstruction of air passages, usually between the pharynx and bifurcation of trachea. Almost always accidental.
 - **Café coronary:** Alcoholic who is grossly intoxicated dies while having meal. Death occurs due to sudden heart attack. High blood alcohol content anesthetizes the gag reflex.

134. Ans. (a) **Homicidal smothering and traumatic asphyxia**

Ref: *The essentials of FSM by KS Narayan Reddy, 31st ed. pg. 335*

Please refer to above explanation.

135. Ans. (b) **Suffocation**

Ref: *The Essentials of FSM by KS Narayan Reddy, 31st ed. pg. 335*

Please refer to above explanation.

136. Ans. (d) **Eyelids**

Ref: *The Essentials of FSM by K.S. Narayan Reddy 31st ed. pg. 140-43, 147; Reddy's, 27th pg. 142*

Order of appearance and disappearance (in sequence)

- Heart (left chamber in 1 hour)
- Eyelids (3-4 hours)
- Face muscles
- Neck and trunk
- Upper extremities
- Legs
- Small muscle of finger and toes (last to be affected, 11-12 hours)

Extra Mile

- Postmortem rigidity lasts for **18-36 hours** in summer and 24-48 hours in winter.
- Postmortem rigidity disappear in the same order as that of the appearance

137. Ans. (d) **60°C**

Ref: *AK Gupta's 'Essentials of Forensic medicine & Toxicology' 4/e, p-96*

- When temperature of flame is 65 degree Celsius or above, body is rigid with limbs flexed known as pugilistic or Fencing posture **due to coagulation of albumin constituents of muscles (Boxer's posture in defence)**.
- But this is not always a true ante-mortem phenomenon as heat stiffening can occur after death due to postmortem bums.

138. Ans. (a) **Neck**

Ref: *Forensic Medicine and Toxicology' by RN Karmakar*
Bloodless dissection of neck is to be done in asphyxia.

FORENSIC PSYCHIATRY

139. Ans. (b) **Lung maturity**

Tests to detect infanticide:

- **Fodere test:** The lungs are ligated across the hila and separated. Weight of the lung in an infant before respiration is 30 g, after respiration it doubles. The increase in weight is due to increased flow of blood.
- **Plouquets test:** Weight of the lung is 1/70th of the total fetal weight before respiration and 1/35th of the total weight after respiration.
- **Breslau's second life test:** Test to detect air in stomach and intestine

140. Ans. (a) **Intake of indigestible plant materials**

- Bezoar is mass found trapped in GIT
- A **phytobezoar** is a type of bezoar, or trapped mass in the stomach, that consists of components of indigestible plant material, such as fibres, skins and seeds. It is frequently reported in patients with impaired digestion and decreased gastric motility.
- **Trichobezoar** is a bezoar formed from hair.
- **Pharmacobezoar:** are mostly tablets or semi-liquid masses of drugs, normally found following overdose of sustained-release medications.

ANSWERS TO BOARD REVIEW QUESTIONS

141. Ans. (b) **Race**

Ref: Parikh 6th ed. / 2.26, http://en.wikipedia.org/wiki/Cephalic_index

142. Ans. (a) **Physical torture**

Ref: Textbook of forensic medicine and toxicology: Principles and practice, 5/e, By Krishan Vij / 192

Ref: Forensic medicine and toxicology R.N. Karmakar, 3/e, p 94, Clinical immunotoxicology by David S. Newcombe, p 233

176. Ans. (b) **318**

Ref: Parikh 6, p 5.87

177. Ans. (b) **Section 416 CrPC**

Ref: Principles of forensic medicine and toxicology by Rajesh bardale, p 3, Textbook on the Indian penal code by Krishna deo gaur, p 107

178. Ans. (c) **Organs are removed one by one**

Ref: Parikh 6/e/5.71, Handbook of death and dying, vol. 1, Clifton D. Bryant/530, 531, Ludwig J. Handbook of Autopsy Practice. 3/e, Totowa, NJ: Humana Press, 2002, Volmar KE. History of autopsy technique. In: Collins KA, Hutchins GM, eds. Autopsy performance and reporting. 2./e, Northfield, Ill, Col. of American Pathologist, 2003

179. Ans. (d) **Brain**

Ref: Essenstial forensic neuropathology, p 94

180. Ans. (c) **Wrinkled dusty sclera**

Ref: Parikh 7/e, p 3.10, Knight's forensic pathology, 3/e, p 54

181. Ans. (a) **3 to 5 hours**

Ref: Parikh 7/e, p 3.10, Knight's forensic pathology 3rd/e, p 54

182. Ans. (a) **Estimate fetal age**

Ref: Textbook of forensic medicine and toxicology by nageshkumar rao, p 321

183. Ans. (c) **To protect the accused**

Ref: Parikh 7/e, p 1.11

184. Ans. (c) **50% glycerine**

Ref: Textbook of forensic medicine and toxicology: Principles and practice by vij 4/e, p 33

185. Ans. (a) **Loops**

Ref: Fingerprint Analysis Laboratory Workbook by Hillary Moses Daluz, P 15-16

- **Loops** are the most common type of finger print present in around 60-70% of the finger prints.
- **Whorls** are the second most common type of finger print, seen in around 30-35% of finger prints.
- **Arches** are the least common type of finger print, seen in only 5% of finger prints.
- **Fingerprint classifications are:**
 - Henry classification system
 - National Crime Information System classification period

186. Ans. (d) **Root resorption at the base**

GUSTAFSON'S METHOD

- This method is based on morphological and histological changes of the teeth.
- This assessed **regressive changes** such as:
 - Amount of occlusal attrition(A)
 - Coronal secondary dentine deposition(S)
 - Loss of periodontal attachment(P)
 - Cementum apposition at the root apex(C)
- Root resorption at the apex(R)
- Dentine translucency(T)
 - $An + Sn + Pn + Cn + Rn + Tn = X$; a total score
- Age was estimated using the formula
 - $Age = (11.43 + 3.63X) \text{ years}$
- If was found that an increase in the total score corresponds to an increase in age

ANSWER TO IMAGE-BASED QUESTION

187. Ans. (b) **Arsenic Poisoning**

Preventive and Social Medicine (PSM)

MOST RECENT QUESTIONS 2019

1. **Inertization is:**
 - a. Reducing organic and combustible waste to inorganic
 - b. Burning biomedical waste
 - c. Biomedical waste converted into non harmful
 - d. To avoid water contamination
2. **Amplifier host of Japanese encephalitis:**
 - a. Pig
 - b. Dogs
 - c. Cats
 - d. Birds
3. **Best index for calculation of nutrient value of protein**
 - a. Serum albumin concentration
 - b. Arm-muscle circumference
 - c. Creatinine-height index
 - d. Serum transferrin level
4. **Best index for measurement health indicator in society:**
 - a. Under 5 mortality rate
 - b. Infant Mortality Rate
 - c. Child death rate
 - d. Maternal mortality rate
5. **Which of these has the max natural source of vitamin A?**
 - a. Carrot
 - b. Halibut liver oil
 - c. Cod fish oil
 - d. Cow milk
6. **According to WHO, marker for obesity Index is:**
 - a. Quetelet index
 - b. Chandler index
 - c. Pearl index
 - d. Sullivan's index
7. **According to WHO, which one is a notifiable disease?**
 - a. Yellow fever
 - b. Polio
 - c. Influenza
 - d. Malaria
8. **Most common reported disease in post disaster period:**
 - a. Acute gastroenteritis
 - b. Pneumonia
 - c. Leptospirosis
 - d. Malnutrition
9. **Amount of sodium in ORS as per WHO:**
 - a. 65 mmol/L
 - b. 75 mmol/L
 - c. 20 mmol/L
 - d. 100 mmol/L

10. **As compared to cow milk, the protein content of human milk is:**
 - a. 3–4 times more than cow milk
 - b. 3–4 times less than cowmilk
 - c. Double than cow milk
 - d. Same as cowmilk
11. **BCG is diluted with:**
 - a. NS
 - b. DW
 - c. RL
 - d. Distilled water
12. **Nowadays which is the most common pasteurization method?**
 - a. Holder (vat) method
 - b. Ultra high temperature method
 - c. High temperature and short time method
 - d. Low temperature and long time method
13. **True about Quarantine:**
 - a. Restriction of movement of Infected patient
 - b. Restriction of movement of healthy contact of an infectious disease
 - c. Movement restricted for shortest incubation period
 - d. Isolation of diseased person
14. **Which test is done at sub Centre during pregnancy:**
 - a. USG
 - b. Haemoglobin
 - c. OGTT
 - d. Triple test

CONCEPT OF HEALTH AND DISEASE

15. **True about PQLI** *(Recent Pattern Question 2016)*
 - a. Literacy rate, birth rate, life expectancy at birth
 - b. Life expectancy at 1 year, IMR, literacy rate
 - c. Life expectancy at birth, income, literacy rate
 - d. Soon to be replaced by GNP
16. **Father of public health:**
 - a. Tuberculosis
 - b. Cholera
 - c. Malaria
 - d. Plague
17. **PQLI lies between:**
 - a. 0 and 1
 - b. 0 and 10
 - c. 0 and 100
 - d. 1 and 10
18. **Which of the following is true about Human Development Index:**
 - a. Maternal mortality rate
 - b. IMR
 - c. Life expectancy-Birth
 - d. Life expectancy- 1 year

19. **HDI consists of all EXCEPT:**
 a. Real GDP per capita income
 b. Life expectancy at birth
 c. Mean year of schooling and expected year of schooling
 d. Range 0 to 100
20. **Human development index value is:**
 a. 0–1
 b. 0–100
 c. Any number
 d. No number
21. **Not included in PQLI is:**
 a. Income
 b. Literacy
 c. Life expectancy at age 1
 d. Infant mortality
22. **Image of iceberg phenomenon with value of 12 cases mentioned above the surface, 20 at the surface, 50 beneath the surface. Which disease has following pattern:**
 a. Tuberculosis
 b. Measles
 c. Rabies
 d. Tetanus
23. **In iceberg phenomenon, the submerged part represents**
 a. Undiagnosed cases in community
 b. Diagnosed cases in community
 c. Clinical cases that physician sees
 d. Clinical cases that investigator sees
24. **Changes in occurrence of a disease over a long period of time:**
 a. Secular trend
 b. Cyclic trends
 c. Seasonal trends
 d. Epidemic
25. **Disease recurring after many years:**
 a. Secular trends
 b. Cyclic trend
 c. Seasonal trend
 d. Propagated epidemics
26. **A disease condition like influenza pandemics occurs every 10 years. Which trend is reflected here:**
 a. Secular trend
 b. Epidemic
 c. Seasonal trend
 d. Cyclic trend
27. **Accidents happening during weekends is:**
 a. Cyclic trends
 b. Seasonal trends
 c. Secular trends
 d. Point source epidemic
28. **Which of following defines ability of organism to cause infection:**
 a. Pathogenicity
 b. Infectivity
 c. Antigenicity
 d. Virulence
29. **In ICD-10 how many volumes are there:**
 a. 1
 b. 2
 c. 3
 d. 4
30. **Framingham study is:** (Recent Pattern Question 2018)
 a. Prospective cohort
 b. Retrospective cohort
 c. Case control study
 d. Cross sectional study
31. **Incidence can be calculated by:** (Recent Pattern Question 2018)
 a. Cohort study
 b. Case control study
 c. Cross sectional study
 d. Retrospective cohort
32. **Framingham heart study comes under:** (Recent Pattern Question 2017)
 a. Cohort
 b. Case control
 c. Cross sectional study
 d. Ecological study
33. **Framingham heart study is** (Recent Pattern Question 2016)
 a. Cohort
 b. Case control
 c. Interventional
 d. Cross sectional
34. **Hospital patient admission rate differs in different hospitals with different disease. This causes which type of bias?** (Recent Pattern Question 2016)
 a. Subject bias
 b. Investigator bias
 c. Berksonian bias
 d. Analyser bias
35. **Fetal cardiac monitoring is a type of:** (Recent Pattern Question 2016)
 a. Primary prevention
 b. Secondary prevention
 c. Tertiary prevention
 d. Primordial prevention
36. **Relative risk calculation is done for:** (Recent Pattern Question 2016)
 a. Cohort study
 b. Case control study
 c. Cross sectional study
 d. Ecological study
37. **What is true about double blind trial?**
 a. Patient getting double treatment
 b. Patient does not know that he is a part of clinical trial
 c. Patient is getting both placebo and medication
 d. Patient does not know what is he getting
38. **Randomization is:**
 a. It brings bias in study group, therefore avoided
 b. It is the Procedure by which participants are allocated into groups usually called 'study' and 'control' group
 c. It ensures that investigator has full control over allocation of participants to study or control group
 d. It is done usually before entering in the study and then consent is taken
39. **'Primordial Prevention' means:**
 a. Preventive action taken prior to onset of disease
 b. Prevention of emergence of risk factors of the disease
 c. Prevention of disease from causing complication
 d. Early detection of disease by screening
40. **Immunization is which type of prevention?**
 a. Primordial
 b. Primary
 c. Secondary
 d. Tertiary
41. **Polio vaccine is which type of prevention:**
 a. Primary
 b. Secondary
 c. Tertiary
 d. Primordial

STUDY DESIGNS AND PREVENTIVE MEASURES

42. All of the following are true regarding primary prevention EXCEPT:
 - a. Immunization
 - b. Specific protection
 - c. Early diagnosis and treatment
 - d. Contraceptives
43. Screening of cervical cancer is which level of prevention?
 - a. Primordial
 - b. Primary
 - c. Secondary
 - d. Tertiary
44. Vaccine is what level of prevention:
 - a. Primordial
 - b. Primary
 - c. Secondary
 - d. Tertiary
45. Tracking of blood pressure is which type of prevention:
 - a. Primordial
 - b. Primary
 - c. Secondary
 - d. Tertiary
46. All of the following comes under primary prevention EXCEPT:
 - a. Pap smear
 - b. Helmets
 - c. Contraception
 - d. Vaccines
47. PAP smear is an example of:
 - a. Early diagnosis and treatment
 - b. Health promotion
 - c. Specific protection
 - d. Disability limitation
48. Desk provided with table top to prevent neck problems is an example of:
 - a. Primordial prevention
 - b. Primary protection
 - c. Specific protection
 - d. Disability limitation
49. Patient is on psychotherapy, what is the level of prevention:
 - a. Primordial
 - b. Primary
 - c. Secondary
 - d. Tertiary
50. Iodized salt is given in an area endemic to goiter. Type of prevention:
 - a. Health promotion
 - b. Specific protection
 - c. Primordial prevention
 - d. Treatment
51. IFA supplementation is an example of:
 - a. Primordial
 - b. Specific protection
 - c. Secondary
 - d. Tertiary
52. Tracking of BP implies:
 - a. BP increase with age
 - b. BP decreases with age
 - c. BP of normotensive becomes hypertensive
 - d. BP of hypertensive remains hypertensive
53. Best for prevention of risk factor:
 - a. Primordial prevention
 - b. Primary prevention
 - c. Secondary prevention
 - d. Tertiary prevention

EPIDEMIOLOGY, SCREENING AND VACCINES

54. Vaccine storage at level of PHC? *(Recent Pattern Question 2018-19)*
 - a. Walk in freezer
 - b. Walk in coolers
 - c. Ice line refrigerator
 - d. Cold boxes
55. In a Baby who is on steroids, live vaccine can be given after: *(Recent Pattern Question 2018-19)*
 - a. 2 weeks
 - b. 4 weeks
 - c. 6 weeks
 - d. 10 weeks
56. All of the following live vaccines are contraindicated in pregnancy EXCEPT: *(Recent Pattern Question 2018)*
 - a. Yellow fever
 - b. BCG
 - c. Rubella
 - d. OPV
57. Food poisoning is an example of: *(Recent Pattern Question 2018)*
 - a. Point source epidemic
 - b. Propagated source epidemic
 - c. Common source epidemic
 - d. Pandemic
58. Diabetes, hypertension or CAD screening should be started after: *(Recent Pattern Question 2018)*
 - a. 30
 - b. 35
 - c. 45
 - d. 55
59. Neonatal tetanus prevention is best done by: *(Recent Pattern Question 2018)*
 - a. Tetanus toxoid
 - b. Tetanus immunoglobulin
 - c. Metronidazole
 - d. Penicillin
60. True about incidence: *(Recent Pattern Question 2018)*
 - a. Total number of cases in a community
 - b. Number of at risk patients
 - c. Number of new cases
 - d. Number of deaths in community
61. Only vaccine given to adults *(Recent Pattern Question 2018)*
 - a. DPT
 - b. dT
 - c. MMR
 - d. OPV
62. In a case of epidemic, 3 villages are affected simultaneously with typhoid cases. Upon study it is found that one milk man is going to all these 3 villages. Identify the type of epidemic: *(Recent Pattern Question 2017)*
 - a. Point source
 - b. Common source, propagative
 - c. Common source, multiple exposure
 - d. Common source, continuous exposure
63. When some people develop a disease after exposure from a primary case, it is known as: *(Recent Pattern Question 2017)*
 - a. Incidence
 - b. Prevalence
 - c. Lead time
 - d. Secondary attack rate

- 64. In situation of an epidemic, what is the medical officer's first role/first to do:** *(Recent Pattern Question 2017)*
- Do diagnosis and submit
 - Find out at risk population
 - Find out about number of cases
 - Confirm epidemic whether it exists in real
- 65. Net reproduction rate is defined as:** *(Recent Pattern Question 2017)*
- Number of live birth in the reproductive age group of a female
 - Average number of children born to a married woman
 - Average number of girls born to a woman assuming no mortality
 - Number of girls born to a woman during her lifetime assuming mortality
- 66. If net reproduction rate is desired to be 1, what should be the couple protection rate:** *(Recent Pattern Question 2017)*
- 42
 - 60
 - 70
 - 82
- 67. Lung cancer patients : 300 smokers and 300 nonsmokers, 10 year history taken. What can be calculated?** *(Recent Pattern Question 2017)*
- Prevalence
 - Incidence
 - RR
 - Odds ratio
- 68. What is the recommended dose for human rabies immunoglobulin (Ig) in 4-month-old child?** *(Recent Pattern Question 2016)*
- 20 IU/kg
 - 30 IU/kg
 - 40 IU/kg
 - 50 IU/kg
- 69. What is the measles vaccine dose?** *(Recent Pattern Question 2016)*
- 0.1 cc
 - 0.5 cc
 - 0.01 cc
 - 1.0 cc
- 70. Reconstructed Japanese encephalitis vaccine at 2–8 degrees can be stored up to how many years?** *(Recent Pattern Question 2016)*
- 1
 - 2
 - 3
 - 4
- 71. True about sentinel surveillance:**
- Includes notifiable cases *(Recent Pattern Question 2016)*
 - Done through evaluation of sub centre reports
 - Done by anganwadi worker
 - Increase reporting bias
- 72. Varicella zoster immunization is given to all EXCEPT:** *(Recent Pattern Question 2016)*
- Contacts with varicella zoster
 - To the newborn and pregnant female who was exposed 6 week before delivery
 - All HIV positive patients
 - Patients with varicella zoster
- 73. Father of epidemiology is:**
- Hippocrates
 - John Snow
 - Ambroise Pare
 - Rudolf Virchow
- 74. Father of Medicine:**
- John Snow
 - Edward Jenner
 - Louis Pasteur
 - Hippocrates
- 75. Which of the following set is termed as epidemiological triad?**
- Endemic, epidemic and outbreaks
 - Agent, host and environment
 - Incidence, prevalence and disease load
 - Agent, man and disease
- 76. In a population of 5000, number of new cases of TB is 500; old cases in the same population are 150. What is the prevalence of TB:**
- 9%
 - 12%
 - 13%
 - 18%
- 77. First case which comes to the notice of investigator is:**
- Index case
 - Initial case
 - Primary case
 - Secondary case
- 78. 1st case seen by an investigator:**
- Index case
 - Primary case
 - Secondary case
 - Generation time
- 79. First case in community is known as:**
- Index case
 - Initial case
 - Primary case
 - Secondary case
- 80. Quarantine is:**
- Separation for the period of communicability of infected person from others
 - Limitation of freedom of movement of well person or animals till incubation period of disease
 - Identification of source of infection and factors influencing its spread in community
 - Notification of disease to local health authority to put control measures on it
- 81. Disease seen all over the world:**
- Endemic
 - Epidemic
 - Pandemic
 - Sporadic
- 82. Point source epidemic is:**
- Gradual rise and gradual fall in number of cases
 - Sharp rise and sharp fall in number of cases
 - Sharp rise and fall is interrupted by secondary waves
 - Gradual rise and fall is interrupted by secondary waves
- 83. Period between infected host to appearance of symptoms**
- Generation time
 - Serial interval
 - Communicable period
 - Latent period
- 84. Period of disease initiation to disease detection is known as:**
- Window period
 - Generation time
 - Lead time
 - Latent period

85. Lead time is:

- a. Time from early diagnosis to starting treatment
- b. Time from treatment to mortality
- c. Time between detection of disease through screening and its clinical symptoms
- d. Time between clinical symptom to complete treatment

86. Number of live birth per 1000 women in the reproductive age is:

- a. Net reproductive rate b. Total fertility rate
- c. Gross reproduction rate d. General fertility rate

87. General fertility rate:

- a. Average number of children born to a women in her reproductive life span
- b. Annual number of live births per 1000 married women during reproductive age
- c. Total number of girl child born to a female
- d. Total number of boy child born to a female

88. Average number of girls born to woman experiencing Curie pattern is denoted by:

- a. Net reproductive rate b. Total fertility rate
- c. Gross reproduction rate d. General fertility rate

89. Maternal mortality rate is expressed as:

- a. 1000 live births b. 100,000 live births
- c. 1000 pregnancies d. 100 pregnancies

90. Which of the following is true about cohort study:

- a. Disease to risk factor study
- b. Effect to cause
- c. NOT associated with attributable risk
- d. Associated with antecedent causation

91. Disadvantage of case control study when compared to cohort study:

- a. Easy to carry out b. Rapid and inexpensive
- c. Cannot measure cause to effect
- d. Useful in rare diseases

92. Cross sectional study is associated with:

- a. Indicates prevalence b. Incidence
- c. Positive predictive value d. Relative risk

93. Cohort study can determine all EXCEPT:

- a. Prevalence b. Incidence
- c. Relative risk d. Exposure

94. True statement about PPV is:

- a. It increases with prevalence
- b. It decreases with prevalence
- c. No relation with prevalence
- d. Increases incidence

95. Sensitivity is used to calculate:

- a. True negative b. False positive
- c. True positive d. False negative

96. Components of epidemiological triad are all EXCEPT

- a. Environment b. Agent
- c. Host d. Pathogenesis

97. Predictive value indicating positive test in a screening modality is calculated by:

- a. $TP/TP + FP \times 100$ b. $TN/TN + FN \times 100$
- c. $TP/TP + FN \times 100$ d. $TN/FP + TN \times 100$

98. Specificity formula:

- a. $TP/TP + FP \times 100$ b. $TN/TN + FN \times 100$
- c. $TP/TP + FN \times 100$ d. $TN/FP + TN \times 100$

99. Important "great divide year" after which the added population exceeds that of previous decade:

- a. 1957 b. 1921
- c. 1951 d. 1957

100. All are true about case control study EXCEPT:

- a. Attribute risk b. Measurement of exposure
- c. Matching d. Odd's ratio

101. Screening is done because of all EXCEPT:

- a. Testing for infection or disease in population or in individuals who are not seeking health care
- b. It is defined presumptive identification of un recognized disease
- c. The search for unrecognized disease or defect by means of rapidly applied test , examinations or other procedures in apparently healthy individuals
- d. This is use of clinical or laboratory tests to detect disease in individual seeking health care for other reasons

102. All of the following vaccines are contraindicated in pregnancy EXCEPT:

- a. Measles b. Rubella
- c. BCG d. Tetanus

103. Newborn child with HIV+ and symptomatic, which vaccine will NOT be given:

- a. Measles b. OPV vaccine
- c. BCG d. Live J.E.

104. Yellow fever vaccination becomes effective after how many days of vaccination:

- a. 5 days b. 10 days
- c. 10 weeks d. 10 months

105. All of the following are true for yellow fever EXCEPT:

- a. Caused by vector aedes
- b. Incubation period of 3-6 days
- c. One attack gives life long immunity
- d. Validity of vaccination certification begins immediately after vaccination

106. Postexposure prophylaxis schedule of rabies vaccine in a previously immunized person:

- a. Day 0, 3, 7, 14, 21,90 b. Day 0, 3, 7, 14, 28, 90
- c. Day 0, 3 d. Day 0, 7, 28

107. Pre-exposure schedule in rabies vaccine?

- a. Day 0, 3, 7, 14, 28, 90 b. Day 0, 3, 7, 14, 21, 90
- c. Day 0, 7, 28 d. Day 0, 7, 21

108. Live attenuated vaccine can be given to:

- a. Children under 8 years b. HIV patients
- c. Patients on steroids d. Patients on radiation

- 109. Toxoids are prepared from:**
 a. Exotoxins b. Biotoxins
 c. Both d. None
- 110. Japanese encephalitis vaccine is:**
 a. Live attenuated b. Inactivated toxoid
 c. Cellular fractions d. Combined
- 111. Strain of Varicella zoster vaccine is:**
 a. Nakayama b. DANISH 1331
 c. Jeryl Lynn d. Oka
- 112. Reverse cold chain is used for:**
 a. Transportation of vaccines to laboratory to check its potency
 b. Carrying stool samples of polio patients from Primary Health Centre (PHC) to laboratory
 c. Transportation of outdated vaccines from PHC to district hospital
 d. Transportation of vaccines from camps to sub center
- 113. Which of the following vaccines does not provide herd immunity:**
 a. Hepatitis A b. Rabies
 c. Measles d. Diphtheria
- 114. Naranjo algorithm is used for:**
 a. Environmental factors effecting drug
 b. Para-metric based data evaluation
 c. Calculating adverse drug reaction
 d. Demographic factor affecting drugs action
- 115. Phase IV of clinical trial is done:**
 a. To find safety and toxicity
 b. To compare with existing drugs
 c. Pre marketing surveillance
 d. Post marketing surveillance
- 116. At which stage of clinical trial be taken should the permission of drug control**
 a. Phase 1 b. Phase 2
 c. Phase 3 d. Phase 4

COMMUNICABLE AND NONCOMMUNICABLE DISEASE

- 117. Identify the mosquito:** (Recent Pattern Question 2018-19)

- a. Culex b. Aedes
 c. Anopheles d. Mansonia

- 118. In a case of Measles, postexposure immunoglobulin can be given within how many days after exposure:**

(Recent Pattern Question 2018-19)

- a. 3 days b. 7 days
 c. 10 days d. 14 days

- 119. In a case of Cholera period of isolation is for ____ days?**

(Recent Pattern Question 2018-19)

- a. 7 days b. 7-14 days
 c. 3-4 weeks d. 1-2 months

- 120. How much is the daily Iodine requirement of a 3-5 months old child?** (Recent Pattern Question 2018-19)

- a. 150-200 mcg/day b. 100-120 mcg/day
 c. 200-400 mcg/day d. >400 mcg/day

- 121. Advantage of adding zinc with ORS:**

(Recent Pattern Question 2018-19)

- a. Reduces infection
 b. Antispasmodic
 c. Reduces duration of diarrhoea
 d. Enhance sodium absorption

- 122. Which of the following disease transmission does not require vector:** (Recent Pattern Question 2018-19)

- a. RMSF b. Q fever
 c. Scrub typhus d. Trench fever

- 123. Correct about lepromin test:**

(Recent Pattern Question 2018-19)

- a. Differentiates from TB
 b. Example of type 2 Hypersensitivity reaction
 c. Test result can be read after 24 hours
 d. Classify the type of leprosy

- 124. Dose of vitamin-A to a 2-year-old child with keratomalacia?** (Recent Pattern Question 2018-19)

- a. 1 lac IU once
 b. 1 Lac IU three times at 0,1,14 days
 c. 2 Lac IU once
 d. 2 Lac IU thrice every 6 months

- 125. Correct about initiating treatment in an adult patient with AIDS:** (Recent Pattern Question 2018-19)

- a. CD4 count <200/cu.mm required for initiation of treatment
 b. CD4 count <350/cu.mm required for initiation of treatment
 c. CD4 count <500/cu.mm required for initiation of treatment
 d. No cut off of CD 4 count required for initiation of treatment

- 126. Cattle and sheep livestock is natural host for which of the following?** (Recent Pattern Question 2018)

- a. Crimean-Congo fever
 b. Dengue
 c. KFD
 d. Yellow fever

- 127. True about chicken pox infection:**
a. Centrifugal distribution (*Recent Pattern Question 2018*)
b. Centripetal distribution
c. Severe prodromal symptoms
d. Involves mainly extensor surface
- 128. Which is the most common clinical feature of Tularemia?** (*Recent Pattern Question 2018*)
a. Fever
b. Headache
c. Lymphadenopathy
d. Diarrhea
- 129. Quintan fever is caused by:** (*Recent Pattern Question 2018*)
a. Rickettsia typhi
b. Bartonella
c. Coxiella burnetii
d. Rickettsia conorii
- 130. Culex mosquito is a vector for:** (*Recent Pattern Question 2018*)
a. Chikungunya fever
b. Dengue fever
c. Japanese encephalitis
d. Malaria
- 131. What is the color of RTI/STI kit number 6:** (*Recent Pattern Question 2017*)
a. Grey
b. Yellow
c. Red
d. Black
- 132. Black RTI kit is used in:** (*Recent Pattern Question 2017*)
a. Urogenital infection
b. Genital ulcer
c. Scrotum swelling
d. Inguinal bubo
- 133. Which cancer is preventable by vaccine:** (*Recent Pattern Question 2016*)
a. Ovarian CA
b. Cervix CA
c. Breast CA
d. Uterus CA
- 134. Incubation period for cholera:** (*Recent Pattern Question 2016*)
a. 1–7 days
b. Few hours to 5 days
c. 2 weeks
d. 4 weeks
- 135. All of the following are WHO notifiable diseases EXCEPT:**
a. Cholera
b. Chickenpox
c. Plague
d. Yellow fever
- 136. Which of the following diseases are notifiable to WHO in Geneva under the International Health Regulations:**
a. Plague, polio and malaria
b. Cholera, influenza and yellow fever
c. Cholera, plague and polio
d. Cholera, plague and yellow fever
- 137. Chicken pox is infective:**
a. 2 days before and 2 days after rash appearance
b. 2 days before and 5 days after rash appearance
c. 4 days before and 4 days after rash appearance
d. 4 days before and 5 days after rash appearance
- 138. Which has lowest incubation period:**
a. Mumps
b. Influenza
c. Measles
d. Chicken pox
- 139. Nosocomial infections are those which develop:**
a. 24 hours after hospitalization
b. Within 48 hours of hospitalization
c. After 48 hours of hospitalization
d. After 7 days of hospitalization
- 140. Cycle that is seen in RBCs in malaria:**
a. Sexual
b. Sporogony
c. Exogenous
d. Endogenous
- 141. Following is not caused by virus:**
a. Rocky mountain spotted fever
b. KFD
c. Dengue
d. Yellow fever
- 142. Which of the following is transmitted by mites:**
a. Endemic typhus
b. Epidemic typhus
c. Trench fever
d. Scrub typhus
- 143. Which of the following is not transmitted by aedes mosquito:**
a. Bancroftian filariasis
b. Yellow fever
c. Dengue fever
d. Chikungunya fever
- 144. Subacute Sclerosing Pan Encephalitis (SSPE) is a late complication of:**
a. Measles
b. Mumps
c. Rubella
d. Chicken pox
- 145. Prevalence of TB in a community is estimated by:**
a. Tuberculin test
b. AFB smear
c. Chest X-ray
d. Mantoux test
- 146. Tuberculosis diagnosis in India is based on:**
a. Sputum smear microscopy
b. Sputum culture examination
c. Mantoux test
d. Chest X-ray
- 147. XDR means extensive drug resistance to:**
a. H+R
b. 1 Fluoroquinolone
c. Minimum of 1 injectable drug
d. All of the above
- 148. All of the following are the components of DOTS in India EXCEPT:**
a. Uninterrupted supply of drugs
b. Political commitment
c. Case detection with the help of X-ray chest
d. Accountability (evaluation as well as monitoring)
- 149. Test to differentiate M.TB from Leprosy:**
a. AFB smear
b. Culture
c. Mantoux test
d. Chest X-ray
- 150. Sputum positive TB patients should be isolated at least for:**
a. 2 weeks
b. 3 weeks
c. 4 weeks
d. 6 weeks

**151. Sputum positive patient who should be quarantined:**

- a. Pregnant women b. Old people
- c. Children above 6 years d. Children below 6 years

152. Intermediate host of Rabies is:

- a. Man b. Dog
- c. Cow d. Rat

153. Leptospirosis is transmitted by:

- a. Fecal oral route b. Aerosol route
- c. Infected rat's urine d. Milk

154. Single drug treatment recommended for Trachoma control in India is:

- a. Azithromycin b. Tetracycline
- c. Erythromycin d. Penicillin

155. Not a component of SAFE strategy for control of Trachoma:

- a. Surgery b. Antibiotics
- c. Facial cleanliness d. Education

156. Pneumonic plague transmission route:

- a. Mice b. Tick
- c. Inhalation d. Flea

157. All are true about WHO considerations regarding Dracunculosis eradication, EXCEPT:

- a. Provision of safe drinking water like piped water and instillation of hand pumps
- b. In endemic areas step wells or by chemoradiation
- c. Education and awareness of public
- d. Control of cyclops

158. Plague is transmitted by all EXCEPT?

- a. X. Cheopsis
- b. X. Astia
- c. Pulex irritans
- d. Culex

159. Antiretroviral therapy is started when CD4 count is less than:

- a. 100 b. 200
- c. 350 d. 400

160. Ebola virus is spread by:

- a. Tics
- b. Inhalation from person to person
- c. Air droplet
- d. Through contact of body fluids

161. A village affected with epidemic of cholera, what is the 1st step which should be taken in the village to decrease the chances of death from cholera:

- a. Safe water supply & sanitation
- b. Cholera vaccination to all individuals
- c. Primary Chemoprophylaxis
- d. Treat everyone in the village with tetracycline

162. In cholera epidemic which step should be first taken:

- a. Vaccination to all individuals immediately
- b. Primary chemoprophylaxis
- c. Cure with tetracycline
- d. Safe water supply and sanitation

163. Oral cancer is caused due to:

- a. 50-70% in India by tobacco chewing
- b. 90% in south east Asia population by tobacco chewing
- c. In central Asian district of Former Soviet Union most cases are due to smoking
- d. In eastern coastal region of Andhra Pradesh chewing betel nuts

164. Reverse smoking causes:

- a. Carcinoma lip b. Carcinoma hard palate
- c. Carcinoma soft palate d. Carcinoma lung

165. Which of the following increases the risk of lung CA:

- a. Amount of smoking/day b. Use of filter cigarette
- c. Duration of smoking d. All of the above

NATIONAL HEALTH PROGRAMS & POLICIES**166. Which of the following is not correct about Urban Malaria scheme? (Recent Pattern Question 2018-19)**

- a. Comprise vector control by intensive Anti-larval measure
- b. Includes all urban areas with more than 50,000 population
- c. Areas with annual parasite index of 2 are included
- d. Includes area with slide positivity of more than 10 cases per 10,000 smears

167. Blood smear for malaria is collected by:*(Recent Pattern Question 2018-19)*

- a. Male MPW b. Medical officer
- c. ASHA d. Health assistant

168. Sputum for AFB is collected at village level by:*(Recent Pattern Question 2018-19)*

- a. Medical officer b. Anganwadi worker
- c. Health worker male d. Health assistant

169. Active surveillance of malaria is done by:*(Recent Pattern Question 2018-19)*

- a. Anganwadi workers b. Multipurpose worker
- c. ASHA d. Medical officer

170. Suraksha clinic is for: (Recent Pattern Question 2018-19)

- a. NVBDCP b. RTI/STD
- c. Blood transfusion safety d. Women safety

171. Ujjawala Scheme is for: (Recent Pattern Question 2018-19)

- a. Drug abuser rehabilitation
- b. Blind persons rehabilitation
- c. Online tracking of AIDS positive patients
- d. Child trafficking

172. Under vision 2020: in a school eye screening program, a teacher checks vision of a student will refer to which centre: (Recent Pattern Question 2018-19)

- a. Service centre
- b. Training centre
- c. Centre for excellence
- d. Vision centre

173. HIV targeted intervention not done in which population? *(Recent Pattern Question 2018-19)*

- a. Migrant labourer
- b. Street children
- c. Truck driver
- d. Transgenders

174. Programs included in NRHM is/are:

(Recent Pattern Question 2018)

- a. National vector borne disease control program
- b. Revised national tuberculosis control program
- c. Iodine deficiency disorder control program
- d. All of the above

175. Which of the following is not emphasized in school health services: *(Recent Pattern Question 2018)*

- a. Dental caries
- b. Infectious diseases
- c. Malnutrition
- d. Lung infections

176. Which of the following is not the work responsibility of ASHA: *(Recent Pattern Question 2018)*

- a. Immunization and contraception counseling
- b. Delivery at home
- c. Provide primary medical care for minor ailments
- d. Promote construction of household toilets

177. True about incentives given to ASHA worker in Janani Suraksha Yojna: *(Recent Pattern Question 2018)*

- a. 400 INR to ASHA and 1000 INR to mother in rural area in high performing states
- b. 400 INR to ASHA and 1000 INR to mother in rural area in low performing states
- c. 400 INR to ASHA and 1000 INR to mother in urban area high performing states
- d. 400 INR to ASHA and 1000 INR to mother in Urban area low performing states

178. An IQ of 55 comes in which category:

(Recent Pattern Question 2017)

- a. Profound
- b. Mild
- c. Moderate
- d. Idiot

179. 1 male health worker, 1 female health worker should be present at each PHC. This is given by which committee?

- a. Jungalwalla committee *(Recent Pattern Question 2016)*
- b. Kartar singh committee
- c. Bhore committee
- d. Mudaliar committee

180. All are true about national mental health program EXCEPT:

- a. Inpatient service
- b. Outpatient service
- c. Complete hospitalization
- d. Emergency service

181. Regarding mental health program, which statement is true:

- a. Started in 1951
- b. Started in 1987
- c. Started in 1987
- d. Started in 1999

182. Cafeteria approach is related with which of the following:

- a. National rural health mission
- b. National surveillance program for communicable diseases
- c. Reproductive and child health program
- d. National Vector Borne Disease Control Programme.

183. According to guidelines in AIDS control program, for a lady presenting with lower abdominal pain, the color code of kit used in treatment is?

- a. White
- b. Yellow
- c. Green
- d. Gray

184. Maximum recommended number of students in a school class room:

- a. 30
- b. 35
- c. 40
- d. 50

185. IQ level in severe mental retardation is:

- a. 50-69
- b. 40-49
- c. 20-39
- d. 21-34

186. True about national population policy 2000:

- a. Reduce MMR to <30/10,000 live births
- b. Reduce IMR to <100/10,000 live births
- c. 100% birth and death registration
- d. 100% institutional deliveries

187. True about millennium development goal 2000:

- a. Immunization coverage 85%
- b. Decrease child mortality rate
- c. Decrease maternal mortality rate
- d. Eradicate the communicable disease

188. The millennium development goals (MDG) are to be achieved by the year:

- a. 2010
- b. 2012
- c. 2015
- d. 2020

189. Which of the following is not eradicated:

- a. Leprosy
- b. Yaws
- c. Measles
- d. Polio

190. NOT included in immunization schedule:

- a. Kala-azar
- b. Polio
- c. Hepatitis
- d. BCG

191. In national vector borne disease control program which disease is not included?

- a. Malaria
- b. Yellow fever
- c. Japanese encephalitis
- d. Kala-azar

PREVENTIVE OBSTETRICS, PEDIATRICS AND GERIATRICS

192. For doctor to practise MTP minimum number of MTP to be performed is *(Recent Pattern Question 2018-19)*

- a. 10
- b. 25
- c. 50
- d. 100

193. A 28-year-old lady (G_2P_1) does not want to conceive again immediately after first trimester abortion. Which of the following is the best method for her?

(Recent Pattern Question 2018-19)

- a. OCP
- b. IUD
- c. Barrier method
- d. Implanon

194. How much additional calories per day is required in a pregnant lady:

(Recent Pattern Question 2018-19)

- a. 350 kcal
- b. 550 kcal
- c. 650 kcal
- d. 520 kcal

195. Most common cause of LBW in India:

(Recent Pattern Question 2018-19)

- a. Short gestational age
- b. Intrauterine growth retardation
- c. Maternal diabetes mellitus
- d. Genetic cause

196. According to WHO, all are true about reduced osmolarity ORS (in mmol/L) EXCEPT:

(Recent Pattern Question 2018)

- a. Glucose – 90
- b. Na – 75
- c. Potassium – 20
- d. Citrate – 10

197. Iron required in lactation:

(Recent Pattern Question 2017)

- a. 300 µg/day
- b. 400 µg/day
- c. 20 mg/day
- d. 100 mg/day

198. Total calories (kcal/day) required for a Female with sedentary activity:

(Recent Pattern Question 2017)

- a. 1900
- b. 2200
- c. 2500
- d. 2800

199. Total osmolarity of reduced osmolality ORS:

(Recent Pattern Question 2017)

- a. 215 mmol/L
- b. 220 mmol/L
- c. 225 mmol/L
- d. 245 mmol/L

200. Most common indirect cause of maternal mortality:

- a. Anemia
- b. Sepsis
- c. Hemorrhage
- d. Obstructed labor

201. Obstetric care will mostly affect:

- a. Infant mortality rate
- b. Early neonatal mortality rate
- c. Late neonatal mortality rate
- d. Perinatal mortality rate

202. Prophylactic iron and folic acid content according to RCH program during pregnancy:

- a. 500 mg iron + 100 mcg folic acid
- b. 100 mg iron + 500 mcg folic acid
- c. 100 mg iron + 100 mcg folic acid
- d. 20 mg iron + 100 mcg folic acid

203. Total amount of iron given during the pregnancy:

- a. 600 mg
- b. 800 mg
- c. 1000 mg
- d. 1200 mg

204. IFA tablet strength is:

- a. Iron 100 mg and folic acid 500 µg
- b. Iron 500 mg + folic acid 100 µg
- c. Iron 100 mg + folic acid 100 µg
- d. Iron 500 mg + folic acid 500 µg

205. Additional calorie allowance for a mother during first six months of lactation should range between

- a. 250–300 kcal
- b. 350–400 kcal
- c. 500–550 kcal
- d. 650–700 kcal

206. Registration of birth should be done:

- a. Within 15 days
- b. After 21 days
- c. Before 21 days
- d. Within 30 days

207. According to Integrated Management of Neonatal And Childhood Illness, color used in triage for home management

- a. Red
- b. Green
- c. Black
- d. Yellow

208. Best drug for diarrhea is:

- a. Cotrimoxazole
- b. Metronidazole
- c. ORS
- d. Ringer lactate

209. Exclusive breast feeding is up to:

- a. 6 weeks
- b. 6 months
- c. 9 Months
- d. 1 year

210. Infant mortality rate does not include:

- a. Post neonatal mortality
- b. Early neonatal mortality
- c. Perinatal mortality
- d. Late neonatal mortality

NUTRITION AND HEALTH

211. Waist to hip ratio that increases risk of cardiovascular disease is:

(Recent Pattern Question 2018-19)

- a. >0.80 in male
- b. >0.80 in female
- c. >0.85 in male
- d. >0.85 in female

212. Which of the following food adulteration can lead to beriberi:

(Recent Pattern Question 2018-19)

- a. Maize
- b. Sorghum
- c. Undermilled rice
- d. Polished rice

213. True about low glycemic index food:

(Recent Pattern Question 2018-19)

- a. Reduced peak and rapid absorption
- b. Reduced peak and prolonged absorption
- c. High peak and fast absorption
- d. High peak and prolong absorption

214. The glycemic index for glucose is:

(Recent Pattern Question 2018)

- a. 0.5
- b. 1
- c. 1.5
- d. 2

215. Richest source of linoleic acid?

(Recent Pattern Question 2017)

- a. Safflower oil
- b. Palm oil
- c. Sunflower oil
- d. Corn oil

216. Plant source with highest protein:

(Recent Pattern Question 2017)

- a. Black gram
- b. Dry peas
- c. Soyabean
- d. Bengal gram

- 217. What is the dose of iron folic acid given till 6-10 years?**
(Recent Pattern Question 2017)
- 20 mg iron with 0.1 mg FA
 - 20 mg iron with 0.2 mg FA
 - 50 mg iron with 0.5 mg FA
 - 100 mg iron with 0.5 mg FA
- 218. Total calories (kcal/day) required for a male with moderate activity?** (Recent Pattern Question 2017)
- 2230
 - 2730
 - 2900
 - 3500
- 219. How many calories are there in 100 mL breast milk?**
(Recent Pattern Question 2017)
- 60–65
 - 67–70
 - 72–78
 - 100–110
- 220. WRDA Vitamin B₁₂ in pregnancy:**
(Recent Pattern Question 2017)
- 1.2 mcg
 - 1.5 mcg
 - 0.8 mcg
 - 0.2 mcg
- 221. Epidemic dropsy is caused by this toxin:**
(Recent Pattern Question 2016)
- BOAA
 - Sanguinarine
 - Alkaloid
 - Ergot
- 222. In first 6 months of lactation how much extra calories are required by the lactating mother?**
- 150 Kcal
 - 350 Kcal
 - 600 Kcal
 - 650 Kcal
- 223. All of the following statements are true with regard to a reference Indian adult woman EXCEPT:**
- She is healthy
 - She is between 20–39 years of age
 - She may be engaged in 8 hours of moderately active work in a day
 - She weighs 60 kg
- 224. In Xerophthalmia, what is X1B:**
- Conjunctival xerosis
 - Bitot's spot
 - Corneal xerosis
 - Corneal ulcer
- 225. Secondary sign noted for xerophthalmia according to WHO:**
- Conjunctival xerosis
 - Corneal xerosis
 - Bitot spots
 - Night blindness
- 226. Xerophthalmia is a public health problem if bitot's spot incidence is:**
- 0.1%
 - 1%
 - 0.5%
 - 5%
- 227. According to prevalence criteria for determining xerophthalmia problems given by WHO, following are true for an endemic area:**
- Bitot spot 5% poluation of under 6 years
 - Conjunctival xerosis 1%
 - Conjunctival ulcers 0.05%
 - Night blindness 1%
- 228. Trace element is what percent of bodyweight:**
- 0.001%
 - 0.01%
 - 0.1%
 - 1%
- 229. Protein daily requirement is:**
- 1 g/kg
 - 2 g/kg
 - 3 g/kg
 - 4 g/kg
- 230. Which of the following vitamin is not an antioxidant:**
- Vitamin A
 - Vitamin B
 - Vitamin C
 - Vitamin E
- 231. All of the following vitamins are antioxidants EXCEPT:**
- Beta carotene
 - Vitamin B
 - Vitamin C
 - Vitamin E
- 232. Pellagra is caused by deficiency of:**
- Thiamine
 - Niacin
 - Biotin
 - Ascorbic acid
- 233. All are features of kwashiorkor EXCEPT:**
- Irritability
 - Edema in lower limb
 - Increase appetite
 - Apathy
- 234. Toxin of epidemic dropsy is:**
- BOAA
 - Sanguinarine
 - Alkaloid
 - Ergot
- 235. Epidemic dropsy can be due to this toxin:**
- BOAA
 - Sanguinarine
 - Alkaloid
 - Ergot
- 236. Epidemic dropsy is caused by:**
- Sanguinarine
 - Ergot
 - Alkaloid
 - BOAA
- 237. All are tests of pasteurization of milk efficiency EXCEPT:**
- Methylene blue reductase test
 - Phosphatase test
 - Standard plate count
 - Coliform count
- 238. Refrigerated breast milk can be kept for:**
- 6 hours
 - 10 hours
 - 12 hours
 - 24 hours
- 239. Methionine is a limiting amino acid in:**
- Cereals
 - Maize
 - Wheat
 - Pulses
- 240. Which amino acid is deficient in pulses:**
- Lysine
 - Threonine
 - Methionine
 - Cysteine
- 241. What is the biological value of egg protein:**
- 80
 - 90
 - 100
 - 120
- 242. Vitamin D is high in:**
- Human Milk
 - Cow's milk
 - Green vegetables
 - Egg
- 243. Which of the following is a rich source of vitamin D?**
- Milk
 - Shark liver oil
 - Halibut liver oil
 - Cod liver oil
- 244. Vitamin D is found in:**
- Iron
 - Milk
 - Meat
 - Fish liver oil

245. Physiologically most active form of vitamin D is:

- a. Calciferol
- b. Calcidiol
- c. Ergocalciferol
- d. Calcitriol

246. Most essential fatty acid is:

- a. Linoleic acid
- b. Linolenic acid
- c. Arachidonic acid
- d. All of the above

247. All are essential fatty acids EXCEPT:

- a. Linoleic acid
- b. Linolenic acid
- c. Arachidonic acid
- d. Glutamic acid

248. Hypothyroidism is associated with deficiency of:

- a. Iron
- b. Iodine
- c. Zinc
- d. Fluorine

249. Chronic malnutrition is assessed by:

- a. Weight/height
- b. Height/age
- c. Weight/age
- d. Mid arm circumference

ENVIRONMENT AND HEALTH

250. Horrock's apparatus is used for:

(Recent Pattern Question 2018)

- a. Measuring the hardness of water
- b. Surveillance of drinking water quality
- c. Calculating bleaching powder dose for water disinfection
- d. Calculating mid arm circumference in malnutrition

251. Hospital infection is known as *(Recent Pattern Question 2016)*

- a. Opportunistic infection
- b. Nosocomial infection
- c. Viral infection
- d. Health care infection

252. For hookworm to be a major public health problem, chandler's index should be more than:

- a. 100
- b. 200
- c. 250
- d. 300

253. Chandler's index is:

- a. Number of hookworm larva per gram of stool
- b. Number of hookworm eggs per gram of stool
- c. Number of hookworm per gram of stool
- d. Number of E. coli in a water sample

254. Chandler's index is associated with:

- a. Hook worm
- b. Pin worm
- c. Round worm
- d. Guinea worm

255. Soiling index is used to monitor:

- a. Water pollution
- b. Air pollution
- c. Soil pollution
- d. All of the above

256. The indicator agents to determine fecal pollution of drinking water is:

- a. Proteus species
- b. Coagulase-negative staphylococcus
- c. Klebsiella species
- d. E. coli

257. In India, at least how many meters away the sanitary well should be located from likely source of contamination:

- a. 10 meters
- b. 15 meters
- c. 50 meters
- d. 75 meters

FAMILY PLANNING AND CONTRACEPTION

258. Highest Contraceptive failure:

(Recent Pattern Question 2018-19)

- a. Implant
- b. IUCD
- c. Spermicide
- d. OCP

259. A woman from village delivers her 7th baby and she wants contraception. When is the ideal time for immediate post-partum IUD insertion?

(Recent Pattern Question 2018-19)

- a. Immediately after baby's expulsion
- b. Within 1 week of delivery
- c. After 6 weeks of delivery
- d. After 6 months of delivery

260. Unmet need for contraceptive means:

- a. Contraception desired *(Recent Pattern Question 2018)*
- b. Sexually inactive female
- c. Family planning in those who are not using any contraception
- d. Women younger than 25 years

261. Definition of pearl index is? *(Recent Pattern Question 2017)*

- a. Failure rate in 100 couple
- b. Failure rate in 1000 couple
- c. Failures per 100 women years of exposure
- d. Failures per 1000 women years of exposure

262. 100 females used contraceptive for 1 year. There is 1 failure (HWY). How much is the accidental pregnancy rate? *(Recent Pattern Question 2017)*

- a. 0.01
- b. 1
- c. 1.5
- d. 2.0

263. Contraceptive contraindicated during lactation is:

- a. Combined OCP
- b. IUD
- c. Progesterone only pill
- d. None

264. Best contraceptive for a lactating female:

- a. Barrier
- b. Triphasic pill
- c. Combined OCP
- d. Progesterone only pill

265. Mechanism of action of combined OCP pills:

- a. Prevent fertilization
- b. Prevent release of ovum from ovary
- c. Prevent implantation of fertilized ovum
- d. Reduce sperm motility

266. OCPs give protection against:

- a. STDs
- b. Breast cancer
- c. Ovarian cancer
- d. Hepatocellular carcinoma

267. Best time to screen in Breast self examination (BSE) technique is:

- Just before the menstruation
- Just after the menstruation
- During ovulation
- 2-3 days post-ovulation

268. True about pearl index:

- Population study
- Family planning
- Contraceptive methods
- Contraceptive failure

269. Failure rate of pomoroy's technique of sterilization?

- 0.1%
- 0.5%
- 1%
- 5%

DEMOGRAPHY AND HEALTH

270. Death registration has to be done in:

(Recent Pattern Question 2018-19)

- 7 days
- 14 days
- 21 days
- 28 days

271. Which of the following is true about population attributable risk: *(Recent Pattern Question 2018-19)*

- $PAR = \frac{\text{Incidence among exposed} - \text{Incidence among non-exposed}}{\text{Incidence among non-exposed}} \times 100$
- $PAR = \frac{\text{Incidence among exposed} - \text{Incidence among non-exposed}}{\text{Incidence among exposed}} \times 100$
- $PAR = \frac{\text{Incidence among non-exposed} - \text{Incidence among exposed}}{\text{Incidence among total population}} \times 100$
- $PAR = \frac{\text{Incidence among total population} - \text{Incidence among non-exposed}}{\text{Incidence among total population}} \times 100$

272. In which of the following mortality is considered:

(Recent Pattern Question 2018-19)

- Total fertility rate
- Net reproduction rate
- Gross reproduction rate
- General fertility rate

273. Birth rate reduced and death rate reduced. Population is in which stage: *(Recent Pattern Question 2017)*

- 1
- 2
- 4
- 5

274. Which is not a demographic indicator?

(Recent Pattern Question 2016)

- Social Mobility
- Mortality
- Immigration
- Emmigration

275. Numerator of dependency ratio is:

- Population >10 years and <65 years
- Population <15 years and >65 years

- Population < 10 years- and >60 years
- Population >15 years and >60 years

276. Age pyramid of India is:

- Broad at base and narrow at apex
- Broad from base to apex
- Broad at apex and narrow at base
- Spindle shaped

277. All of the following are true regarding confounding factor EXCEPT:

- It is associated with exposure under investigation
- It is distributed equally in study & control groups
- It is associated both with exposure and disease
- It is removed by matching in case control study

278. Area under standard normal curve on area between two standard deviation on either side of mean is:

- 68.3%
- 85.2%
- 95.4%
- 99.7%

279. In a standard, normal curve, between three standard deviations on either side of mean will cover approximately

- 68.3% values
- 94.2% values
- 95.4% values
- 99.7% values

280. Growth curve of country like India, true is:

- Tapering at top
- Tapering at bottom
- Bulging in middle
- Widening of base

281. Range of kuppu swami scale for upper middle class:

- 26-29
- 16-25
- 16-26
- 26-30

282. Blindness rate in india due to refractive errors

- 62.6%
- 19.7%
- 5.8%
- 6.2%

283. According to national control programme of cancer, diabetes and heart diseases, all of the following are true EXCEPT:

- According to WHO, Coronary Heart disease is considered as a modern epidemic i.e., a disease that affects the population, not an unavoidable attribute of ageing.
- According to the stroke control programme, first priority goes to control of Diabetes, elimination of smoking, prevention and management of other risk factors.
- Cancer is characterized by group of diseases i.e., abnormal cell growth, ability to invade adjacent tissues, distant organs, eventual death of affected person if tumor has progressed beyond the stage. The DALY's lost world wide due to cancer is 77.812.
- Diabetes is an "ice berg" disease. Increase in both prevalence and incidence of type 2 DM globally is associated with industrialization & socio-economic development.

DISASTER MANAGEMENT, DISINFECTION AND BMW MANAGEMENT

284. Best method for waste disposal when suitable land available: *(Recent Pattern Question 2018-19)*

- a. Burial
- b. Dumping
- c. Controlled tipping
- d. Composting

285. Human anatomical wastes are disposed of in a _____ bag? *(Recent Pattern Question 2018-19)*

- a. Yellow
- b. Red
- c. Black
- d. Blue

286. Most important step to be taken before disaster: *(Recent Pattern Question 2018-19)*

- a. Response and rehabilitation
- b. Response and mitigation
- c. Response and preparedness
- d. Mitigation and preparedness

287. First step to be taken postdisaster: *(Recent Pattern Question 2018-19)*

- a. Response and mitigation
- b. Response and rehabilitation
- c. Reconstruction and mitigation
- d. Mitigation and preparedness

288. Which ministry will be responsible for rehabilitation postdisaster? *(Recent Pattern Question 2018-19)*

- a. Ministry of HRD
- b. Ministry of Home affairs
- c. Ministry of Agriculture
- d. Ministry of water and forest

289. In a triage black color is for: *(Recent Pattern Question 2018)*

- a. Immediate resuscitation required
- b. Ambulatory patients
- c. Unsalvageable
- d. Highest priority patients

290. Body fluids and fetuses are classified under this category of waste: *(Recent Pattern Question 2018)*

- a. Infectious waste
- b. Pathological waste
- c. Genotoxic waste
- d. Humanized waste

291. Disaster management day:

- a. 2nd week of November
- b. 2nd week of October
- c. 4th week of October
- d. 4th week of November

292. Who will be in-charge in case of disaster management:

- a. PHC
- b. Sub centre
- c. CHC
- d. District hospital

293. During massive disaster what should be done first:

- a. Search and rescue, first aid
- b. Triage
- c. Stabilization of victims
- d. Hospital treatment and redistribution of patients to hospitals if necessary

294. In a disaster management triage, patients who need surgery within 24 hours, are categorized under which color category:

- a. Red
- b. Green
- c. Blue
- d. Black

295. Which is the colour of highest priority in emergency triage:

- a. Red
- b. Yellow
- c. Black
- d. White

296. Gamma rays are used for sterilization of:

- a. Catheters
- b. Canulas
- c. Syringes
- d. All of the above

297. Autoclaving is not useful for disposal of:

- a. Surgical dressings
- b. Metallic instruments
- c. Petri dishes
- d. Liquid paraffin

298. Hot air oven can be used to sterilize all EXCEPT:

- a. Scalpels
- b. Glassware
- c. Plastic Syringes
- d. Dressings

299. Sharp wastes should be disposed in which color bag?

- a. Blue
- b. Black
- c. Red
- d. Yellow

300. Which of the following hospital waste must be discarded in Blue bag?

- a. Plastic syringe
- b. Catheter
- c. Canula
- d. All of the above

301. Category 7 on biomedical waste management contains

- a. Soiled waste
- b. Solid waste
- c. Liquid waste
- d. Incineration ash

302. Phenol co-efficient indicates

- a. Efficacy of a disinfectant
- b. Dilution of a disinfectant
- c. Quantity of a disinfectant
- d. Purity of a disinfectant

HEALTH PLANNING, CARE AND MANAGEMENT IN INDIA

303. Population covered by PHC in plains:

(Recent Pattern Question 2018-19)

- a. 20,000
- b. 30,000
- c. 50,000
- d. 80,000

304. Which is correct about Kartar Singh Committee:

(Recent Pattern Question 2017)

- a. No private practice
- b. Multi-purpose worker scheme
- c. ROME scheme
- d. Equal pay for equal work

305. As per norms pharmacist and lab technician are suggested per how much population?
(Recent Pattern Question 2017)
a. 5000 b. 10,000
c. 15,000 d. 20,000
306. In a District hospital, the requirement of special new born care beds is?
(Recent Pattern Question 2017)
a. 6 b. 10
c. 16 d. 20
307. ASHA covers how much population in a plain?
(Recent Pattern Question 2016)
a. 1000 b. 2000
c. 1500 d. 2500
308. Number of visits to be carried out by ASHA in a home delivery
(Recent Pattern Question 2016)
a. 3 b. 4
c. 6 d. 7
309. Under RNTCP, rural lab covers how much population in plains
(Recent Pattern Question 2016)
a. 5000 b. 20,000-30,000
c. 1 lakh d. 1 lakh to 5 lakh
310. Which of the following is NOT an element of PHC:
a. Water chlorination b. Maternal health care
c. Sanitation d. Equity of distribution
311. A health care system which is appropriate to everyone whether the service is needed at all in relation to essential human needs, can be accessible to everyone, available to everyone as first level of health care and the cost can be affordable by everyone is:
a. Primary health care
b. Secondary health care
c. Tertiary health care
d. Basic health care
312. All are true about principles of primary health care EXCEPT?
a. Community participation
b. Intersectoral co-ordination
c. Unequitable distribution
d. Appropriate technology
313. Not evaluated in clinical evaluation of pneumonia at PHC:
a. Respiratory rate b. Inability to feed
c. Oxygen saturation d. Chest indrawing
314. Population covered by CHC:
a. 5000 b. 20,000
c. 30,000 d. 100,000
315. 1st referral unit is:
a. PHC b. CHC
c. Subcenter d. District hospital
316. Beds in CHC:
a. 20 b. 30
c. 40 d. 60
317. National Rural Health Mission was established in:
a. 1993 b. 1995
c. 2005 d. 2010
318. Multipurpose worker scheme was implemented in India with the recommendation of:
a. Bhore Committee b. Kartar singh Committee
c. Srivastava Committee d. Jungalwalla Committee
319. Multipurpose health worker works for _____ population
a. 1000 b. 3000
c. 100 d. 5000
320. Asha worker works for ____ population:
a. 3000 b. 1000
c. 5000 d. 400
321. All are true about ASHA are all EXCEPT:
a. Selected by village panchayat/Gram Sabha
b. Trained by ANM
c. Minimum class 4 passed
d. Comes under NRHM 2005-2012
322. ASHA is located at:
a. Subcentre b. PHC
c. CHC d. Village
323. All of the following are true about Accredited Social Health Activist (ASHA) EXCEPT:
a. Is a mental health worker
b. Is a basic sanitation activist
c. Is deployed for one thousand population
d. Arranges escort/accompanies pregnant women/ children requiring admission/treatment
324. Functions of female multipurpose health worker includes:
a. Visit 4 sub-centers/month
b. Collection of blood sample
c. Conduct 50% delivery
d. Chlorination of water
325. A female multipurpose worker should be able to detect all of the following EXCEPT:
a. Mal-presentation b. Renal disease
c. Anemia d. Hydramnios
326. A female multipurpose health worker does not work in:
a. Distribution of condoms
b. Birth/death statistics
c. Active malaria surveillance
d. Immunization of mothers
327. Amount of cereals provided to children under the mid-day meals in schools is:
a. 50 grams b. 100 grams
c. 150 grams d. 75 grams
328. Mid-day meal programme provides
a. 1/3 calories, 1/3 proteins b. 1/3 calories, 1/2 proteins
c. 1/2 calories, 1/3 proteins d. 1/2 calories, 1/2 proteins

- 329. BMI obesity starts:**
 a. 25 b. 30
 c. 35 d. 40
- 330. Body mass index is calculated by:**
 a. (Weight in kg/Height in meters²)
 b. (Weight in kg/Height in meters³)
 c. (Weight in kg²)/Height in meters²)
 d. (Weight in kg² × Height in meters²)
- 331. Least common cause of neonatal mortality in India:**
 a. Prematurity b. Birth injuries
 c. Low birth weight d. Asphyxia
- 332. ICDS include children upto age of _____ years**
 a. 3 b. 5
 c. 6 d. 14
- 333. Baby Friendly Hospital Initiative was launched in the year**
 a. 1981 b. 1991
 c. 1993 d. 1997
- 334. All of the following are features of baby friendly hospitals EXCEPT:**
 a. Breast feeding is initiated within half an hour of normal delivery
 b. No pacifiers and teats are given
 c. No advertisements, promotional material or free products for infant feeding are allowed
 d. Infants are kept in the nursery for first 24 hours
- 335. Which of the following seen in block:**
 a. Panchayat samiti b. Panchayat sabha
 c. Gram sabha d. Gram samiti
- 336. Community development is block comprises of:**
 a. 70 villages and 70000 population
 b. 100 villages and 100000 population
 c. 500 villages and 500000 population
 d. 1000 villages and 1000000 population
-
- OCCUPATIONAL HEALTH**
-
- 337. Green house gas includes (Recent Pattern Question 2016)**
 a. CO₂, ozone, methane
 b. Only ozone
 c. Ozone, methane only
 d. Methane, CO
- 338. Maximum permissible dose of radiation exposure for general human beings is:**
 a. 0.5 Rad per person per year
 b. 5 Rad per person per year
 c. 50 Rad per person per year
 d. 5 Rem per person
- 339. Acceptable noise level (in decibels) for Hospital wards is:**
 a. 20–35 b. 35–45
 c. 45–55 d. 50–60
- 340. Asbestosis is associated with which cancer:**
 a. Lung cancer b. Liver cancer
 c. Colon cancer d. Stomach cancer
- 341. Mesothelioma is seen in which type of pneumoconiosis:**
 a. Anthracosis b. Byssinosis
 c. Asbestosis d. Silicosis
- 342. Bagassosis is the name given to occupational disease of lung caused by inhalation of**
 a. Silica b. Cotton dust
 c. Sugarcane dust d. Asbestos
- 343. All are FALSE about Lead Poisoning EXCEPT:**
 a. CPU > 100 mcg/L indicates exposure to lead
 b. Greatest source is drinking water from lead pipes
 c. Stippling of basophils is a significant finding
 d. Can cause Blue Line on gums
- 344. One of the following symptoms is NOT caused by inorganic lead poisoning:**
 a. Anemia b. Insomnia
 c. Pallor d. Burtonian line
- 345. Nausea, Vomiting, Blue line on gums, Wrist/ foot drops, Pallor, Colic are manifestations of poisoning due to:**
 a. Mercury b. Arsenic
 c. Organic lead d. Inorganic lead
- 346. True about ESI act 1948:**
 a. Applicable on educational institutions also
 b. Employer : employee contribution is 1.75:4.75 %
 c. Maternity benefit for 3 months
 d. Beneficiaries are those income with >15000/month
- 347. According to ESI act 1948, 4.75 percent of total wage bill of employer is:**
 a. Total wages b. Turn over
 c. Profit d. Contribution
- 348. Which is true about EMPLOYEE STATE INSURANCE ACT (ESI), 1948:**
 a. The employer contributes 4.75%
 b. The employee contributes 1.80%
 c. Include sickness benefit of 70% of average daily wages & is payable for 91 days
 d. Dependency benefit : pension at rate of 50% wages
- 349. In which of the following management techniques, interpretation is done in terms of finding out cost effectiveness:**
 a. Cost effective analysis b. Cost benefit analysis
 c. System analysis d. Network analysis
- 350. Critical path is shown by:**
 a. Time b. Money
 c. Man power d. Proper sequence
- 351. In a baby ward, temperature should be:**
 a. 27–29°C b. 29–31°C
 c. 32–33°C d. 33–35°C

DISINFECTION AND MISCELLANEOUS

- 352. In chlorination of water, the main disinfecting action is due to**
- Hypochlorite ions
 - Hydrogen ions
 - Hydrochloric acid
 - Hypochlorous acid
- 353. Residual chlorine is detected by:**
- Horrock's test
 - Polarimeter
 - Ortho toluidine test
 - Chromatography
- 354. In Nalgonda technique:**
- Lime is added after bleaching powder
 - Alum is added after lime
 - Lime is added after alum
 - Bleaching powder is added before lime
- 355. Hardy Weinberg law indicates all EXCEPT:**
- States that genotype frequencies in a population remain constant or are in equilibrium from generation to generation unless specific disturbing influences are introduced
 - Hardy Weinberg law states that population is static
 - Factors influencing gene pool include mutation, natural selection, population movements(assertive mating), public health measures
 - Natural selection is a process where harmful genes are not eliminated from the gene pool and genes favorable to individual are not passed onto offspring
- 356. Which of the following is a prospective study?**
- 30-year-old female to check for cystic fibrosis
 - Female > 40 years with breast lump
 - Heel prick test for neonatal tetanus at birth
 - Illegal immigrant screening
- 357. In 1935 students were admitted to a college where height and weight was taken. Based on previous data a study was conducted in 1977 in same population to determine how many will develop CAD in 1986. This study is known as:**
- Experimental
 - Cohort
 - Retrospective cohort
 - Mixed cohort
- 358. Biological environmental changes are recurrent. What is to be done to reduce error**
- Standardization
 - Excessive training of examiner
 - Using 2 examiner
 - Repeated measurement

BIOSTATISTICS

- 359. Sample registration is done:**
- (Recent Pattern Question 2018)
- Every 3 months
 - Every 6 months
 - Every 9 months
 - Every 12 months

- 360. Pictorial diagram of frequency distribution is:**

(Recent Pattern Question 2018)

- Histogram
- Scatter diagram
- Pie chart
- Bar chart

- 361. Calculate odds ratio from the given table:**

(Recent Pattern Question 2017)

	Disease	Non diseased
Exposure	33	53
Non exposed	2	27
	35	82

- 32
- 8.4
- 88.4
- 11.4

- 362. Sensitivity formula is**

(Recent Pattern Question 2016)

- $TP/TP + FP \times 100$
- $TN/TN + FN \times 100$
- $TP/TP + FN \times 100$
- $TN/FP + TN \times 100$

- 363. A pharmaceutical company introduced a new pregnancy kit. It shows out of 100 pregnant women, 99 were positive and out of 100 non pregnant women, 90 negative. Sensitivity is**

(Recent Pattern Question 2016)

- 95
- 97
- 98
- 99

- 364. From 1970–1995, 500 people were monitored. Exposed to smoking 400, Non-exposed 100. Out of 400 exposed 50 developed the lung cancer and out of 100 non exposed 5 developed the lung cancer. Calculate relative Risk:**

(Recent Pattern Question 2016)

- 1.2
- 2.5
- 12.5
- 1.5

- 365. In a hospital 10 babies were born in a day, each weighs 2.7 kg. what is the probable standard deviation:**

- 0.00
- 0.27
- 2.7
- 27

- 366. All are true about Chi-square test EXCEPT:**

- Non parametric test
- Degree of freedom is calculated by $(c-1)(r-1)$
- Used to test significance of association between two quantitative data
- Used for non-Gaussian distribution

- 367. In a 4 x 5 table for Chi-square test, what is the degree of freedom?**

- 20
- 16
- 12
- 9

- 368. Correlation coefficient of 1.76 indicates**

- Positive correlation
- Highly positive correlation
- Absence of correlation
- Wrong calculation

- 369. Which is the best method of central tendency that is used to show quantitative variable:**

- Mean
- Median
- Mode
- Box and whisker

- 370. Frequently occurring value in a series is known as**

- Average
- Median
- Mean
- Mode

371. A smoker states that he has been smoking for 6 years. In the first year he was taking up to 5 sticks per day only. In the next 3 years he increased it to half pack per day. In the 5th year, his habits worsened to 1 pack per day. In the last year he stated that his daily sticks consumption is 2 packs per day. Select the correct statement:
Mean, median and mode of number of sticks are:
a. 16, 10, 15 b. 16, 10, 10
c. 10, 10, 15 d. 16, 10, 15
372. Calculate the mean & mode of the given values:
2,2,3,4,4,4,4,5,5,7,8,8,9
a. 4 and 5 b. 5 and 4
c. 5 and 9 d. 9 and 5
373. A diagnostic test for a particular disease has a sensitivity of 0.90 and a specificity of 0.80. A single test is applied to each subject in the population in which the diseased population is 30%. What is the probability that a person, negative to this test, has no disease?
a. Less than 50% b. 70%
c. 95% d. 72%
374. 40 out of 100 smokers and 20 out of 100 non-smokers developed lung cancer. Calculate the odd's ratio:
a. 2.1 b. 2.6
c. 3.1 d. 3.33
375. On a screening test, negative result is seen in 50% of non-diseased population and positive result in 10% healthy population. Calculate specificity:
a. 0.5 b. 0.6
c. 0.83 d. 0.9
376. According to malaria control program 2017, the goal is to reduce the annual incidence by:
a. <1/100 b. <1/1000
c. <1/10000 d. <1/100000

BOARD REVIEW QUESTIONS

377. Patient requiring immediate referral is allotted what colour code according to IMNCI colour coding?
a. Pink b. Red
c. Green d. Yellow
378. Which of the following procedure is not done in CHC?
a. Abortion
b. Blood transfusion
c. Caesarean section
d. Urine microscopy and culture sensitivity
379. Identification of cholera by Snow is an example of?
a. Spot map b. Random trial
c. Analytical design d. Experimental design
380. Random sampling is not done in?
a. Cluster sampling b. Quota sampling
c. Stratified sampling d. Simple random
381. Hard tick causes which of the following?
a. Oriental sore b. KFD
c. Tick Typhus d. Q fever
382. Radiation exposure permissible per year is?
a. 2 rads b. 5 rads
c. 10 rads d. 20 rads
383. Maximum iron is in which nut?
a. Pista b. Cashew
c. Peanut d. Walnut
384. Cyclical trend is due to?
a. Migration b. Herd immunity
c. Seasonal variation d. Life style modification
385. The extended sickness benefit is given for?
a. 4 years b. 365 days
c. 3 years d. 2 years
386. Average incubation period of typhoid is:
a. 2-3 days b. 5-8 days
c. 10-15 days d. 15-30 days
387. The systematic distortion of retrospective study is?
a. Confounding b. Effect modification
c. Recall bias d. Measurement bias
388. Duration of training of ASHA worker is?
a. 21 days b. 23 days
c. 30 days d. 35 days
389. Which is not true for components of DOTS?
a. High compliance b. Given under observation
c. Political commitment d. Accountability
390. Vitamin deficient in breast milk is?
a. Vitamin A b. Vitamin B complex
c. Vitamin C d. Vitamin D
391. Discarded cytotoxic medicines should be disposed in?
a. Blue bag b. Black bag
c. Red bag d. Yellow bag
392. Midyear population is calculated on?
a. 1st June b. 30th June
c. 1st July d. 31st June
393. True about "Zero base budgeting" is?
a. Relies on data of previous budget
b. Proceeds from resources to target
c. Proceeds from target to resource
d. Not a priority based budgeting
394. First disability census was done in the year?
a. 1881 b. 1951
c. 1981 d. 2001

395. Gas causing global warming but is not a green house gas?
a. CO₂ b. SO₂
c. CFC d. Ozone
396. Two variables are highly correlated when "r" is?
a. 0 b. +0.5
c. +1.0 d. -1.0
397. Secular trend is best demonstrated by?
a. Line diagram b. Bar graph
c. Stem-leaf plot d. Box and whisker plots
398. Rural health scheme was introduced by?
a. Bhore committee b. Mukherjee committee
c. Shrivastava committee d. Mudaliar committee
399. "Import General Manifest" comes under?
a. Custom's Act b. Railway Act
c. Transport Act d. Merchant Marine Act
400. Antemortem rabies diagnosis is commonly made by?
a. Corneal scraping b. Brain biopsy
c. Skin biopsy d. Saliva
401. Which of the following is a live attenuated bacterial vaccine?
a. BCG vaccine b. OPV
c. HiB vaccine d. Pertusis vaccine
402. Epidemic typhus is transmitted by?
a. Louse b. Soft tick
c. Hard tick d. Rat flea
403. Reference weight of Indian men and women is?
a. 60 and 55 kg b. 60 and 50 kg
c. 55 and 50 kg d. 50 and 45 kg
404. Age group of child under children rights is?
a. < 10 years b. 10-15 years
c. 15-18 years d. 18 years and younger
405. KFD is caused by?
a. Flavivirus b. Myxovirus
c. Alphavirus d. Phlebovirus
406. Byssinosis is most commonly seen in?
a. Spinners b. Sugarcane industry
c. Dyers d. Weavers
407. Lung disease seen in Coal & Rock miners?
a. Anthracosis b. Byssinosis
c. Bagassosis d. Silicosis
408. Goal for blindness under NPCB is to reduce prevalence of blindness in 2010 to
a. 0.1% b. 0.3%
c. 0.5% d. 1.0%
409. Calculate BMI if weight in kilograms is 98 and height in centimeters is 175:
a. 28 b. 32
c. 36 d. 40
410. Children surveyed in cluster sampling for coverage of national immunization programme?
a. 30 cluster of 5 children b. 20 cluster of 5 children
c. 30 cluster of 10 children d. 30 cluster of 7 children
411. Neoplasia is classified under which chapter of ICD?
a. Chapter I b. Chapter II
c. Chapter IV d. Chapter V
412. Risk modification in CAD is?
a. Primordial prevention
b. Primary prevention
c. Secondary prevention
d. Tertiary prevention
413. Growth rate is calculated by?
a. Crude birth rate/Crude death rate
b. Net reproduction-Crude death rate
c. Total fertility rate - Crude death rate
d. Crude birth rate-Crude death rate
414. Life span of mosquito is?
a. 1 week b. 2 weeks
c. 1 month d. 1 year
415. Life span of house fly is?
a. 5 days b. 10 days
c. 15 days d. 30 days
416. Denominator of infant mortality rate is?
a. Per live birth b. per 100 live births
c. Per 1000 live births d. Per lakh live births
417. Content of chlorine in bleaching powder is?
a. 25% b. 27%
c. 33% d. 35%
418. Two standard deviation includes what percentage of the values of distribution:
a. 68.27% b. 86%
c. 95.45% d. 99.73%
419. WHO funds which programme in India?
a. RNTCP
b. National Leprosy Eradication Programme
c. Janani Suraksha Yojna
d. National old age pension plan
420. Serial interval is a measure of?
a. Sensitivity b. Specificity
c. Incubation period d. Positive predictive value
421. Caloric requirement to maintain BMR in a normal healthy person is?
a. 20-30 kcal/kg/day b. 30-40 kcal/kg/day
c. 35-40 kcal/kg/day d. 40-50 kcal/kg/day
422. Breast Feeding Week is celebrated during:
a. 1st week of March
b. 1st week of July
c. 1st week of August
d. 3rd week of September
423. World health day is celebrated on?
a. 7 th April b. 1st July
c. 3rd December d. 1st December
424. Perinatal mortality includes what time after birth?
a. 7 days b. 28 days
c. 10 months d. 1 Year

425. Comfort zone of temperature is?

- a. 25-26.9°C
- b. 27-29°C
- c. <19°C
- d. 19-23°C

426. Average Hospital waste produced per bed per day in govt hospitals is?

- a. 1.5 - 2.0 kg
- b. 0.5 - 4.0 kg
- c. 0.5 - 2.0 kg
- d. 1.5 - 4.0 kg

427. Screening of the diseases is which type of prevention?

- a. Primordial
- b. Primary
- c. Secondary
- d. Tertiary

428. Urban malaria is caused by?

- a. Anopheles culicifacies
- b. Anopheles stephensi
- c. Anopheles fluviatilis
- d. Anopheles minimus

429. ASHA is recruited under?

- a. NRHM
- b. National urban health mission
- c. ICDS
- d. Village health system

430. JE virus life cycle in nature runs between?

- a. Pigs - Cattle
- b. Cattle-Birds
- c. Pigs-human
- d. Bird-Pigs

431. Range of flight of Aedes mosquito is?

- a. 1 Km
- b. Less than 100 m
- c. 500 m
- d. 10 km

432. Bacterial indicator of recent contamination of water is?

- a. Clostridium perfringens
- b. E.coli
- c. Clostridium welchii
- d. Klebsiella

IMAGE-BASED QUESTIONS

433. The following image shows:

- a. Histogram
- b. Correlation coefficient
- c. Frequency Polygon
- d. Bar Diagram

435. The following image shows presence of ?

- a. Sandfly
- b. Aedes
- c. Culex
- d. Tse Tse Fly

434. The following image shows:

- a. Histogram
- b. Correlation coefficient
- c. Frequency Polygon
- d. Bar Diagram

436. The image shows presence of?

- a. Aedes larvae
- b. Culex larvae
- c. Anopheles larvae
- d. Mansonia larva

437. Which of the following organization is shown below?

- a. World health organization
- b. UNICEF
- c. FAO
- d. World Bank

438. The following symbol shows which program of government of India?

- a. National Rural Health Mission
- b. National urban health Mission
- c. Reproductive and child Health Programme
- d. A.Y.U.S.H

439. Identify:

- a. Mirena
- b. Cu T 380 A
- c. Para Gard
- d. Ortho evra

Answers to Image-Based Questions are given at the end of explained questions

ANSWERS WITH EXPLANATIONS

MOST RECENT QUESTIONS 2019

1. Ans. (a) To avoid water contamination

Ref: K. Park 25th ed. P 851

- Inertization is a method of disposal of biomedical waste.
- It involves mixing the waste with cement or other substances before disposal, in order to minimize the risk of toxic substances contained in the wastes migrating into the surface water or ground water.

Extra Mile

- **Incineration:** It is high temperature dry oxidation process, that reduces organic and combustible waste into inorganic incombustible matter and results in a very significant reduction of waste- volume and weight

2. Ans. (a) Pig

Ref: K. Park 25th ed. P 311

- JE is a mosquito borne encephalitis caused by a group B arbovirus (Flavivirus) and transmitted by Culicine mosquitoes.
- JE has several extrahuman hosts
 - Pig → Mosquito → Pig
 - Ardeid bird → Mosquito → Ardeid bird
- Disease transmitted to man by infected host. Man is incidental dead-end host.
- Infected pigs do not show any symptom. They are considered as amplifier host
- Cattles and Buffaloes: Mosquito attractants
- Domestic animal which shows signs of encephalitis due to JE virus infection: Horse.

3. Ans. (a) Serum-Albumin concentration

Ref: K. Park 25th ed. P 667

- To assess the state of protein nutrition, multiple tests have been suggested. These include:
 - Serum albumin concentration, Arm-muscle circumference, Creatinine-height index, Serum transferrin level.
- At present, the best measure of the state of protein nutrition is serum-albumin concentration.
 - **Normal:** >3.5 g/dL
 - **Mild malnutrition:** <3.5 g/dL
 - **Severe malnutrition:** 3 g/dL
- Serum albumin and transferrin assess the ability of liver to synthesize protein.

4. Ans. (b) Infant mortality rate

Ref: K. Park 25th ed. P 25

- IMR is the ratio of deaths under 1 year of age in a given year to the total number of live births in the same year.
- It is usually expressed as a rate per 1000 live births
- It is one of the most universally accepted indicators of health status not only of infants, but also of whole population and of the socio-economic conditions under which they live.
- In addition IMR is also a sensitive indicator of the availability, utilization and effectiveness of health care, particularly perinatal care.

5. Ans. (b) Halibut liver oil

Ref: K. Park 25th ed. P 672

Vitamin A is widely distributed in animal and plant foods.

- In animal food it is present as preformed Vitamin A (Retinol). Ex in: Liver, egg, butter, cheese, fish and meat.
 - 1 mcg of retinol = 1 RE (Retinol Equivalents)
- In plant foods as provitamins (carotenes). Ex in green leafy vegetables (cheapest source), fruits like mango, papaya, carrots

TABLE: Retinol content of some foods

Food products	Retinol Equivalents (RE) (mcg/100 gram)		
Halibut liver oil	900,000	Carrot	1,167
Cod liver oil	18,000	Spinach	607
Liver Ox	16,500	Amaranth	515
Margarine	900	Mango ripe	313
Butter	825	Papaya	118
Egg	140	Tomato	85
Cow milk	38	Orange	25

6. Ans. (a) Quetelet index

Ref: K. Park 25th ed. P 429

- For assessment of obesity, WHO has given the Body Mass Index formula, also known as Quetelet index.
- $BMI = \frac{\text{Weight (in kg)}}{\text{Height (in m}^2\text{)}}$

Other indices are:

- Ponderal index = $\frac{\text{Weight (in cm)}}{\text{Cube root of body weight (kg)}}$

- Broca index = Height in cm — 100
- Corpulence index = $\frac{\text{Actual weight}}{\text{Desirable weight}}$
 - This shouldn't exceed 1.2

Extra Mile

- **Pearl index:** Measures contraceptive failures
- **Chandler index:** Used for measurement of hookworm infestation as public health problem
- **Sullivan's Index** is measurement of Disability Free Life Expectancy

7. Ans. (a) Yellow fever

Ref: K. Park 25th ed. P 904

- At the international level, following diseases are notifiable to WHO in Geneva, under the International Health Regulations (IHR).
- According to IHR, yearly data of notofocation should be detailed by age and sex,
- **Notifiable diseases are:**
 - Cholera, Plague, Yellow fever, as per WHO
 - Relapsing fever, louse borne typhus, polio, influenza, malaria, rabies and salmonellosis as per international surveillance.

8. Ans. (a) Acute gastroenteritis

Ref: K. Park 25th ed. P 858

- **Book states:** "most commonly reported disease in post-disaster period is outbreak of gastroenteritis".

9. Ans. (b) 75 mmol/L

Ref: K. Park 25th ed. P 247

TABLE: Composition of reduced osmolarity ORS

Constituent	Amount (mmol/L)
• Sodium	75
• Glucose, Anhydrous	75
• Chloride	65
• Potassium	20
• Citrate	10
Total	245

10. Ans. (b) 3–4 times less than cowmilk

Ref: K. Park 25th ed. P 591-92

- Human milk has low protein content. It is **around 3 times less than cow's milk** and lower than the most mammals.

- Vitamin D is present in human milk (earlier it was believed that human milk was deficient in Vit D)
- In human breast milk Vitamin A and C content is more than cow's milk
- Iron absorption and bioavailability of human milk is more (70%) as more compared to cow's milk (30%)
- Human milk is more rich in copper, selenium and cobalt, as compared to cow's milk.

TABLE: Comparison between breast milk during the 1st month of lactation and unprocessed cow milk

Constituent	Breast milk (g/L)	Cow milk (g/L)
Proteins	11	33
• Casein	4	28
• Soluble protiens	7	5
▪ Lactalbumin	3.5	1.5 to 1.8
▪ Beta-lactaglobulin	0	3.7
▪ Lactotransferrin	1 to 2	0.2 to 0.5
▪ Immunoglobulin	1 to 2	0.5
▪ Lysozyme	0.5	Traces
Non-protein: Nitrogenous substances	0.32	0.32
Lipids	35	35
• Linoleic acid	3.5	1
Carbohydrates	70	50
▪ Lactose	62	50
▪ Nitrogenous oligosaccharides	8	0
Minerals:	2	8
• Ca (Calcium)	0.33	1
• P (Phosphorus)	0.15	1
• Fe (Iron)	0.4 to 1.5 mg	0.3 to 0.5 mg
Vitamins		
• C60 mg	20 mg	
• D50 IU	25 IU	
Energy	640–720 kcal	650 kcal
	2670–3000 kJ	2717 kJ

11. Ans. (a) NS

Ref: K. Park 25th ed. P 213

- For reconstituting the vaccine, normal saline is recommended as diluent (distilled water can cause irritation)

FMGE Solutions Screening Examination

516

- Reconstituted vaccine can be used up to 3 hours and left over should be discarded
- A satisfactory injection should produce a wheal of 5 mm in diameter.

12. Ans. (c) High temperature and Short Time method

Ref: K. Park 25th ed. P 711

- HTST method, also known as High Temperature and Short Time method.
 - Milk is rapidly heated to 72°C, held at that temperature for not less than 15 seconds and then rapidly cooled to 4°C
 - **Book states:** "This is the most widely used method now"
 - Large amount of milk can be pasteurized by HTST method

13. Ans. (b) Restriction of movement of healthy contact of an infectious disease

Ref: K. Park 25th ed. P 132

- **Quarantine** is defined as: "the limitation of freedom of movement of such well persons who are exposed to communicable disease for a period of time no longer than the longest usual incubation period of the disease, in such manner as to prevent effective contact with those not so exposed."
- **Isolation** on the other hand is separation of infected person from others for the period of communicability.

14. Ans. (b) Haemoglobin

Ref: K. Park 25th ed. P 961

- At sub-centre laboratory examinations that are given are:
 - Urine test for pregnancy confirmation
 - Haemoglobin estimation
 - Urine and albumin and sugar

CONCEPT OF HEALTH AND DISEASE

15. Ans. (b) Life expectancy at 1 year, IMR, literacy rate

Ref: K. Park, 23rd ed. pg. 17

TABLE: Comparison between PQLI and HDI

PQLI (Physical Quality of Life Index)	HDI (Human Development Index)
Literacy rate	Knowledge
Infant mortality rate	Income
Life expectancy (at 1 year)	Life expectancy (@ birth)
Range: 0 and 100	Range: 0 and +1
Value in India: 65	0.640

Extra Mile

- Range of correlation coefficient: -1 to +1

16. Ans. (b) Cholera

Ref: K. Park, 23rd ed. pg. 5

- **Father of public Health:** John Snow, identified Cholera
- Father of modern epidemiology: John Snow
- Father of Medicine/first true epidemiologist: Hippocrates.

17. Ans. (c) 0 and 100

Ref: K. Park, 23rd ed. pg. 17

Physical Quality of Life Index (PQLI)	Human Development Index (HDI)
Literacy rate	Knowledge
Infant mortality rate	Income
Life expectancy (at 1 year)	Life expectancy (@ birth)
Range: 0 and 100	Range: 0 and +1
Value in India: 65	0.640

Extra Mile

- Range of correlation coefficient: -1 to +1

18. Ans. (c) Life expectancy- Birth

Ref: K. Park, 23rd ed. pg. 17

Please refer to above table

19. Ans. (d) Range 0 to 100

Ref: K. Park, 23rd ed. pg. 17

Refer to above explanation

20. Ans. (a) 0-1

Ref: K. Park, 23rd ed. pg. 17

- The HDI value ranges between 0 to 1.
- This value for a country shows the distance that it has already travelled towards maximum possible value of 1 and also allows comparisons with other countries.

21. Ans. (a) Income

Ref: K. Park 23rd ed. pg. 17

Components/Indicators of PQLI

- Literacy rate
- Infant mortality rate
- Life expectancy at age 1 year

22. Ans. (a) **Tuberculosis**Ref: K. Park, 23rd ed. pg. 39, 135

- **Iceberg phenomenon** can be compared to a disease in community.
- **Floating tip of iceberg** (visible portion): clinical cases that physicians sees in community. It can be detected by diagnostic tests.
- **Submerged part** (hidden portion): are the latent, undiagnosed cases and carriers. It is detected by screening test by an epidemiologist.
- **Water surface** (demarcation line): demarcation between apparent and inapparent disease.
- **Iceberg phenomenon of a disease is NOT shown by:**
 - Rabies
 - Tetanus
 - Measles
 - Rubella

23. Ans. (a) **Undiagnosed cases in community**Ref: K. Park, 23rd ed. pg. 39, 135; K. Park, 21st ed. pg. 3724. Ans. (a) **Secular trend**Ref: K. Park, 23rd ed. pg. 66, 21st ed. pg. 61,62**Time Distribution of Disease**

- **Secular trend:** It implies changes in occurrence of a disease over a period of long time, generally several years or decade.
 - **Ex:** Polio, Diphtheria, Pertusis are the diseases which are reducing in India in fast few decades; and diseases like DM, Obesity and hypertension has increased in past few decades.
- **Epidemic:** Short term fluctuation of a Disease occur in few days, week, or months. E.g. food poisoning, Bhopal gas tragedy

Periodic Fluctuation

- **Cyclic trends:** some diseases occur in cycles spread over a period of time which means days, weeks, months, or years. Non-infectious condition may also show periodic fluctuations *ex: automobile accidents in US are more frequent on weekends, esp: Saturday*. Other examples can be measles occurring every 2-3 years, Rubella every 6-9 years, influenza pandemics at intervals of 7-10 years (due to antigenic variations)
- **Seasonal trend:** It is seasonal variation/fluctuation in occurrence of a disease. The seasonal variation of disease occurrence may be related to environmental condition like humidity, rainfall, temperature.
- **Example:** Measles and varicella in early spring season, upper respiratory infection in incidence increases in winter, gastroenteritis increases in summer.

25. Ans. (a) **Secular trends**Ref: K. Park, 23rd ed. pg. 66, 21st ed. pg. 62*Please refer to above explanation*26. Ans. (d) **Cyclic trend**Ref: K. Park, 23rd ed. pg. 66, 21st ed. pg. 6227. Ans. (a) **Cyclic trends**Ref: K. Park, 23rd ed. pg. 65-66, 21st ed. pg. 61,62*Please refer to above explanation*28. Ans. (b) **Infectivity**Ref: K. Park, 23rd ed. pg. 36

- **Infectivity:** this is ability of an infectious agent to invade and multiply (produce infection) in a host.
- **Pathogenicity:** it is the ability to induce **clinically apparent illness**.
- **Virulence:** proportion of clinical cases resulting in **severe clinical manifestation**.

29. Ans. (c) **3**Ref: K. Park, 23rd ed. pg. 49, 21st ed. pg. 47

- ICD-10 (International Classification of Diseases, 10th revision on January 1, 1993).
- ICD does uniform classification of diseases which can be used throughout the world to make accurate comparisons of morbidity and mortality data for decision making in prevention, facilitation and management of health care system.
- **ICD-10 consists of 3 volumes:**
 - **Volume-I:** contains reports of the international conference of 10th revision, classification of morphology of neoplasms, special tabulation list for mortality and morbidity, definition and nomenclature regulation.
 - **Volume-II:** Instruction manual
 - **Volume- III:** Alphabetical Index
- **Note:** there are 21 major chapters in ICD-10

STUDY DESIGNS AND PREVENTIVE MEASURES30. Ans. (a) **Prospective cohort**Ref: K. Park 23rd ed. P 80

- The Framingham heart study was initiated in 1948 by US public health service to study the relationship between number of risk factors (like BP, smoking, serum cholesterol, obesity) and subsequent development of cardiovascular disease.

FMGE Solutions Screening Examination

518

- Study was done in town of Framingham for 20 years in view of the slow development of heart disease.
- It is an example of prospective cohort study.

31. Ans. (a) Cohort study

Ref: K. Park 23rd ed. P 65

- Incidence and relative risk is accurately calculated by cohort study.
- It is a type of analytical or observational study used for hypothesis testing, also called TROHOC study prospective study/forward looking study/cause to effect study/exposure to outcome study/risk factor to disease study incidence study follow-up study.
- Prevalence is determined by cross sectional studies.

32. Ans. (a) Cohort

Ref: K. Park, 23rd ed. pg. 80

- The Framingham heart study was initiated in 1948 by US public health service to study the relationship between number of risk factors (like BP, smoking, serum

cholesterol, obesity) and subsequent development of cardiovascular disease. It was a very good example of cohort study.

33. Ans. (a) Cohort

Ref: K. Park, 23rd ed. pg. 80

- The Framingham heart study was initiated in 1948 by US public health service to study the relationship between number of risk factors (like BP, smoking, serum cholesterol, obesity) and subsequent development of cardiovascular disease.

34. Ans. (c) Berksonian bias

Ref: K. Park, 23rd ed. pg. 73-74

- Berksonian bias is a type of study bias that arises because of the different rates of admission to hospitals for people with different diseases.
- It is termed after Dr. Joseph Berkson who recognized this problem.

35. Ans. (b) Secondary prevention

Ref: K. Park, 23rd ed.

- Fetal cardiac monitoring is a screening test to detect any fetal distress in utero.
- All screening and diagnostic tests are secondary level of prevention.

TABLE: Levels of prevention

Level of prevention	Timing	Mode of prevention	Example
Primordial	Before emergence of risk factor	—	<ul style="list-style-type: none"> • Preventing obesity • Practicing healthy lifestyle
Primary	Risk factor present but no disease yet	By health promotion and specific protection.	<ul style="list-style-type: none"> • All vaccines • Contraceptives • Mosquito nets/repellants/DDT • Chemoprophylaxis
Secondary	When Disease has probably started	By early diagnosis and treatment	<ul style="list-style-type: none"> • All screening and diagnostic tests. • Treatment measures • BP monitoring
Tertiary	Disease in progression	By disability limitation and rehabilitation.	<ul style="list-style-type: none"> • Physiotherapy • Crutches in polio

36. Ans. (a) Cohort study

Ref: K. Park, 23rd ed. pg. 78

- Relative risk is the ratio of disease among exposed and disease among non exposed. It is also known as risk ratio.
- RR = incidence of disease among exposed/Incidence of disease among non-exposed
- It is a direct measure of strength of association between suspected cause and effect.

37. Ans. (d) Patient does not know what is he getting

Ref: K. Park, 23rd ed. pg. 83

- In **double blind trial**, neither patient nor the doctor are aware of group allocation and the treatment received. Patient is either getting placebo or the drug.
- All the clinical trials must take an informed consent regarding the same from the participants.

Extra Mile

- **SINGLE BLIND TRIAL:** it is planned in such a way that participant is not aware whether he belong to the study group or control group.
- **TRIPLE BLIND TRIAL:** in this type of trial, the participant, the investigator and the person analyzing the data are all "blind" (not aware)
- **Note:** Double blinding is most commonly used method when blind trial is conducted.

38. Ans. (b) **It is the procedure by which participants are allocated into groups usually called 'study' and 'control' group**

Ref: K. Park, 23rd ed. pg. 82, 21st ed. pg. 78

- Randomization is "heart" of a control trial. It is a statistical procedure by which the participants are allocated into groups usually called "study" and "control" group.
- It is an attempt to eliminate bias and allow comparability.
- By doing this it is ensured that investigator has NO control over allocation of participants to study or control group. THIS REMOVES SELECTION BIAS.

40. Ans. (b) **Primary**

Ref: K. Park, 23rd ed. pg. 41, 370-73

- All vaccines/immunization are primary level of prevention.
- BCG vaccine used for treatment of bladder CA is secondary level of prevention.

Extra Mile

TABLE: Level of Prevention with their modes and example

Level of prevention	Timing	Mode of prevention	Example
Primordial	Before emergence of risk factor	–	<ul style="list-style-type: none"> • Practising healthy lifestyle • Preventing obesity
Primary	Risk factor present but NO disease yet	By health promotion and specific protection.	<ul style="list-style-type: none"> • All vaccines • Contraceptives • Mosquito nets/repellants/DDT • Chemoprophylaxis
Secondary	When Disease has probably started	By early diagnosis and treatment	<ul style="list-style-type: none"> • All screening and diagnostic tests. • Treatment measures • BP monitoring
Tertiary	Disease in progression:	By disability limitation and rehabilitation.	<ul style="list-style-type: none"> • Physiotherapy • Crutches in polio

41. Ans. (a) **Primary**

Ref: K. Park, 23rd ed. pg. 41, 370-74

- **RANDOMIZATION** is done only after the participant has entered the study, i.e. after having been qualified for the trial and has given his informed consent to participate in the study.

39. Ans. (b) **Prevention of emergence of risk factors of the disease**

Ref: K. Park, 23rd ed. pg. 41, 370

- Primordial prevention refers to prevention of development of risk factors in countries or population groups where they are yet to appear.
- For instance, adult health problems like obesity, hypertension etc. take root in childhood, when lifestyles like smoking, eating patterns, physical exercise are formed
- As part of primordial prevention, efforts are made to discourage high risk children, adolescents and young adults from adopting harmful lifestyles. The primary intervention is through individual and mass education.

FMGE Solutions Screening Examination

520

42. Ans. (c) **Early diagnosis and treatment**Ref: K. Park, 23rd ed. pg. 41, 370-74

- Early diagnosis and treatment comes under secondary level of prevention.

Please refer to above explanation

43. Ans. (c) **Secondary**Ref: K. Park, 23rd ed. pg. 41, 370-74

- All screening and diagnostic tests and treatment measures come under secondary level of prevention.
- Refer to previous explanation.

44. Ans. (b) **Primary**Ref: K. Park, 23rd ed. pg. 41, 370-74

- All vaccines/immunization are primary level of prevention.
- Refer to above table.

45. Ans. (c) **Secondary**Ref: K. Park, 23rd ed. pg. 41, 376

- Tracking of blood pressure helps in early diagnosis of hypertension.
- Hence comes in secondary level of prevention.

46. Ans. (a) **Pap smear**Ref: K. Park, 23rd ed. pg. 41, 385

- **Primary prevention** is the action taken prior to the onset of disease which removes the possibilities of disease occurrence.
- **Modes of intervention:**
 - Health promotion
 - Specific protection
- It is applicable for "risk factors are present but disease has not yet taken place"
- *Pap smear is a screening test, which comes under secondary level of prevention.*

47. Ans. (a) **Early diagnosis and treatment**Ref: K. Park, 23rd ed. pg. 41, 370

- Pap smear is a screening test for cervical cancer. It is an example of secondary level of prevention. The mode of secondary level of prevention is by early diagnosis and treatment.

48. Ans. (c) **Specific protection**Ref: K. Park, 23rd ed. pg. 41, 370

- *Specific prevention of neck problem before onset of disease.*

- Desk provided with table top, probably decrease the risk of developing neck problems like cervical spondylosis etc.
- This is primary level of prevention done by specific protection.

TABLE: Levels of prevention

Level of Prevention	Timing	Mode of prevention
Primordial	Before emergence of risk factor	-
Primary	Risk factor present but NO disease yet	<ul style="list-style-type: none"> • Health promotion • Specific protection
Secondary	When probably Disease has started	<ul style="list-style-type: none"> • Early diagnosis • Treatment
Tertiary	Disease in progression	<ul style="list-style-type: none"> • Disability limitation • Rehabilitation

49. Ans. (c) **Secondary**Ref: K. Park, 23rd ed. pg. 41, 370-73

- Any treatment measure comes under secondary level of prevention.
- Refer to above explanation

50. Ans. (b) **Specific protection**Ref: K. Park, 23rd ed. pg. 41, 370-73

- Iodised salt is given in an area which has risk of developing goiter. This is a primary level of prevention done by specific protection.
- Primordial prevention is done before the emergence of risk factor.

51. Ans. (b) **Specific protection**Ref: K. Park, 23rd ed. pg. 41

- IFA supplement is a chemoprophylaxis given during pregnancy for anemia. It comes under primary level of prevention which is implemented under specific protection.

52. Ans. (d) **BP of hypertensive remains hypertensive**Ref: K. Park 23rd ed. pg. 374**Park 23rd/P 374 States:**

If BP of a person is tracked from early childhood to adult life then those individuals whose blood pressure was initially high in the distribution, would probably continue in the same "track".

53. Ans. (a) **Primordial prevention**Ref: K. Park, 23rd ed. pg. 41, 21st ed. pg. 39-40

- Primordial level of prevention is defined as prevention of emergence or development of risk factors in countries or population groups in which disease entity is not yet appeared, or population group which are not yet exposed.

- **Modes of intervention:**
 - Individual education
 - Mass education
- *Primordial level is considered as best level of prevention for non-communicable diseases*

EPIDEMIOLOGY, SCREENING AND VACCINES

54. Ans. (c) Ice line refrigerator

Ref: K. Park 25th ed. P 118-19

TABLE: Cold chain equipment

Storage	Transportation
Electrical <ul style="list-style-type: none"> • Walk in cooler • Walk in freezer • Ice line refrigerator (ILR) • Domestic refrigerator • Deep freezer 	<ul style="list-style-type: none"> • Refrigerated vaccine • Insulated vaccine van • Cold box • Vaccine carrier: used to carry 16-20 vials • Day carriers: used to carry 6-8 vials. Two fully frozen ice packs are used
Solar <ul style="list-style-type: none"> • Solar refrigerator battery drive • Solar refrigerator direct drive 	NOTE: <ul style="list-style-type: none"> • The risk of cold chain failure is greatest at sub-centre and village level • Therefore, vaccines are NOT stored at sub centre level and must be supplied on the day of use
Nonelectrical <ul style="list-style-type: none"> • Cold box • Vaccine carrier 	

TABLE: Differences between all the equipment

Equipment	Temperature	Used for storing	Installed at
Walk in cooler	Maintain + 2 to + 8°C	Store all vaccines like BCG, HepB, DPT, Pentavalent, IPV, TT	<ul style="list-style-type: none"> • Govt medical store depots • State and regional vaccine stores
Walk – in- freezer	(–15 to – 25°C)	<ul style="list-style-type: none"> • For bulk storage of OPV vaccine • Preparation of frozen ice packs for vaccine transportation 	National, regional and state vaccine stores
Deep freezer	(–15 to – 25°C)	<ul style="list-style-type: none"> • Store OPV vaccine for 3 months • Freezing ice packs 	District level and sub district level
Ice line refrigerator (ideal for safe storage of vaccine)	(+2 to + 8°C)	<ul style="list-style-type: none"> • For vaccines like OPV, BCG, Measles and JE stored at the bottom of basket • DPT, TT, Hep B, IPV, pentavalent and Diluents—kept in upper part of basket 	Large size ILR: District and sub district level Small size ILR: PHC
Domestic refrigerator	(+2 to + 8°C)	<ul style="list-style-type: none"> • Placement of vaccine in the refrigerator with freezer on top is as follows: <ul style="list-style-type: none"> • Top shelf: Measles, BCG, OPV, Rota virus • Middle shelf: DPT, Pentavalent, TT, IPV, Hep-B, JE • Bottom shelf: Ice packs filled with water and in door of refrigerator 	Used for storage vaccine at private clinics and nursing homes
Cold boxes	Fully frozen ice packs are used. Kept at bottom and sides	Used for transportation of vaccines.	Supplied to all peripheral centres

FMGE Solutions Screening Examination

522

55. Ans. (b) 4 weeks

Ref: K. Park 25th ed. P 111;
www.immunize.org/askexperts/precautions-contraindications.asp

- Book states: "Live vaccines should not be administered to persons with immune deficiency diseases or to persons whose immune system is suppressed because of leukaemia, lymphoma, malignancy or because of therapy with corticosteroids, alkylating agent, anti-metabolites and radiation"
- The immunosuppressive effect of corticosteroid may vary.
- As dose of 2 mg/kg or 20 mg/day for 2 weeks or more raise concern about safety of vaccination with live vaccines like MMR, varicella etc.
- It is recommended to wait for 1 month after discontinuation of steroid therapy before administering a live vaccine virus.
- **Note:** Inactivated vaccines and toxoids can be used administered to all immunocompromised patients in usual doses and schedules.

Extra Mile

- Pregnancy is also a contraindication for live vaccines.
- When two live vaccines are required, they should be given either simultaneously at different sites or with an interval of at least 3 weeks

56. Ans. (a) Yellow fever

Ref: K. Park 23rd ed. P 283

Contraindications of Yellow Fever Vaccines

- Children aged <9 months for routine immunization (or <6 months during an epidemic)
- Pregnant women (except during outbreak)
- People with severe egg protein allergy
- People with severe immunodeficiency caused by HIV/AIDS.

57. Ans. (a) Point source epidemic

Ref: K. Park 23rd ed. P 64-65

Types of Epidemics

- **Point source or single exposure epidemics:**
 - Sharp rise and sharp fall in number of cases
 - Clustering of cases in narrow spectrum of time
 - All cases develop within one incubation period of disease.
 - Ex: Food poisoning, measles, chicken pox, Bhopal gas tragedy
- **Common source, continuous or repeated exposure epidemics:**

- Sharp rise in number of cases
- Fall in number of cases is interrupted by secondary waves/peaks
- Ex: Contaminated well in a village, Sex worker in a gonorrhea outbreak
- **Propagated epidemics:**
 - Gradual rise and gradual fall over a long time (tail off)
 - Usually infectious in origin and results from person to person transmission
 - Transmission continues till number of susceptibles is depleted or they are no longer exposed to infected individuals
 - Ex: Hep A, Polio, HIV, Tuberculosis

Extra Mile

- **Endemic:** Constant presence of a disease in a defined geographical area
- **Pandemic:** Epidemic affecting a large population, occurring over a large geographical area.
- **Sporadic:** Scattered cases. They are widely separated in space and time and show little or no connection.

58. Ans. (c) 45

Ref: K. Park 23rd ed. P 360, 395

- Diabetes, hypertension and coronary artery diseases are among the diseases with high mortality.
- **Book states:** "CHD is responsible for 30–50% of deaths in diabetics over the age of 40 years.
- "Target population for screening diabetes are those from age group 40 and above"

59. Ans. (a) Tetanus toxoid

Ref: K. Park 23rd ed. P 311-312

- Tetanus occurring in newborn is known as neonatal tetanus. However it is acquired more commonly during the active age i.e. 5–40 years.
- Infants usually contract the disease during the birth, when delivered in a nonaseptic condition, especially when the umbilical cord is cut with the unclean instrument or when the umbilical stump is dressed with ashes, soil or cow dung.
- No age is immune unless protected by previous immunization.
- The immunity resulting from 2 injections from tetanus toxoid is highly effective and lasts for several years.

Prevention of Neonatal Tetanus

- **Active immunization:** Tetanus is best prevented by active immunization with tetanus toxoid. It stimulates the production of the protective antitoxin. Two preparations are available:

- **Combined vaccine:** DPT.
 - ◆ Offered routinely to infants under expanded immunization program.
 - ◆ 3 doses of vaccine given starting at 6 weeks of age in a gap of 4–8 weeks
- **Monovalent vaccine:**
 - ◆ Plain or fluid (formal) toxoid
 - ◆ Tetanus vaccine, adsorbed
- **Passive immunization**
 - Temporary protection can be provided by an injection of human tetanus hyperimmunoglobulin or ATS. It is the prophylactic to be used.
 - **Dose:** 250 IU for all ages.

60. Ans. (c) Number of new cases

Ref: K. Park 23rd ed. P 60

Incidence

Incidence rate is defined as “the number of NEW cases occurring in a defined population during a specified period of time”. It is given by the formula:

$$\text{Incidence} = \frac{\text{Number of new cases of specific disease during a given time period}}{\text{Population at-risk during that period}} \times 100$$

For example, if there had been 500 new cases of an illness in a population of 30,000 in a year, the incidence rate would be:

$$\begin{aligned} &= 500/30,000 \times 1000 \\ &= 16.7 \text{ per } 1000 \text{ per year} \end{aligned}$$

61. Ans. (b) dT

Ref: K. Park 23rd ed. P 162

- **Book states:** “For immunizing children over 12 years of age and adults, the preparation of choice is dT, which is adult type of diphtheria tetanus vaccine”
- This preparation contains no more than 2 L of diphtheria toxoid per dose, as compared to 25 L in the ordinary DPT vaccine.
- Administration of dT vaccine to adults is carried out in 2 doses at an interval of 4–6 weeks, followed by booster 6–12 months after second dose.

62. Ans. (d) Common source, continuous exposure

Ref: K. Park, 23rd ed. pg. 65

- **EPIDEMIC:** Sudden occurrence and rise of a particular health related behaviour/events which is in excess of “expected occurrence”
- **Common source, continuous or repeated exposure epidemics:**
 - Sharp rise in number of cases

- Fall in number of cases is interrupted by secondary waves/peaks
- **Ex: Contaminated well in a village, Sex worker in a gonorrhea outbreak**

63. Ans. (d) Secondary attack rate

Ref: K. Park, 23rd ed. pg. 100

- **Secondary attack rate** is defined as “the number of exposed persons developing the disease within the range of incubation period, following exposure to the primary case.” It is given by the formula:

$$\text{SAR} = \frac{\text{No. of exposed person developing the disease within range of incubation period}}{\text{Total no. of exposed/susceptible contacts}}$$

64. Ans. (d) Confirm epidemic whether it exists in real

Ref: K. Park, 23rd ed. pg. 131

In case of investigating an epidemic, an orderly procedure or the following practical guidelines should be followed:

- **Verification of diagnosis:** It is the first step in epidemic investigation
- **Confirmation of existence of epidemic:** It is the next step to confirm if epidemic exists. It is done by comparing the disease frequencies during the same period of previous years.
- Defining the population at risk
- Rapid search for all cases and their characteristics
- Data analysis
- Hypothesis formulation
- Testing of hypothesis
- Ecological factor evaluation
- Further investigation of population at risk
- Writing the report

65. Ans. (d) Number of girls born to a woman during her lifetime assuming mortality

Ref: K. Park, 23rd ed. pg. 488-89

- **Net Reproduction Rate (NRR):** Net Reproduction Rate (NRR) is defined as the number of assuming fixed age-specific fertility and mortality rates (21). NRR is a demographic indicator. NRR of 1 is equivalent to attaining approximately the 2-child norm.
- **General Fertility Rate (GFR):** It is the “number of live births per 1000 women in the reproductive age-group (15-44 or 49 years) in a given year”.

$$\text{GFR} = \frac{\text{Number of live births in an area during the year}}{\text{Mid-year female population age 15-44 (or 49) in the same area in same year}} \times 1000$$

FMGE Solutions Screening Examination

General fertility rate is a better measure of fertility than the crude birth rate because the denominator is restricted to the number of women in the child-bearing age, rather than the whole population. The major weakness of this rate is that not all women in the denominator are exposed to the risk of childbirth.

- **General Marital Fertility Rate (GMFR):** It is the “number of live births per 1000 married women in the reproductive age group (15–44 or 49) in a given year”.

$$\text{GMFR} = \frac{\text{Number of live births in an year}}{\text{Mid-year married female population in the age-group 15-49 years}} \times 1000$$

- **Total fertility rate (TFR):** Total fertility rate represents the average number of children a woman would have if she were to pass through the women now in each age group.
- **Total marital fertility rate:** Average number of children that would be born to a married woman if she experiences the current fertility pattern throughout her reproductive span.
- **Gross reproduction rate (GRR):** Average number of girls that would be born to a woman if she experiences the current fertility pattern throughout her reproductive span (15–44 or 49 years), assuming no mortality.

66. Ans. (b) 60

Ref: K. Park, 23rd ed. pg. 493

Couple Protection Rate (CPR)

- **Couple protection rate (CPR)** is an indicator of the prevalence of contraceptive practice in the community. It is defined as the per cent of eligible couples effectively protected against childbirth by one or the other approved methods of family planning, viz. sterilization, IUD, condom or oral pills.
- Sterilization accounts for over 60% of effectively protected couples. Demographers are of the view that the demographic goal of $\text{NRR} = 1$ can be achieved only if the CPR exceeds 60%.

67. Ans. (d) Odds ratio

- The given scenario is a retrospective study, also known as case control study. It is better known to calculate the odd's ratio.
- Prevalence is better given by cross sectional study.
- Incidence and relative risk is accurately calculated by cohort study.

68. Ans. (a) 20 IU/kg

Ref: K. Park, 23rd ed. pg. 280

- Rabies Ig for passive immunization is administered only once, preferably at, or as soon as possible after the initiation of post exposure vaccination.
- Beyond 7th day after the first dose, rabies Ig is not indicated
- The dose of human rabies Ig is 20 IU/kg body weight.
- The dose of equine Ig and F (ab') 2 products, is 40 IU/kg body weight.

69. Ans. (b) 0.5 cc

Ref: K. Park, 23rd ed. pg. 148

- Only live attenuated vaccines are recommended for use.
- The vaccine is presented as freeze-dried product. Before use, the lyophilized vaccine is reconstituted with sterile diluent.
- Each dose of 0.5 cc contains ≥ 1000 viral infective units of the vaccine strain.

Extra Mile

- Reconstituted measles vaccine loses 50% of its potency after 1 hour at 20°C.
- It loses almost all potency after 2 hour at 37°C.
- The vaccine is sensitive to light, hence kept in colored glass vials.
- After reconstitution, the vaccine must be stored in the dark at 2 – 8°C and used within 4 hours.

70. Ans. (c) 3

Ref: http://www.who.int/immunization_standards/vaccine_quality/pq266_je_1dose_biologique/en/; K. Park 23rd ed. pg. 481

- JE vaccine can be stored at 2–8°C for up to 3 years (shelf life)
- Similarly, Rabies vaccines prequalified by WHO, do not contain preservatives, such as thiomersal. The shelf life of these vaccines is ≥ 3 years, provided they are stored at +2 to +8°C and protected from sunlight.

71. Ans. (a) Includes notifiable cases

Ref: K. Park, 23rd ed. pg. 40

- **Surveillance** is defined as “the continuous scrutiny of the factors that determines the occurrence and distribution of disease and other conditions of ill health”
- **The main objectives of surveillance are:**
 - To provide information about new and changing trends in the health status of a population.
 - To provide timely warning of public health disasters so that intervention can be mobilized.
 - To provide feedback which may be expected to modify the policy of the system itself and lead to redefinition of objectives.

**Sentinel surveillance:**

- A method to identify the “missing cases” (by usual surveillance).
- **The** sentinel surveillance data is extrapolated to the entire population to estimate the disease prevalence in total population.
- **This** system provides more valuable and detailed information that could be obtained from traditional notification system (e.g. *Subcenter reports*).
- Advantage:
 - **Reporting bias is minimized** and feedback information to the providers is simplified
- **Done by whom?**
 - Sentinel surveillance agencies
 - Competent physicians (or institutions) in selected areas

72. Ans. (d) Patients with varicella zosterRef: K. Park, 23rd ed. pg. 145**Varicella Zoster Immunoglobulin (VZIG)**

- VZIG given within 72 hours of exposure, has been recommended for prevention of chicken pox in exposed susceptible individuals particularly in immunosuppressed patients. These include:
 - Person with congenital cellular immunodeficiency
 - Susceptible persons receiving immunosuppressive therapy
 - Persons with HIV/AIDS
 - Susceptible and exposed persons, in particular pregnant women
 - Newborns
 - Premature infants of low birth weight
- **NOTE:** VZIG has no role in established disease
- **Dose of VZIG:** 12.5 units/kg up to max of 625 units
- **Since VZIG appears to bind the varicella vaccine, the two should not be given together.**

73. Ans. (b) John SnowRef: K. Park, 23rd ed. pg. 5-6

- Father of public Health: Cholera
- *Father of modern epidemiology: John Snow*
- Father of Medicine/first true epidemiologist: Hippocrates.

74. Ans. (d) HippocratesRef: K. Park, 23rd ed. pg. 5-6

Refer to above answer

75. Ans (b) Agent, host and environmentRef: K. Park, 23rd ed. pg. 33-34, Park, 19th pg. 30

A broad concept of disease causation that synthesized the basic factors of agent, host and environment (see adjacent figure)

Epidemiological triad

This model—agent, host and environment—has been in use for many years. It helped epidemiologists to focus on different classes of factors, especially with regard to infectious diseases

76. Ans. (c) 13%Ref: K. Park, 23rd ed. pg. 61

- Prevalence is calculated as

$$\frac{\text{No. of new cases} + \text{no of old cases}}{\text{Total Population}} \times 100$$

- Therefore prevalence = $\frac{500 + 150}{5000} \times 100$
- Prevalence = 13%

Extra Mile

- *Prevalence is a Proportion*
- *Incidence is a Rate*

77. Ans. (a) Index caseRef: K. Park 23rd ed. pg. 95

- **Index Case:** In epidemiology, first case of a disease in a group which is **seen** by an investigator or which brought to the attention of the clinician. **It is not always the primary case.**
- **Primary case:** *First case of communicable disease introduced into the population unit being studied.*
- **Secondary case:** All case who develop from primary case
- **Incubation period:** Entry of organism till 1st sign/symptom
- **Median incubation:** Time period for 50% case to occur

78. Ans. (a) Index caseRef: K. Park, 23rd ed. pg. 95

Please refer to above explanation

79. Ans. (c) Primary caseRef: K. Park, 23rd ed. pg. 95, 21st ed. pg. 91

FMGE Solutions Screening Examination

- **Index case:** First case which comes to attention of investigator.
- **Primary case:** First case of communicable disease introduced into the population unit being studied.
- **Secondary case:** Cases which arise due to contacts with primary case.

80. Ans. (b) **Limitation of freedom of movement of well person or animals till incubation period of disease**

Ref: K. Park, 23rd ed. pg. 120, 21st ed. pg. 111

- **QUARANTINE** is defined as **Limitation of freedom of movement of such well person or domestic animals who are exposed to a communicable disease for a longer period of time, not longer than the longest usual incubation period of the disease.** This effectively prevents the contact with those who are not exposed, thereby reduces chances of possible transmission.
- **ISOLATION** is separation for the period of communicability of **INFECTED** person or animals from others in order to reduce direct or indirect transmission.
- **Epidemiological investigations** Identification of source of infection and factors influencing its spread in community
- **Notification:** Notification of an infectious disease to local health authority to put control measures on it.

81. Ans. (c) **Pandemic**

Ref: K. Park, 23rd ed. pg. 93, 21st ed. pg. 88-89

- **Endemic:** Constant presence of a disease or an infectious agent within a given geographical area or a population group.
- **Epidemic:** Sudden occurrence and rise of a particular health related behaviour/event which is in excess of "expected occurrence".
- **Sporadic:** Scattered cases, which occur irregularly, haphazardly from time to time. These cases are few and separated widely in space and time that they show little or no connection with each other, nor a recognizable common source of infection.
- **Pandemic:** An epidemic usually affecting a large proportion of population, occurring over a wide geographic area such as a section of nation, the entire nation, a continent or the world.

82. Ans. (b) **Sharp rise and sharp fall in number of cases**

Ref: K. Park, 23rd ed. pg. 64, 93

Types of Epidemics

- **Point source or single exposure epidemics**

- Sharp rise and sharp fall in number of cases
- Clustering of cases in narrow spectrum of time
- All cases develop within one incubation period of disease.
- **Ex: Food poisoning, measles, chicken pox, Bhopal gas tragedy**
- **Common source, continuous or repeated exposure epidemics:**
 - Sharp rise in number of cases
 - Fall in number of cases is interrupted by secondary waves/peaks
 - **Ex: Contaminated well in a village, Sex worker in a gonorrhea outbreak**
- **Propagated epidemics:**
 - Gradual rise and gradual fall over a long time (tail off)
 - Results from person to person transmission
 - Transmission continues till number of susceptibles is depleted or they are no longer exposed to infected individuals
 - **Ex: HIV, Tuberculosis**

Extra Mile

- **Endemic:** constant presence of a disease in a defined geographical area
- **Pandemic:** epidemic affecting a large population, occurring over a large geographical area.
- **Sporadic:** scattered cases. They are widely separated in space and time and shows little or no connection.

83. Ans. (a) **Generation time**

Ref: K. Park, 23rd ed. pg. 100

- **Generation time:** The interval of time between receipt of infection by a host and a **maximal infectivity** of the host (**Generation time = Incubation period**)
- **Serial interval:** The gap in time between the onset of primary case and secondary case is called serial interval.
- **Communicable period:** Time during which an infectious agent may be transferred directly or indirectly from an infected person to another person, from an infected animal to a person or vice versa including arthropods.
- **Latent period:** The period from disease **initiation to disease detection**.

84. Ans. (d) **Latent period**

Ref: K. Park, 23rd ed. pg. 99, 21st ed. pg. 94

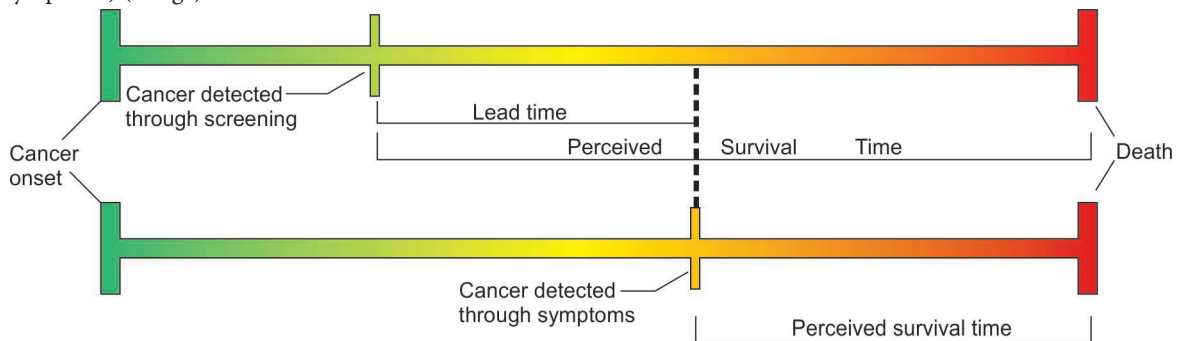

- In infectious diseases the term incubation period is used, which is equivalent to latent period in non-infectious diseases.
- **Latent period** is defined as "the period from disease initiation to disease detection"

85. Ans. (c) Time between detection of disease through screening and its clinical symptoms

Ref: K. Park, 23rd ed. pg. 99-100

- **Lead time** is the length of time between the detection of a disease and its usual clinical presentation and diagnosis
- OR
- It is the time between early diagnosis with screening, and when diagnosis would have been made without screening (through symptoms) (Image).

86. Ans. (d) General fertility rate

Ref: K. Park, 23rd ed. pg. 488

- **General fertility rate** is the annual number of live births per 1000 married women of child bearing age (15-49 years).
- **Total fertility rate** average number of children born to a women in her reproductive life span.
- **Gross reproduction rate** is total number of girl children born to a female. It is half of the TFR.
- **Net reproduction rate** is total number of girl children born to a female, taking into account their mortality.

87. Ans. (b) Annual number of live births per 1000 married women during reproductive age

Ref: Park's, 21st ed. pg. 451

Please refer to above explanation

88. Ans. (c) Gross reproduction rate

Ref: K. Park, 23rd ed. pg. 488-89

89. Ans. (b) 100,000 live births

Ref: K. Park, 23rd ed. pg. 25, 557

- Maternal Mortality Rate (MMR) is expressed as per 100,000 live births.
 - MMR
- $$= \frac{\text{No. of maternal deaths in a given year}}{\text{Total no. of live births in the same year}} \times 100,000$$
- MMR is a RATIO

- **MCC of MMR in India:** Post-partum hemorrhage
- **MC direct cause of MMR:** PPH
- **MC indirect cause of MMR:** Anemia
- **Maternal death:** Death of mother anytime during pregnancy/labor or **within 42 days** of termination of pregnancy.

90. Ans. (d) Associated with antecedent causation

Ref: K. Park, 23rd ed. pg. 75

COHORT STUDY

- Is a type of analytical or observational study used for hypothesis testing, also called as TROHOC study / prospective study/forward looking study/cause to effect study/exposure to outcome study/risk factor to disease study /incidence study/ follow up study.
- **Strength of association of prospective study is given by:**
 - **Relative risk:** incidence exposed/incidence among non exposed
 - **Attributable risk =**

$$\frac{\text{incidence among exposed} - \text{incidence among non-exposed}}{\text{Incidence among exposed}} \times 100$$
- **Population attributable risk =**

$$\frac{\text{incidence among total} - \text{incidence among non-exposed}}{\text{Incidence among total}} \times 100$$
- Classical example of cohort study is FRAMINGHAM HEART STUDY which is an antecedent study.
- Other examples include DOLLS AND HILLS which is an example of prospective study on smoking and lung cancer.

FMGE Solutions Screening Examination

528

91. Ans. (c) **Cannot measure cause to effect**

Ref: K. Park, 23rd ed. pg. 75-76

- “Cause to effect” study is done only in Cohort study. In case- control study, study is done from “effect to cause”.

Comparison Between Cohort Study and Case Control Study

Cohort Study	Case Control study
• Time consuming	• Less time consuming
• Expensive	• Relatively cheaper
• Chance of loss of follow up is high	• No loss of follow up
• NOT useful for rare diseases	• Useful for rare diseases
• It has ethical issues	• NO ethical issues
• Calculate incidence and relative risk (more accurate)	• Calculate Odd's ratio
• Cohort study is also known as: <ul style="list-style-type: none"> ▪ Prospective study ▪ Cause to effect study ▪ Exposure to outcome study ▪ Incidence study ▪ Follow up study 	• Case control study is also known as: <ul style="list-style-type: none"> ▪ Retrospective study ▪ Effect to cause study ▪ Outcome to exposure study ▪ Case reference study

92. Ans. (a) **Indicates prevalence**

Ref: K. Park, 23rd ed. pg. 75-77

Cross sectional study is the simplest form of observational epidemiological study which is based on single examination of a cross section of a population at one point of time , results of sample are then projected to the whole population

Advantages

- Provides prevalence of a disease
- Provides a whole picture of population at one point of time
- More useful for chronic disease

97. Ans. (a) **TP/TP + FP × 100**

SENSITIVITY	$\frac{TP}{TP + FN} \times 100$	PREDICTIVE VALUE OF A NEGATIVE TEST	$\frac{TN}{TN + FN} \times 100$
SPECIFICITY	$\frac{TN}{FP + TN} \times 100$	% OF FALSE NEGATIVES	$\frac{FN}{TP + FN} \times 100$
PREDICTIVE VALUE OF A POSITIVE TEST	$\frac{TP}{TP + FP} \times 100$	% OF FALSE POSITIVES	$\frac{FP}{FP + TN} \times 100$

Disadvantages

- Tells about distribution of a disease rather than the etiology
- Establishment of time sequence of a disease is not possible
- Provides little information of a natural history and incidence of a disease

93. Ans. (a) **Prevalence**

Ref: K. Park, 23rd ed. pg. 75-77, 21st ed. pg. 71-72

- Prevalence is determined by cross sectional studies.

94. Ans. (a) **It increases with prevalence**

Ref: K. Park, 23rd ed. pg. 140-141

POSITIVE PREDICTIVE VALUE

- Ability of screening test to identify correctly all those who have disease out of all those who test positive on a screening test.
- It depends upon sensitivity, specificity and prevalence of a disease in a population
- PPV of a screening is directly proportional to prevalence of disease
- **If Prevalence of a disease increases in a population, PPV increase for the screening test.**

$$PPV = \frac{TP}{TP + FP} \times 100$$

- $PPV \propto \text{Prevalence}$

95. Ans. (c) **True positive**

SENSITIVITY: Defined as ability of a screening test to identify all those who have disease (cases/ True Posiive)

$$\text{Sensitivity} = \frac{a}{(a+c)} \times 100 = \frac{TP}{(TP+FN)} \times 100$$

96. Ans. (d) **Pathogenesis**

The causative factors of disease include AGENT, HOST, ENVIRONMENT. These 3 are referred as Epidemiological triad. Interaction of these 3 factors is required for development of disease.

98. Ans. (d) $TN/FP + TN \times 100$

Ref: K. Park, 23rd ed. pg. 139-140, 21st ed. pg. 113

- Specificity is defined as ability of a test to identify correctly those who do not have the disease i.e. "true negatives"

Specificity

$$= \frac{\text{True Negative}}{\text{False Positive} + \text{True Negative}} \times 100$$

99. Ans. (b) 1921

Ref: Internet Source

The year 1921 is a "year of the great divide" in the demographic history of India when mortality started to decline leading to acceleration in the rate of population growth. During the next three decades (1921-51) the rate of population growth continued at a level of over one per cent per annum. It is going increasingly since then. Hence the year 1921 is rightly called the demographic divide or year of great divide.

Impact of economic growth in an economy will generally have the following impact on the population:

- High birth rate and High death rate –Leads to low population growth (under-developed economy)
- High birth rate and Low death rate: Leads to High population growth (developing economy)
- Low birth rate and Low death rate: Leads to Low population growth (developed economy)
- In countries where children are regarded as assets, the rate of birth will be high, however due to low economic growth the health services will be poorer leading to high death rates also. E.g. India
- Once the country achieves certain level of economic growth over a period of time, the health services would

become accessible to people, which would lead to high rate of birth and low rate of death.

- Once a good level of economic growth and literacy rate is achieved, the people will tend to have less children, leading to low rate of birth and low rate of death.

100. Ans. (a) **Attribute risk**

Ref: K. Park, 23rd ed. pg. 71-72

Case control study is often called retrospective study.

The 4 Basic Steps of Case Control Study

- Matching
- Measurement of exposure
- Selection of cases and controls

FMGE Solutions Screening Examination

530

- Analysis and interpretation (relative risk)
- $$\text{Relative Risk} = \frac{\text{Incidence among exposed}}{\text{Incidence among non-exposed}}$$

101. Ans. (d) **This is use of clinical or laboratory tests to detect disease in individual seeking health care for other reasons**

Ref: K. Park, 23rd ed. pg. 135

Option D is case finding and the difference is that the examinations or test done for an individual *who is seeking health care is case finding not a screening*.

102. Ans. (d) **Tetanus**

Ref: K. Park, 23rd ed. pg. 312

- All live and meningococcal vaccines are C/I in pregnancy EXCEPT: **YF and OPV**
- Measles, rubella and BCG are live vaccines while Tetanus is from toxoid category.
- Remember, these live vaccines can't cross the placenta
- These vaccines are still contraindicated because pregnancy is an immune-compromised state, they might harm mother.

Vaccines Indicated During Pregnancy

- Killed
- Toxoids (*tetanus*)
- Cell fraction (Hep A, Hep B)
- OPV and YF

103. Ans. (d) **Live J.E.**

Ref: K. Park, 23rd ed. pg. 119, 286-87

- Regardless of symptomatology, all LIVE vaccines are contraindicated in HIV+ newborn EXCEPT:
 - Measles
 - OPV
 - BCG
- In asymptomatic HIV+ adults, all vaccines can be given during asymptomatic phase.
- In symptomatic HIV+ adults, all live vaccines are contraindicated except: **BCG and MMR**

Extra Mile

- All vaccines are contra-indicated during epidemics EXCEPT: **MEASLES**
- All vaccines are contra-indicated post disaster EXCEPT: **MEASLES**

104. Ans. (b) **10 days**

Ref: K. Park, 23rd ed. pg. 121, 283

- Yellow fever vaccine certificate becomes valid **after 10** days of vaccination and valid upto 10 years.
- Immunity of yellow fever vaccination coverage: **10 days-lifetime 35 years.**

- Quarantine period of yellow fever: **6 days** (maximum I.P of YF)

International Travelers

- WHO recommends revaccination every 10 years

105. Ans. (d) **Validity of vaccination certification begins immediately after vaccination**

Ref: K. Park, 23rd ed. pg. 121, 283

106. Ans. (c) **Day 0, 3**

Ref: K. Park, 23rd ed. pg. 279-80

TABLE: Schedule of Prophylaxis Rabies vaccine

Types of prophylaxis	Schedule
Pre-exposure	Day 0, 7, 28
Post-exposure	Day 0, 3, 7, 28, (1/0)
Post-exposure in vaccinated	Day 0, 3

Note: 1/M schedule of Rabies Ig → 0, 3, 7, 14, 28 (Essen Regimen)

107. Ans. (c) **Day 0, 7, 28**

Ref: K. Park, 23rd ed. pg. 279-80

- Pre exposure schedule in rabies vaccine is on day 0, 7, 28.

Please refer to above table

108. Ans. (a) **Children under 8 years**

Ref: K. Park, 23rd ed. pg. 103, 21st ed. pg. 28

- Live vaccines are prepared from live (generally attenuated) organisms. Generally live vaccines are more potent than killed vaccines. In case of administration of live vaccines usually require single dose except polio vaccine which require 3 doses.
- Live vaccines are usually contraindicated in persons with immunodeficiency disorders or persons with leukemia, lymphoma, malignancies, or because of therapy with alkylating agents, corticosteroids, radiotherapy, antimetabolite drugs.
- Pregnancy is the another contraindication unless risk of infection exceeds the risk of harm to the fetus.

109. Ans. (a) **Exotoxins**

Ref: K. Park, 23rd ed. pg. 105

110. Ans. (a) **Live attenuated**

Ref: K. Park, 23rd ed. pg. 286-87

- JE vaccine is a live attenuated vaccine. It is available in killed vaccine form also.
- **Strain:** SA 14-14-2- live
Nakayama strain- killed
- **One dose of JE vaccine is given at 16-24 months of age.**

Extra Mile

- **MC live vaccine used:** BCG
- **MC killed vaccine used:** Pertusis
- **All live vaccines are contra-indicated in pregnancy EXCEPT:** YF and OPV

Live Vaccine	Killed	Toxoids	Cell fraction	Combined
<ul style="list-style-type: none"> • BCG • OPV (<i>sabin</i>) • MMR • Yellow fever • Live J.E. • Live H1N1 • Live cholera 	<ul style="list-style-type: none"> • Hep A • Hep B • Pertusis • IPV (<i>salk</i>) • Rabies • Meningo-coccal • Killed J.E. • Killed H1N1 	<ul style="list-style-type: none"> • Diphtheria • Tetanus 	<ul style="list-style-type: none"> • Hep B • Meningo-coccal • HiB • Pneumo-coccal 	<ul style="list-style-type: none"> • DPT • MMR

111. Ans. (d) Oka

Ref: K. Park, 23rd ed. pg. 143

Vaccines and their Associated Strain

Vaccine	Strain
• Anti HIV	Ankara strain (<i>under trial</i>)
• Anti-malarial	Lytic cocktail (SPF 66)
• BCG	DANISH 1331
• Japanese Encephalitis	Nakayama Strain (killed) SA 14-14-2 (live)- currently used
• Killed H1N1	California strain
• Measles	Edmonston strain
• Mumps	Jeryl Lynn Strain
• Rabies	Fixed viral strain
• Rubella	RA 27/3 strain
• Varicella	Oka strain
• Yellow fever	17 D strain

112. Ans. (b) Carrying stool samples of Polio patients from Primary Health Centre (PHC) to laboratory

Ref: K. Park 23rd ed./109-110, 19th/99

- **WHO indicators of AFP surveillance and laboratory performance:** it has several indicators, including Stool specimens for isolation of a non-polio enterovirus (Target > 10%).
- The indicator of quality of "reverse cold chain" (which means that **the specimen has been maintained at <8°C during transportation from field to laboratory continuously**) and how well laboratory has been able to perform routine isolation of enteroviruses.

Revising Concept and Key Points of 'Cold Chain'

- **Cold chain** is a system of storage and transport of vaccines at low temperature from the **manufacturer to the actual vaccination site**
- The cold chain system is necessary because vaccine failure may result due to non strict temperature controls
- **Polio** is the most sensitive to heat, requiring storage at minus 20 degree °C.
- Vaccines which must be stored in the **freezer compartment** are: **polio and measles**.
- Vaccines which must be stored in the **COLD PART but never allowed to freeze** are: typhoid, DPT, tetanus toxoid, DT, BCG and diluents.

113. Ans. (b) Rabies

Ref: K. Park, 23rd ed. pg. 102, 21st ed. pg. 97

- Herd immunity is the level of resistance of a community or a group of people to a particular disease.

Vaccines which DONOT provide herd protection	Vaccines which provide herd protection
<ul style="list-style-type: none"> • Tetanus • Rabies • Japanese encephalitis • Hepatitis B • Yellow fever 	<ul style="list-style-type: none"> • Diphtheria • Pertussis • Measles • Mumps • Hepatitis A • Polio

114. Ans. (c) Calculating adverse drug reaction

- The **Naranjo algorithm, Naranjo Scale, or Naranjo Nomogram** is a questionnaire designed by Naranjo *et al.* for determining the likelihood of whether an adverse drug reaction is actually due to the drug rather than the result of other factors.
- Probability is assigned via a score termed definite, probable, possible or doubtful. Values obtained from this algorithm are sometimes used in peer reviews to verify the validity of author's conclusions regarding adverse drug reactions. It is also called the Naranjo Scale or Naranjo Score.

Scoring

- ≥ 9 = definite ADR
- 5–8 = probable ADR
- 1–4 = possible ADR
- 0 = doubtful ADR

115. Ans. (d) Post marketing surveillance

Ref: K. Park, 23rd ed. pg. 84-85

Clinical Trials

532

Phase	Subjects	Purpose
• Phase 1	Healthy human volunteer	Safety and non-toxicity
• Phase 2	Patients (20–200)	Effectiveness
• Phase 3	Patients	Comparison with existing drug
• Phase 4	Patient	Long term side effects Post marketing surveillance

- Most important phase of clinical trial: Phase 3
- A new drug is launched in market after phase 3

PHASE 4

- Post marketing surveillance
- Longest phase: 10–25 years
- To study the long term side effects of a drug
- Doesn't require ethical clearance.

116. Ans. (c) Phase 3

Ref: K. Park, 23rd ed. pg. 84-85

- **Phase 1:** Human pharmacology and safety: Drugs are tested on healthy individuals (20–50 people).
 - **Main aim:** To find out maximum tolerable dose hence, dose finding study.
- **Phase 2:** Therapeutic exploration and dose ranging:
 - **Main aim:** to check the safety, efficacy of drug.
- **Phase 3:** Therapeutic confirmation/comparison:
 - **Main aim:** To confirm the safety of drug, efficacy. 'New drug application' (NDA) is submitted to the licencing authority, who if convinced give marketing permission for the drug.
- **Phase 4:** Postmarketing surveillance studies:
 - **Main aim:** To study the rare side effect caused by new drugs.

COMMUNICABLE AND NONCOMMUNICABLE DISEASE

117. Ans. (c) Anopheles

Identification features of anopheles mosquito

- Spotted wings
- When at rest, inclined at an angle of 45° to the surface
- No buzzing sound

TABLE: Difference between anopheles and Aedes mosquito

Anopheles Mosquito		Aedes Mosquito
Malaria	Diseases spread	Dengue, Yellow Fever, Chikungunya, Lymphatic filariasis
Pregnant females	Which mosquitoes bite?	Pregnant females
Night	When do they bite?	Day
With abdomen sticking upwards	Resting position	Lies parallel to resting surface
Predominantly rural	Location	Predominantly urban
Bodies of water	Breeding ground	Shallow water surfaces

118. Ans. (a) 3 days

Ref: K. Park 25th ed. P 162

- Apart from vaccine, measles can be prevented by administration of immunoglobulin early in the incubation period.
- **Dose:** 0.25 ml/kg
- It should be given within 3–4 days of exposure
- These persons who are passively immunized should be given live measles vaccine 8–12 weeks later

119. Ans. (b) 7–14 days

Ref: K. Park 25th ed. P 253

- Infection of cholera is dose dependent. Infection occurs when the number of vibrio ingested exceeds the dose that is infective for individual.
- To produce clinical disease 10^{11} organisms required.
- NOTE: An infected person can excrete 10-20 litre of fluid, which contain $10^7 - 10^9$ vibrios per ml.
- A case of cholera is infectious for a period of 10–14 days
- Convalescent carriers are infectious for 2–3 weeks.
- A chronic carrier state may last from a month up to 10 years or more.

120. Ans. (b) 100–120 mcg/day

Ref: K. Park 25th ed. P 681, PubMed

Requirement of iodine in child age group:

- **7–12 month:** 110 mcg/day
- **1–8 years:** 90 mcg/day
- **9–13 years:** 120 mcg/day
- **Adult/14–18 years:** 150 mcg/day
- **Pregnancy:** 250 mcg/day

121. Ans. (c) Reduces duration of diarrhoea

Ref: K. Park 25th ed. P 489

- For the control of diarrhoea, India is the first country to introduce low osmolarity ORS.
- As an adjunct to ORS, zinc is also added.
- Addition of zinc results in reduction of the number and severity of episodes and duration of diarrhoea.

122. Ans. (b) Q fever

Ref: K. Park 25th ed. P 328

- **Q fever** differs from other rickettsial infection. There is no arthropod involved in its transmission to man.
- **Transmission can be due to:**
 - Inhalation of infected dust contaminated by urine or faeces of diseased animal or through aerosol (*most important route: respiratory route*).
 - Through abrasion, conjunctiva or ingestion of contaminated food such as meat, milk and milk products
- I.P.: 2 – 3 weeks
- **Clinical feature:** Acute onset fever, chills, general malaise, headache. NO rash or local lesion. The infection can cause: pneumonia, hepatitis, encephalitis.
- **DOC:** Doxycycline

Extra Mile

Rickettsial diseases, their Agents and insect vectors

Disease	Rickettsial agent	Insect Vectors
Epidemic typhus	<i>R. prowazekii</i>	Louse
Endemic typhus	<i>R. typhi</i>	Flea
Scrub typhus	<i>R. tsutsugamushi</i>	Mite
Indian tick typhus	<i>R. conorii</i>	Tick
Rocky mountain spotted fever	<i>R. rickettsii</i>	Tick
Rickettsial pox	<i>R. akari</i>	Mite
Q fever	<i>C. burnetii</i>	
Trench fever	<i>Rochalimaea quintana</i>	Louse

123. Ans. (d) Classify the type of leprosy

Ref: K. Park 25th ed. P 347-48

- Lepromin test is performed by injecting 0.1 ml of

lepromin in inner aspect of forearm

- Routinely, reaction is read at 48 hours and 21 days. Two types of reactions:
 - **Early reaction:** Aka **Fernandez reaction**. Reaction is evidenced by redness and induration at the site of inoculation. Size >10 mm after 48 hours is considered positive
 - ♦ **Early reaction** indicates if a person has been previously sensitized by exposure to and infection by leprosy bacilli.
 - ♦ It is described as **delayed hypersensitivity reaction (type IV)** to soluble constituents of leprosy bacilli.
 - **Late reaction:** Aka **Mitsuda reaction**: Become apparent 7-10 days after injection. Evaluate after 21 days. Reaction is said to be positive if there is nodule >5 mm at the site of inoculation
 - ♦ **Late reaction** is induced by bacillary component of the antigen. It indicates cell mediated immunity
- **Value of lepromin test:**
 - **Lepromin test** is NOT a diagnostic test
 - **Drawbacks:** Positives result in non-cases and negative result in lepromatous and near-lepromatous cases.
 - A useful tool in evaluating the immune status of leprosy patients (cell mediated immunity).
 - It is of considerable value in confirming the results classification and cases of leprosy on clinical and bacteriological ground.
 - In other words the test is widely used as an aid to classify the type of disease.

124. Ans. (d) 2 Lac IU thrice every 6 months

Ref: K. Park 25th ed. P 673

- The strategy to counter vitamin A deficiency is to administer a single massive dose of 200,000 IU of vitamin A in oil (retinol palmitate) orally every 6-month to preschool children (1–6 years).
- Dose is reduced to half in children In age group of 6 months to 1 year.

125. Ans. (d) No cut off of CD 4 count required for initiation of treatment

Ref: K. Park 25th ed. P 380-81

TABLE: WHEN TO START ART

When to Start in adult (>19 years old)	ART should be initiated in all adults living with HIV, regarding of WHO clinical stage and at any CD4 cell count.
	As a priority. ART should be initiated in all adults with severe or advanced HIV clinical disease (WHO clinical stage 3 or 4) and adults with a CD4 count ≤ 350 cells/mm ³ .

Contd...

FMGE Solutions Screening Examination

When to start ART in pregnant and breast-feeding women	ART should be initiated in all pregnant and breastfeeding women living with HIV, regardless of WHO clinical stage and at any CD4 cell count and continued lifelong.
When to start ART in adolescents (10-19 years of age)	ART should be initiated in all adolescents living with HIV, regardless of WHO clinical stage and at any CD4 cell count (conditional recommendation). As priority, ART should be initiated in all adolescents with severe or advanced HIV clinical disease (WHO clinical stage 3 or 4) and adolescents with a CD4 count ≤ 350 cells/mm ³ .
When to start ART in children younger than 10 years of age	ART should be initiated in all children living with HIV, regardless of WHO clinical stage or at any CD4 cell count. • Infants diagnosed in the first year of life • Children living with HIV 1 year old to less than 10 years old (conditional recommendation).
	As a priority, ART should be initiated in all children <2 years of age or children younger than 5 years of age with WHO clinical stage 3 or 4 or CD count ≤ 750 cells/mm ³ or CD4 percentage <25% and children 5 years of age and older with WHO clinical stage 3 or 4 or CD4 count ≤ 350 cells/mm ³ .
Timing of ART for adults and children with TB	ART should be started in all TB patients living with HIV regardless of CD4 count. TB treatment should be initiated first, followed by ART as soon as possible within the first 8 weeks of treatment. HIV-positive TB patients with profound immunosuppression (e.g. CD4 counts less than 50 cells/mm ³) should receive ART within the first two weeks of initiating TB treatment.
	ART should be started in any child with active TB disease as soon as possible and within 8 weeks following the initiation of antituberculosis treatment regardless of the CD4 cell count and clinical stage.

126. Ans. (a) Crimean-Congo fever

Ref: PubMed

- Host of Crimean-Congo hemorrhagic fever is cattle like cows and sheep.
Crimean-Congo hemorrhagic fever (CHF) is caused by infection with a tick-borne virus (Nairovirus) in the family *Bunyaviridae*. The disease was first characterized in the Crimea in 1944 and given the name Crimean hemorrhagic fever.

Extra Mile

- **Host of KFD:** Small mammals like squirrels and rats are main reservoirs. Monkeys are amplifying host.
- **Monkeys and forest mosquitoes** are the reservoir of the Yellow fever.

127. Ans. (b) Centripetal distribution

Ref: K.Park 23rd ed. P 145

TABLE: Differences between smallpox and chicken pox

Smallpox	Chicken pox
• Incubation: About 12 days (Range: 7–17 days)	About 15 days (Range 7–12 days)
• Prodromal symptoms: Severe	Usually mild
• Distribution of rash:	
• Centrifugal <ul style="list-style-type: none"> ■ Palms and soles frequently involved ■ Axilla usually free ■ Rash predominant on extensor surfaces and bony prominences 	• Centripetal <ul style="list-style-type: none"> ■ Seldom affected ■ Axilla affected ■ Rash mostly on flexor surfaces
• Characteristics of the rash:	
■ Deep-seated	■ Superficial
■ Vesicles multilocular and umbilicated	■ Unilocular dew-drop like appearance
■ Only one stage of rash may be seen at one time	■ Rash pleomorphic. i.e. different stages of the rash evident at one given time, because rash appears in successive crops
■ No area of inflammation is seen around the vesicles	■ An area of inflammation is seen around the vesicles
• Evolution of rash:	
■ Evolution of rash is slow, deliberate and majestic, passing through definite stages of macule, papule, vesicle and pustule	■ Evolution of rash is very rapid
■ Scabs begin to form 10–14 days after the rash appears	■ Scabs begin to form 4–7 days after the rash appears
• Fever:	
■ Fever subsides with the appearance of rash, but may rise again in the pustular stage (secondary rise of fever)	■ Temperature rises with each fresh crop of rash

128. Ans. (c) Lymphadenopathy

Ref: Harrison's 19th ed. P 1067-68

- Tularemia is a zoonosis caused by *Francisella tularensis*.
- Humans of any age, sex, or race are universally susceptible to this systemic infection.

- It is primarily a disease of wild animals and persists in contaminated environments, ectoparasites, and animal carriers.
- *F. tularensis* is a class A bioterrorism agent. With rare exceptions, tularemia is the only disease produced by *F. tularensis*—a small (0.2 µm by 0.2–0.7 µm), gram-negative, pleomorphic, nonmotile, non-spore-forming bacillus. Bipolar staining results in a coccoid appearance.
- **Incubation period:** 2–10

Clinical Manifestations

- Tularemia often starts with a sudden onset of fever, chills, headache, and generalized myalgias and arthralgias.

TABLE: Clinical Presentation of Tularemia

Sign or symptom	Rate of occurrence, %	
	Children	Adults
Lymphadenopathy	96	65
Fever (>38.3°C of > 101°F)	87	21
Ulcer/eschar/papule	45	51
Myalgias/arthralgias	39	2
Headache	9	5
Cough	9	5
Pharyngitis	43	–
Diarrhea	43	–

129. Ans. (b) *Bartonella*

Ref: K.Park 23rd ed. P 302

- **Quintan fever or Trench fever** (also known as “five-day fever” and “urban trench fever”) is a moderately serious disease transmitted by body louse.
- It is caused by ***Bartonella Quintana*** (found in the stomach of the body louse).
- The disease is limited to central Europe.

Extra Mile

- *Rickettsia conorii* causes Indian tick typhus
- *Coxiella burnetti* causes Q fever
- Epidemic typhus is caused by Louse
- *Rickettsia typhi* causes Murine typhus (flea borne typhus).

130. Ans. (c) *Japanese encephalitis*

Ref: K.Park 23rd ed. P 284-85

- Japanese encephalitis (JE) is a mosquito borne infection, caused by group B arbovirus (Flavivirus) and transmitted by culex mosquito.
- Disease is transmitted by man by the bite of infected mosquito. Man is incidental dead end host.
- Major host for JE: Pigs.
- Infected pigs do not show any overt symptom but circulate the virus so that mosquitoes get infected and transmit the virus to man. Therefore pigs are also considered as amplifier host.
- Cattles and buffaloes are mosquito attractants.
- **Mosquito vectors of JE:**
 - *Culex tritaeniorhynchus* (common)
 - *Culex vishnui* (common)
 - *Culex gelidus*

Extra Mile

Disease	Vector
Chikungunya fever	Aedes mosquito
KFD	Ticks
Malaria	Anopheles mosquito
	<ul style="list-style-type: none"> • An. Culicifacies: For rural areas • An. Stephensi: For urban areas
Dengue	<i>Aedes aegypti</i> <i>Aedes albopictus</i>

131. Ans. (b) *Yellow*

Ref: K. Park, 23rd ed. pg. 438

- NACO has branded the STI/RTI (sexually transmitted infection/Reproductive tract infection) as “suraksha clinic” and has developed a communication strategy for generating demand for these services.
- Pre-packed STI/RTI colour coded kits have been provided for free supply to all designated STI/RTI clinics.

TABLE: RTI/STI Color kits under NACP/RCH/NRHM

Contents of the STI/RTI drug kits			
STI/RTI syndromic diagnosis	Name of the kit prescribed	Color coding of the kit	Contents of the kits (Name of the Drugs)
Urethral Discharge (UD) Cervicitis (CD) Ano-rectal Discharge (ARD) Presumptive Treatment (PT)	Kit-1	Gray	1 tablet of Azithromycin (1 gram) 2 tablets of Azithromycin (500 mg): If chlamydia Cefixime 400 mg single dose: If gonococcal

Contd...

Contents of the STI/RTI drug kits			
STI/RTI syndromic diagnosis	Name of the kit prescribed	Color coding of the kit	Contents of the kits (Name of the Drugs)
Vaginitis (VD)	Kit-2	Green	1 table of secnidazole (2 gram)/2 tablets of secnidazole (1 gram) & fluconazole (150 mg)
Genital Ulcer-Disease Non-Herpetic (GUD-NH)	Kit-3	White	Injection Benzathine penicillin (2.4 MU) + 1 tablet azithromycin (1 gram)
Genital Ulcer-Disease Non-Herpetic (GUD-NH)- for patient allergic to penicillin	Kit-4	Blue	28 tablets/capsules of Doxycycline (100 mg) & 1 tablet of azithromycin (1 gram)
Genital Ulcer-Disease-Herpetic (GUD-H)	Kit-5	Red	21 tablets of Acyclovir (400 mg)
Lower Abdominal Pain (LAP/PID)	Kit-6	Yellow	1 tablet of cefixime (400 mg) 28 tablets of Metronidazole (400 mg) 28 tablets of Doxycycline (100 mg)
Inguinal bubo (IB)/Scrotal swelling	Kit-7	Black	42 tablets of Doxycycline (100 mg) & 1 tablet of Azithromycin (1 gram)

132. Ans. (d) **Inguinal bubo**

Please refer to above explanation

133. Ans. (b) **Cervix CA**

Ref: PubMed

- Among the given options, only cervix cancer can be prevented by vaccine.
- The most common causative agent of cervix CA is HPV (6, 11, 16, 18). HPV 16 and 18 has maximum risk.
- Vaccine is protective against either: 2, 4 or 9 types of HPV.
- Three HPV vaccines have Food and Drug Administration (FDA) approval in the US
- Cervarix (*provides protection against HPV 16, 18*) is for girls only, while Gardasil (*against 6, 11, 16, 18*) and Gardasil 9 can be used for both girls and boys. Gardasil 9 offers girls protection against more strains of HPV that can cause cervical cancer.
- The HPV vaccine is **recommended for girls and boys ages 11 or 12**, although it can be given as early as age 9. It is ideal for girls and boys to receive the vaccine before they have sexual contact and are exposed to HPV.

134. Ans. (b) **Few hours to 5 days**

Ref: K. Park 23rd ed. P 230

- Incubation period of cholera is **few hours to 5 days**, but **commonly 1–2 days**.

135. Ans. (b) **Chicken pox**

Ref: K. Park, 23rd ed. pg. 143, 841, 21st ed. pg. 780

- The following diseases are notifiable to WHO in Geneva:
 - Cholera
 - Plague
 - Yellow fever

- In addition to these a few others like: Louse borne typhus, relapsing fever, Polio, Influenza, malaria, rabies and salmonellosis are subject to international surveillance.

136. Ans. (d) **Cholera, plague and yellow fever**

Ref: K. Park, 23rd ed. pg. 841–42, 21st ed. pg. 780

137. Ans. (b) **2 days before and 5 days after rash appearance**

Ref: K. Park, 23rd ed. pg. 143

- Chicken pox is infective 2 days before appearance of rash and 5 days after rash disappearance.
- Measles is infective 4 days before appearance of rash and 5 days after rash disappearance
- Mnemonic: rule of 25 and 45
 - 2–5: chicken pox
 - 4–5: measles

138. Ans. (b) **Influenza**

Ref: K. Park, 23rd ed. pg. 153

Disease	Causative Organism	Incubation Period
Mumps	RNA Myxo Virus	14 to 21 days
Influenza	Orthomyxo Virus	18 to 72 hours
Measles (rubeola)	RNA Paramyxo Virus	10 to 14 days
Chicken pox	Human Herpes Virus 3	14 to 16 days

139. Ans. (c) **After 48 hours of hospitalization**

Ref: K. Park, 23rd ed. pg. 94, 359

- Nosocomial infections are hospital acquired infections.
- It is considered nosocomial if it develops **after a minimum of 48 hours of hospitalization**.
- Most common organism responsible for nosocomial infection: **Staph. Aureus**.

140. Ans. (d) **Endogenous**Ref: K. Park 23rd ed. pg. 255-57**TABLE:** Cycle of Plasmodium in Humans

Pre-erythrocytic
<ul style="list-style-type: none"> Development of sporozoites in liver Liberate merozoites known as "Cryptozoites" No clinical sign/symptoms; sterile blood.
Erythrocytic
<ul style="list-style-type: none"> Parasite resides inside RBCs (endogenous); passes through the stages of Trophozoite, schizont, Merozoite. Multiplication of parasite leads to clinical signs/symptoms now
Gametogony
<ul style="list-style-type: none"> Few merozoites develop in RBCs of spleen and bone marrow to form gametocytes
Exo-erythrocytic
<ul style="list-style-type: none"> Persist in liver Seen in <i>P. vivax</i> and <i>P. ovale</i>. Causes relapse of vivax and ovale malaria

141. Ans. (a) **Rocky mountain spotted fever**Ref: K. Park, 23rd ed. pg. 299-300**TABLE:** Diseases, their causative agents and vectors

Disease	Causative agent	Vector
RMSF (<i>Rocky Mountain Spotted Fever</i>)	<i>R. Rickettsii</i>	Tick
Kyasanur forest disease (KFD) aka monkey disease	<i>Group B togavirus (Flavivirus)</i>	Hard tick (in India); Soft tick (outside India)
Dengue	<i>Arbovirus 4 serotypes (Den-1,2,3,4)</i>	<i>Aedes Aegypti</i>
Yellow fever	<i>Flavivirus fibricus</i>	<i>Aedes Aegypti</i>

142. Ans. (d) **Scrub typhus**Ref: K. Park, 23rd ed. pg. 299-300, Park's, PSM, 20/ 262**Rickettsial Diseases, their Agents and Insect Vectors**

Disease	Rickettsial agent	Insect Vectors
Epidemic typhus	<i>R. prowazekii</i>	Louse
Endemic typhus	<i>R. typhi</i>	Flea
Scrub typhus	<i>R. tsutsugarnushi</i>	Mite
Indian tick typhus	<i>R. conorii</i>	Tick
Rocky mountain spotted fever	<i>R. rickettsii</i>	Tick
Rickettsial pox	<i>R. akari</i>	Mite
Q fever	<i>C. burnetii</i>	
Trench fever	<i>Rochalimae aquintana</i>	Louse

- DOC for rickettsial infection: **Doxycycline**

143. Ans. (a) **Bancroftian filariasis**Ref: K. Park, 23rd ed. pg. 270-71, Park, 20th pg. 262

Bancroftian filariasis is transmitted by Culex Mosquito.

Anopheles (Sophisticated mosquito)	Culex (nuisance mosquito)	Aedes (tiger mosquito)	Mansonoides
Malaria	<ul style="list-style-type: none"> Japanese encephalitis West Nile fever <i>Bancroftian filariasis</i> Viral arthritis 	<ul style="list-style-type: none"> Yellow fever Rift valley fever Chikangunya fever Dengue Dengue haemorrhagic fever 	Brugian filariasis

FMGE Solutions Screening Examination

538

144. Ans. (a) **Measles**

MEASLES

- Caused by RNA paramyxovirus
- I.P.: 10–14 days.
- Pathognomonic feature: **Koplik's spot** (on Buccal mucosa opposite 2nd molar)
- **Most common complication** of measles in **young children: Otitis Media**
- Late/rare complication of measles: **SSPE**.

Extra Mile

- Late complication of mumps: Orchitis
- Most common late complication of chicken pox: Shingles
- Complication of rubella infection in pregnancy: *Congenital Rubella Syndrome*
 - **Triad of CRS**
 - ♦ Sensorineural deafness
 - ♦ Congenital heart defect (PDA most commonly)
 - ♦ Cataract

145. Ans. (a) **Tuberculin test**

Ref: K. Park, 23rd ed. pg. 185

- **Tuberculin Test** is the only way of estimating the prevalence of infection in a community.
 - A positive test indicates past or present infection by *Mycobacterium tuberculosis*.
 - Remember: A positive tuberculin test is NOT a confirmatory diagnostic of MTB.
- **Sputum smear examination** (Z-N stain) by direct microscopy is the diagnostic choice for TB case detection.
- Chest X-Ray is a supportive diagnostic test for TB.
- **Montoux test** is also a screening test for TB. A positive test indicates current or past infection.

146. Ans. (a) **Sputum smear microscopy**

Ref: K. Park, 23rd ed. pg. 176-77

- **Sputum smear examination** (Z-N stain) by direct microscopy is the diagnostic choice for TB case detection in India.
- **Chest X-Ray** is a supportive diagnostic test for TB.
- **Montoux test** is also a screening test for TB. A positive test indicates current or past infection with any of the mycobacterium species.

147. Ans. (d) **All of the above**

Ref: K. Park, 23rd ed. pg. 199-200

Definition of Extensive Drug Resistance

- Resistance to both isoniazid (H) and rifampicin, and

- Resistance to 1 fluoroquinolones and
- Resistance to one 2nd line injectables out of 3 (*kanamycin, amikacin, capreomycin*).

Older Definition of XDR

- Resistance of isoniazid (H) and rifampicin both +
- Resistance to any 3rd line drugs.

Extra Mile

- Multiple drug resistance (MDR) means resistance to isoniazid (H) and rifampicin (R).

148. Ans. (c) **Case detection with the help of X-ray chest**

Ref: K. Park, 23rd ed. pg. 176, 188, 427, Park, 19th pg. 354

Good quality sputum microscopy and not X ray chest is one of the components of DOTS, **DOTS components**

- **Political commitment**
- **Good quality sputum microscopy**
- **Directly observed treatment**
- **Uninterrupted supply of good quality drugs**
- **Accountability**

149. Ans. (b) **Culture**

Ref: K. Park, 23rd ed. pg. 176-177, 183

- **Sputum smear examination** (Z-N stain) by direct microscopy to check acid fast bacilli is the diagnostic of choice for TB case detection in India.
- Leprosy is caused by *M. Leprae* and is diagnosed by clinical examination.
- **All mycobacterial infections are acid fast. So, MTB and M. Leprae can't be differentiated by AFB smear.**
- Culture has better sensitivity and M.TB infection can be differentiated from other mycobacterial infection by culture.

150. Ans. (c) **4 weeks**

Ref: K. Park, 23rd ed. pg. 181-182

151. Ans. (d) **Children below 6 years**

Ref: K. Park, 23rd ed. pg. 182-84

- **About national TB program, if a person is smear positive for TB:**
 - All the family who is in close contact with the patient is given prophylaxis
 - Children under age 6 is given prophylaxis

Note: India's Revised National Tuberculosis Control Programme (RNTCP) recommends screening of all household contacts of smear-positive pulmonary tuberculosis (PTB) cases for tuberculosis (TB) disease, and 6-month isoniazid preventive therapy (IPT) for asymptomatic **children aged <6 years**.

152. Ans. (b) **Dog**Ref: K. Park, 23rd ed. pg. 276-77

- Rabies is caused by Lyssa virus type 1
- **Types of rabies virus:** Street virus and fixed virus
- **I.P.:** 4 days to 3–8 weeks or upto years in some cases
- **Intermediate host:** Dog
- **Dead end host:** Humans

Extra Mile

- Rat bite or Human bite doesn't cause rabies.

153. Ans. (c) **Infected rat's urine**Ref: K. Park, 23rd ed. pg. 291-92

- *Leptospirosis* is caused by infection with bacteria of the genus *Leptospira* and affects humans as well as other animals.
- One of the zoonotic infection, which transmits from animals to human
- Leptospirosis is transmitted by the urine of an infected animal like rat, mice or moles and is contagious as long as the urine is still moist.

Extra Mile

- Doxycycline 200–250 mg once a week used as prophylaxis.

154. Ans. (a) **Azithromycin**Ref: K. Park, 23rd ed. pg. 308-309

- Trachoma is caused by *C. Trachomatis*.
- I.P.- 5-12 days
- **SAFE** strategy used for control of trachoma
 - S: Surgery
 - A: Antibiotic
 - F: Face wash
 - E: Environment
- DOC for Trachoma: **Azithromycin** > tetracycline

Extra Mile

- Please don't confuse between SAFE strategy and Safe delivery strategy.
 - Safe delivery strategy is used for prevention of neonatal Tetanus.
 - Neonatal tetanus is aka 8th day disease (I.P.- 8 days)
- **DOC for Rickettsial diseases:** Doxycycline

155. Ans. (d) **Education**Ref: K. Park, 23rd ed. pg. 308-209

Please refer to above explanation

156. Ans. (c) **Inhalation**Ref: K. Park, 23rd ed. pg. 292-94

- **Pneumonic plague**, a severe type of lung infection
- It is one of three main forms of plague, all of which are caused by the bacterium *Yersinia pestis*.
- Primary pneumonic plague results from inhalation of fine infective droplets and can be transmitted from human to human without involvement of fleas or animals.

157. Ans. (b) **In endemic areas step wells or by chemo radiation**Ref: K. Park, 23rd ed. pg. 245-46**WHO considerations for Dracunculosis Eradication:**

- Control of Cyclops
- Provision of safe drinking water like piped water and instillation of hand pumps
- Education and awareness of public for safe drinking water
- Active search for new cases
- Niridazole, mebendazole and metronidazole are not effective in preventing transmission.

158. Ans. (d) **Culex**Ref: K. Park, 23rd ed. pg. 292-93

- The commonest and most effective vector of plague is rat flea x.cheopsis.
- Others are X.Astia, X.Brasiliensis and Pulexirritans.
- Culex is a vector of lymphatic filariasis and Japanese encephalitis (*culex tritaeniorhynchus*).

159. Ans. (c) **350**Ref: K. Park, 23rd ed. pg. 343-45

- Best marker of HIV progression: CD4:CD8 ratio
- Normal CD4 count: 900-1400
- Opportunistic infection occur when CD4 count goes below: < 500
- **Anti retroviral therapy is started when CD4 count goes below: < 350 (old guidelines). The latest guidelines suggests to initiate ART in all symptomatic HIV positive patients regardless of CD4 count.**
- Single pill once a day regimen consists of dolutegravir, abacavir and lamivudine or choose 2 NRTI and 1 NNRTI combination.

160. Ans. (d) **Through contact of body fluids**Ref: K. Park, 23rd ed. pg. 356

- Incubation period of ebola virus **2-21 days**
- According to WHO "Ebola then spreads through human-to-human transmission via direct contact (through broken skin or mucous membranes) with the blood, secretions, organs or other bodily fluids of infected people, and with surfaces and materials (e.g. bedding, clothing) contaminated with these fluids."

FMGE Solutions Screening Examination

540

161. Ans. (a) Safe water supply & sanitation

Ref: K. Park, 23rd ed. pg. 232-33

- Cholera is an acute diarrheal disease caused by *Vibrio cholerae*.
- I.P.- 1-2 days
- **First step in epidemic of cholera: Verification of diagnosis**
- **First line treatment of choice:** water and electrolyte replacement because most death in cholera is due to hypovolemic shock.
- In the given question, safe water supply and sanitation should be the 1st step to decrease mortality from cholera.

Extra Mile

- Stool appearance of cholera: "Rice watery stool"
- **Chemoprophylaxis of cholera:** Tetracycline 500mg BID for 5 days.
- **Drug of choice for cholera:**
 - **Adults:** Doxycycline 300 mg stat.
 - **Children:** Azithromycin 20 mg/kg, single dose
 - **Pregnant Female:** Azithromycin 1 gm, single dose

162. Ans. (d) Safe water supply and sanitation

Ref: K. Park, 23rd ed. pg. 232-33

Please refer to above explanation

163. Ans. (b) 90% in south east Asia population by tobacco chewing

Ref: Park, 21st ed. pg. 357-358

ORAL CANCER

- Most cases of oral cancer (~ 90%) in south east asia are linked to tobacco chewing and tobacco smoking.
- Alcohol and pre-cancerous lesion (like leukoplakia, erythroplakia) have also shown to increase the risk of development of oral cancer.
- In India, the most common form of tobacco chewing is betel quid which usually consist of betel leaf, areca nut, lime and tobacco.
- Cancer of oral cavity is also very prevalent in central Asian districts of Erstwhile Russian Republics, where people chew "nass" or "nasswar" - a mixture of tobacco, ashes, lime and cotton seed oil.
- In eastern coastal regions of Andhra Pradesh epidermoid carcinoma of hard palate is most common. It is linked with habit of reverse smoking of cigar (*chutta*), i.e., smoking with burning end inside the mouth.

164. Ans. (b) Carcinoma hard palate

Ref: K. Park, 21st ed. pg. 357-58

- In eastern coastal regions of Andhra Pradesh epidermoid **carcinoma of hard palate** is most common. It is linked with habit of reverse smoking of cigar (*chutta*), i.e., smoking with burning end inside the mouth.

165. Ans. (d) All of the above

Ref: K. Park, 21st ed. pg. 360

- Recent studies have shown that smoking increases the risk of lung cancer by 8.6% as compared to non smokers.
- **The risk is strongly related to:**
 - Number of cigarette smoked
 - Age of starting to smoke
 - Mode of smoking
 - Nicotine and tar content
 - Length of cigarette
- One study in India has proved that there is no difference between the tar and nicotine delivery of the filter and non-filter cigarettes smoked in India. Therefore a **filter gives NO protection to Indian smokers**. The "king-size" filter cigarettes deliver more tar and nicotine than ordinary cigarette.

NATIONAL HEALTH PROGRAMS & POLICIES

166. Ans. (d) Includes area with slide positivity of more than 10 cases per 10,000 smears

Ref: K. Park 25th ed. P 429, 286

- The urban malaria scheme was launched in 1971 to reduce or interrupt malaria transmission in urban areas.
- It is currently protecting 130 million population from malaria and other mosquito borne diseases
- It comprises of following methodologies:
 - Vector control by intensive antilarval measure and drug treatment
 - Prevention of mosquito breeding in domestic and peri domestic areas by using larvivorous fish in water bodies
 - Use of larvicides in water bodies
- The expert committee on malaria had recommended the inclusion of:
 - All urban areas with more than 50,000 population
 - Slide positivity rate of 5% and above
 - Areas with annual parasitic index ≥ 2 per 1000 per year have been classified as high risk areas, and thereby eligible for vector control.

167. Ans. (a) Male MPW

Ref: K. Park 25th ed. P 973

Work responsibilities for health worker male/male MPW (Multi-purpose worker)

- Malaria surveillance activities
- Collect thick and thin blood smears on glass slide from a case having fever
- Identify cases of Japanese encephalitis, filariasis, kala azar
- Identify persons 15 years and above with prolonged cough and take sputum smear and supervise the TB patients to take regular treatment (DOTS-MDT)
- Identify suspects of leprosy patients, blindness all cases including cataract suspects
- Administer vaccine under expanded program on immunization
- Spread awareness and educate public on family planning and distribution of conventional contraceptives
- Identify cases of diarrhoea, dysentery, jaundice, whooping cough, diphtheria, encephalitis, acute eye infection and notify to health assistant. Give ORS and educate community about preventive measures
- Maintain record of birth, death and other diseases like TB, leprosy, malaria cases

168. Ans. (c) Health worker male

Ref: K. Park 25th ed. P 973

- Collection of sputum from TB suspected patients and making smear is job responsibility of health worker-male.
- Under RNTCP they need to:
 - Identify persons >15 years with prolonged cough and haem-optysis. Take their sputum smear and refer them to PHC for further investigations.
 - Check whether all cases of TB are taking regular medication or not and motivate them to do so.
 - Assist ASHA and village health volunteers to carry out DOTS activities.

169. Ans. (b) Multipurpose worker

Ref: K. Park 25th ed. P 449

- Aim of malaria surveillance program:
 - Target controlled interventions in high transmission areas and assess their impact
 - Early detection of outbreaks
- The active surveillance (active case detection) is done by multipurpose worker/ANM in rural areas with blood smears
- Passive case detection is done in fever cases by ASHA/peripheral health volunteer.
- Best method of diagnosis with maximum sensitivity and specificity: Microscopy
- Method of choice for malaria diagnosis in remote areas/tribal, inaccessible rural areas: RDT kit (Rapid Diagnostic Test).

170. Ans. (b) RTI/STD

Ref: K. Park 25th ed. P 472

- According to STD control program, STD control is linked to HIV/AIDS control as behaviour leading to both are same
- HIV is transmitted more easily in presence of STD
- NACO, therefore has branded the Sexually Transmitted Infection (STI)/Reproductive Tract Infections (RTI) services as **Suraksha clinic, and has developed** a communication strategy for generating demand for these services.
- Prepacked STI/RTI colour coded kits are provided at all state AIDS control societies. The kits are:
 - **Kit 1:** Grey—For urethral discharge, anorectal discharge and cervicitis
 - **Kit 2:** Green—for vaginitis
 - **Kit 3:** White—for genital ulcers—non herpetic
 - **Kit 4:** Blue—for genital ulcers—non herpetic in patient allergic to penicillin
 - **Kit 5:** Red—for genital ulcers—herpetic
 - **Kit 6:** Yellow—for lower abdominal pain
 - **Kit 7:** Black—for Inguinal bubo

171. Ans. (d) Child trafficking

Ref: K. Park 25th ed. P 645

- In India, Ujjawala scheme was launched to combat child trafficking by the ministry of women and child development on 4th December 2007.
- Scheme has 5 provisions for victims trafficked for commercial sexual exploitation:
 - **Prevention:** Formation of community vigilance group, adolescents group, awareness creations and organizing work-shops
 - **Rescue:** Safe withdrawal of victims from exploitation place
 - **Reintegration:** of victims into society
 - **Rehabilitation:** By providing them safe shelter, medical care, basic amenities, legal aid, vocational training and employment
 - **Repatriation:** Provide support to cross border victims for their safe repatriation to their country of origin

172. Ans. (a) Service centre

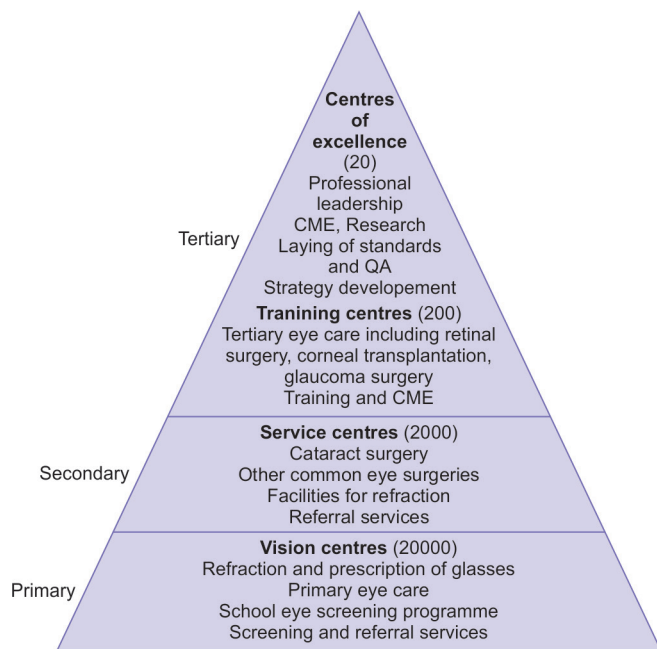

Ref: K. Park 25th ed. P 474

Vision 2020: The Right to Sight

- A global initiative to reduce avoidable (preventable and curable) causes of blindness by year 2020.
- The plan has the following features:
 - Target diseases are: cataract, refractive error, childhood blindness, corneal blindness, glaucoma, diabetic retinopathy

FMGE Solutions Screening Examination

- The proposed 4 tier structure includes:
 - ◆ Centre of excellence (20)
 - ◆ Training centres (200)
 - ◆ Service centres (2000)
 - ◆ Vision centres (20,000)
- The shown **image** depicts the proposed structure for primary, secondary and tertiary eye care (referral from base to apex)

173. Ans. (b) Street children

Ref: K. Park 25th ed. P 373

Key population affected with HIV in India

- The HIV epidemic in India is driven by sexual transmission, which accounts for 86% of new infection in 2017.
- The following population is mainly affected, which needs targeted intervention:
 - **Female sex workers:** in 2017, ~1.6% were found to be living with AIDS
 - **IV drug abusers:** Major route of HIV transmission in north-east states. In 2017, 6.3% of HIV drug abusers are found to be living with AIDS
 - **Hijras/transgenders:** Prevalence in 2017 was found to be 3.1%
 - **Migrant labourers:** An estimated 7.2 million migrant workers in India, of whom 0.2% are living with HIV
 - **Truck drivers:** NACO estimated 0.2% of truck drivers are living with HIV in 2017-18. They are considered as bridge population for HIV transmission since they often have unprotected sex with high risk groups as well as their regular sex partners.

174. Ans. (d) All of the above

Ref: K. Park 23rd ed. P 449

- The main aim of NRHM is to provide accessible, affordable, accountable, effective and reliable primary health care, and bridging the gap in rural health care through creation of a cadre of Accredited Social Health Activist (ASHA).
- The mission is an instrument to integrate multiple vertical programs alongwith their funds at the district level.
- The programs integrated into NRHM are existing programs of health and family welfare including RCH II: national vector borne disease control programs against malaria, filarial, kala-azar dengue fever/DHF and Japanese encephalitis; national leprosy eradication program; revised national tuberculosis control program; national program for control of blindness; iodine deficiency disorder control program, and integrated disease surveillance project.

175. Ans. (d) Lung infections

Ref: K. Park 23rd ed. P 579

- School health services is an economical and powerful means of raising community health, especially in future generations.
- It is based on the local health problems of school child and vary from one place to another.
- According to surveys, the main emphasis of school health fall in following categories:
 - Malnutrition
 - Infectious diseases
 - Intestinal parasites
 - Diseases of the skin, eye and ear
 - Dental caries
- Objectives of school health service
 - Promotion of positive health
 - Prevention of diseases
 - Early diagnosis, treatment and follow up of defects
 - Awakening health consciousness in children
 - Provision of healthful environment

176. Ans. (b) Delivery at home

Ref: K. Park 23rd ed. P 449-450

- ASHA is a health activist in the community, who creates awareness on health. Her responsibilities are as follows:
 - Create awareness and information on nutrition, basic sanitation, hygienic practices and the need for timely utilization of health and family welfare services.
 - Counsel the women for safe delivery, breastfeeding, immunization, contraception and prevention of common infections including STI's.

- Facilitate the services available at anganwadi, subcenter, PHC.
- Escort/accompany pregnant women and children requiring treatment/admissions to the nearest health center.
- Act as depot holder for essential provisions being made available to every habitation like ORS powder, iron and folic acid tablet, chloroquine, disposable delivery kits, OCP's, condoms etc.
- Provide primary medical care for minor ailments like diarrhea, fever and first aid for minor injuries. Also provide DOTS under RNTCP.
- To inform about the birth and death in her village or any unusual health problems/outbreaks in the community.
- To promote construction of household toilets under total sanitation campaign.

177. Ans. (d) 400 INR to ASHA and 1000 INR to mother in Urban area low performing states

Ref: K. Park 23rd ed. P 455

- The scale of assistance under the scheme from 2012–2013 for encouraging safe delivery at the health institutions is as follows:

Rural area			Urban area		
Category	Mother's package	ASHA's package*	Total ₹	Mother's package	ASHA's package**
LPS	1400	600	2000	1000	400
HPS	700	600	1300	600	400

Abbreviations: LPS, low performing states; HPS, high performing states

* ASHA incentive of ₹600/- in rural areas includes ₹300/- for ANC component and ₹300/- for accompanying pregnant woman for institutional delivery.

** ASHA incentive of ₹400/- in urban area includes ₹200/- for ANC component and ₹200/- for accompanying pregnant woman for institutional delivery.

178. Ans. (b) Mild

Ref: K. Park, 23rd ed. pg. 582

TABLE: Categories of mental retardation

Mental Status	IQ Range
Normal IQ	>70
Mild mental retardation	50–70
Moderate MR	35–49
Severe MR	20–34
Profound MR	Below 20

179. Ans. (b) Kartar Singh Committee

Ref: K. Park, 23rd ed. pg. 874-75

- **Kartar Singh Committee:** Recommended multi-purpose worker scheme. Kartar singh committee recommended:
 - **Current ANM** to be replaced by the newly designated “female health worker” and present day basic health workers, malaria surveillance workers, family planning health assistants to be replaced by “male health workers”
- **Bhore Committee recommendation:**
 - Integration of preventive and curative services at all administrative levels
 - **Short-term program:** Each PHC should cater to a population of 40,000 with a secondary health centre to serve as a supervisory, coordinating and referral institution
 - **Long-term program aka 3 million plan:** Setting up a 75 bedded primary health unit for each 10,000 to 20,000 population; and secondary health unit with 650 bedded hospital, again regionalized around district hospital with 2500 beds
 - **Major change in medical education** which includes 3 month training in preventive and social medicine to prepare “social physicians”.
- **Srivastava Committee**
 - Group on medical education and manpower.
 - Recommended bands of para-professionals and semi-professional health worker.
 - ROME (Reorientation of Medical Education) scheme.
 - Village Health Guide scheme.
 - 3-Tier rural health infrastructure
- **Jungalwalla committee**
 - Equal pay for equal work
 - No private practice
- **Mudaliar committee:** Health survey and planning committee

180. Ans. (c) Complete hospitalization

Ref: K. Park, 23rd ed. pg. 473-74

**Community Mental Health Programme
Include Essential Elements**

- Inpatient services
- Outpatient service
- Partial hospitalization
- Emergency services
- Diagnostic services
- Pre care & after care services including foster home placement and home visiting

FMGE Solutions Screening Examination

544

- Education services
- Training
- Research and evaluation

181. Ans. (c) **Started in 1987**

Ref: K. Park, 23rd ed. pg. 473-74

- National Mental Health Program: 1982
- National Family Planning Program: 1952
- National Aids Control Program: 1987
- National Anti Malaria Program: 1999

182. Ans (c) **Reproductive and child health program**

Ref: K. Park, 23rd ed. pg. 452, Park, 19th ed. pg. 392

- India's family welfare program seeks to promote on a voluntary basis, responsible and planned parenthood with the "two child norm" male, female or both through 'cafeteria approach', that is **an independent choice of family planning methods, best suited for the couples.**

183. Ans. (b) **Yellow**

Ref: Parks, 21st ed. pg. 397

Color Coding System

Kit 1	Grey	Urethral and ano-rectal discharge and cervicitis
Kit 2	Green	Vaginitis
Kit 3	White	Genital ulcers
Kit 4	Blue	Genital ulcers
Kit 5	Red	Genital ulcers
Kit 6	Yellow	Abdominal pain
Kit 7	Black	Scrotal swelling

184. Ans. (c) **40**

Ref: K. Park 23rd ed. / 804-805

185. Ans. (d) **21-34**

Ref: K. Park, 23rd ed. pg. 582-83

Mental status	IQ Range
Normal IQ	70 and over
Mild mental retardation	50-70
Moderate MR	35-49
Severe MR	20-34
Profound MR	20 and below

186. Ans. (c) **100% birth and death registration**

Ref: K Park, 23rd ed. pg. 493-94

• National Population Policy 2000

- Address the unmet needs for basic reproductive and child health services, supplies and infrastructure
- Make school education up to age 14 free and compulsory, and reduce drop outs at primary and secondary school levels to <20% for both boys and girls
- **Reduce IMR to < 30 per 1000 live births**
- **Reduce MMR to <100 per 100,000 live births**
- Achieve universal immunization of children against all VPDs
- Promote delayed marriage for girls (not <18 years and preferably >20 years)
- **Achieve 80% institutional deliveries and 100% by trained persons**
- Achieve universal access to information/counseling, and services for fertility regulation and contraception with a wide basket of choice
- **Achieve 100% registration of birth, deaths, marriage & pregnancy**
- Contain the spread of AIDS, and promote greater integration between the management of RTI and STI and the NACO.

187. Ans. (b) **Decrease child mortality rate**

Ref: K. Park, 23rd ed. pg. 11,27, 32, 893

■ MILLENNIUM DEVELOPMENT GOALS (MDGs)

- There are 8 MDGs:
 - **Goal 1:** Eradicated extreme poverty and hunger
 - **Goal 2:** universalize primary education
 - **Goal 3:** Gender equality and women empowerment
 - **Goal 4: Reduce child mortality**
 - **Goal 5: Improve maternal health**
 - **Goal 6:** Combat HIV/AIDS, malaria and other disease (Tuberculosis)
 - **Goal 7:** Ensure environmental sustainability
 - **Goal 8:** Develop global partnerships for development
- 3 out of 8 goals, 8 out of 18 targets required to achieve them and 18 out of 48 indicators of progress are 'directly health related'
- **Goal 4, 5 and 6 are directly health related**
- Goal 2 and 3 'do not pertain to health'

188. Ans (c) **2015**

Ref: K. Park, 23rd ed. pg. 27, 32, K. Park, 19th ed. pg. 743

- The Millennium Development Goals (MDG) are to be achieved by the year 2015.

189. Ans. (a) **Leprosy**

Ref: K. Park, 23rd ed. pg. 314-15, 22nd ed pg. 289-90

- Leprosy has been eliminated from India, but it has not yet eradicated.
- The definition of elimination is <1 case/10,000 population.

190. Ans. (a) Kala-azar

Ref: K. Park, 21st ed. pg. 113

- Indian Academy of Pediatrics (IAP) approved following vaccines (Kala Azar is NOT included in schedule)
- **Following vaccines are approved by IAP:** Polio, hepatitis, BCG, DPT, Hib, MMR, TT, typhoid.

191. Ans. (b) Yellow fever

Ref: K. Park, 21st ed. pg. 380

- The National Vector Borne Disease Control Programme (NVBDCP) is implemented for the prevention and control of vector borne diseases such as: Malaria, Filariasis, kala-azar, Japanese encephalitis, Dengue and Chikunguniya.
- Yellow fever is NOT a part of NVBDCP.

PREVENTIVE OBSTETRICS, PEDIATRICS AND GERIATRICS

192. Ans. (b) 25

Ref: K. Park 25th ed. P 557

MTP Act 1971

- **Conditions for MTP:**
 - **Medical:** Where continuation of pregnancy might endanger mother's life
 - **Eugenic:** There is high risk of child being born with serious physical or mental abnormalities
 - **Humanitarian:** Where pregnancy is outcome of rape
 - **Socio-economic:** Social or economic environment that could lead to risk of injury to the health of mother
 - **Failure of contraceptive devices:** Where pregnancy is as a result of contraceptive method failure
- In case the woman is under 18 years or a lunatic of any age—a written consent of guardian is necessary
- **Who can perform:**
 - **If pregnancy below 12 weeks:** A registered medical practitioner having experience in OBG
 - **If >12 weeks – 20 weeks:** Opinion of two registered medical practitioner is necessary
- **Where to be performed:** Established hospitals or a place approved by government or any non-government institution after obtaining license from chief medical officer of district.

MTP Rules 1975

- **Approval of boards:** According to new rules the chief medical officer of district is empowered to certify if the doctor has necessary training in gynaecology and obstetrics to do abortions. Application to certification boards is NOT required.
- **Qualification required:**
 - If assisted an RMP of an approved institution in performance of **25 cases** of MTP or
 - 6 months of housemanship in OBG or
 - MD in OBG or
 - 3 years of practice in OBG for those doctors registered before 1971 MTP Act
 - 1 year of practice in OBG for those doctors registered after 1971 MTP Act

193. Ans. (b) IUD

Ref: K. Park 25th ed. P 549

- The best contraceptive method post placental and post abortion is IUD
- IUD is the most effective reversible contraceptive method.
- IUD is generally contraindicated in unmotivated persons, but since in this case the patient herself doesn't wish to conceive in near future, IUD is preferred.

Advantages of IUD:

- Ease of insertion
- Prevent uterine synechiae
- Longer action and inexpensive
- Contraceptive effect is reversible by simply removal of IUD
- Free of systemic metabolic side effects as seen with pills
- No need for continuous motivation (as seen with pills or barrier method). Only a single act of motivation is required.

Ideal IUD candidate:

- In monogamous relationship
- Has borne at-least one child
- No history of PID
- Has normal menstrual period
- Willing to check the IUD tail
- Has access to follow up and treatment

Timing of insertion

- During menstruation or within 10 days of beginning of a menstrual period (diameter of cervical canal is greater)
- Can be done during the **first week after the delivery** before she leaves hospital (immediate postpartum insertion).
 - Special care required during first week as it has greater risk of perforation

FMGE Solutions Screening Examination

546

- **Note:** Immediate postpartum can also be done within 10 minutes after placenta expulsion in a vaginal delivery.
- **Loop insertion:** Convenient time for loop insertion is 6–8 weeks after delivery (*postpuerperal insertion/Extended postpartum*)
- Can also be taken up immediately after first trimester abortion
 - IUD insertion after second trimester is NOT recommended → Increased risk of infection

194. Ans. (a) 350 kcal

Ref: K. Park 25th ed. P 690-91

- The energy requirement of women is increased over and above their normal requirement in following conditions:
 - **Pregnancy:** + 350 kcal/day throughout pregnancy
 - **Lactation:** + 600 kcal/day during first 6 months and +520 kcal/day during next 6 months.

Extra Mile

TABLE: Energy requirement of Indians at different ages

Age group	Remarks	(kcal/day)
Man	Sedentary work	2,320
	Moderate work	2,730
	Heavy work	3,490
Woman	Sedentary work	1,900
	Moderate work	2,230
	Heavy work	2,850
	Pregnant woman	+350
	Lactation	+600
		+520
Infants	0-6 months	500
	6-12 months	670
Children	1-3 years	1,060
	4-6 years	1,350
	7-9 years	1,690

195. Ans. (b) Intrauterine growth retardation

Ref: K. Park 25th ed. P 587

Low birth weight

- Defined as birth weight of less than 2.5 kg, regardless of gestational age
- The birth weight of an infant is the single most important determinant of its chances of survival, healthy growth and development.
- Two main groups of low birth weight:

- **Premature born (short gestation):** MC in developed countries where population of low birth weight is less
- **Fetal growth retardation:** MC in countries (like India) where proportion is high. It is considered as the most common cause of low birth weight in India.

Extra Mile

- Apart from birth weight, babies can be classified in 3 groups according to gestational age:
 - **Preterm:** Born before 37 weeks of gestation (<259 days)
 - **Term:** Born between 37–42 weeks (259–293 days)
 - **Post-term:** Born at 42 completed week or any time after (≥294 days)
- **Preterm babies are further classified as:**
 - **Extremely preterm:** (<28 weeks)
 - **Very preterm** (28 to <32 weeks)
 - **Moderate to late preterm** (32–37 weeks)
- Birth weight >4 kg is considered as overweight
- **Average birth weight in India:** 2.8 kg.

196. Ans. (a) Glucose – 90

Ref: K. Park 23rd ed. P 224

- In reduced osmolarity ORS, content of glucose is 75 mmol/L

Composition of reduced osmolarity ORS

Reduced osmolarity ORS	Grams/Liter
• Sodium chloride	2.6
• Glucose, anhydrous	13.5
• Potassium chloride	1.5
• Trisodium citrate, dehydrate	2.9
• Total weight	20.5
Reduced osmolarity ORS	mmol/Liter
• Sodium	75
• Chloride	65
• Glucose, anhydrous	75
• Potassium	20
• Citrate	10
• Total osmolarity	245

197. Ans. (c) 20 mg/day

Ref: K. Park, 23rd pg. 636

- **Park states:** “Iron required during lactation is 21 mg/day”

198. Ans. (a) 1900

Ref: K. Park, 23rd ed. pg. 634

**TABLE:** Energy requirements of Indians at different ages

Age group	Remarks	(kcal/day)
Man	Sedentary work	2,320
	Moderate work	2,730
	Heavy work	3,490
Woman	Sedentary work	1,900
	Moderate work	2,230
	Heavy work	2,850
	Pregnant woman	+350
	Lactation	+600
		+520
Infants	0–6 months	500
	6–12 months	670
Children	1–3 years	1,060
	4–6 years	1,350
	7–9 years	1,690

199. Ans. (d) **245 mmol/L**Ref: K. Park, 23rd ed. pg. 224**Composition of reduced osmolarity ORS**

Reduced osmolarity ORS	Grams/Liter
• Sodium chloride	2.6
• Glucose, anhydrous	13.5
• Potassium chloride	1.5
• Trisodium citrate, dehydrate	2.9
Total weight	20.5
Reduced osmolarity ORS	mmol/liter
• Sodium	75
• Chloride	65
• Glucose, anhydrous	75
• Potassium	20
• Citrate	10
Total osmolarity	245

200. Ans. (a) **Anemia**

- **Most common Indirect cause of maternal mortality in India:** Anemia
- **Most common cause of maternal mortality in India:** Post partum hemorrhage (PPH)
- **Most common direct cause of MMR:** PPH

Direct maternal mortality	Indirect maternal mortality
<ul style="list-style-type: none"> • It results from obstetric complication of pregnant state (pregnancy, labor and puerperium) from interventions or incorrect treatment. 	<ul style="list-style-type: none"> • It results from previous existing disease or disease that develops during pregnancy.
<ul style="list-style-type: none"> • Ex: PPH, obstructed labor, sepsis 	<ul style="list-style-type: none"> • Anemia, HTN, gestational DM, epilepsy

201. Ans. (d) **Perinatal mortality rate**Ref: K. Park, 23rd ed. pg. 563-64

- **Perinatal period** is from 28th week age of gestation to 7th day of newborn life.
- Perinatal mortality rate includes late fetal deaths and early neonatal deaths.
- A better obstetric care will be able to diagnose any fetal stress which will result in early intervention, which will certainly help in delivering a healthy baby.
- Therefore an obstetric will mostly affect Perinatal mortality rate.

202. Ans. (b) **100 mg iron + 500 mcg folic acid**Ref: K. Park, 23rd ed. pg. 527

- **Adult** iron + folic acid tablet given in pregnancy: 1 tab/day × 100 days
- **Kids** iron + folic acid tablet given: 1 tab/day × 100 days per year- 0 to 5 years of age.

TABLE: Iron and Folic acid tablet content

	Iron	Folic acid
Adult tab	100 mg	500 mcg
Kids tab (1/5th)	20 mg	100 mcg

203. Ans. (c) **1000 mg**Ref: K. Park, 23rd ed. pg. 527

According to RCH program, 100 mg of elemental iron and 500 mcg of folic acid must be given to a pregnant lady for 100 days, which will be around 1000 mg iron absorbed.

- **Adult:** Iron + folic acid tablet given in pregnancy: 1 tab/day × 100 days
- **Kids:** Iron + folic acid tablet given: 1 tab/day × 100 days per year- 0 to 5 years of age.

FMGE Solutions Screening Examination

548

204. Ans. (a) **Iron 100 mg and folic acid 500 µg**

Ref: K. Park, 23rd ed. pg. 620-22

205. Ans. (c) **500-550 kcal**

Ref: K. Park, 23rd ed. pg. 530-31

1st trimester	+ 150 kcal/day
3rd trimester	+300 kcal/day
Lactation	+550 Kcal/day

206. Ans. (c) **Before 21 days**

Ref: K. Park, 23rd ed. pg. 840-41

Registration of Some Vital Events

- Birth: before 21 days
- Death: before 21 days
- Marriage: before 30 days

207. Ans. (b) **Green**

Ref: Park's PSM, 21st ed. pg. 414

- According to Integrated Management of Neonatal and Childhood Illness (IMNCI), childhood morbidity and mortality is caused by diarrhea, ARI, malaria, malnutrition etc.
- Conditions are classified according to severity, and treatment action taken according to color code triage:
 - **Red:** Urgent referral after pre-referral treatments.
 - **Yellow:** treat at outpatient health facility (treat local infection, give oral drugs, advise care-taker)
 - **Green:** Home management (advise care-taker on how to give oral drugs, when to approach immediately, follow up etc.)

208. Ans. (c) **ORS**

Ref: K. Park, 23rd ed. pg. 224, 453

- WHO recommends ORS as the best measure in diarrhea for preventing the complications that may arise due to water and electrolyte loss.
- Metronidazole can be used as supportive therapy. It controls the anaerobic infection of G.I.

209. Ans. (b) **6 months**

Ref: K. Park, 23rd ed. pg. 508, 530-33

Exclusive breast feeding: 0 to 6 month and should be continue upto 2 years

210. Ans. (c) **Perinatal mortality**

Ref: K. Park, 23rd ed. pg. 567, 19th pg. 449 fig 9

$$\text{IMR} = \frac{\text{Number of death of children less than 1 year of age in a year}}{\text{Number of live births in the same year}} \times 1000$$

Perinatal Mortality Rate (PMR)

$$\text{PMR} = \frac{[\text{Late fetal deaths (28 weeks gestation and more)} + \text{early neonatal deaths (first week) in one year}]}{\text{Live births in the same year}} \times 100$$

Perinatal Mortality Rate (PMR)=

$$\frac{\text{Late fetal deaths} + \text{Early neonatal deaths}}{\text{Late fetal deaths} + \text{live births}} \times 100$$

Where Late fetal means 28 weeks gestation or more; Early neonatal means first week

NUTRITION AND HEALTH

211. Ans. (d) **>0.85 in female**

Ref: K. Park 25th ed. P 429

- Waist circumference is measured at the mid-point between lower border of rib and iliac crest. It correlates closely to BMI and waist to hip ratio.
- Changes in waist circumference reflects changes in risk factor of cardiovascular disease and other chronic diseases.
- Increased risk of metabolic complications with **waist circumference:**
 - Men ≥ 102 cm
 - Women ≥ 88 cm
- Waist hip ratio is calculated by waist circumference measurement divided by hip measurement.
- **Waist hip ratio** that increases the risk of cardiovascular disease:
 - Men: > 1
 - Women: > 0.85

212. Ans. (d) **Polished rice**

Ref: K. Park 25th ed. P 675

- Beri-Beri occurs as a result of thiamine deficiency.
- Thiamine is usually lost from rice during process of milling, washing and cooking of rice.
- This is the reason peoples are advised to avoid highly polished rice and consume parboiled and under milled rice.
- Thiamine is also destroyed in toast and in cereals cooked with baking soda.

Extra Mile

- Thiamine deficiency can lead to: Beri-Beri and Wernicke's encephalopathy
- Beri-Beri occur in 3 main forms:
 - **Dry Beri-Beri:** Characterized by nerve involvement (peripheral neuritis)
 - **Wet Beri-Beri:** Aka cardiac Beri-Beri. Heart involvement
 - **Infantile Beri-Beri:** Seen in infants between 2-4 months. Occur secondary to thiamine deficient mother breast feeding.

213. Ans. (b) Reduced peak and prolonged absorption

Ref: K. Park 25th ed. P 670

- **Glycemic index (GI)** of a food is defined by the area under 2 hours blood glucose response curve (AUC) following the ingestion of a fixed portion of test carbohydrate (usually 50 g) as a proportion (%) of the AUC of the standard (either glucose or white bread).
- Food can be of low glycemic index or high glycemic index:
 - **Low glycemic index:** Food products having soluble and insoluble fibers, which favour slow release of sugar into small intestine and slow absorption into blood (reduced peak and prolonged absorption rate).
 - **High glycemic index:** Foods with readily digestible and absorbable sugar (high peak and rapid absorption)

Classification	GI range	Examples
Low GI	55 or less	Most fruit and vegetables (except potatoes, watermelon and sweet corn), whole grains, pasta foods, beans lentils
Medium GI	56-69	Sucrose, basmati rice brown rice
High GI	70 or more	Corn flakes, baked potato, some white rice varieties (e.g. jasmine), White bread, candy bar and syrupy foods.

214. Ans. (b) 1

Ref: K. Park 23rd ed. P 613-14

- Glycemic index (GI) of a food is defined by the area under 2 hours blood glucose response curve (AUC) following the ingestion of a fixed portion of test carbohydrate (usually 50 g) as a proportion (%) of the AUC of the standard (either glucose or white bread).
- A value of 100 represents the standard, an equivalent amount of pure **glucose**.
- Food can be of low glycemic index or high glycemic index:

- **Low glycemic index:** Food products having insoluble fibers, which favor slow release of sugar into small intestine and its absorption into blood.
- **High glycemic index:** Foods with readily digestible and absorbable sugar.

TABLE: Classification of food according to GI

Classification	GI range	Examples
Low GI	55 or less	Most fruit and vegetables (except potatoes, watermelon and sweet corn), whole grains, pasta foods, beans, lentils
Medium GI	56-69	Sucrose, basmati rice, brown rice
High GI	70 or more	Corn flakes, baked potato, some white rice varieties (e.g. jasmine), white bread, candy bar and syrupy foods.

215. Ans. (a) Safflower oil

Ref: K. Park, 23rd pg. 611

TABLE: Dietary Sources of EFA

Essential fatty acids	Dietary source	Percent content
Linoleic acid	Safflower oil	73
	Corn oil	57
	Sunflower oil	56
	Soyabean oil	51
	Sesame oil	40
	Groundnut oil	39
	Mustard oil	15
Arachidonic acid	Palm oil	9
	Coconut oil	2
	Meat, eggs Milk (Fat)	0.5-0.3 0.4-0.6
Linolenic acid	Soyabean oil Leafy greens	7 Varied
Eichosapentaenoic acid	Fish oil	10

216. Ans. (c) Soyabean

Ref: K. Park, 23rd pg. 628

FMGE Solutions Screening Examination

550

TABLE: Nutritive value of pulses (values per 100 g)

Pulses	Energy (kcal)	Proteins (g)
Bengal gram	360	17.1
Black gram	347	24.0
Red gram	335	22.3
Soyabean	432	43.2
Green gram	348	24.5
Peas dry	315	19.7
Horse gram	321	22.0

217. Ans. (a) **20 mg iron with 0.1 mg FA**

Ref: K. Park, 23rd ed. pg. 620, 624

218. Ans. (b) **2730**

Ref: K. Park, 23rd ed. pg. 634

Please refer to above explanation

219. Ans. (a) **60–65**

Ref: K. Park, 23rd ed. pg. 630

TABLE: Nutritive value of milks compared (value per 100 g)

	Buffalo	Cow	Goat	Human
Fat (g)	6.5	4.1	4.5	3.4
Protein (g)	4.3	3.2	3.3	1.1
Lactose (g)	5.1	4.4	4.6	7.4
Calcium (mg)	210	120	170	28
Iron (mg)	0.2	0.2	0.3	
Vitamin C (mg)	1	2	1	3
Minerals (g)	0.8	0.8	0.8	0.1
Water (g)	81.0	87	86.8	88
Energy (kcal)	117	67	72	65

220. Ans. (a) **1.2 mcg**

Ref: K. Park, 23rd ed. pg. 620

Vitamin B₁₂

- Vitamin B₁₂ is complex organo-metallic compound with a cobalt atom. The preparation which is therapeutically used is cyanocobalamin, which is relatively cheap.

Source: Good sources are liver, kidney, meat, fish, eggs, milk and cheese. Vitamin B₁₂ is not found in foods of vegetable origin. It is also synthesized by bacteria in colon.

Deficiency: Vitamin B₁₂ deficiency is associated with megaloblastic anaemia (pernicious anaemia), demyelinating neurological lesions in the spinal cord.

REQUIREMENT

Intake values recommended by ICMR (2010) are as below:

Population group	Per day requirement
a. Normal adults	1 mcg
b. Pregnancy	1.2 mcg
c. Lactation	1.5 mcg
d. Infants & children	0.2 mcg

221. Ans. (b) **Sanguinarine**

Ref: K. Park, 23rd ed. pg. 658

- Epidemic dropsy** is caused by contamination of mustard oil with Argemone oil (*seeds of argemone Mexicana seeds closely resemble that of mustard oil*)
- Toxin which is contained in argemone oil is **Sanguinarine**
- This sanguinarine interferes with oxidation of Pyruvic acid, which leads to accumulation of pyruvic acid in blood.
- This may cause non-inflammatory edema of lower limbs, diarrhea, dyspnea and even cardiac failure and death.

222. Ans. (d) **650 Kcal**

Ref: D.C. Dutta, 8th ed. pg. 174

Dutta states: A healthy mother will produce **about 500–800 mL of milk a day** to feed her infant. This requires about **700 Kcal/day** for the mother, which must be made up from diet or from her body store. For this purpose a store of about 5 kg of fat during pregnancy is essential to make up any nutritional deficit during lactation.

Extra Mile

- Iron need during lactation is 1 mg/day.
- Daily requirement of calcium during pregnancy and lactation averages 1–1.5 g.

223. Ans (d) **She weighs 60 kg**

Ref: Park, 19th ed. pg. 501-2

- 60 kg weight is of Indian reference man and not woman

TABLE: Summary of Indian reference man and woman

An Indian reference man	An Indian reference woman
• Between 18 and 29 years of age	• Between 18 and 29 years of age
• Weights 60 kg • Height = 1.73	• Healthy and weighs 55 kg. • Height = 1.61
• Free from disease and physically fit for active work.	• Engaged for 8 hours in general household work, in light industry or in other moderately active work.

Contd...

An Indian reference man	An Indian reference woman
<ul style="list-style-type: none"> Employed for 8 hours in occupation that usually involves moderate activity Spends 8 hours in bed, 4 to 6 hours sitting and moving around and 2 hours in walking and in active recreation or household duties 	<ul style="list-style-type: none"> Spends 4 to 6 hours sitting or moving around only through light activity Spends 2 hours in walking or in active recreation or in household duties

224. Ans. (b) **Bitot's spot**Ref: K. Park, 23rd ed. pg. 615, 641

- Xerophthalmia:** All the ocular manifestation of Vitamin A deficiency.
- First clinical sign of Vitamin A deficiency: *Conjunctival Xerosis*
- First clinical symptom of vitamin A deficiency: *Night blindness* **WHO Classification of Xerophthalmia**

CLASS	SIGNS
X1A	Conjunctival xerosis
X1B	Conjunctival xerosis with bitot's spot
X2	Corneal xerosis
X3A	Corneal xerosis with ulceration
X3B	Keratomalacia

225. Ans. (c) **Bitot spots**Ref: K. Park, 23rd ed. pg. 606, 615, 641

- First clinical sign: conjunctival xerosis
- First clinical symptom: Night blindness
- Refer to above table.

226. Ans. (c) **0.5%**Ref: K. Park, 23rd ed. pg. 615, 641
Criteria and Prevalence for Determining Xerophthalmia Severity:

Criteria	Prevalence at risk
• Night blindness	>1%
• Bitot's spot	>0.5%
• Corneal xerosis/keratomalacia	>0.01%
• Corneal ulcer	>0.05%
• Serum retinol	>5%

- Refer to previous answer for WHO classification of Xerophthalmia

227. Ans. (d) **Night blindness 1%**Ref: K. Park, 23rd ed. pg. 615, 641, 899*Please refer to above explanation.*228. Ans. (b) **0.01%**Ref: K. Park, 23rd ed. pg. 625

- Minerals form only 5 percent of the typical human diet but are essential for normal health and function.
- Trace elements (or trace minerals)** are usually defined as minerals that are required in amounts between 1 to 100 mg/day by adults or make up less than 0.01 percent of total body weight.
- Macrominerals** are defined as minerals that are required by adults in amounts greater than 100 mg/day or make up *less than 1 percent of total body weight*.
- Ultra-trace minerals** generally are defined as minerals that are required in amounts less than 1 mg/day.

229. Ans. (a) **1 g/kg**Ref: K. Park, 21st ed. pg. 563

- According to Indian medical council recommendation the daily protein requirement is 1 g/kg body weight.
- Assessment of protein nutritional status is done by: arm muscle circumference, the creatinine-height index, serum albumin and transferrin, total body nitrogen etc.
- Best measure of the state of protein nutrition is: serum albumin concentration (should be more than 3.5 g/dL)

230. Ans. (b) **Vitamin B**Ref: K. Park, 23rd ed. pg. 626

- Antioxidants are substances which are both nutrients and non-nutrients.
- These anti-oxidants reduce the toxic effects of reactive oxygen species and nitrogen species which are generated during physiological or pathological conditions and result in oxidant damage
- Vitamins which acts as antioxidants are remembered as ACE:** vitamin A, C and E
- Other vitamins which acts as anti-oxidants are: Selenium, Glutathione
- Non-nutrient products that also act as anti-oxidants are:** Plant phenols, Flavonoids, Coumarins, caffeic, benzyl isothiocyanates, gallic and ellagic acid.
- Vitamin B is not an anti-oxidant.

231. Ans. (b) **Vitamin B**Ref: K. Park, 23rd ed. pg. 626*Please refer to above explanation*

FMGE Solutions Screening Examination

552

232. Ans. (b) Niacin

Ref: K. Park, 23rd ed. pg. 619

- Pellagra is caused by deficiency of Vitamin B3 (Niacin).
- It is seen commonly in maize eating populations because maize is deficient in tryptophan which is usually converted to niacin.
- Therefore maize eaters develop deficiency of Niacin which ultimately leads to pellagra.
- **4 D's associated to Pellagra:**
 - Diarrhea
 - Dermatitis
 - Dememntia
 - Death
- In severe cases of pellagra *Casal's Necklace* is seen which is a scaly pigmented rash around neck, seems like necklace.

233. Ans. (c) Increase appetite

Ref: K. Park, 23rd ed. pg. 639-40

TABLE: Features of Kwashiorkor and Marasmus

Features	Marasmus	Kwashiorkor
Muscle wasting	Obvious	Hidden by fat and edema
Edema	None	Present in lower legs and face
Mental changes	Quiet and apathic	Irritable, Moaning and apathic
Weight	Very low	Low to Normal
Appetite	Good	Poor
Hepatomegaly	None	Present, due to fat deposition
Hair changes	Seldom	Sparse, silky "flag sign"

234. Ans. (b) Sanguinarine

Ref: K. Park, 23rd ed. pg. 658

- **Epidemic dropsy** is caused by contamination of mustard oil with Argemone oil (*seeds of argemone Mexicana seeds closely resembles to that of mustard oil*)
- Toxin which is contained in argemone oil is **Sanguinarine**
- This sanguinarine interferes with oxidation of Pyruvic acid, which leads to accumulation of pyruvic acid in blood.
- This may cause non-inflammatory edema of lower limbs, diarrhea, dyspnea and even cardiac failure and death.

235. Ans. (b) Sanguinarine

Ref: K. Park, 23rd ed. pg. 658

236. Ans. (a) Sanguinarine

237. Ans. (a) Methylene blue reductase test

Ref: K. Park, 23rd ed. pg. 655

There are 3 tests to check the efficiency of milk pasteurization:

- **Phosphatase test:** *Most widely used method.* Phosphatase enzyme present in raw milk is degraded upon heating. If found in pasteurized milk, it indicates inadequate pasteurization or addition of raw milk.
- **Standard plate count:** To determine the bacteriological quality of pasteurized milk. 30,000 bacterial count per ml of pasteurized milk is the standard value in most western countries.
- **Coliform count:** Coliform organisms are completely destroyed by pasteurization and therefore, their presence in pasteurized milk is an indication of improper pasteurization or post pasteurization contamination.

Extra Mile

- Pasteurization of milk is by following methods:
 - **Holder Method/ vat method:** 63°C x 30 min- most commonly used method
 - **Flash Method:** 72°C x 15 sec
 - **UHT method (ultra high temp):** 125°C for 2–3 secs, rapidly cooled and bottled ASAP

238. Ans. (d) 24 hours

- Refrigerated milk can be kept for around 24 hours
- At Room temperature: upto 6 to 8 hour
- In Freezer: 3 months

239. Ans. (d) Pulses

Ref: K. Park, 23rd ed. pg. 628

- Pulses contain 20-25% of protein, which is considered more than eggs, fish, meat products. However the quality of protein in pulses is inferior to that of meat products.
- Soyabean contains 40% of protein
- Pulses protein are poor in **methionine** and to a lesser extent in **cysteine**.
- Amino acid rich in pulses: **Lysine**

Extra Mile

TABLE: Food products and their limiting amino acid

Food Item	Limiting Amino Acids
Pulses	Methionine & Cysteine
Cereals	Threonine & Lysine
Maize	Tryptophan & Lysine

240. Ans. (c) Methionine

Ref: K. Park, 23rd ed. pg. 628

- Pulses protein are poor in **methionine** and to a lesser extent in **cysteine**.
- Since option C and D both are correct, we have to choose single best answer and that will be Methionine. Literatures clearly states that cysteine is deficient only up to a lesser extent.

241. Ans. (c) **100**

Ref: K. Park, 23rd ed. pg. 630

Biological value [BV] is a measure of the proportion of absorbed protein from a food which becomes incorporated into the proteins of the organism's body.

TABLE: Biological value of Proteins in several food products

- **Whole egg: 100**
- Cow milk: 91
- Beef: 80
- Casein: 77
- Soy: 74
- Wheat gluten: 64

242. Ans. (d) **Egg**

Ref: K. Park, 23rd ed. pg. 617

- Given these options, the correct answer will be egg which contains 1.25 to 1.5 µg/100 gm.

TABLE: Compare the sources of vitamin D from different dietary sources

Dietary sources	Vitamin D content (µg/100 g)
Halibut liver oil	500 – 10,000
Cod fish liver oil	200 – 750
Shark liver oil	30 – 100
Fish fat	5 – 30
Eggs	1.25 – 1.5
Butter	0.5 – 1.5
Milk, whole	0.1

Extra Mile

- **Richest source of Vitamin D:** Halibut fish liver oil > codfish liver oil > shark liver oil
- Human milk is a poor source of vitamin D.
- Cow's milk is poor in Vitamin C and Iron.
- Vitamin D and Vitamin B₁₂ has no plant source.

243. Ans. (c) **Halibut liver oil**

Ref: K. Park, 23rd ed. pg. 617

- **Richest source of Vitamin D:** Halibut fish liver oil > codfish liver oil > shark liver oil

244. Ans. (d) **Fish liver oil**

Ref: K. Park, 23rd ed. pg. 617

Please refer to above explanation

245. Ans. (d) **Calcitriol**

Ref: K. Park, 23rd ed. pg. 617

- Vitamin D has 3 forms:
 - D1: Calciferol
 - D2: Ergocalciferol
 - **D3: Calcitriol- most potent/active form, synthesized by sunlight. Also found in fish liver oil and animal fats**

246. Ans. (a) **Linoleic acid**

Ref: K. Park, 23rd ed. pg. 609-10

- **Essential fatty acid are**
 - Linoleic Acid: *most essential fatty acid*
 - Linolenic Acid
 - Arachidonic acid
 - Eicosapentanoic acid
 - DHA
- **Richest source of essential fatty acid:** Safflower oil
- **Richest source of saturated fatty acid:** coconut oil
- **Richest source of MUFA:** groundnut oil.

247. Ans. (d) **Glutamic acid**

Ref: K. Park, 23rd ed. pg. 609-10

Refer to previous explanation.

248. Ans. (b) **Iodine**

- Iodine deficiency leads to hypothyroidism which manifests as goiter.
- Due to hypothyroidism, thyroid cells try to compensate it by hyperplasia and hypertrophy of thyroid gland cells (goiter).
- Iron deficiency leads to Microcytic anemia (IDA).
- Zinc deficiency may manifest with *acrodermatitis enteropathica*.
- Fluorine deficiency/excess manifests with dental caries.

Extra Mile

- *Optimum level of fluorine in drinking water: 0.5–0.8 mg per liter.*

249. Ans. (b) **Height/age**

Ref: K. Park, 23rd ed. pg. 640;
Nelson's Pediatrics, 18th ed. Ch 43

The nutritional indices commonly calculated for young children are:

- **Weight for height** – an index used to measure wasting or acute malnutrition; (WHAM)
- **Height for age** – an index used to measure stunting or chronic malnutrition; (HA-CM)
- **Weight for age** – an index used to measure underweight (or wasting and stunting combined). (WASW)
- **Mid arm circumference** is a specific indicator of wasting or acute malnutrition.

ENVIRONMENT AND HEALTH

250. Ans. (c) **Calculating bleaching powder dose for water disinfection**

Ref: K. Park 23rd ed. P 728

Book states: "Horrock's water testing apparatus is designed to find out the dose of bleaching powder required for disinfection of water".

251. Ans. (b) **Nosocomial infection**

Ref: K. Park, 23rd ed. pg. 94

- Nosocomial infection is defined as infection acquired by patient while in a hospital or other health care facility.
- Infection occurs more than 48 hours after admission
- It denotes a new disorder, unrelated to patients primary condition
- Examples: UTI, surgical wound infection.
- **Sources of infection can be:**
 - **Patients** with viral infection (measles, viral hepatitis, influenza), skin infections, UTI and respiratory infection.
 - **Hospital staff** viz doctors, nurses, ward boys
 - **Environment:** Hospital environment viz dust, bed clothes, furniture, sinks, etc.

252. Ans. (d) **300**

Ref: K. Park, 23rd ed. pg. 243-44

- **Chandler's index** is also known as Endemic index.
- It is defined as average number of hookworm eggs per gram of stool for the entire community.
- >300 eggs per gram of stool denotes important public health problem.

TABLE: Interpretation of chandler's index:

Average No. of eggs/g of stool	Interpretation
• < 200	No significance
• 200–250	Potential danger
• 250–300	Minor public health problem
• >300	Major public health problem

253. Ans. (b) **Number of hookworm eggs per gram of stool**

Ref: K. Park, 23rd ed. pg. 243-44

- **Chandler's index** is also known as Endemic index.
- It is defined as average number of hookworm eggs per gram of stool for the entire community.
- Refer to above table for interpretations.

254. Ans. (a) **Hook worm**

Ref: K. Park, 23rd ed. pg. 243-44

Please refer to above explanation

255. Ans. (b) **Air pollution**

Ref: Park, 23rd ed. pg. 736

Indicators of Air Pollution

- **Smoke or Soiling index:** A known volume of air is filtered through a white filter paper under specified conditions and the stain is measured by photoelectric meter. Smoke concentration is estimated and expressed as micrograms/cubic metre of air as an average level over a period of time.
- **Sulphur dioxide** This gas is a major contaminant in many urban and industrial areas. Its concentration is estimated in all air pollution surveys. **So, it is the best indicator of air pollution**
- **Grit and dust measurement:** Deposit gauges collect grit, dust and other solids. There are analysed monthly.
- **Coefficient of haze:** A factor used, particularly in the USA in assessing the amount of smoke or other aerosol in air.
- **Air pollution index:** It is an arbitrary index which takes into account one or more pollutants as a measure of the severity of pollution

256. Ans (d) **E. coli**

Ref: Park, 23rd ed. pg. 720-21

- Ideally, drinking water shouldn't contain any organism known to be pathogenic.
- The primary bacterial indicator recommended as a bacteriological indicator is the **coliform group** of organisms as a whole. These include both fecal and non-fecal organisms.
- Typical example of the fecal group is **E. coli (single best indicator)** and of the non-faecal group, **Klebsiella aerogens**.

Reasons why coliform organisms are chosen as indicators of fecal pollution rather than the water borne pathogens directly:

- Constant presence of coliform organisms in great abundance in human intestine. These organisms are foreign to potable water. Therefore their presence is looked upon as evidence of fecal contamination.
- They are easily detected by culture methods
- Longer survival as compared to other water borne pathogens
- They have greater resistance to the forces of natural purification, as compared to water borne pathogens

Other Indicators Include

- **Faecal streptococci:** Faecal streptococci regularly occur in faeces, but in much smaller numbers than *E. coli*. Their presence is regarded as important **confirmatory evidence of recent faecal pollution of water**.
- ***Cl. perfringens*:** They also occur regularly in faeces and their spores are capable of surviving in water for a longer time than organisms of the coliform group. So, **the presence of spores in the absence of the coliform group**, suggests that faecal contamination occurred at **some remote time**.

257. Ans. (b) **15 meters**

Ref: K. Park, 23rd ed. pg. 709, Park, 19th pg. 465

- The safe distance between the latrine and a source of water supply will depend upon the porosity of the soil, level of ground water, its slope and direction of flow. In general, it may be stated, that latrines of any kind should not be *located within 15 m* (50 ft) from a source of water supply, and should be at a lower elevation to prevent the possibility of bacterial contamination of the water supply.

FAMILY PLANNING AND CONTRACEPTION

258. Ans. (c) **Spermicide**

Ref: K. Park 25th ed. P 550-54

- Contraceptive failure is measured by pearl index.

$$PI = \frac{\text{Total accidental pregnancy}}{\text{Total month of exposure}} \times 1200$$

- Spermicide is a chemical method of contraception usually used with vaginal sponge. It has highest contraceptive failure (highest pearl index).
- No spermicide is effective alone for contraception, therefore they are best used with barrier methods.
- Commonly used modern spermicides are “surface – active agents” → which attach themselves to spermatozoa and inhibits oxygen uptake → Sperms killed.

- Failure rate of different forms of contraception are as follows:

Contraceptive method	Failure rate (Pearl index- per 100 women years -HWY)
OCP	0.1 – 0.5
IUCD	0.2 – 3.0 (Mirena/LNG-20: 0.2 per 100 women)
Subdermal implant/ Norplant	0.7
Centchroman/Saheli	1.83–2.84
Condoms	Male: 2–14 Female: 5–21
Diaphragm	6 – 12
Vaginal sponge/Today	Nulliparous: 9 – 20 Parous: 20 – 40

- **Main drawbacks of spermicide:**
 - High failure rate
 - Must be used immediately before intercourse
 - Difficulty in application
 - Lots of messiness and mild burning sensation

259. Ans. (b) **Within 1 week of delivery**

Ref: K. Park 25th ed. P 549

Refer to above explanation

260. Ans. (c) **Family planning in those who are not using any contraception**

Ref: K. Park 23rd ed. P 511

- Many women who are sexually active would prefer to avoid becoming pregnant, without using any methods of contraception neither by their partner.
- These women are considered to have an “unmet need” for family planning.
- Concept is usually applied and limited to married women only, however it can be applied to sexually active fecund women.

Unmet Need

Unmet need for family planning is defined as the percentage of women of reproductive age, either married or in a union who want to stop or delay childbearing but are not using any method of contraception.

$$\text{Unmet need for family planning} = \frac{\text{Women of reproductive age (15–49) who are married or in a union and who have an unmet need for family planning}}{\text{Total number of women of reproductive age (15–49) who are married or in a union}}$$

FMGE Solutions Screening Examination

556

- **Most common reasons for unmet needs are:**
 - Inconvenient or unsatisfactory services
 - Lack of information
 - Contraceptives side effect fears
 - Opposition from husband or relatives
- According to national family health survey, it is most commonly seen in women below 20 years (almost entirely for spacing the birth).
- It is higher in rural areas than in urban areas.

261. Ans. (c) Failures per 100 women years of exposure

Ref: K. Park, 23rd ed. pg. 510

- **Pearl index** is used to measure the contraceptive efficacy/contraceptive failure.
- It is defined as the number of failures per 100 women-years (HWY) of exposure. It is given by the formula:

$$\text{Failure rate per HWY} = \frac{\text{Total accidental pregnancies}}{\text{Total months of exposure}} \times 1200$$

262. Ans. (a) 0.01

Ref: K. Park, 23rd ed. pg. 510

- Failure rate is 1 HWY; Total month of exposure is 12. We have to find out the number of accidental pregnancies.
- Putting the values in pearl index formula:

$$\text{Failure rate per HWY} = \frac{\text{Total accidental pregnancies}}{\text{Total months of exposure}} \times 1200$$

$$1 = \frac{x}{12} \times 1200$$

$$12 = 1200 x$$

$$\text{Therefore, } x = \frac{12}{1200} = 0.01$$

263. Ans. (a) Combined OCP

Ref: K. Park, 23rd ed. pg. 503

- IUD is considered safe during lactation.
- Progesterone Only Pills (mini pills) used mainly within 72 hours of intercourse to reduce the risk of pregnancy. **Considered safe during lactation.**
- **Composition of combined OCP: (MALA-N/MALA-D)**
 - Ethinyl estradiol: 0.03 mg (30 mcg)
 - Norgesterol/Desogesterol: 0.15 mg (150 mcg)
- **Adverse effects of combined OCP**
 - Myocardial infarction
 - Thrombosis
 - Cervical CA

- Breast CA
- Hepatocellular adenoma

Contraindications of OCPs

Absolute contraindication	Relative contraindication
<ul style="list-style-type: none"> • Breast CA • History of thromboembolism • Abnormal uterine bleeding • Cardiac abnormalities 	<ul style="list-style-type: none"> • Age > 40 years • Lactating mothers (0-6 months) • DM, HTN, chronic renal disease • Infrequent bleeding, Amenorrhea • Epilepsy and migraine

264. Ans. (d) Progesterone only pill

Ref: K. Park, 23rd ed. pg. 503

Please refer to above explanation

265. Ans. (b) Prevent release of ovum from ovary

Ref: K. Park, 23rd ed. pg. 501

- Combined oral contraceptive pills act by inhibiting ovulation by suppressing the release of gonadotropins.
- Continuous progesterone by OCPs which give negative feedback to GnRH, which decreases LH release and upto some extent FSH release also.
- This prevents LH surge and as a result inhibits ovulation.

266. Ans. (c) Ovarian cancer

Ref: K. Park, 23rd ed. pg. 501-502

Beneficial Effects of OCPs

- Ovarian CA
- PID
- Ectopic pregnancy
- Endometrial CA

267. Ans. (b) Just after the menstruation

Ref: K. Park, 23rd ed. pg. 389-90

- **Breast self-examination (BSE)** is a screening method used in an attempt to detect early breast cancer. The method involves the woman herself looking at and feeling each breast for possible lumps, distortions or swelling.
- **For pre-menopausal** women, the most commonly recommended time is just after the end of menstruation, because the breasts are least likely to be swollen and tender at this time.
- **For postmenopausal**, women or these having irregular cycles might do a self-exam once a month regardless of their menstrual cycle.

268. Ans. (d) Contraceptive failure

Ref: Park's PSM, 23rd ed. pg. 510

- Pearl index is used to measure the contraceptive efficacy/contraceptive failure.
- It is defined as the number of failures per 100 women-years (HWY) of exposure.

$$PI = \frac{\text{Total accidental pregnancies}}{\text{Total months of exposure}} \times 1200$$

- Another method used to measure contraceptive failure/efficacy is *life table analysis*.
- Life table analysis: calculates failure rates for each month of use.

269. Ans. (a) 0.1%

Ref: K. Park, 23rd ed. pg. 494-96

- Pomoroy's technique is the most popular method of ligation.
- Failure Rate: 0.1-0.3%
- Failure rate of vasectomy: 0.15 per HWY

DEMOGRAPHY AND HEALTH

270. Ans. (c) 21 days

Ref: K. Park 25th ed. P 903

- According to Central Birth and Death Registration Act 1969:
 - The time limit for registration of vital events like births and death is 21 days
 - Late fee is imposed in case of default
 - From October 2018, Aadhar number is must for registration of death
- **Lay reporting of health information:** Collection of information (birth and death), its use and its transmission to other levels of the health system by the non-professional health worker (like village health guide).

Extra Mile

- **Registration of marriage:** Within 30 days

271. Ans. (d) $PAR = \frac{\text{Incidence among total population} - \text{incidence among non-exposed}}{\text{Incidence among total population}} \times 100$

Ref: K. Park 25th ed. P 86

- **Population – attributable risk** is incidence of disease (or death) in total population minus the incidence of disease (or death) among those who were NOT exposed to the suspected causal factor divided by incidence among total population.

- **Use:** It provides an estimate of the amount by which the disease could be reduced in that population if the suspected factor is eliminated or modified.

Extra Mile

$$\text{Relative risk} = \frac{\text{Incidence among exposed}}{\text{Incidence among non-exposed}}$$

$$\text{Attributable risk} = \frac{\text{Incidence among exposed} - \text{incidence among non exposed}}{\text{Incidence among exposed}} \times 100$$

272. Ans. (b) Net reproduction rate

Ref: K. Park 25th ed. P 539 – 540

- **Net Reproduction Rate (NRR):** No. of daughters a new-born girl will bear during her life time *assuming fixed age specific fertility and mortality rates*.
 - It is a demographic indicator
 - NRR of 1 is equivalent to attaining approximately the 2-child norm.
 - If NRR <1, the reproductive performance of the population is said to be below replacement level.
- **Total Fertility Rate:** it is the average number of children a woman would have if she were to pass through her reproductive years bearing children at the same rates as the women now in each age group.
- **Gross Reproduction Rate:** Average number of girls that would be born to a woman if she experiences the current fertility pattern throughout her reproductive span (15–44 or 49 years), assuming no mortality.
- **General Fertility Rate:** It is the number of live birth per 1000 women in reproductive age group (15–44 or 49 years) in a given year
 - $GFR =$

$\frac{\text{No. of live births in an area during a year}}{\text{Mid year female population of age 15-44 (or 49) years} \times 1000}$

273. Ans. (c) 4

Ref: K. Park, 23rd ed. pg. 479

Demographic cycle

The history of world population since 1650 suggests that there is a demographic cycle of 5 stages through which a nation passes:

- **First stage (High stationary):** This stage is characterized by a **high birth rate** and a **high death rate** which cancel each other and the population remains stationary.
- **Second stage (Early expanding):** The **death rate begins to decline**, while the **birth rate remains unchanged**. Many countries in South Asia, and Africa

FMGE Solutions Screening Examination

are in this phase. Birth rates have increased in some of these countries possibly as a result of improved health conditions, and shortening periods of breastfeeding.

- **Third stage (Late expanding):** The death rate declines still further, and the birth rate tends to fall. The population continues to grow because births exceed deaths. **India has entered this phase.**
- **Fourth stage (Low stationary):** This stage is characterized by a **low birth and low death rate** with the result that the population becomes stationary.
- **Fifth stage (Declining):** The population begins to decline because birth rate is lower than the death rate.

274. Ans. (d) **Emmigration**

Ref: K. Park 23rd ed. P 481

- Demographic characteristics provide an overview of its population size, composition, territorial distribution and changes therein and the **components of changes such as: Nativity, mortality, social mobility.**
- Demographic indicators have been divided into 2 parts:
 - **Population statistics:** Include indicators that measures the population size, sex ratio, density and dependency ratio

- **Vital statistics:** Include indicators such as birth rate, death rate, natural growth rate, life expectancy at birth, mortality and fertility rates.

275. Ans. (b) **Population <15 years and >65 years**

Ref: K. Park 23rd ed. / 484

- Dependency ratio is the proportion of persons above 65 years of age and children below 15 years of age who are considered to be dependent on economically productive age group (15-64).

Dependency Ratio =

$$\frac{\text{Persons} < 15 \text{ years} + > 65 \text{ years}}{\text{Persons between 15 and 65 years}}$$

- Dependency ratio of India is 62 per 100 or 0.62. this means 62 non-earning peoples in India are dependent on 100 earning population.

276. Ans. (a) **Broad at base and narrow at apex**

Ref: K. Park 23rd ed. / 482

277. Ans. (b) **It is distributed equally in study & control groups**

Ref: K. Park 23rd ed. / 72

278. Ans (c) **95.4%**

Ref: K. Park 23rd ed. / 849

- The standard normal curve is a smooth, bell shaped, perfectly symmetrical curve, based on infinitely large number of observations.
- The area between 2 standard deviations on either side of the mean will cover most of the values i.e. ~95%.

The normal distribution or 'normal curve' is an important concept in statistical theory. In a normal curve :

- The area between one standard deviation on either side of the mean will include approximately 68% of values in the distribution.
- The area between two standard deviations will cover approx 95% of the values.
- The area between two standard deviations will cover approx 99.7% of the values

More About Standard Curve

- The standard normal curve is a smooth, **bell-shaped, perfectly symmetrical curve**
- It is based on an infinitely large number of observations.
- The **total area of the curve is 1**
- Its **mean is zero**
- Its **standard deviation is 1**
- The mean, median and mode all coincide

279. Ans. (d) **99.7% values**

Ref: K. Park, 23rd ed. pg. 848-49

280. Ans. (a) **Tapering at top**

Ref: K. Park, 23rd ed. pg. 848-49

281. Ans. (b) **16-25**

Ref: K. Park, 23rd ed. pg. 690

MODIFIED KUPPUSWAMI SCALE: Scale of socioeconomic status of urban families, includes Education status of head, occupation status of head, Income per capita.

Total score of 3 components	Socioeconomic class
• 26-29	Upper
• 16-25	Upper-middle
• 11-15	Lower-middle
• 05-10	Upper-lower
• <5	Lower

282. Ans. (b) **19.7%**

Ref: Park, 23rd ed. pg. 402

- According to the National survey on blindness 2001-2002 conducted in the country recognized the main causes for visual impairment and blindness are given below:

Cataract	62.6%
Refractive Errors	19.7%
Glaucoma	5.8%
Posterior segment pathology	4.7%
Corneal opacity	0.9%
Other causes	4.19%

283. Ans. (b) **According to the stroke control programme, first priority goes to control of Diabetes, elimination of smoking, prevention and management of other risk factors**

Ref: K. Park 23rd ed. pg. 472

According to the STROKE CONTROL PROGRAMME the *first priority goes to control of arterial hypertension which is the major cause of stroke.*

DISASTER MANAGEMENT, DISINFECTION AND BMW MANAGEMENT

284. Ans. (c) **Controlled tipping**

Ref: K. Park 25th ed. P 814

- **Book states:** "Controlled tipping or sanitary landfill is the most satisfactory method of refuse disposal where suitable land is available"
- **Three methods of controlled tipping:**
 - **The trench method:** Preferred where level ground is available. The refuse is compacted in long trench (6-10 feet deep, 12-36 feet wide) and covered with excavated earth.
 - **The ramp method:** Preferred where terrain is moderately sloping
 - **The area method:** Used for filling land depressions, disused quarries and clay pits. The refuse uniformly consolidated in layers up to 2-2.5 m (6-8 ft). Each layer is sealed with mud (12 inches/30 cm thick).

Extra Mile

Other methods of refuse disposal

- **Dumping:** Easy method for disposal of dry waste. Refuse is dumped (as open) in low lying areas usually as a method of land reclamation. It is the most insanitary method that creates public health hazard (WHO expert committee).
- **Incineration:** Disposal of refuse hygienically by burning or incineration. Method of choice where suitable land is NOT available. Best for hospital and industrial waste
- **Composting:** Method of combined disposal of refuse and night soil or sludge. Best and cultivation and soil. Methods of composting:
 - **Bangalore method** (Anaerobic method)
 - **Mechanical composting** (Aerobic composting)
- **Manure pits:** Done by digging manure pits by individual house hold. Preferred in rural areas where system of refuse collection and disposal is not systematic. Refuse is converted into manure in 5-6 months → used in field.
- **Burial:** Preferred for small camps. Refuse is disposed in a small trench (1.5 m wide and 2 m deep). It is covered with 20-30 cm of earth every day. Can be taken out after 6 month and used in field.

285. Ans. (a) **Yellow**

Ref: K. Park 25th ed. P 853

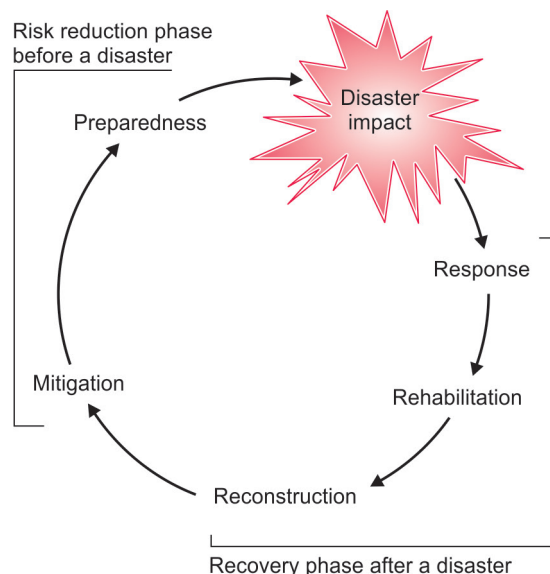

TABLE: Biomedical waste management

Color Category	Type of biomedical waste	Treatment options
Yellow	<ul style="list-style-type: none"> Human & Animal anatomical waste Soiled waste (with blood, body fluid) Expired/Discarded/cytotoxic medicine Chemical waste Chemical liquid waste Discarded linen, mattress, beddings contaminated with blood or body fluids 	Incineration/Deep burial Nonchlorinated chemical disinfection
Red	<ul style="list-style-type: none"> Recyclable contaminated waste <ul style="list-style-type: none"> Disposable items such as tubes, bottles, IV sets, urine bags, syringes without needle, gloves 	Autoclaving or microwaving/hydroclaving followed by shredding
White/Translucent (puncture/leak proof container)	<ul style="list-style-type: none"> Waste sharps including metals: Needles, blades or any contaminated sharp object 	Autoclaving or dry heat sterilization followed by shredding and mutilation
Blue	<ul style="list-style-type: none"> Glassware: included medicine vials except those contaminated with cytotoxic waste Metallic body implants 	Disinfection (by soaking waste with detergent and sodium hypochlorite)/ Autoclaving/ Microwaving/ Hydroclaving

286. Ans. (d) **Mitigation and preparedness**

Ref: K. Park 25th ed. P 857, 859

- There are 3 fundamental aspects of disaster management (as seen in disaster cycle):
 - Disaster response
 - Disaster preparedness
 - Disaster mitigation

- Before the disaster the most important steps are mitigation and preparedness of disaster
- Emergency prevention and mitigation** involves measures designed to either prevent hazard or to lessen the effect of emergencies. It also reduces the medical casualties drastically. It includes:
 - Flood mitigation works
 - Appropriate land use planning
 - Improved building codes
 - Reduction and protection of vulnerable population and structures
- Disaster preparedness:**
 - It is a long-term development activities whose goals are to strengthen the overall capacity and capability of a country to manage efficiently all types of emergency
 - Objective:** To ensure that all resources, systems are in place to provide prompt effective assistance to disaster victims thus facilitating relief measures and rehabilitation of services
- Cornerstone of emergency preparedness programme:** Community members, resources, organizations and administration.

287. Ans. (b) **Response and rehabilitation**

Ref: K. Park 25th ed. P 857

- After the disaster the first step is **response in first few hours** in order to manage the mass casualties.
- This is further divided into:
 - Search, rescue and first aid** (most immediate help comes from an uninjured survivor)
 - Field care:** Most injured ones are converged spontaneously to health facilities using any form of transport

- **Triage:** Rapidly classifying the injured on basis of severity of injury.
 - ♦ Highest priority is given to victim whose immediate or long term prognosis is dramatically affected by simple intensive care
 - ♦ **Lowest priority:** Moribund patients
 - ♦ **Most accepted triage method:** 4 colour coded system:
 - * **Red:** High priority treatment or transfer
 - * **Yellow:** Medium priority
 - * **Green:** Ambulatory patients
 - * **Black:** Dead or moribund patients
- **Tagging:** Victims should be tagged with name, age, place of origin, triage category, diagnosis and initial treatment
- Identification and removal of dead from disaster scene
- **Rehabilitation and reconstruction:**
 - The final phase in a disaster should lead to restoration of the pre-disaster condition. This is done by:
 - **Water supply:** first priority of ensuring water quality is chlorination (increase residual chlorine level to about 0.2 – 0.5 mg/litre)
 - Food safety
 - Basic sanitation and personal hygiene
 - Vector control

288. Ans. (b) Ministry of Home affairs

Ref: K. Park 25th ed. P 862

- The overall coordination of disaster management vests with ministry of Home affairs
- Top-level decision making committee:
 - Cabinet committee on security
 - National crisis management committee
- Agency responsible for preparation of disaster management plans and its execution at national level: The National Disaster Management Authority
- Health management in a disaster is under: Ministry of Health and family welfare (a special wing under it- Emergency Medical Relief Wing)

Extra Mile

- **World disaster reduction day:** Second Wednesday of October
- **Execution of relief work in case of natural disasters:** The state government

289. Ans. (c) Unsalvageable

Ref: PubMed

- In a disaster management, categorization of victims are done on the basis of likelihood of survival.

TABLE: Triage color code and their significance

Category	Color	Remarks/steps
Category 1	Red	Highest priority —patient immediate resuscitation or life-saving surgery (0 to 6 hours)
Category 2	Yellow/blue	High possible resuscitation or life saving surgery (within 6 to 24 hours)
Category 3	Green	Ambulatory/low minor injuries; non-life threatening
Category 4	Black	Dead, Moribund; least priority/unsalvageable

290. Ans. (b) Pathological waste

Ref: K. Park 23rd ed. P 789

TABLE: Classification of health care waste

Waste category	Description and examples
Infectious waste	Waste suspected to contain pathogens e.g. laboratory culture; waste from isolation wards; tissues (swabs), materials, or equipments that have been in contact with infected patients; excreta.
Pathological waste	Human tissues or fluids e.g. body parts; blood and other body fluids; fetuses.
Sharps	Sharp waste e.g. needles; infusion sets; scalpels; knives; blades; broken glass.
Pharmaceutical waste	Waste containing pharmaceuticals e.g. pharmaceuticals that are expired or no longer needed; items contaminated by or containing pharmaceuticals (bottles, boxes)
Genotoxic waste	Waste containing substances with genotoxic properties e.g. waste containing cytostatic drugs (often used in cancer therapy): genotoxic chemicals.
Chemical waste	Waste containing chemical substances e.g. laboratory reagents; film developer; disinfectants that are expired or no longer needed; solvents.
Wastes with high content of heavy metals	Batteries; broken thermometers; blood-pressure gauges; etc.
Pressurized containers	Gas cylinders, gas cartridges aerosol cans
Radioactive waste	Waste containing radioactive substances e.g. unused liquids from radiotherapy or laboratory research; contaminated glassware, packages, or absorbent paper; urine and excreta from patients treated or tested with unsealed radionuclides; sealed sources.

FMGE Solutions Screening Examination

562

291. Ans. (b) 2nd week of October

Ref: K. Park 23rd ed. pg. 795

- **WORLD DISASTER REDUCTION DAY:** 2ND WEDNESDAY IN MONTH OF OCTOBER
- **24TH OCTOBER:** UN DAY
- **25TH NOVEMBER:** INT'L DAY FOR ELIMINATION OF VIOLENCE AGAINST WOMEN

292. Ans. (d) District hospital

Ref: K. Park, 23rd ed. pg. 795-96

- There are 3 fundamental aspects of disaster management:
 - Disaster response
 - Disaster preparedness, and
 - Disaster mitigation
- District hospital take role in case of disasters like earthquake, flood etc.

293. Ans. (a) Search and rescue, first aid

Ref: K. Park, 23rd ed. pg. 795-97

- The management of mass casualties (massive disaster) can be further divided into:
 - Search and rescue, first aid,
 - Triage
 - Stabilization of victims,
 - Hospital treatment and redistribution of patients to hospitals if necessary.
- Foremost step for disease prevention and control in post disaster phase is chlorination of all the water bodies. Most practical and effective strategy of disease prevention is "supplying safe drinking water and proper disposal of excreta.

294. Ans. (c) Blue

Ref: K. Park, 23rd ed. pg. 795-97

- In a disaster management, categorization of victims are done on the basis of likelihood of survival.

TABLE: Triage color code and their significance

Category	Color	Remarks/Steps
Category 1	Red	Highest priority- patient immediate resuscitations or life-saving surgery (0 to 6 hr)
Category 2	Yellow/blue	High priority resuscitation or life saving surgery (within 6 to 24hr)
Category 3	Green	Ambulatory/ low minor injuries; non-life threatening
Category 4	Black	Dead, Moribund; least priority

295. Ans. (a) Red

Ref: K. Park, 23rd ed. pg. 795-97

296. Ans. (d) All of the above

Ref: K. Park 23rd ed. pg. 127-128

- Gamma radiation is used for sterilizing plastics, syringes, swabs, culture plates, catheter, rubber, oils, greases and metal foils.

297. Ans. (d) Liquid paraffin

Ref: K. Park, 23rd ed. pg. 128

- **Autoclaving** is a method of disinfection mainly used for surgical dressings, instruments, laboratory wares, media and pharmaceutical products.
- Principle: Steam + High pressure (~ 30 psi) and temperature 121 C.
- Efficiency test of autoclaving: spores of *Bacillus Stearothermophilus*.

298. Ans. (c) Plastic syringes

Ref: K. Park, 23rd ed. pg. 127-28

HOT AIR OVEN

- Holding period of 160 C x 1 hour
- Used for forceps, glasswares, scissors, scalpels, glass syringes, swabs and few pharmaceutical products like liquid paraffin, fats, grease.

299. Ans. (a) Blue

Ref: K. Park, 23rd ed. pg. 126-28, 753

- Sharp wastes like needles, syringes, blades, scalpels, glass are disposed in blue/white translucent bag

Color coding	Biomedical waste	Treatment option
Yellow	<ul style="list-style-type: none"> • Human anatomical waste • Animal waste • Microbiological waste • Soiled waste 	Incineration/deep burial
Red	<ul style="list-style-type: none"> • Microbiological waste • Soiled waste and Solid waste 	Autoclave/microwave/chemical treatment
Blue/white translucent	<ul style="list-style-type: none"> • Sharp waste • Solid waste 	Autoclave/microwave/chemical treatment and destruction/shredding
Black	<ul style="list-style-type: none"> • Discarded and cytotoxic meds • Incineration ash • Chemical waste (solid) 	Secured landfill

300. Ans. (d) All of the above

Ref: K. Park, 23rd ed. pg. 126-28, 753

- Sharp wastes like needles, syringes, blades, scalpels, glass are disposed in blue/white translucent bag

- Blue/white translucent bag: Sharp waste and Solid waste
- Refer to above explanation.

301. Ans. (b) **Solid waste**

Cat.	BMW	Wastes included
1.	Human Anatomical Waste	Human tissues, organs, body parts
2.	Animal waste	Animal tissues, body parts, organs, carcasses, fluids, blood
3.	Microbiology & biotechnology waste	Waste from lab cultures, stocks, specimens of microorganisms, vaccines, cell cultures, toxins, wastes from production of biological
4.	Waste sharps	Needles, syringes, scalpels, glass, blade
5.	Discarded medication & cytotoxic drugs	Expired medicines, discarded medicines
6.	Soiled waste	Items contaminated with blood, fluids, including cotton, dressings, linen, bandage, plasters
7.	Solid waste	Disposable items (except sharps), including catheter, tubes, i.v sets
8.	Liquid waste	Waste generated from lab, washing, cleaning, disinfecting activities
9.	Incineration ash	Ash from incineration of any BMW
10.	Chemical waste	Chemical used in disinfection

302. Ans. (a) **Efficacy of a disinfectant****HEALTH PLANNING, CARE AND MANAGEMENT IN INDIA**303. Ans. (b) **30,000**

Ref: K. Park 25th ed. P 964

Health Care Unit	Population covered	
	Plain	Hilly/Tribal/Backward
CHC	120,000	80,000
PHC	30,000	20,000
MPW	5000	3000
AWW	400-800	300-800
ASHA/VHG/TBA	1000	One ASHA per habitation

304. Ans. (b) **Multi-purpose worker scheme**

Ref: K. Park, 23rd ed. pg. 874-75

- **Kartar Singh Committee:** Recommended multi-purpose worker scheme. Kartar Singh Committee recommended:
 - **Current ANM** to be replaced by the newly designated "female health worker" and present day basic health workers, malaria surveillance workers, family planning health assistants to be replaced by "male health workers"

305. Ans. (b) **10,000**

Ref: K. Park, 23rd ed. pg. 900

TABLE: Suggested norms for health personnel

Personnel category	Norms suggested
Nurses	1 per 5000
Health worker male and female	1 per 5000 in plain 1 per 3000 in tribal and hilly areas
Trained dai	One for each village
Health assistant (male and female)	1 per 30,000 in plain 1 per 20,000 in tribal and hilly areas
Pharmacist	1 per 10,000
Lab technician	1 per 10,000
ASHA	1 per 1000

306. Ans. (c) **16**

The guidelines are from India New Born Action Plan 2014

Special New Born Care Unit (SNCU)

- It should be present in all district and sub-district hospitals.
- It comprises 12 beds and 4 beds for rooming in purposes
- The unit provides care for sick newborns >1800 g and routine new born care except ventilator services.

New Born Stabilization Unit (NBSU)

- It should be present in all CHC and FRU
- It comprises 4 beds and 2 beds for rooming in purposes.
- The unit aims to stabilize the sick new-borns before referral and manage baby >1800 g with jaundice, sepsis and hypothermia.

FMGE Solutions Screening Examination

564

New Born Care Corner (NBCC)

- It should be present at all points where delivery will occur including PHC and subcenter.
- It comprises minimum one bed.
- Objective is to provide immediate care at birth, feeding support and immediate referral.

307. Ans. (a) 1000

Ref: Park's, 23rd ed. pg. 449-50

- ASHA is Accredited Social Health Activist.
- One ASHA works for **1000 population**.
- In tribal, hilly and desert areas, the norm is one ASHA per habitation.

Impact Indicators of ASHA

- Infant mortality rate
- Child malnutrition rate
- Number of TB/leprosy case detection as compared to previous year.

Must Know Points About ASHA

- **ASHA** must be the resident of the village preferably in the **age group of 25-45 years**.
- Minimum **education** required for ASHA: **8th pass**
- ASHA is selected by village panchayat/Gram Sabha
- ASHA comes under national Rural Health Mission (NRHM): 2005-2012
- Act as bridge between village and ANM (Auxiliary Nurse midwife)
- Training of ASHA is done by ANM and AWW for a **minimum duration of 23 days**.

308. Ans. (d) 7

Ref: Park's, 23rd ed. pg. 449-50

- ASHA will make visits to all newborns according to specified schedule up to 42 days of life. The scheduled visits are as follows:
 - **Six visits** in case of **institutional delivery**: Day 3, 7, 14, 21, 28, 42
 - **Seven visits** in case of **home delivery**: Day 1, 3, 7, 14, 28, 42
 - **Five visits** in case of **caesarean delivery** (mother discharged after 5 – 6 days): Day 7, 14, 21, 28, 42

309. Ans. (c) 1 lakh

Ref: K. Park, 23rd ed. pg. 428

- Designated microscopy centre (DMC): The most peripheral laboratory under RNTCP network is DMC which serves a population of around **100,000 in plains** and **50,000 in tribal and hilly areas**.

310. Ans. (d) Equity of distribution

Ref: K. Park, 23rd ed. pg. 891

- PHC is Primary Health Care outlined by Alma Ata in 1978.
- It is defined as essential health care, which is characterized by 4 A's
 - Acceptable (*it should be acceptable by everyone*)
 - Accessible (*it should be accessible by everyone*)
 - Available (*it should be available to everyone*)
 - Affordable (*it should be affordable to everyone*)

TABLE: Elements of PHC (Primary Health Care) (remembered as ELEMENTS)

E	Essential drugs
L	Locally endemic disease prevention and control
E	EPI (Expanded program of immunization)
M	MCH (Maternal and child Health care including family planning)
E	Education
N	Nutrition
T	Treatment of common ailments
S	Safe water supply and sanitation

- Equity of distribution is NOT an element of PHC, but it is one of the principles/pillars of the PHC.
- **4 Principles/Pillars of Primary Health Care:**
 - Equitable distribution
 - Community participation
 - Intersectoral coordination
 - Appropriate technology.

311. Ans. (a) Primary health care

Ref: K. Park, 23rd ed. pg. 891-92

Please refer to above explanation

312. Ans. (c) Unequitable distribution

Ref: K. Park, 23rd ed. pg. 891-92

Please refer to above explanation.

313. Ans. (c) Oxygen saturation

Ref: K. Park, 23rd ed. pg. 904-905

314. Ans. (d) 100,000

Ref: K. Park, 23rd ed. pg. 907

- CHC is community health Centre. It covers 120,000 population in plain areas and 80,000 population in hilly areas.

- Since, 120,000 is not in option, 100,000 is the closest and best answer.

Extra Mile

- PHC is considered as *Primary level of health care* is. It is considered as *1st level of contact*.
- CHC is considered as *secondary level of health care* and *first referral unit*.
- *Tertiary level of health care* is delivered through medical colleges and hospitals.

Health Care Unit	Population covered	
	Plain	Hilly/Tribal/Backward
CHC	120,000	80,000
PHC	30,000	20,000
MPW	5000	3000
AWW	400-800	300-800
ASHA/VHG/TBA	1000	

315. Ans. (b) **CHC**

Ref: K. Park 23rd ed. pg. 907

Please refer to above explanation

316. Ans. (b) **30**

Ref: K. Park 23rd ed. pg. 907

- **PHC level: 4 to 6 bed** and staff 15 and 1 MBBS and medical officer
- **CHC level: 30 beds** and 30 staff including 7 doctors MD/MS/OBS/GYNE/ PEDIA/ OPHTHA/ANES/PSM
- **Sub center level: zero bed** and 3 staff. MPW (1 male and 1 female)/ ANM (auxiliary nurse midwife).

317. Ans. (c) **2005**

Ref: K. Park, 23rd ed. pg. 448

- National Rural Health Mission (NRHM) was established in 2005.
- Goal of NRHM is to provide every village in the country with a trained female community health activist: **ASHA** (Accredited Social Health Activist).

Other Important Health Programmes of India

- National Tuberculosis Programme (NTP): 1962
- Revised National TB Control Programme (RNTCP): 1993
- National AIDS Control Programme (NACP): 1987
- National Malaria Control Programme (NMCP): 1953
- National Leprosy Control Program: 1955
- Integrated Child Development Services scheme (ICDS): 1975

- National Programme for Control of Blindness (NPCB): 1976

318. Ans. (b) **Kartar Singh Committee**

Ref: K. Park, 23rd ed. pg. 874

- **Kartar Singh Committee:** Recommended multi-purpose worker scheme
- **Bhore Committee:** Health survey and development
- **Srivastava Committee**
 - Group on medical education and manpower.
 - Recommended bands of para-professionals and semi-professional health worker.
 - ROME (Reorientation of Medical Education) scheme.
 - Village Health Guide scheme.
 - 3-Tier rural health infrastructure
- **Jungalwalla committee**
 - Equal pay for equal work
 - No private practice

319. Ans. (d) **5000**

Ref: K. Park, 23rd ed. pg. 903-904

- MPW works at sub centre level, 1 per 5000 population in plain areas and 1 per 3000 population in hilly/tribal areas.
- At present a sub centre is staffed by one female health worker known as Auxiliary Nurse Midwife (ANM) and one male health worker known as multipurpose worker.

320. Ans. (b) **1000**

Ref: K. Park, 23rd ed. pg. 449, 21st ed. pg. 407

- ASHA is Accredited Social Health Activist.
- One ASHA works for **1000 population**.
- In tribal, hilly and desert areas, the norm is one ASHA per habitation.

Impact Indicators of ASHA

- Infant mortality rate
- Child malnutrition rate
- Number of TB/leprosy case detection as compared to previous year.

Extra Mile**ASHA**

- **ASHA** must be the resident of the village preferably in the **age group of 25–45 years**.
- Minimum **education** required for ASHA: **8th pass**
- ASHA is selected by village panchayat/Gram Sabha
- ASHA comes under national Rural Health Mission (NRHM): 2005–2012
- Act as bridge between village and ANM (Auxiliary Nurse midwife)
- Training of ASHA is done by ANM and AWW for a **minimum duration of 23 days**.

Extra Mile

- One multi-purpose worker (MPW) is for: **5000 population**
- One village health guide (VHG) is for: **1000**
- One Anganwadi worker (AWW) is for: **400-800**

321. Ans. (c) **Minimum class 4 passed**

Ref: K. Park, 23rd ed. pg. 449-50, s 21st ed. pg. 407

- **Minimum education required for ASHA: 8TH pass**
- Please refer to above explanation for more details.

322. Ans. (d) **Village**

Ref: K. Park, 23rd ed. pg. 449-50

323. Ans. (a) **Is a mental health worker**

Ref: K. Park, 23rd ed. pg. 449-50

324. Ans. (c) **Conduct 50% delivery**

Ref: K. Park, 23rd ed. pg. 903-904

- The Female Health Workers are expected to provide comprehensive primary health care to the community.
- The range of services they are expected to provide under Multi purpose Health Worker (MPW) scheme is very wide and encompasses promotive, preventive and curative services including conducting around 50% of deliveries, *anemic mothers and other pregnancy related issues*.
- **Visit-** At least *one visit, once in two months* to each household in the area allotted.
- *Collection of blood samples are functions of MPW male.*
- Female health workers have no role in the process of chlorination or disinfection of water.

325. Ans (b) **Renal disease**

Ref: K. Park, 23rd ed. pg. 903, 196th pg. 754

- Renal disease cannot be picked up by a health worker unless it is responsible for alteration of the urine grossly.
- Please refer to above explanation

326. Ans. (c) **Active malaria surveillance**

Ref: K. Park, 23rd ed. pg. 903-904

327. Ans. (d) **75 grams**

Ref: K. Park, 23rd ed. pg. 661, 20th 575

A Midday School Meal

Foodstuffs	g/day/child
• Cereals and millets	75
• Pulses	30
• Oils and fats	8
• Leafy vegetables	30
• Nonleafy vegetables	30

Principles of Mid Day Meal Programme

- The meal should be a *supplement and not a substitute to the home diet*
- The meal should supply at least **one-third of the total energy** requirement, and **half of the protein** need
- The cost of the meal should be *reasonably low*
- The meal should be such that it can be prepared *easily in schools*; no complicated cooking process should be involved.
- As far as possible, *locally available foods should be used*; this will reduce the cost of the meal, and the menu should be frequently changed to avoid monotony.

328. Ans. (b) **1/3 calories, 1/2 proteins**

Ref: K. Park, 23rd ed. pg. 661-62

- Mid-day meal program is also known as National Program of Nutritional Support to primary education.
- The main advantage of this program is to influence more children towards schools in order to improve the literacy.
- This meal only act as a supplement and NOT as a substitute to home diet.
- *This meal should provide 1/3 of the total calories requirement and 1/2 of the total protein requirement.*

329. Ans. (b) **30**

Ref: K. Park, 23rd ed. pg. 399-400

- BMI is Body Mass Index, aka Quetlet's Index.
- It is calculated as: BMI = weight (kg)/height (m)²

Classification	BMI
Underweight	<18.5
Normal BMI	18.5–24.99
Overweight/pre-obese	25–29.99
Obesity	>30.0
• Grade I	• 30–34.99
• Grade II	• 35–39.99
• Grade III	• ≥40

330. Ans. (a) (Weight in kg/Height in meters²)

Ref: K. Park, 23rd ed. pg. 399-400

331. Ans. (b) Birth injuries

Ref: K. Park, 23rd ed. pg. 564

- **Most common cause of neonatal mortality in India** is preterm birth.
- A preterm child is more likely to be low birth weight and premature, which contribute to neonatal mortality rate.
- Death due to Birth injuries are there, but it is relatively very less as compared to prematurity, low birth weight and asphyxia.

332. Ans. (c) 6

Ref: K. Park, 23rd ed. pg. 590, 661, 21st ed. pg. 545, 611

- **ICDS** is Integrated Child Development Services which was started in 1975.
- This program include a strong supplementary nutrition component in form of Vitamin A prophylaxis and iron & folic acid distribution.
- The workers at village level who deliver the services are called *Anganwadi workers*.

Beneficiaries of ICDS

- Preschool children below 6 years.
- Adolescent girls 11 to 18 years old.
- Pregnant and lactating mothers.

333. Ans. (b) 1991

Ref: K. Park, 23rd ed. pg. 540-41

- The **Baby Friendly Hospital Initiative (BFHI)**, is programme of the World Health Organization and UNICEF.
- *Main goal of this initiative is to improve infant and young child nutrition by promoting breast feeding.*
- This includes helping the mother *initiate breast-feeding within the first hour of birth in normal delivery* and 4 hours following caesarean section
- It also aims at improving the care of pregnant women, mothers and newborns at health facilities that provide maternity services for protecting, promoting and supporting breastfeeding.
- No advertisement promotional material or free products for infant feeding should be allowed in the facility.

334. Ans. (d) Infants are kept in the nursery for first 24 hours

Ref: K. Park, 23rd ed. pg. 540-541

335. Ans. (a) Panchayat samiti

Ref: K. Park, 23rd ed. pg. 881-82

- **Panchayat Samiti** is a local government body at the tahsil level in India. It works for the villages of the tahsil that together are called a **Development Block**.
- The Panchayat Samiti is the link between the Gram Panchayat and the zila parishad.

Note

- **Gram Sabha** has been envisaged as the foundation of the Panchayati Raj system. A village having population not less than 1500 forms Gram Sabha and every adult of the village is member of Gram Sabha. These members of gram sabha can elect members of gram panchayat.

336. Ans (b) 100 villages and 1,00,000 population

Ref: Park's PSM, 20 pg. 783, 784

"Under the community development programme, the rural areas of the country have been organized into Community Development Blocks —each Block comprising approximately **100 villages and a population of one lakh.**"

OCCUPATIONAL HEALTH

337. Ans. (a) CO₂, ozone, methane

Ref: Inventory of US greenhouse gas emissions and sinks, 1990-1994 By United States Environmental Protection Agency

- A **greenhouse gas** is a gas in an atmosphere that absorbs and emits radiation within the thermal infrared range. This process is the fundamental cause of the greenhouse effect.
- The **primary greenhouse gases in Earth's atmosphere** are **water vapor, carbon dioxide, methane, nitrous oxide, and ozone (O₃).**
- Chlorofluorocarbons (CFCs), Hydrofluorocarbons (HFCs) and other compounds such as perfluorinated carbons are also green house gases.
- Without greenhouse gases, the average temperature of Earth's surface would be about -18°C (0°F), rather than present average of 15°C (59°F).

338. Ans. (b) 5 Rad per person per year

Ref: K. Park, 23rd ed. pg. 804

- Maximum permissible radiation exposure for general population: 5 Rad (0.5 Rem) per person per year.
- Maximum permissible radiation exposure for workers: 50 Rad (5 Rem) per person per year.

FMGE Solutions Screening Examination

568

- Greatest source of radiation outside house: Extra-terrestrial cosmic rays.
- Greatest source of radiation inside house: TV
- Greatest man-made source of radiation: X-ray

Extra Mile

- Permissible sound level in hospital wards: 20–35 decibel.
- Maximum tolerable sound level: <85 decibel
- Permanent hearing loss at: >100 decibel
- Tympanic membrane ruptures at: 150–160 decibel.

339. Ans (a) 20-35

Ref: K. Park, 23rd ed. pg. 741-42, 19th pg. 599

Acceptable noise levels (dBA)		
Residential:	Bed room	25
	Living room	40
Commercial:	Office	35-45
	Conference	40-45
	Restaurants	40-60
Industrial:	Workshop	40-60
	Laboratory	40-50
Educational:	Class room	30-40
	Library	35-40
Hospitals:	Wards	20-35

340. Ans. (a) Lung cancer

Ref: K. Park, 23rd ed. pg. 807

- Asbestosis occurs due to long duration (>10 years) exposure to asbestos.
- This may lead to pulmonary fibrosis, carcinoma of bronchus, mesothelioma of pleura/peritoneum and GIT cancer.

Other Important Occupational Cancer

Agent	Associated Cancer
Asbestosis	Mesothelioma
Arsenic	Skin, lung, liver CA
Benzene	Leukemia
Benzidine	Bladder CA
Silica	Lung CA
Wood dust	Nasal sinus

- Most common occupational cancer: skin CA (75%), mainly squamous cell CA.

341. Ans. (c) Asbestosis

Ref: K. Park, 23rd ed. pg. 807

- Pneumoconiosis occurs due to occupational exposure to dust.
- Dust particle of size 0.5 to 3 microns are most dangerous, as they can reach the interior of lungs easily.
- Most common pneumoconiosis associated with Mesothelioma and lung cancer: **Asbestosis**.
- Most common pneumoconiosis: **Silicosis**

TABLE: Other important pneumoconiosis to remember:

Disease	Exposure source
• Silicosis	Silica dust
• Anthracosis	Coal dust
• Asbestosis	Asbestos dust
• Bagassosis	Sugarcane dust (<i>thermoactinomyces sacchari</i>)
• Byssinosis	Cotton fibre
• Siderosis	Iron dust

342. Ans. (c) Sugarcane dust

Ref: K. Park, 23rd ed. pg. 807

343. Ans. (d) Can cause Blue Line on gums

Ref: K. Park, 23rd ed. pg. 807-808

- Lead poisoning is known as Plumbism.
- This is most commonly seen among painters, therefore also known as Painter's colic.
- Most common source of lead poisoning: Petrol
- Most common mode of lead poisoning: Inhalation

Clinical Finding of lead poisoning:

- Burtonian line: Blue line on gums
- Facial pallor: first and most consistent sign (always present).
- Lead colic: constipation/diarrhea
- Wrist drop/foot drop
- Encephalopathy

Investigation of Pb Poisoning:

- CPU: Coproporphyrin in Urine is a useful screening test- > 150: exposure to lead
- Amino Levulinic Acid (ALAU), lead levels in blood and urine: diagnostic test.
- Upon PBS, **basophilic stippling of RBC's** and **Microcytic Hypochromic anemia** seen.
- DOC for Pb poisoning: EDTA

344. Ans. (b) Insomnia

Ref: K. Park, 23rd ed. pg. 807-808

- Insomnia is caused by organic lead poisoning.
- Organic lead poisoning causes CNS side effects while Inorganic lead poisoning causes non-CNS side effects.

Due to organic lead (CNS effects)	Due to inorganic lead (Non-CNS effects)
<ul style="list-style-type: none"> • Insomnia • Mental confusion • Headache • Delirium 	<ul style="list-style-type: none"> • Facial pallor: <i>earliest and most consistent sign.</i> • Anemia: Microcytic Hypochromic • RBC's stippling • Burtonian Line on upper gums • Lead Colic: constipation (<i>or copper</i>) • Lead Palsy (wrist + foot drop)

345. Ans. (d) **Inorganic lead**

Ref: K. Park, 23rd ed. pg. 807-808

Please refer to above explanation

346. Ans. (c) **Maternity benefit for 3 months**

Ref: K. Park, 23rd ed. pg. 8015-16

- ESI (The Employees State Insurance) Act 1948 covers the social security and health insurance in India.
- ESI NOT applicable on: (MERD)
 - Mines
 - Education
 - Railways
 - Defence
- The employer contributes 4.75% and employee contributes 1.75 % of total wage bill.
- It covers all employees getting wages upto 15,000 per month.
- Maternity benefit for a duration of 12 weeks (3 months).
- Sickness benefits payable upto 91 days and extended sickness benefit payable for upto 2 years.

347. Ans. (d) **Contribution**

Ref: K. Park, 23rd ed. pg. 815-16

- The scheme is run by the contribution of the both employee and employer, and grants from central and state government.
- The employer contributes 4.75% of total wage bill. The employee contributes 1.75 % of wages.
- **Exemption:** employees getting < Rs. 70. The state government share of expenditure on medical care is 1/8 of total cost of medical care. ESI corporation share of expenditure is 7.8 of total cost of medical care.

348. Ans. (a) **The employer contributes 4.75%**

Ref: K. Park, 23rd ed. pg. 815-816

Please refer to above explanation.

349. Ans. (c) **System analysis**

Ref: K. Park, 23rd ed. pg. 872

- **Cost effective analysis** is a management technique where benefits are stated in terms of results achieved. Eg: No. of life saved.
- **Cost benefit analysis** is a management technique where benefits are stated in terms of money.
- **System analysis** is a management technique of *finding out the cost effectiveness* of the available alternatives.
- **Network analysis** is the graphic plan of all events and activities to be completed in order to reach an end objective. 2 types of network analysis technique:
 - PERT (Programme Evaluation And Review Technique): arrow diagram representation of event.
 - CPM (Critical Path Method): the longest path.

350. Ans. (a) **Time**

Ref: K. Park, 23rd ed. pg. 872

- **Network analysis** is the graphic plan of all events and activities to be completed in order to reach an end objective. 2 types of network analysis technique:
 - PERT (*Programme Evaluation and Review Technique*): an arrow diagram representing the logical sequence in which events must take place. It aids in planning scheduling and monitoring the project.
 - CPM (*Critical Path Method*): the longest path of the network. If any activity in the critical path is delayed, entire project will be delayed.

351. Ans. (b) **29-31°C**

DISINFECTION AND MISCELLANEOUS

352. Ans. (d) **Hypochlorous acid**

Ref: K. Park, 23rd ed. pg. 714-15

CHLORINATION OF WATER

- **Disinfecting action of chlorine in water is mainly due to hypochlorous acid (HOCl).**
- Hypochlorite ions has minor role in disinfection.
- Compared to UV rays or ozone, only Chlorine has residual germicidal effect.

Extra Mile

- **Chlorine has no effect on:**
 - Bacterial spores, protozoal cysts and helminthic ova
 - Viral agents of Hepatitis A, Polio are also resistant at normal doses.
- **Horrock's apparatus:** Cl₂ demand (to measure Cl₂ required for water disinfection)

353. Ans (c) **Ortho toluidine test**

Ref: K. Park, 23rd ed. pg. 715, 19th pg. 578

FMGE Solutions Screening Examination

570

- **Orthotolidine arsenite test** - used for testing residual chlorine at the end of **one hour contact**.
- If the "free" residual chlorine level is less than 0.5 mg/litre, the chlorination procedure should be repeated before any water is drawn.
- Wells are best **disinfected at night** after the day's draw off.
- During epidemics of cholera, wells should be disinfected every day

Extra Mile

- **Horrock's Apparatus** is used for **estimating the chlorine demand of the well water** and calculate the amount of bleaching powder required to disinfect the well.
- Roughly, **2.5 grams of good quality bleaching powder** would be required to disinfect **1,000 litres** of water. Bleaching powder contains **33% available chlorine**
- The **hypochlorous acid** is the most effective form of chlorine for **water disinfection**.
- Chlorine acts best as a disinfectant when the **pH of water is around 7**.
- The **standard prescribed** for chloride is **200 mg/litre**
- The **maximum permissible level** is **600 mg/litre**

354. Ans. (b) **Alum is added after lime**

Ref: K. Park, 23rd ed. pg. 714-15

- Nalgonda Technique is utilized for defluorination of water.
- Sequence of components added for defluorination is: (LAB)
 - Lime
 - Alum
 - Bleaching powder

355. Ans. (d) **Natural selection is a process where harmful genes are not eliminated from the gene pool and genes favorable to individual are not passed onto offspring.**

According to Hardy Weinberg law genes are passed on to the offsprings in a gene pool.

356. Ans. (a) **30-year-old female to check for cystic fibrosis**

357. Ans. (d) **Mixed cohort**

358. Ans. (d) **Repeated measurement**

BIOSTATISTICS

359. Ans. (b) **Every 6 months**

Ref: K. Park 23rd ed. P 841

Sample Registration System (SRS)

Since civil registration is deficient in India, a Sample Registration System (SRS) was initiated in the mid-1960s to provide reliable estimates of birth and death rates at the National and State levels. The SRS is a dual-record system, consisting of continuous enumeration of births and deaths by an enumerator and an independent survey every 6 months by an investigator-supervisor. The half-yearly survey, in addition to serving as an independent check on the events recorded by the enumerator, produces the denominator required for computing rates.

The SRS now covers the entire country. It is a major source of health information.

360. Ans. (a) **Histogram**

Ref: K. Park 23rd ed. P 845

Histogram

It is a pictorial diagram of frequency distribution. It consists of a series of blocks (Figure). The class intervals are given along the horizontal axis and the frequencies along the vertical axis. The area of each block or rectangle is proportional to the frequency. The figure is the histogram of the frequency distribution of blood pressure in females 45-64 years.

Frequency distribution of diastolic blood pressure in females aged 45-64 years

361. Ans. (b) **8.4**

Ref: K. Park, 23rd ed. pg. 65

- An odds ratio (OR) is a measure of association between an exposure and an outcome. The OR represents the odds

that an outcome will occur given a particular exposure, compared to the odds of the outcome occurring in the absence of that exposure.

$$\bullet \text{ OR} = \frac{a \times d}{b \times c} = \frac{33 \times 27}{53 \times 2} = 8.4$$

362. Ans. (c) $\frac{TP}{TP + FN} \times 100$

Sensitivity: Defined as ability of a screening test to identify all those who have disease (cases/ True positive)

$$\text{Sensitivity} = \frac{a}{(a + c)} \times 100 = \frac{TP}{(TP + FN)} \times 100$$

363. Ans. (d) 99

	Pregnant	Non-Pregnant
Positive test	99	10
Negative test	1	90

$$\text{Sensitivity} = \frac{a}{(a + c)} \times 100 = \frac{99}{99 + 1} \times 100 = 99$$

364. Ans. (b) 2.5

Ref: K. Park, 23rd ed. pg. 78

- RR = incidence of disease among exposed/ Incidence of disease among non-exposed

	Disease (+)	Disease (-)	Total
Exposed	50	350	400
Non-exposed	5	95	100

- Putting the value in formula = $50/400 \div 5/100$
 $= 50/400 \times 100/5$
 $= 2.5$

365. Ans. (a) 0.00

Ref: K. Park, 23rd ed. pg. 848

- Standard deviation is the deviation from the mean value.
- 10 babies were born, each weighs 2.7 kg, which gives a mean value of 2.7, indicating there is no deviation from the mean value.
- Hence the answer will be 0 (zero)
- Standard deviation is also known as root mean square deviation.

366. Ans. (c) Used to test significance of association between two quantitative data

Ref: K. Park, 23rd ed. pg. 852

- Chi-square test is used to test significance of association between two QUALITATIVE data.
- It is used for non-Gaussian distribution.
- This test is a non-parametric test of significance.

- Degree of freedom used in chi-square test is calculated by $(c-1)(r-1)$

367. Ans. (c) 12

Ref: K. Park, 23rd ed. pg. 852

- Degree of freedom:** It is the no. of observations in a dataset that can freely vary once the parameters have been estimated.
- It is used in *chi-square test* and *t-test*.
- DOF:** $(c-1)(r-1)$, where c is no. of columns and r is no. of rows.
- In the given question there are 4 columns and 5 rows.
- Therefore $(4-1)(5-1)$ gives 12.

368. Ans. (d) Wrong calculation

Ref: K. Park, 23rd ed. pg. 852-53

- Correlation coefficient (r) is used to find out if there is any significant relationship between two variables (e.g: x and y) or not.
- Correlation coefficient (r) tends to lie between -1.0 to $+1.0$ ($-1 < r < +1$)
 - If $r = +1$: strong positive association between two variables
 - If $r = 0$: no association between two variables
 - If $r = -1$: strong negative association

369. Ans. (a) Mean

Ref: K. Park, 23rd ed. pg. 847-88

- Best measure of central tendency: **MEAN**
- Best measure of central tendency for NOMINAL data: **MODE**
- Best measure of central tendency for ORDINAL data: **MEDIAN**
- Best measure of central tendency for metric/quantitative data: **MEAN**

370. Ans. (d) Mode

Ref: K. Park, 23rd ed. pg. 847-88

THE MODE

- The mode is the commonly occurring value in a distribution of data. It is the most frequent item or the most fashionable value in a series of observations. For example, the diastolic blood pressure of 20 individuals was:
 85, 75, 79, 71, 95, 75, 75, 77, 75, 90
 71, 75, 79, 95, 75, 77, 84, 75, 81, 75
- The mode or the most frequently occurring value is 75.

371. Ans. (b) 16, 10, 10

Ref: K. Park, 23rd ed. pg. 847-88

- Patient is smoker from last 6 years.

FMGE Solutions Screening Examination

572

- In the first year 5 sticks per day; in the 2nd, 3rd and 4th year it is 10 sticks per day; in 5th year 20 sticks per day and in 6th year 40 sticks per day.

Therefore, mean = $\frac{5 + 10 + 10 + 10 + 20 + 40}{6}$

= 15.83, which is rounded as 16

- Median is middle value in ascending order. Since, it has two middle value,

$$\frac{10 + 10}{2} = 10$$

- Mode is most repeated/frequent value, which is 10, repeated 3 times.
- Therefore the mean, median and mode will be 16, 10, 10 respectively.

372. Ans. (b) 5 and 4

$$\text{Mean} = \frac{\sum X}{n}$$

Therefore, mean =

$$\frac{2+2+3+4+4+4+4+5+5+7+8+8+9}{13} = 65/13$$

13

Mean = 5

- Mode is most repeated/frequent value, which is 4, repeated 4 times.
- Therefore the mean, mode will be 5 and 4 respectively.

373. Ans. (c) 95%

Ref: K. Park, 23rd ed. pg. 140-141

- Assume there are 1000 people. So, there are 300 diseased people among them (as it given prevalence 30%) and the people who do not have the disease is 700. So true positive is 270 (sensitivity-90%)

False negative is 30.

True negative is 560 (specificity-80%).

False positive is 140.

Negative Predictive Value = $\frac{\text{True Negative}}{\text{True Negative} + \text{False Negative}} \times 100$

$$= \frac{560}{560+30} \times 100$$

= 94.9%

374. Ans. (b) 2.6

Ref: K. Park, 23rd ed. pg. 73

- An odds ratio (OR) is a measure of association between an exposure and an outcome. The OR represents the odds that an outcome will occur given a particular exposure, compared to the odds of the outcome occurring in the absence of that exposure. Odds ratios are most commonly used in case-control studies.
- For example in the given case, 40 out of 100 smokers developed lung cancer and 20 out of 100 developed lung cancer. For calculating odd's ratio, we first plot this in the 4 boxes

	Disease (+)	Disease (-)
Smoker	40	60
Non-smoker	20	80

$$\text{OR} = \frac{a \times d}{b \times c} = \frac{40 \times 80}{60 \times 20} = 2.6$$

375. Ans. (c) 0.83

Ref: K. Park, 21st ed. pg. 113

- The screening test shows true negative result in 50% of diseased population
- In 10% healthy population, the test shows positive result. That means 10% false positive.

Putting this into formula:

$$\frac{\text{True negative}}{\text{False positive} + \text{True negative}} \times 100$$

$$\frac{50}{10 + 50} \times 100$$

$$\frac{50}{60} \times 100 = 83\% = 0.83$$

376. Ans. (b) <1/1000

Ref: Park's 23rd ed.

Strategic action plan for malaria control in India (2012-2017)

- Malaria control is now incorporated into the health service delivery programmes under NRHM.

Objective

To achieve API <1 per 1000 population by the end of 2017.

Goals

The national goals for strategic plan are:

- Screening all fever cases suspected for malaria (60% through quality microscopy and 40% by rapid diagnostic test).
- Treating all *P. falciparum* cases with full course of effective ACT and primaquine, and all *P. vivax* cases with 3 days chloroquine and 14 days primaquine.
- Equipping all health institutions (PHC level and above), especially in high-risk areas, with microscopy facility and RDT for emergency use and injectable artemisinin derivatives.
- Strengthening all district and sub-district hospitals in malaria endemic areas as per IPHS with facilities for management of severe malaria cases.

Outcome Indicators

The outcome indicators of strategic plan are:

1. At least 80% of those suffering from malaria get correct, affordable, appropriate and complete treatment within 24 hours of reporting to the health system, by the year 2017.
2. At least 80% of those at high risk of malaria get protected by effective preventive measures such as ITN/LLIN or IRS by 2017.

3. At least 10% of the population in high-risk areas is surveyed annually (annual blood examination rate > 10%).

Impact Indicators

The impact indicators of strategic plan are:

1. To bring down annual incidence of malaria to **less than 1 per 1000 population** at national level by 2017.
2. At least 50% reduction in mortality due to malaria by the year 2017, taking 2010 level as baseline.

ANSWERS TO BOARD REVIEW QUESTIONS

377. Ans. (a) **Pink**

Ref: Park, 20th ed. pg. 387, OP Ghai, 7th ed. pg. 738

378. Ans. (d) **Urine microscopy and culture sensitivity**

Ref: www.mohfw.nic.in/NRHM/Task_grp/Task_group_IPHS.pdf

ANSWERS TO IMAGE-BASED QUESTIONS

433. Ans. (b) **Correlation coefficient**434. Ans. (a) **Histogram**435. Ans. (a) **Sandfly**436. Ans. (a) **Aedes Larvae**437. Ans. (b) **UNICEF**438. Ans. (a) **National Rural Health Mission**439. Ans. (a) **Mirena**

The image shows presence of Mirena is a long acting reversible contraceptive, which contains Levonorgestrel and hence has a dual benefit of hormonal action and local action of intrauterine device.

Medicine

MOST RECENT QUESTIONS 2019

1. A patient had RTA and was put on mechanical ventilation. He is opening his eyes on verbal command. He moves all his limbs spontaneously. What will be his GCS score?
 - a. 9T
 - b. 10T
 - c. 11T
 - d. 12T
2. Postural tremors are seen in all except?
 - a. Alcohol withdrawal
 - b. Essential tremors
 - c. Generalized paresis
 - d. Physiological tremors
3. Most common cause of fulminant diabetes is?
 - a. Viruses
 - b. Diabetic Ketoacidosis
 - c. Non-ketotic hyperosmolar coma
 - d. Autoimmunity
4. MC joint involved in diabetes is seen is?
 - a. Ankle
 - b. Knee
 - c. Shoulder
 - d. Foot
5. Which type of Insulin is used to manage a case of Diabetic ketoacidosis?
 - a. Regular
 - b. Lispro
 - c. Glargine
 - d. Aspart
6. Slow onset of action and lack of peak is seen with?
 - a. Glargine
 - b. Lispro
 - c. Regular
 - d. NPH
7. MC characteristic physical finding of prolactinoma after galactorrhea is?
 - a. Bitemporal hemianopia
 - b. Anovulatory cycles
 - c. Amenorrhea
 - d. Infertility
8. Ipsilateral 3rd nerve palsy with crossed hemiplegia is a feature of?
 - a. Weber syndrome
 - b. Benedikt syndrome
 - c. Wallenberg syndrome
 - d. Horner syndrome

CARDIOLOGY

You are requested to spend few minutes on the youtube link provided and learn ECG analysis by the author <https://youtu.be/M-8Rt3e7x8g>

9. All are true about steps followed in management of ventricular fibrillation except? (Most Recent Question 2019)
 - a. CPR cycle duration is 2 minutes
 - b. Chest compressions at 100-120/min
 - c. Start CPR followed by immediate defibrillation
 - d. Intravenous access followed by Immediate defibrillation
10. Comment on the diagnosis.

- a. Prinzmetal angina
 - b. Myocardial ischemia
 - c. Pulmonary embolism
 - d. Hyperkalemia
11. Which of the following is used for management of this 65-year-old patient with respiratory distress? Bedside Echo shows an Ejection fraction of 35%.

(Most Recent Question 2019)

- a. Lasix, nitrates and sacubitril-valsartan
 - b. Lasix, norepinephrine and sacubitril-valsartan
 - c. Lasix, nitrates and morphine
 - d. Lasix, ACEI and digoxin
- 12. Which of following leads to a continuous murmur?**
- a. Peripheral Pulmonic stenosis
 - b. Severe Pulmonary artery hypertension
 - c. Type A aortic dissection
 - d. Rupture of cardiac chamber
- 13. Which is true about Postural Hypotension?**
(Most Recent Question 2019)
- a. Decrease in systolic blood pressure 20 mm Hg within 6 mins of postural change
 - b. Decrease in systolic blood pressure 20 mm Hg within 3 min of postural change
 - c. Decrease in diastolic blood pressure 20 mm Hg within 6 mins of postural change
 - d. Decrease in diastolic blood pressure 20 mm Hg within 3mins of postural change
- 14. A 60-year-old female presents with left sided weakness for more than one hour and left sided facial weakness with BP of 160/100 mm Hg. CT is normal. What is the next best step?**
(Most Recent Question 2019)
- a. Start thrombolysis
 - b. Give loading dose of aspirin and clopidogrel
 - c. Only manage BP
 - d. No intervention required
- 15. Best management of a hemodynamically stable patient with ECG showing Broad QRS complex with antidromic tachycardia is?**
(Recent Pattern Question 2018-19)
- a. Oral Verapamil
 - b. Oral Beta-blocker
 - c. Cardioversion
 - d. Intravenous Procainamide
- 16. Which of these is not done in Wolf Parkinson White syndrome?**
(Recent Pattern Question 2018-19)
- a. Treadmill
 - b. Holter monitoring
 - c. Oral beta blocker
 - d. Procainamide
- 17. Which of the following is not correct about defibrillation?**
(Recent Pattern Question 2018-19)
- a. Easy for untrained person
 - b. Decrease in success rate with delay in initiation
 - c. Improves prognosis
 - d. 1-minute gap between 2 shocks
- 18. Modified Duke's criteria are used for diagnosis of?**
(Recent Pattern Question 2018-19)
- a. Infective endarteritis
 - b. Infectious mononucleosis
 - c. Inflammatory myopathy
 - d. Infective endocarditis
- 19. Which of the following shall be seen with use of a small size BP cuff?**
(Recent Pattern Question 2018-19)
- a. False elevation of BP
 - b. Falsely low value of BP
 - c. Cancels the effect of calcified arteries
 - d. Increases trans-arm impedance
- 20. Which of the following is a cardioprotective lipid?**
(Recent Pattern Question 2018-19)
- a. LDL
 - b. HDL
 - c. VLDL
 - d. Chylomicrons
- 21. Rescue P.C.I is done for which of the following?**
(Recent Pattern Question 2018-19)
- a. Persistent chest pain with ST elevation >30 minutes after thrombolysis
 - b. Persistent chest pain with ST elevation >60 minutes after thrombolysis
 - c. Persistent Chest pain with ST elevation >90 minutes after thrombolysis
 - d. Persistent Chest pain with ST elevation for >120 minutes after thrombolysis
- 22. Which of the following condition should not be considered if JVP rises on deep inspiration?**
(Recent Pattern Question 2018)
- a. Constrictive pericarditis
 - b. Restrictive cardiomyopathy
 - c. Complete heart block
 - d. Atrial fibrillation
- 23. The PR interval in ECG denotes**
(Recent Pattern Question 2018)
- a. Atrial depolarization only
 - b. Atrial depolarization with A-V conduction
 - c. Ventricular depolarization and ventricular repolarization
 - d. Atrial depolarization with atrial repolarization
- 24. Which of the following is not associated with pulmonary artery hypertension?**
(Recent Pattern Question 2018)
- a. Interstitial lung disease
 - b. Left ventricular hypertrophy
 - c. Mitral stenosis
 - d. Cor-pulmonale
- 25. A patient presents with pedal oedema with Water-hammer pulse. What is the diagnosis?**
(Recent Pattern Question 2017)
- a. B₁ deficiency
 - b. B₃ deficiency
 - c. B₆ deficiency
 - d. B₁₂ deficiency
- 26. Which is correct about the ECG finding of hypocalcemia?**
(Recent Pattern Question 2017)
- a. Prolonged QT
 - b. Tall tented T wave
 - c. Prolonged PR
 - d. Narrow QRS
- 27. Which is the preferred bypass graft used in CABG?**
(Recent Pattern Question 2017)
- a. Internal mammary artery
 - b. Great saphenous vein
 - c. Short saphenous vein
 - d. Gastro-epiploic artery

28. Wide fixed Split S2 is seen in?

(Recent Pattern Question 2017)

- a. PDA
- b. ASD
- c. TOF
- d. VSD

29. What is the earliest change in ECG in case of hyperkalemia?

(Recent Pattern Question 2017)

- a. Tall tented T wave
- b. Inverted P
- c. Prolonged QRS
- d. T wave inversion

30. Which rhythm disorder is shown in this ECG?

(Recent Pattern Question 2017)

- a. Ventricular fibrillation
- b. PSVT
- c. Atrial fibrillation
- d. Atrial flutter

31. Which is incorrect about the ECG shown below?

(Recent Pattern Question 2017)

- a. QT = 0.04 sec
- b. PR = 0.16 sec
- c. QRS = 0.10 sec
- d. P wave = 0.12 sec

32. Which drug is not useful in chronic CHF?

(Recent Pattern Question 2017)

- a. Carvedilol
- b. Ramipril
- c. Atenolol
- d. Diuretics

33. The ECG finding shown below is due to which of the following drugs?

(Recent Pattern Question 2017)

- a. Diuretics
- b. A.R.B
- c. A.C.E inhibitors
- d. Beta blockers

34. Which of the following is correct about the image shown below?

(Recent Pattern Question 2017)

- a. Atrial fibrillation
- b. Atrial flutter
- c. PSVT
- d. VT

35. During CPR when is vasopressin given?

(Recent Pattern Question 2016)

- a. Never be used
- b. Use every 3 minutes
- c. First line drug of choice
- d. Given along with adrenaline

36. Which antiarrhythmic drug is given in post resuscitation arrhythmia?

(Recent Pattern Question 2016)

- a. Lignocaine
- b. Magnesium sulfate
- c. Amiodarone
- d. Atropine

37. In JVP y descent is absent and X wave is prominent? This suggests:

- a. Restrictive cardiomyopathy
- b. Cardiac tamponade
- c. Constrictive pericarditis
- d. Right ventricular failure

38. Digitalis is used in mitral stenosis when patient develops?

- a. Atrial fibrillation
- b. Right ventricular failure
- c. Acute pulmonary edema
- d. Myocarditis

- 39. Murmur heard in aortic stenosis?**
- Right 2nd intercostal, low pitch murmur
 - Apex, low pitch murmur
 - Left Sternal area, low pitch murmur
 - Pan-systolic murmur, high pitch murmur
- 40. In coarctation of aorta, site of rib notching is?**
- Superior to rib
 - Inferior to rib
 - At sternum
 - At Vertebra
- 41. Cardiac marker earliest to rise is?**
- CPK MB
 - LDH
 - SAP
 - Troponin I
- 42. Hypotension with muffled heart sounds and congested neck veins is seen in?**
- Cardiac tamponade
 - Pericardial effusion
 - Constrictive pericarditis
 - Acute congestive heart failure
- 43. Which of the following is given to decrease Serum Triglycerides?**
- Fibrates
 - Statins
 - Ezetimibe
 - Niacin
- 44. In a patient there is dyspnea in upright position which is relieved in supine position. Diagnosis?**
- Tachypnea
 - Orthopnea
 - Paroxysmal nocturnal dyspnea
 - Platypnea
- 45. Which is the best way to differentiate between stable angina and NSTEMI?**
- ECG
 - Cardiac-biomarker
 - Trans thoracic Echocardiography
 - Multi uptake gated Acquisition scan
- 46. Duroziez's sign is seen in?**
- Aortic regurgitation
 - Aortic stenosis
 - Mitral stenosis
 - Mitral regurgitation
- 47. Which of the following is a diagnostic criteria for Rheumatic fever?**
- Oral ulcer
 - Malar rash
 - Erythema Marginatum
 - Morning stiffness
- 48. Organism leading to hospital acquired infective endocarditis?**
- Staph aureus
 - Klebsiella
 - Streptococcus pneumoniae
 - Meningococcus
- 49. Aetiology of Dressler syndrome is?**
- Viral
 - Autoimmune
 - Idiopathic
 - Toxin mediated
- 50. Rib notching is seen in?**
- Coarctation of aorta
 - Hypertension
 - Fibromuscular dysplasia
 - Aortic dissection
- 51. A female has a DBP = 100 mm Hg on two consecutive occasions. Best treatment is?**
- Rest
 - Sedative
 - Anti-hypertensive drugs
 - Error in BP machine
- 52. A 65-year-old male had MI one year ago. Now the same patients presents with hypertension. Which of the following drug is best suited for this patient?**
- Clonidine
 - Thiazide
 - Metoprolol
 - Lisinopril
- 53. Resistant hypertension is defined as?**
- Resistance to 2 or more anti hypertension drugs
 - Resistance to 3 or more anti-hypertensive drugs including thiazides
 - Resistance to aldosterone
 - Resistance of Angiotension II receptors
- 54. An 8-year-old girl, collapsed while playing and died. CXR given below. Which of the following is unlikely to be an etiology of this event?**

- Stroke
 - Cardiomyopathy
 - Arrhythmia
 - Shock
- 55. If a person is having ventricular tachycardia, extra systoles appears in:**
- P wave
 - QRS complex
 - T wave
 - R wave
- 56. Internal jugular vein pressure determines pressure of:**
- RA
 - RV
 - LA
 - LV
- 57. Hyaline atherosclerosis is seen in:**
- Benign hypertension
 - Chronic hypertension
 - Diabetic nephropathy
 - Analgesic nephropathy
- 58. Mccallum patch in rheumatic heart disease is seen in?**
- Right atrium
 - Left atrium
 - Right ventricle
 - Left ventricle
- 59. Canon A wave is seen in:**
- Atrial fibrillation
 - Complete heart block
 - Ventricular fibrillation
 - Mobitz 1 heart block

- 60. Aortic dissection is seen in?**
a. Takayasu disease b. Atherosclerosis
c. Syphilis aortitis d. Marfan syndrome
- 61. Incorrect about conduction system of heart:**
a. SAN is dominant pacemaker
b. AVN exhibits conduction delay of 0.1 sec
c. Purkinje fibres have the slowest conduction
d. Left fascicle divides into anterior and posterior fascicle
- 62. A wave in JVP is absent in:**
a. Atrial fibrillation b. Heart block
c. Tricuspid regurgitation d. Complete heart block
- 63. Cannon a waves are seen in:**
a. Atrial fibrillation b. Junctional tachycardia
c. Constrictive pericarditis d. Cardiac tamponade
- 64. Severe mitral stenosis is identified by:**
a. Loud S1
b. Loud opening snap
c. Duration of mid-diastolic murmur
d. Intensity of mid-diastolic murmur
- 65. What would you do immediately after a cardiac arrest?**
a. Give epinephrine b. Check for breathing,
c. Check for pulse d. Chest compressions
- 66. P wave in ECG is due to:**
a. Ventricular depolarization
b. Atrial repolarization
c. Ventricular repolarization
d. Atrial depolarization
- 67. Initial ECG change in Hyperkalemia is?**
a. Tall tented T waves b. PR prolongation
c. qRS widening d. ST segment depression
- 68. Incorrect about Dressler syndrome is?**
a. Post MI pericarditis
b. Post MI pleuritis
c. Autoimmune
d. Treatment with steroids is necessary
- 69. Most common cause of aortic dissection:**
a. Syphilis b. Hypertension
c. Marfan syndrome d. Cystic medial necrosis
- 70. Marker specific for myocardial infarction:**
a. Troponin I b. Troponin C
c. Troponin T d. LDH
- 71. All are used for secondary prevention of MI EXCEPT:**
a. Aspirin b. Statins
c. Beta blockers d. Warfarin
- 72. Reverse split S2 is seen in**
a. Aortic stenosis
b. Mitral stenosis
c. Pulmonary artery hypertension
d. Pulmonic stenosis
- 73. ECG finding of Hyperkalemia:**
a. T wave inversion b. ST depression
c. P pulmonale d. Wide QRS complex
- 74. Coronary artery disease is associated with all EXCEPT:**
a. Chlamydia b. Poor dental hygiene
c. Smoking d. Alcohol
- 75. Pericardial cyst is seen at:**
a. Cardiophrenic angle b. Middle mediastinum
c. Posterior mediastinum d. Lingula
- 76. Snow man appearance or figure of 8 appearance is seen in?**
a. Total anomalous pulmonary venous connection
b. Transposition of great arteries
c. Tetralogy of fallot
d. Tricuspid atresia
- 77. Which of the following is a cause of wide pulse pressure:**
a. Aortic stenosis b. Aortic regurgitation
c. Mitral stenosis d. Tricuspid stenosis
- 78. Cannon a wave is seen in?**
a. Junctional rhythm b. Atrial fibrillation
c. Atrial flutter d. Ventricular fibrillation
- 79. Most common cause of unilateral pedal edema?**
a. Pregnancy b. Lymphedema
c. Venous insufficiency d. Milroy disease
- 80. Which of the following affects HOCM?**
a. Systolic dysfunction b. Diastolic dysfunction
c. Valvular dysfunction d. Rhythm defects
- 81. According to revised guidelines of American heart association, which of the following drugs is not recommended in cardiac arrest?**
a. Adrenaline b. Atropine
c. Amiodarone d. Vasopressin
- 82. A Patient presented with deficiency of thiamine. What could be possible outcome:**
a. Delayed wound healing b. Cardiac abnormality
c. Memory loss d. Gingival bleeding
- 83. After intake of NSAID tablet a lady complains of difficulty in breathing and appearance of bee hives. Pulse rate is 100 and BP is 90/60 mm Hg. Diagnosis is:**
a. Massive pulmonary embolism
b. Neurogenic shock
c. DIC
d. Anaphylaxis
- 84. Which is the best investigation best to confirm diagnosis of anaphylaxis?**
a. Ig A levels b. Ig D levels
c. Serum tryptase d. Serum precipitins
- 85. MCC of aortic aneurysm?**
a. Idiopathic b. Trauma
c. Atherosclerosis d. Arteriosclerosis
- 86. A 1-year-old male child is having a Heart Rate 40/min, BP 90/60. His serum Potassium = 6.5. What is the next best management?**
a. Ipratropium b. Adrenaline
c. Sodium bicarbonate d. Calcium chloride

87. Mortality in primary cardiac amyloidosis develops over?

- a. 3–6 months b. 6–12 months
- c. 12–18 months d. 24–36 months

88. Which is best for plaque morphology in atherosclerosis?

- a. CCTA b. Echocardiography
- c. ECG d. Coronary angiography

NEUROLOGY

89. A 60-year-old male diabetic and hypertensive patient was found unconscious in the morning. On examination pulse rate is 120/min, BP = 160/100 mm Hg and bilateral extensor plantars are elicited. What is the next step to be done for management? *(Most Recent Question 2019)*

- a. Order CT scan
- b. Check blood glucose
- c. Give intravenous mannitol
- d. Immediately reduce BP with antihypertensives

90. Which of the following is not a feature of Parkinson disease? *(Recent Pattern Question 2018-19)*

- a. Hypophonia
- b. Freezing
- c. Rigidity
- d. Diplopia

91. Normal deep tendon reflexes with muscle weakness is seen in? *(Recent Pattern Question 2018-19)*

- a. M. Gravis b. G.B.S
- c. Transverse myelitis d. Traumatic neuritis

92. Reversible dementia is seen in? *(Recent Pattern Question 2018-19)*

- a. Subacute combined demyelination of spinal cord
- b. Acute inflammatory demyelinating polyneuropathy
- c. Creutzfeldt Jacob disease
- d. Pick's disease

93. Extensor plantar reflex on pinching gastrocnemius muscle is called? *(Recent Pattern Question 2018-19)*

- a. Gower sign b. Homan sign
- c. Oppenheim reflex d. Gordon reflex

94. Which is the most common cranial nerve involved in raised ICP? *(Recent Pattern Question 2018-19)*

- a. Abducens b. Trochlear
- c. Trigeminal d. Facial

95. Which of the following is not seen in Horner syndrome? *(Recent Pattern Question 2018-19)*

- a. Mydriasis b. Ptosis
- c. Anhidrosis d. Enophthalmos

96. Painless burn in hand is seen in: *(Recent Pattern Question 2018)*

- a. SLE
- b. Syringomyelia
- c. Mononeuritis multiplex
- d. Diabetes mellitus

97. Prosopagnosia is: *(Recent Pattern Question 2018)*

- a. Inability to read b. Inability to write
- c. Anosmia d. Inability to recognize face

98. Wernicke's encephalopathy is due to deficiency of: *(Recent Pattern Question 2018)*

- a. Thiamine b. B₆
- c. Niacin d. B₁₂

99. Which of the following manifestation is seen in metabolic encephalopathy?

- a. Motor aphasia b. Sensory aphasia
- c. Conduction aphasia d. Anomic aphasia

100. Which of these is the best for management of methanol poisoning? *(Recent Pattern Question 2018)*

- a. Acamprosate b. Fomepizole
- c. Disulfiram d. Naltrexone

101. All are examples of upper motor neuron lesion EXCEPT: *(Recent Pattern Question 2018)*

- a. Prion disease b. Multiple sclerosis
- c. Anterior horn cell disease d. Tuberous sclerosis

102. What is the most common cause of meningitis in young adults? *(Recent Pattern Question 2017)*

- a. Listeria b. Strep pneumonia
- c. Neisseria meningitis d. Group B streptococcus

103. What is seen in complete transection of spinal cord? *(Recent Pattern Question 2017)*

- a. Loss of bladder control
- b. Loss of temperature regulation
- c. Hemianaesthesia d. Hemiparesis

104. Which of the following is not lost on the same side in hemi-section of the spinal cord half injury? *(Recent Pattern Question 2017)*

- a. Position sense b. Thermal sense
- c. Vibration sense d. Tactile discrimination

105. Pendular knee jerk is seen in lesion at _____? *(Recent Pattern Question 2017)*

- a. Cerebellum b. Basal ganglia
- c. Tectum d. Uncus

106. Unconscious proprioception is carried by? *(Recent Pattern Question 2017)*

- a. Dorsal column
- b. Spinocerebellar pathways
- c. Anterior spinothalamic tract
- d. Rubro-spinal pathway

107. In which of the following will EMG show decremental response? *(Recent Pattern Question 2017)*

- a. M. Gravis b. Lambert-Eaton syndrome
- c. Guillain-Barré syndrome d. Botulinism

108. Most common cause of headache? *(Recent Pattern Question 2016)*

- a. Tension headache
- b. Cluster headache
- c. Migraine
- d. Raised intra-cranial tension

109. Which of the following is the correct Miller Fisher syndrome triad? (Recent Pattern Question 2016)

- a. Global confusion, areflexia, ataxia
- b. Ophthalmoplegia, ataxia, areflexia
- c. Ophthalmoplegia, areflexia, aphasia
- d. Global confusion, areflexia, aphasia

110. CT head of a patient shows? (Recent Pattern Question 2016)

- a. Neurosarcoidosis
- b. SAH
- c. TB meningitis
- d. Intraparenchymal bleed

111. Treatment of post-lumbar puncture headache? (Recent Pattern Question 2016)

- a. Codeine
- b. Dantrolene
- c. Caffeine
- d. Diazepam

112. Best treatment for glioblastoma multiforme? (Recent Pattern Question 2016)

- a. Chemotherapy
- b. Radiation
- c. Excision with radiation
- d. Stereotactic surgery

113. Axillary freckling is seen in? (Recent Pattern Question 2016)

- a. Neurofibromatosis
- b. Tuberous sclerosis
- c. Ichthyosis vulgaris
- d. Von Hippel-Lindau

114. True about chorea? (Recent Pattern Question 2016)

- a. Semi-purposive and rhythmic movements
- b. Slow and uniform movement
- c. Slow writhing movement
- d. Semi-purposive and non-repetitive, randomly distributed movements

115. Which tract damage leads to loss of pain and temperature? (Recent Pattern Question 2016)

- a. Lateral spinothalamic tract
- b. Ventral spinothalamic tract
- c. Lateral corticospinal pathway
- d. Dorsal column

116. Lesion of which tract leads to voluntary skilled movements? (Recent Pattern Question 2016)

- a. Corticospinal tract
- b. Rubrospinal tract
- c. Tectospinal tract
- d. Lateral spinothalamic pathway

117. Log roll positioning is done for?

- a. Spine injury evaluation (Recent Pattern Question 2016)
- b. Relieve compression on back
- c. Perform rapid sequence intubation
- d. Perform peritoneal lavage

118. Kernohan-Woltman sign is? (Recent Pattern Question 2016)

- a. Medial displacement of midbrain
- b. Lateral displacement of midbrain
- c. Upper displacement of pons
- d. Downward displacement of pons

119. Which is true about uncal herniation? (Recent Pattern Question 2016)

- a. 3rd nerve involvement
- b. 4th nerve involvement
- c. 6th nerve involvement
- d. 7th nerve involvement

120. Rivastigmine is given in?

- a. Parkinsonism
- b. Alzheimer's disease
- c. Schizophrenia
- d. Anxiety

121. A lady cannot speak but can tell by writing. Which of the following brain areas is affected?

- a. Broca's area
- b. Wernicke's area
- c. Paracentral lobule
- d. Insula

122. Nucleus ambiguus is located in?

- a. Medulla
- b. Pons
- c. Midbrain
- d. Paracentral lobule

123. Wernicke's area is located in:

- a. Superior temporal gyrus
- b. Inferior temporal gyrus
- c. Post-central gyrus
- d. Angular gyrus

124. Glasgow coma scale = 3 indicates?

- a. Death
- b. Severe disability
- c. Coma
- d. Brain death

125. Glasgow coma scale score of M_4 represents?

- a. Withdrawal on flexion
- b. Decorticate posturing
- c. Decerebrate posturing
- d. Localise pain

126. A patient after alcoholic drink fell asleep in chair overnight with hanging arm and develops Saturday Night Palsy. Which of the following best describes the clinical manifestations?

- a. Neuropraxia
- b. Axonotmesis
- c. Neurotmesis
- d. Necroptosis

127. CSF glucose compared to blood glucose is of _____ concentration in blood?

- a. <30%
- b. 30–60%
- c. 60–80%
- d. 40–50%

128. A 32-year-old AIDS positive female presented with headaches and nuchal stiffness. On lumbar puncture examination clear CSF was obtained with leucocytes >100/cu.mm. India ink staining was positive. The most probable diagnosis is?

- a. Candida meningitis
- b. Tubercular meningitis
- c. Cryptosporidium
- d. Cryptococcus meningitis

- 129. A man has acute onset of paraplegia with symmetrical bilateral areflexia. Diagnosis is:**
- Acute transverse myelitis
 - Subacute combined degenerative disorder
 - Guillian Barre syndrome
 - Poliomyelitis
- 130. Boxers present with:**
- Epidural hemorrhage
 - Subdural hemorrhage
 - Sub arachnoid hemorrhage
 - Intra ventricular hemorrhage
- 131. All of the following are causes of primary headache EXCEPT:**
- Migraine
 - Tension headache
 - Cluster headache
 - Sinusitis
- 132. DOC for listeria meningitis:**
- Ampicillin
 - Cefotaxime
 - Ceftriaxone
 - Ciprofloxacin
- 133. DOC for Herpes simplex encephalitis:**
- Acyclovir
 - Inosine prabonex
 - Intravenous immunoglobulins
 - Amphotericin B
- 134. SSPE is seen in?**
- Rubella
 - Mumps.
 - Measles
 - Chicken pox
- 135. All are seen in Horner syndrome EXCEPT:**
- Ptosis
 - Miosis
 - Hyperhidrosis
 - Enophthalmos
- 136. Which is not a part of lower motor neuron:**
- Anterior nerve root
 - Peripheral ganglia
 - Peripheral nerve
 - Anterior horn cell
- 137. Most common brain tumor?**
- Astrocytoma
 - Glioblastoma Multiforme
 - Meningioma
 - Ependymoma
- 138. Increased intra-cranial tension leads to?**
- Hypotension and tachycardia
 - Hypertension and tachycardia
 - Hypertension and bradycardia
 - Hypotension and bradycardia
- 139. In increased intracranial pressure which is the first cranial nerve to be affected first?**
- 3rd
 - 4th
 - 5th
 - 6th
- 140. A road traffic accident patient in the casualty is comatose with unilaterally dilated pupil. The NCCT of the patient shows a Lesion peripherally present with concavo – convex border. What is the probable diagnosis?**
- Sub-dural hematoma
 - Epi-dural hematoma,
 - Sub-arachnoid hemorrhage
 - Intra-parenchymal bleeding
- 141. Extradural hemorrhage on NCCT is visualized as?**
- Hyperdense biconvex
 - Hypodense biconcave
 - Hyperdense biconcave
 - Hypodense biconvex
- 142. The submerged part of cerebral cortex is?**
- Insula
 - Broadman area
 - Corpus callosum
 - Piriform sulcus
- 143. Investigation of choice for sub-arachnoid hemorrhage is:**
- NCCT
 - MRI
 - CECT
 - MRA
- 144. Wernicke's aphasia is characterized by all EXCEPT:**
- Non fluent speech
 - Poor comprehension
 - Poor repetition
 - Para-phasia
- 145. Most common benign brain tumor?**
- Meningioma
 - Oligodendroglioma
 - Ependymoma
 - Medulloblastoma
- 146. Lewy bodies are seen in:**
- Parkinsonism
 - Alzheimer's disease
 - Huntington chorea
 - All of above
- 147. Least chances of seizures are seen with?**
- Hypoglycemia
 - Hypocalcemia
 - HIV encephalopathy
 - Neuro-cysticercosis
- 148. A patient presents with headache and nuchal rigidity. Lumbar puncture was performed and CSF shows normal protein and normal glucose with clear CSF. Microscopic examination of CSF showed 50 lymphocytes/cu.mm with lymphocytic pleocytosis. What is the diagnosis?**
- Bacterial meningitis
 - Viral meningitis
 - TB meningitis
 - Aseptic meningitis
- 149. Which of the following is not seen in tubercular meningitis:**
- Evidence of old pulmonary lesions or a miliary pattern is found on chest radiography
 - Culture of CSF is diagnostic in majority of cases and remains the gold standard.
 - It is seen most often in young children but also develops in adults.
 - Cerebrospinal fluid reveals a low leukocyte count.
- 150. CSF finding in Gullian Barre syndrome is?**
- Normal cells with increased protein
 - Increased protein with normal cells
 - Normal cells and normal protein
 - Increased cells with low sugar
- 151. Which is the earliest symptom of Parkinson's disease?**
- Tremors
 - Rigidity
 - Bradykinesia
 - Chorea
- 152. Which of the following is not a feature of Parkinsonism?**
- Chorea
 - Recurrent falls
 - Tremors
 - Freezing

- 153. Earliest feature of parkinsonism?**
a. Anosmia b. Rigidity
c. Postural instability d. Freezing
- 154. Which of the following is not the feature of upper motor neuron disease?**
a. Hypotonia b. Spasticity
c. Weakness of muscles d. Superficial reflex absent
- 155. Incorrect about LMN defect?**
a. Flaccid paralysis b. Muscular hypertrophy
c. Hypo-reflexia d. Superficial reflex present
- 156. Right 12th nerve damage leads to?**
a. Tongue deviation to left on protrusion
b. Tongue deviation to right on protrusion
c. Nasal twang to voice
d. Scanning speech defects
- 157. Which of the following tests are helpful in diagnosing neural tube defect?**
a. Acetyl choline esterase in the amniotic fluid
b. Alpha-ketoglutarate in the amniotic fluid
c. Glutamate in the amniotic fluid
d. Beta hydroxyl butyrate in the amniotic fluid
- 158. Protein deposited in Alzheimer's disease is?**
a. Tau protein b. Alpha synuclein protein
c. Huntington protein d. Protein 14.3.3
- 159. Unilateral ptosis is not seen in?**
a. Myasthenia gravis b. Thyroid ophthalmopathy
c. Marfan syndrome d. Pancoast tumor
- 160. A patient after an accident was unconscious. On physical examination there was unilateral papillary dilatation. Possible reason for the same is?**
a. Uncal herniation b. Tonsillar herniation
c. Cingulate herniation d. Transcalvarial herniation
- 161. Most common site of brain hemorrhage is?**
a. Putamen b. Internal capsule
c. Ventral pons d. Cerebellum
- 162. Investigation of choice for myasthenia gravis?**
a. Single fiber E.M.G
b. Muscle biopsy
c. Nerve conduction velocity
d. Anti-acetylcholine receptor antibody
- 163. CSF is absorbed by:**
a. Choroid plexus
b. Sub-arachnoid granulations
c. Dura matter
d. Pia matter
- 164. Incorrect about dementia pugilistica:**
a. Seen in boxers b. Difficulty in gait
c. Decreased cognition d. Nystagmus
- 165. Most common cause of cerebro vascular accident:**
a. Infarction b. Hemorrhage
c. Embolism d. Aortic dissection
- 166. Korsakoff psychosis is seen in:**
a. Thiamine deficiency
b. Riboflavin deficiency
c. Niacin deficiency
d. Cyanacobalamin deficiency
- 167. Two point discrimination test exhibits maximum sensitivity in?**
a. Shin b. Toes
c. Finger pads d. Soles
- 168. A patient presented with right sided hemiplegia while on warfarin. Which of the following will be the initial investigation of choice?**
a. Chest X-ray b. CT-scan
c. MRI d. PET-scan
- 169. Hemiballismus is due to lesion in?**
a. Ipsilateral caudate nucleus
b. Contralateral sub-thalamic lesion
c. Contralateral Putamen
d. Ipsilateral sub-thalamic lesion
- 170. Pontine stroke is due to involvement of?**
a. Basilar artery
b. Middle cerebral artery
c. Middle meningeal artery
d. Anterior communicating artery
- 171. Which vessel does not contribute to circle of Willis:**
a. Middle cerebral artery b. Anterior cerebral artery
c. Posterior cerebral artery d. Internal carotid artery
- 172. Duret hemorrhage is?**
a. Traumatic brain haemorrhage in contre-coup injury
b. Adrenal haemorrhage in water house friderichsen
c. Brain hemorrhage due to tear of basilar artery branches
d. Petechial hemorrhages in fat embolism
- 173. Which of the following is not a feature of Wernicke's encephalopathy:**
a. Global confusion b. Ophthalmoplegia
c. Ataxia d. Aphasia
- 174. Broca's aphasia is characterized by:**
a. Non-fluent aphasia b. Word salad
c. Anomia d. Apraxia
- 175. Which of the following cranial nerve is first compressed in unruptured berry aneurysm?**
a. 3rd nerve b. 4th nerve
c. 5th nerve d. 6th nerve
- 176. Which of the following is not a test for integrity of 7th and 9th nerve:**
a. Position of uvula b. Palate symmetry
c. Taste d. Tongue protrusion
- 177. Cranial Nerve 8 palsy causes all EXCEPT:**
a. Gag reflex b. Vertigo
c. Motion sickness d. Tinnitus

178. A patient is unable to solve mathematical calculations, which part of his brain is damaged?

- a. Temporal lobe b. Frontal lobe
- c. Parietal lobe d. Occipital lobe

179. Asymmetrical Ptosis is seen in?

- a. Myasthenia gravis
- b. Thyroid myopathy
- c. Drug induced myopathy
- d. Duchenne's muscular dystrophy

180. Cut off for TIA definition?

- a. 12 hours b. 24 hours
- c. 48 hours d. 36 hours

181. What are nitrergic neurons:

- a. Postganglionic neurons releasing nitric oxide
- b. 1st order neurons releasing nitric oxide
- c. Post ganglionic neurons releasing substance P
- d. 1st order neurons releasing calcitonin gene related peptide

182. Stenosis of aqueduct of sylvius results in?

- a. Enlargement of lateral ventricles
- b. Enlargement of fourth ventricle
- c. Enlargement of lateral and third ventricle
- d. Enlargement of lateral and fourth ventricle

ENDOCRINOLOGY

183. An 18-year-old boy appears for army medical. On medical check-up his FBS = 120 and PP = 140 and HbA1c = 6.1%. What is the diagnosis?

- a. Impaired glucose tolerance (Most Recent Question 2019)
- b. Type 2 diabetes mellitus
- c. Type 1 diabetes mellitus
- d. Normal

184. Fulminant diabetes mellitus is seen in?

(Recent Pattern Question 2018-19)

- a. Diabetic ketoacidosis
- b. Coxsackie B virus
- c. Non-Ketotic hyperosmolar coma
- d. Autoimmune pancreatitis

185. In a newly diagnosed case of sick child with Type 1 diabetes mellitus (DM), insulin was given. Which of the following will increase? (Recent Pattern Question 2018)

- a. pH
- b. Breathing rate
- c. Glucosuria
- d. Urine osmolality

186. All of the following syndromes are seen with obesity EXCEPT:

- a. Prader-Willi syndrome
- b. Cohen syndrome
- c. Laurence Moon-Biedl syndrome
- d. Carcinoid syndrome

187. Which of the following is associated with elevated alkaline phosphate, low calcium with low phosphate?

(Recent Pattern Question 2018)

- a. Paget's disease
- b. Osteoporosis
- c. Primary hyperparathyroidism
- d. Vitamin D deficiency

188. Which of the following leads to development of SIADH?

(Recent Pattern Question 2018)

- a. Head trauma b. Pituitary adenoma
- c. Lithium d. All of the above

189. Which of the following is seen in secondary thyrotoxicosis but not in Grave's disease? (Recent Pattern Question 2017)

- a. Lid retraction b. Lid lag
- c. Exophthalmos d. Atrial fibrillation

190. A 15-year-old Type I DM patient presents to O.P.D. When should you recommend the patient to come for follow-up visits for microvascular complications evaluation?

(Recent Pattern Question 2017)

- a. 1 year b. 5 years
- c. 10 years d. 20 years

191. Nephrogenic DI occurs due to defect in?

- a. Na-K ATPase b. SGLT-2
- c. Aquaporin 1 d. Aquaporin 2

192. Which is the gene involved in pathogenesis of Type 1 Diabetes mellitus? (Recent Pattern Question 2017)

- a. CTLA-4 b. ABCD1
- c. HNF-1 Alpha d. HNF-4 Alpha

193. Which is the most common tumour of pituitary?

(Recent Pattern Question 2017)

- a. Non-functioning adenoma
- b. Prolactinoma
- c. ACTH producing adenoma
- d. Oncocytoma

194. Which chromosome is responsible for most common type of MODY? (Recent Pattern Question 2017)

- a. Chromosome 11 b. Chromosome 12
- c. Chromosome 13 d. Chromosome 14

195. Which is not a diabetic patient?

(Recent Pattern Question 2016)

- a. FBS = 136 mg% b. 2 hour value = 180 mg%
- c. HbA1c = 7% d. RBS > 210 mg%

196. Cause of death in diabetic ketoacidosis?

(Recent Pattern Question 2017)

- a. Cerebral edema b. Dehydration
- c. Electrolyte imbalance d. Central pontine myelinosis

197. Hyperpigmentation is seen with which hormone?

- a. FSH
- b. LH
- c. TSH
- d. ACTH

198. Female with blood sugar of 600 mg% and sodium of 110 mEq. Insulin was given, what will happen to serum sodium levels?
- Sodium increase
 - Sodium decrease
 - Sodium unaffected
 - Relative sodium deficiency
199. Which is most common type of Diabetic neuropathy?
- Sensory polyneuropathy
 - Autonomic neuropathy
 - Radiculopathy
 - Myelopathy
200. Lady 45 years of age presents with decreased oestrogen level, increased testosterone and temporal hair recession. Diagnosis is?
- Osteoporosis
 - Rheumatoid arthritis
 - P.C.O.D
 - Granulosa theca cell tumor
201. Which of the following present with hypothyroidism?
- Struma ovarii
 - Grave's disease
 - Myasthenia gravis
 - Toxic multinodular goiter
202. Earliest finding in Diabetic nephropathy is:
- Shrunken kidney is hallmark
 - Fibrin Caps
 - Elevated Creatinine Clearance
 - Urine albumin > 30 mg/dL
203. Which of the following is a mineralocorticoid?
- Cortisone
 - Estrogen
 - Testosterone
 - Aldosterone
204. Which of the following is NOT a steroid?
- Estrogen
 - Progesterone
 - Relaxin
 - Testosterone
205. Aldosterone is secreted by:
- Pituitary
 - Zona glomerulosa
 - Zona fasciculata
 - Adrenal medulla
206. Glucose fever is related with:
- Glucagonoma
 - Parathyroid adenoma
 - Insulinoma
 - Addison disease
207. All are seen in Addison's disease EXCEPT?
- Hyponatremia
 - Hyperkalemia
 - Hypotension
 - Metabolic alkalosis
208. In prolactinoma most common symptom other than galactorrhoea is?
- Bitemporal hemianopia
 - Amenorrhoea
 - Thyroid dysfunction
 - Headache
209. Turner syndrome presents with which heart defect?
- Patent ductus arteriosus
 - Atrial septal defect
 - Coarctation of aorta
 - Ventricular septal defect
210. Rib notching is found in all the following EXCEPT:
- Neurofibromatosis
 - Coarctation of aorta
 - Taussig bing operation
 - Hypoparathyroidism
211. All are true about Hyperthyroidism EXCEPT:
- Anxiety
 - Palpitations
 - Tachycardia
 - Weight gain
212. Obesity in children is seen in:
- Adrenal insufficiency
 - Pseudo-hypo-parathyroidism
 - Prader Willi syndrome
 - Soto syndrome
213. True about obesity?
- Seen mostly in females
 - Prevalence decrease upto 40 years of age
 - No genetic predisposition
 - Smoking is a risk factor
214. Which is the best indicator for short term control (2-3 weeks) of blood glucose?
- Serum fructosamine
 - HbA1c
 - Blood sugar
 - Urine sugar
215. Which of the following drugs used for Diabetes Mellitus causes lactic acidosis:
- Phenformin
 - Metformin
 - Glipizide
 - Pioglitazone
216. Best drug to be used in obese type 2 diabetes mellitus patient?
- Metformin
 - Glipizide
 - Pioglitazone
 - Exenatide
217. Post Prandial capillary glucose should be _____ mg/dl for adequate diabetes control:
- <100 mg/dL
 - <140 mg/dL
 - <180 mg/dL
 - <200 mg/dL
218. All are true about Diabetes insipidus EXCEPT?
- Low urine osmolality
 - Dilutional Hyponatremia
 - Water deprivation test is used for diagnosis
 - Polyuria
219. All are correct about SIADH EXCEPT:
- Normal KFT
 - Low uric acid
 - Relative hyponatremia
 - Normal BP with gain of water
220. Whipple's triad is useful for diagnosis of:
- Insulinoma
 - Glucagonoma
 - Somatostatinoma
 - V.I.Poma
221. Best test for diagnosis of Carcinoid tumor:
- 24-hour urinary 5H.I.A.A
 - 24-hour catecholamines
 - 24-hour vanillylmandelic acid levels
 - 24-hour metanephrine levels
222. Which of the following is produced by carcinoid tumor?
- G.A.B.A
 - Serotonin
 - Epinephrine
 - Nor-epinephrine
223. Most reliable marker for hypothyroidism:
- T3
 - T4
 - TSH
 - Thyroxine binding globulin

224. **Wolf Chaikoff effect is due to**
 a. Iodine deficiency b. Excessive iodine
 c. Iodine metabolism defect d. TPO enzyme deficiency
225. **Which of the following is not a feature of thyrotoxicosis?**
 a. Palpitation b. Anxiety
 c. Weight loss d. Menorrhagia
226. **Proptosis not seen in?**
 a. Grave's disease b. Sarcoidosis
 c. Pituitary Apoplexy d. Myxoedema
227. **All are true about Plummer Vinson syndrome EXCEPT?**
 a. Glossitis b. Lower esophageal web
 c. Anemia d. Premalignant condition
228. **All of following are seen in GH deficiency EXCEPT:**
 a. Hyperglycemia b. Stunting
 c. Delayed bone age d. High pitched voice
229. **Vitamin D deficiency has all EXCEPT:**
 a. Hypocalcemia b. Increased SAP
 c. Increased PTH d. Hyperphosphataemia
230. **Which of the following finding shall be seen in patient with hyper-parathyroidism?**
 a. Hypophosphatemia b. Hyperphosphatemia
 c. Hypermagnesemia d. Hypo magnesemia
231. **All are features of hyper-parathyroidism EXCEPT:**
 a. Increase serum calcium b. Decreased serum phosphate
 c. Diarrhea d. Nephrocalcinosis
232. **Secretory diarrhea is caused by all EXCEPT?**
 a. Medullary thyroid tumor b. Carcinoid Tumor
 c. Somatostinoma d. Glucagonoma
233. **Chorionic villus sampling is done for all EXCEPT?**
 a. Downs b. Trisomy 21
 c. Phenylketonuria d. Gastrochisis
234. **Congenital adrenal hyperplasia due to 11 beta hydroxylase deficiency presents with all EXCEPT?**
 a. Metabolic acidosis b. Hypokalemia
 c. Virilization d. Hypertension

HEMATOLOGY

235. **The coagulogram of this patient shows increased Prothrombin time, activated partial thromboplastin time with platelet count of 1.2 Lacs/cu mm. The diagnosis is?**
(Most Recent Question 2019)

- a. Henoch-Schonlein purpura
 b. Porphyria
 c. D.I.C
 d. Acute ITP

236. **Which of the following test is used for diagnosis of DIC?**
(Recent Pattern Question 2018-19)

- a. Fibrin degradation products
 b. Activated partial thromboplastin time
 c. Prothrombin time
 d. D- Dimer assay

237. **In sickle cell crisis bone pain is due to:**
(Recent Pattern Question 2018)

- a. Bone infarction b. Osteoporosis
 c. Osteomalacia d. Periosteal reaction

238. **A 35-year-old patient shows abnormal Schilling test. Antibiotics were given for 5 days which results in normalization of Schilling test. What is the diagnosis of the patient?**
(Recent Pattern Question 2018)

- a. Bacterial overgrowth syndrome
 b. Chronic pancreatitis
 c. Atrophic gastritis
 d. Ileocecal TB

239. **HTLV-1 is associated with which disease:**
(Recent Pattern Question 2016)

- a. AML b. NHL
 c. Adult T cell leukemia d. AML

240. **In cobalamin deficiency which is not seen?**

- a. Microcytic anemia b. Long tract signs
 c. Loss of proprioception d. Romberg sign

241. **Adult with progressive pallor, hyper-segmented neutrophils and MCV>100 shows?**

- a. Hereditary spherocytosis b. Megaloblastic anemia
 c. Dimorphic Anemia d. Thalassemia

242. **Poikilocytosis and anisocytosis is seen in?**

- a. Megaloblastic anaemia b. Iron deficiency anaemia
 c. Nutritional deficiency anaemia
 d. Thalassemia

243. **2-year-old child with ALL, which of the following has the best prognosis?**

- a. Age between 1–10 years b. TLC >1 lac
 c. Petechiae d. t(9:22)

244. **Blood transfusion associated acute lung injury occurs due to?**

- a. Nosocomial infections b. HLA mediated
 c. Auto-immune disorder d. Genetic susceptibility

245. **Thalassemia is a:**

- a. Autosomal dominant b. Autosomal recessive
 c. X-linked dominant d. X-linked recessive

246. **Low serum iron and low serum ferritin is seen in:**

- a. Iron deficiency anemia
 b. Chronic kidney disease
 c. Sideroblastic anemia
 d. Fanconi anemia

- 247. Thrombocythemia is characterized by:**
a. Platelets elevation b. Low platelets
c. Neutrophilia d. Monocytosis
- 248. Schistocytes are seen in:**
a. HUS b. TTP
c. DIC d. All of the above
- 249. Correct about vitamin-K deficiency is?**
a. Associated thrombocytopenia with prolonged bleeding
b. Deficiency is rarely seen, except in infants
c. Factor X is first to be affected
d. Warfarin causes Vitamin K deficiency
- 250. Hemolytic anemia is associated with the following gall stones:**
a. Pigmented b. Mixed
c. Cholesterol d. None
- 251. A 60-year-old industrial worker presents with shortness of breath for the past week. Blood withdrawn shows thick brownish red color. Diagnosis?**
a. Sick cell anemia b. Hemolytic anemia
c. Meth-hemoglobinaemia d. G-6-P-deficiency
- 252. All are true about cross-matching of blood EXCEPT:**
a. Mandatory in all cases except emergency
b. Recipient serum is tested against donor packed cells
c. Donor serum is tested against recipient packed cells
d. Involves visible agglutination
- 253. Bleeding time is increased in all EXCEPT:**
a. Dengue hemorrhagic fever
b. Von willebrand disease
c. Chronic liver disease
d. Bernard soulier syndrome
- 254. Blood is stored at blood bank at:**
a. +4 degree Celsius b. -4 degree Celsius
c. + 24 degree Celsius d. -60 degree Celsius
- 255. Which of following is a myelo-proliferative disease?**
a. Acute lymphatic leukemia
b. Acute myeloid leukemia c. Chronic myeloid leukemia
d. Chronic lymphocytic leukemia
- 256. Which organism causes infection after splenectomy :-**
a. H. Influenza b. Staph aureus
c. E. coli d. Klebsiella
- 257. Drug of choice in chronic myeloid leukemia:**
a. Imatinib Mesylate b. Fludarabine
c. Cladribine d. Pentostatin
- 258. Philadelphia chromosome refers:**
a. Long arm of chromosome 9 and long arm of chromosome 22
b. Short arm of chromosome 9 and short arm of chromosome 22
c. Short arm of chromosome 9 and long chromosome 22
d. Long arm of chromosome 9 and short arm of chromosome 2

- 259. All are seen in Thalassemia major EXCEPT**
a. Macrocytic anemia
b. Transfusion dependency
c. Hepato-splenomegaly
d. Target cells
- 260. Which of the following is *not* a hyper-coagulable state**
a. Pregnancy
b. MI
c. Abruptio-placentae
d. Cirrhosis
- 261. Elective splenectomy is done in**
a. Hereditary spherocytosis
b. G6PD
c. Beta thalassemia
d. Sick cell anaemia
- 262. Priapism can be due to?**
a. C.M.L
b. Myelo-fibrosis
c. A.I.H.A.
d. Thrombocytopenia
- 263. Hairy cell leukemia is**
a. B cell tumor b. T cell tumor
c. NK cell tumor d. All of above

GASTROINTESTINAL TRACT

- 264. A 3-year-old child presents with steatorrhea, weight loss and features of malabsorption. Which test is done for confirmation of diagnosis? (Most Recent Question 2019)**
a. Small intestinal mucosal biopsy
b. Fecal elastase
c. Benedict's test for reducing substances
d. Rectal mucosal suction biopsy
- 265. Which of the following is correct about cancer developing in Ulcerative colitis? (Recent Pattern Question 2018-19)**
a. Not a premalignant condition
b. Incidence dependant on smoking history
c. Directly related to duration of disease
d. Increased risk in younger patients
- 266. Initial treatment for management of mild to moderate Crohn's disease is: (Recent Pattern Question 2018)**
a. Mesalamine
b. Infliximab
c. Budesonide
d. Sulfasalazine
- 267. Which of the following is true about carcinoid tumor?**
a. Occurs along structures derived from foregut
b. Presentation is hypertension and diaphoresis
c. Intestinal carcinoids are of high malignant potential
d. Best diagnosed by elevated urinary vanillylmandelic acid levels

268. Carcinoid tumor leads to increase in levels of?
 a. 5-Hydroxy tryptamine (Recent Pattern Question 2017)
 b. 5-Hydroxy indole acetic acid
 c. Homovanillic acid
 d. Vaniyl mandelic acid
269. Gastric cancer is caused by
 a. Squamous metaplasia (Recent Pattern Question 2016)
 b. Blood group O
 c. Intestinal metaplasia Type 3
 d. Intestinal hyperplasia
270. Most common site of GIST? (Recent Pattern Question 2016)
 a. Stomach b. Jejunum
 c. Ileum d. Colon
271. A lady presented with IDA and malabsorption. Most accurate test for diagnosis is?
 (Recent Pattern Question 2016)
 a. Antiendomysial antibody
 b. Anti-tissue transglutaminase antibody
 c. Antiepidermal tissue transglutaminase antibody
 d. Antimitochondrial antibody
272. A patient presents with sensory ataxia and patchy loss of papilla on tongue, the first investigation to be done is?
 (Recent Pattern Question 2016)
 a. B₁₂
 b. Punch biopsy of terminal ileum
 c. Brush biopsy of terminal ileum
 d. Serum iron studies
273. A 41-year-old patient presents with chronic diarrhoea for last 3 month. First investigation to be done?
 a. D-xylose absorption (Recent Pattern Question 2016)
 b. Intestinal biopsy
 c. Tissue transglutaminase antibody
 d. Schilling's test
274. Patient presents with loss of tongue papilla. Hemoglobin = 9.5 gm% and MCV = 100 fl? (Recent Pattern Question 2016)
 First investigation to be performed is?
 a. B₁₂ estimation b. Brush biopsy
 c. Folic acid levels d. Incision biopsy
275. Cushing ulcer is seen in? (Recent Pattern Question 2016)
 a. Stomach b. Duodenum
 c. Jejunum d. Ileum
276. Most common site of carcinoid tumor is?
 a. Appendix b. Ileum
 c. Stomach d. Rectum
277. A 45-year-old male is brought to casualty after a night party with complaints of epigastric pain, penetrating towards back. Which is the best for diagnosis?
 a. Serum lipase b. CPK-MB
 c. ALP d. Gamma- GGT
278. GERD is best diagnosed by?
 a. 24 hour pH Monitoring
 b. Upper GI endoscopy
 c. Barium meal follow through
 d. Barium Swallow

279. Which cereal is not to be given in celiac sprue?

a. Wheat b. Maize
 c. Corn d. Rice

280. In ulcerative colitis, which is *not* true about malignancy?

a. Metaplasia b. Low grade dysplasia
 c. High grade dysplasia d. Pleomorphism

281. Iron is absorbed from:

a. Duodenum with fast clearance
 b. Jejunum with fast clearance
 c. Ileum with low clearance
 d. Bone marrow

282. DOC for enteric fever:

a. Ceftriaxone b. Ciprofloxacin
 c. Amikacin d. Cefotaxime

283. Enteric fever on fourth day is best diagnosed by:

a. Stool test b. Widal test
 c. Urine test d. Blood culture

284. Which of the following is seen on the image?

- a. Barium enema = Pipe stem colon
 b. Double contrast enema = Apple core appearance
 c. Barium enema = Pseudo-polyps
 d. Double contrast enema = Thumb printing sign

285. Which of the following is the most probable diagnosis of this X-ray abdomen?

- a. Gas under diaphragm- Peritonitis
 b. Multiple air fluid level- Adhesions and bands
 c. Bird beak – Volvulus
 d. Normal X-ray PA view

286. Diagnosis:

- a. CBD dilatation on ERCP
- b. CBD dilatation on PTC
- c. Cystic duct dilation on ERCP
- d. Cystic duct ectasia on ERCP

287. IOC for G.E.R.D:

- a. 24-hour pH monitoring
- b. Upper G.I. endoscopy
- c. Ultrasound
- d. X-ray abdomen

288. Aspirin is given in management of which cancer:

- a. Pancreatic cancer
- b. Liver cancer
- c. Colon cancer
- d. Stomach cancer

289. Incorrect about Zenkers diverticulum?

- a. Located in Killian triangle
- b. Regurgitation of previous day food
- c. Premalignant
- d. Dysphagia

290. Cobble stoning of colon is seen in?

- a. Crohn's disease
- b. Ulcerative colitis
- c. Ischemic colitis
- d. Amoebic colitis

291. Which of the following is not true about Crohn's disease?

- a. It can involve stomach and duodenum also
- b. Skip lesion
- c. All layers of intestine are involved
- d. Invasion of lymph nodes seen

292. Colon in the given picture is suggestive of:

- a. Ulcerative colitis
- b. Crohn's disease
- c. Diverticulosis
- d. Intussusception

293. Which of the following is least likely to be seen with Crohn's disease:

- a. Skip lesions
- b. Fistula
- c. Toxic megacolon
- d. Transmural involvement

294. In which of the following conditions smoking is protective?

- a. Ulcerative colitis
- b. Crohn's disease
- c. SLE
- d. Alzheimer's

295. Barrett's esophagus causes which cancer:

- a. Adenocarcinoma
- b. Squamous cell CA
- c. Carcinoid tumor
- d. Esophageal leiomyoma

296. H. pylori causes all EXCEPT:

- a. Peptic ulcer
- b. Maltoma
- c. Carcinoid tumor
- d. Gastric CA

297. Traveler diarrhea is caused by?

- a. Campylobacter
- b. Aeromonas
- c. Actinobacillus
- d. Cryptosporidium

HEPATOLOGY

298. Which of the following is not a component of Child Pugh classification? (Recent Pattern Question 2018-19)

- a. SGOT
- b. Bilirubin
- c. Albumin
- d. Prothrombin time

299. Not a prehepatic cause of portal HTN?

(Recent Pattern Question 2018-19)

- a. Budd Chiari syndrome
- b. Banti disease
- c. Portal vein thrombosis
- d. Pyelophlebitis

300. Fatty liver with hepatomegaly is seen in:

(Recent Pattern Question 2018)

- a. Marasmus
- b. Metabolic syndrome
- c. Wilson disease
- d. Nutmeg liver

301. Which of the following is used for chelation of zinc in Wilson disease? (Recent Pattern Question 2017)

- a. Desferroxamine
- b. Zinc
- c. Trientine
- d. Tetrathiomolybdate

302. Which is the best investigation for Wilson disease?

(Recent Pattern Question 2017)

- a. KF ring
- b. Urine copper
- c. Serum copper
- d. Liver copper

303. Steatosis is due to:

(Recent Pattern Question 2016)

- a. Triglycerides
- b. LDL
- c. VLDL
- d. Cholesterol

304. Central regulator of iron metabolism is:

(Recent Pattern Question 2016)

- a. Transferrin
- b. Ferritin
- c. Ferroportin
- d. Hepcidin

305. In Wilson disease, chelation is done by:

- a. Iron
- b. Zinc
- c. Copper
- d. Selenium

306. In hemochromatosis, all are affected EXCEPT:

- a. Hippocampus
- b. Bronze Pancreas
- c. Hyperpigmentation
- d. Restrictive cardiomyopathy

307. Most common chronic viral illness is caused by:

- a. Hepatitis A b. Hepatitis B
- c. Hepatitis C d. Hepatitis D

308. Palmar erythema in liver failure is due to:

- a. Coagulopathy b. Hyperbilirubinemia
- c. Hyperammonemia d. Estrogen

309. A man presented with (+) fever, chills and jaundice.

Diagnosis:

- a. Acute Cholecystitis b. Acute cholangitis
- c. Choledocholithiasis d. Acute viral hepatitis

310. Fulminant liver disease is defined as encephalopathy, coagulopathy developing within how many weeks?

- a. 2 weeks b. 3 weeks
- c. 4 weeks d. 8 weeks

311. Most common cause of Fulminant hepatitis in pregnancy

- a. Hep B b. Hep C
- c. Hep D d. Hep E

316. Select the best answer from the picture of temperature charting of patient with history of constipation for over 2 weeks

- a. Enteric fever b. Brucellosis
- c. Relapsing fever d. Hodgkin lymphoma

RHEUMATOLOGY

317. Most common pulmonary manifestation of SLE:

- a. Shrinking Lung syndrome
- b. Pleuritis *(Most Recent Question 2019)*
- c. Intra alveolar hemorrhage.
- d. Interstitial inflammation

318. Which of the following cannot be diagnosed without positive ANA? *(Most Recent Question 2019)*

- a. SLE b. Sjogren Syndrome
- c. Drug induced lupus d. Scleroderma

319. Correct about Rheumatoid nodules?

(Recent Pattern Question 2018-19)

- a. Tender, located on extensor surface and seen with arthritis
- b. Non-tender, located on extensor surface and seen with arthritis

312. Best marker for maternal to child transfer of hepatitis B virus?

- a. HBsAg b. HBV DNA
- c. HBeAg d. IgM Anti- HBcAg

313. Spironolactone is most useful in?

- a. Cardiac Hypertrophy b. Cirrhotic ascites
- c. Exudative pleural effusion
- d. Renal artery stenosis

314. Raised Intra-abdominal pressure to consider abdominal compartment syndrome is?

- a. 0-12 mm Hg b. >12 mm Hg
- c. >20 mm Hg d. >30 mm Hg

315. Trans-esophageal echocardiography is better over trans-thoracic echocardiography in?

- a. Evaluation of left ventricle
- b. Evaluation of left atria and left Atrial appendage thrombus
- c. Evaluation of Pericardial fluid
- d. Evaluation of commissural fusion

- c. Non-tender, located on flexor surface and seen with arthritis

- d. Tender, located on flexor surface and seen with arthritis

320. Which of the following is the best investigation for acute gout? *(Recent Pattern Question 2018)*

- a. Serum uric acid b. Uric acid in synovial fluid
- c. Uric acid in urine d. Anti CCP antibodies

321. Which is the drug of choice for acute gout?

(Recent Pattern Question 2018)

- a. Febuxostat b. Probenecid
- c. Rofecoxib d. Naproxen

322. Pulseless disease is?

(Recent Pattern Question 2017)

- a. Takayasu's arteritis
- b. Raynaud phenomenon
- c. Coarctation of aorta
- d. Wegener's granulomatosis

- 323. Best Lab test for rheumatic fever?**
(Recent Pattern Question 2016)
a. ASO b. CRP
c. Anti DNase B d. Anti phospholipid
- 324. What is the effect of rheumatoid arthritis on the lung?**
(Recent Pattern Question 2016)
a. DL_{CO} normal
b. CXR is normal
c. Exudative pleural effusion
d. Flow volume pattern showing a obstructive pattern
- 325. In which of causes of oral ulcer, Auto-antibodies are not seen?**
a. Behçet disease b. SLE
c. Pemphigus d. Celiac disease
- 326. Which antibody is incriminated in causing Henoch Schonlein Purpura?**
a. IgA b. IgG
c. IgM d. IgD
- 327. LE cells are seen in:**
a. SLE b. Dermatomyositis
c. Sick cell anemia d. Scleroderma
- 328. Wegener's granulomatosis is diagnosed by:**
a. P-ANCA b. c-ANCA
c. m-ANCA d. A.N.A
- 329. Antibody in Goodpasture syndrome:**
a. Lupus anticoagulant
b. Anti-GBM antibody
c. Anti-Ro antibody
d. Anti- mitochondrial antibody
- 330. Which of the following condition does not cause multiple painful ulcers on tongue?**
a. TB b. Sarcoidosis
c. Herpes d. Behçet's disease
- 331. Wrong about Duchenne muscular dystrophy is?**
a. Pseudo-hypertrophy of calf muscles
b. Gower sign positive
c. Death occurs due to pneumonia
d. Female is symptomatic
- 332. Gower's sign is seen in**
a. Duchenne muscular dystrophy
b. Congenital myopathy
c. Gullian barre syndrome
d. All of the above
- 333. Joint usually not involved in Rheumatoid arthritis?**
a. D.I.P b. P.I.P
c. M.C.P d. Wrist
- 334. Correct about Wegener Granulomatosis is?**
a. Both lung and kidney is involved
b. p-ANCA is positive
c. Seen with inflammatory bowel disease
d. Non granulomatous vasculitis
- 335. All are seen in rheumatoid arthritis EXCEPT:**
a. Deformities b. Mononeuritis multiplex
c. Peri-articular osteoporosis
d. Sero-negative arthritis
- 336. Which of the following is seen in sarcoidosis:**
a. Hypercalcemia b. Hypocalcemia
c. Hyperphosphatemia d. Hypophosphatemia
- 337. Sequela of rheumatic heart disease in a 5 year old child is:**
a. Mitral stenosis b. Mitral regurgitation
c. Tricuspid stenosis d. Tricuspid regurgitation
- 338. Which of the following is not a major Criteria for rheumatic fever?**
a. Carditis b. Arthritis
c. Syndenham chorea d. ASO titer
- 339. All are major criteria for rheumatic fever EXCEPT?**
a. Pancarditis b. Chorea
c. Deforming arthritis d. Subcutaneous nodules
- 340. All of the following are Jones criteria EXCEPT?**
a. Elevated ASO titers b. History of sore throat
c. Increased PR interval d. Arthritis
- 341. Which one of the following is not associated with anti (Ro) SSA antibody**
a. Rheumatoid arthritis b. Sicca syndrome
c. Sarcoidosis d. Ankylosing spondylitis
- 342. Most specific test for SLE**
a. ss DNA b. ds- DNA
c. Anti-smith antibody d. Histone
- 343. Anti RO bodies are present in all EXCEPT:**
a. SLE b. Sjogren syndrome
c. Neonatal lupus
d. Mixed connective tissue disorder
- 344. Which of the following statement is false about Hurler syndrome:**
a. X linked b. MR
c. Joint stiffness d. Coarse facial features
- 345. In Henoch schonlen purpura Ig and complement involved:**
a. IgG, C 3 b. IgA, C 3
c. IgA, C 1 d. IgG, C 1
- 346. Which of these doesn't present with granulomatous Vasculitis?**
a. Polyarteritis nodosa b. Wegener's
c. Churg strauss syndrome d. Microscopic polyangitis
- 347. Martel sign is seen in?**
a. Gout b. Ankylosing spondylitis
c. Osteoarthritis d. Rheumatoid arthritis
- 348. Lady presents with joint pain in both knees and low grade fever off and on. On examination she has a rash on sun exposed parts. Clinical diagnosis?**
a. SLE b. Rheumatoid arthritis
c. Photo-dermatitis d. Porphyria
- 349. In long standing rheumatoid arthritis which will be seen?**
a. Milk alkali syndrome b. Nephrolithiasis
c. Paradoxical aciduria d. Secondary amyloidosis
- 350. Rheumatoid arthritis is seen with?**
a. HLA DR3 b. HLA DR4
c. HLA DR 27 d. HLA B 27

351. Gold is used for management of?

- a. Ankylosing Spondylitis b. Rheumatoid arthritis
- c. Psoriatic arthritis d. Rheumatic arthritis

RESPIRATORY SYSTEM

352. All are true about Allergic Bronchopulmonary aspergilloma except? (Recent Pattern Question 2018-19)

- a. Distal bronchiectasis
- b. Increased in bronchial gland secretions
- c. Increased Ig E
- d. Seen in asthmatics

353. On putting a Subclavian vein catheter, a patient has developed sudden onset severe respiratory distress. Clinical diagnosis is? (Recent Pattern Question 2018-19)

- a. Pneumothorax b. Sepsis
- c. A.R.D.S d. Nosocomial pneumonia

354. Which is correct about transudative pleural effusion?

(Recent Pattern Question 2018)

- a. Pleural fluid protein to serum protein ratio <0.5
- b. Pleural fluid LDH to Serum LDH >0.6
- c. Pleural Fluid LDH more than 2/3 of upper reference limit for serum LDH
- d. Pleural fluid sugar to blood sugar ratio >0.5

355. Which of the following is seen in COAD?

- a. Chronic bronchitis (Recent Pattern Question 2018)
- b. Follicular bronchiolitis
- c. Desquamative pneumonitis
- d. Chemical pneumonitis

356. A 26-year-old patient presents with a history suggestive of tuberculosis. On examination he has pleural effusion. All of the following parameters will be used for analysis of pleural fluid EXCEPT? (Recent Pattern Question 2017)

- a. Gene XPERT b. LDH
- c. Albumin d. ADA

357. A 2 year malnourished child presents with fever, weight loss, tachypnea. CXR of the patient is shown below. What is the best treatment? (Recent Pattern Question 2017)

- a. A.T.T b. A.T.T plus steroids
- c. Chloramphenicol
- d. Clarithromycin + amoxicillin

358. Leukostasis syndrome affects which organ?

(Recent Pattern Question 2016)

- a. Liver b. Spleen
- c. Kidney d. Lung

359. Drainage hemothorax is done best through which space? (Recent Pattern Question 2016)

- a. 2nd intercostal space b. 5th paravertebral space
- c. 5th midaxillary space d. 7th midaxillary space

360. Shock lung synonym is used for?

(Recent Pattern Question 2016)

- a. COPD b. Alveolar proteinosis
- c. ARDS d. HMD

361. Pneumatocele is caused by? (Recent Pattern Question 2016)

- a. Staphylococcus aureus
- b. Streptococcus pyogenes
- c. Hemophilus parainfluenzae
- d. Mycoplasma pneumoniae

362. Health care associated pneumonia is treated by?

(Recent Pattern Question 2016)

- a. Azithromycin b. Doxycycline
- c. Levofloxacin d. Vancomycin

363. A patient develops fracture of shaft of femur. On day 3, he develops respiratory distress and decrease SPO₂ and petechiae. Probable diagnosis is?

(Recent Pattern Question 2016)

- a. Hypostatic pneumonia b. Hemolytic pneumonia
- c. Crush syndrome d. Fat embolism

364. A 30-year-old male presents with severe abdominal pain and rigidity with rebound tenderness. X-ray abdomen shows?

- a. Acute gastritis (Recent Pattern Question 2016)
- b. DU perforation
- c. Intra-abdominal infection anaerobic
- d. Peritoneal rupture of amoebic liver abscess

365. Biot breathing is seen in?

- a. Flail chest b. Uremia
- c. High altitude d. Lesion in the brain

366. Which is the best test to be done for Pulmonary embolism?

- a. D Dimer Assay
- b. MRI
- c. Ventilation perfusion scan
- d. CT with IV contrast

367. Which of the following patients will not be able to respond to increased carbon dioxide levels?

- a. Narcotic over-dosage b. Obesity
- c. Pulmonary edema d. Type 1 respiratory failure

368. In HIV positive patient with pneumocystis jiroveci infection, which of the following is used for prevention?

- Azithromycin
- Acyclovir
- Levofloxacin
- Sulfomethoxazole+ trimethoprim

369. Pop-corn calcification is seen with?

- Pulmonary Hamartoma
- Aspergillosis
- Broncho-Alveolar cancer
- Pulmonary Embolism

370. ARDS is characterised by all EXCEPT?

- Decreased surfactant
- Alveolar transudate
- Decreased lung compliance
- pAO_2 / FiO_2 ratio <200

371. A 45-year-old with trauma presents after 4 hours with cheek swelling and urine not passed. On examination crepitus is palpated with periorbital swelling. What is your diagnosis?

- Renal shut down
- Lung laceration
- Gas gangrene
- Base of skull fracture

372. All are true about Aspirin sensitive asthma EXCEPT?

- Nasal polyposis
- Treatment with inhaled corticosteroids
- Rhinosinusitis
- Increased prostaglandins

373. In a patient with COPD, best management option is?

- Quit smoking
- Bronchodilators
- Low flow Oxygen
- Mucolytics

374. In a patient with smoking history, which is important?

- Duration of smoking
- Number of smoking
- Brand of Cigarette
- Filter of cigarette

375. Hyperventilation leads to?

- Increased CO_2
- Decreased CO_2
- Increased DL_{CO}
- Decreased PO_2

376. What is the diagnosis of CXR shown?

- Viral pneumonia
- Bacterial pneumonia
- Fungal pneumonia
- TB

377. Image CXR shows:

- Right pleural effusion
- Left pleural effusion
- Left lung consolidation
- Right lung consolidation

378. Female patient with bilateral hilar lymphadenopathy and joint pain. ACE levels are elevated. Diagnosis is?

- Sarcoidosis
- Silicosis
- Hodgkin's lymphoma
- Non Hodgkin's lymphoma

379. Mesothelioma is most commonly caused by?

- Asbestosis
- Silicosis
- Anthracois
- Coal workers pneumoconiosis

380. Partial pressure of oxygen in alveoli:

- 60 mm Hg
- 103 mm Hg
- 136 mm Hg
- 160 mm Hg

381. Which of the following is given in the maintenance of severe persistent asthma:

- Steroid
- Leukotriene agonist
- Ipratropium bromide
- Long acting beta2 agonist

382. Oxygen (30-50%) is not given in:

- COPD
- Pneumonia
- Pleural effusion
- Severe asthma

383. Which of the following is due to chronic smoking:

- Centri-acinar emphysema
- Panacinar emphysema
- Irregular emphysema
- Mixed variety

384. Mottling of lungs is seen in?

- Silicosis
- histoplasmosis
- ARDS
- Nocardia

385. Which is correct regarding the CXR?

- a. Pleural thickening
- b. Segmental collapse
- c. Ellis curve
- d. Hypertranslucency

386. Diagnosis on CXR is?

- a. Congenital diaphragmatic hernia
- b. Bochdalek hernia
- c. Pneumothorax
- d. Pneumo-mediastinum

387. CURB 65 criteria includes all EXCEPT:

- a. Age is always more than or equal to 65 years
- b. Respiratory rate more than 30/min
- c. Systolic Blood pressure is more than 90 mm Hg
- d. BUN level is more than >7 mmol/L

388. Most common type of emphysema

- a. Panacinar emphysema
- b. Irregular emphysema
- c. Centriacinar emphysema
- d. Paraseptal emphysema

389. Emphysema presents with all EXCEPT:

- a. Cyanosis
- b. Barrel shaped chest
- c. Associated with smoking
- d. Type 1 respiratory failure

390. In case of Pulmonary embolism, Right ventricle hypokinesia and decreased output, which Drug therapy is most helpful:

- a. Thrombolytic
- b. LMW heparin
- c. Warfarin
- d. Heparin
